1 Introduction

Core Types defines common classes and functionality used by multiple Functional Clusters as part of their public interfaces.

2 Acronyms and Abbreviations

The glossary below includes acronyms and abbreviations relevant to the Core Types that are not included in the [1, AUTOSAR glossary].

Abbreviation / Acronym:	Description:
UUID	<i>Universally Unique Identifier</i> , a 128-bit number used to identify information in computer systems

4 Constraints and assumptions

4.1 Limitations

- The specification of Promise misses the specializations for `<void>` and `<T&>` that `std::promise` defines.
- The specification lacks comparison operators for class `ErrorCode`.
- The specification of class `Result` uses an insufficient conditional noexcept classifier that does not consider the properties of the `<E>` type.
- The specification of some data types (`Array`, `Map`, `Optional`, `String`, `StringView`, `Variant`) mentions “supporting constructs”, but lacks a precise scope definition of this term.
- The specification of some data types (`Map`, `Vector`, `String`) is lacking a comprehensive definition of memory allocation behavior; it currently only describes it as “implementation-defined”.
- Chapter 7 (“[Functional Specification](#)”) describes some behavior informally that should rather be given as specification items.

4.2 Applicability to car domains

No restrictions to applicability.

5 Dependencies to other modules

This Functional Cluster only depends on [2], in particular the C++11 standard library.

6 Requirements Tracing

The following tables reference the requirements specified in <CITATIONS_OF_CONTRIBUTED_DOCUMENTS> and links to the fulfillment of these. Please note that if column “Satisfied by” is empty for a specific requirement this means that this requirement is not fulfilled by this document.

Requirement	Description	Satisfied by
[RS_AP_00128]	Use of exceptions in API.	[SWS_CORE_00001] [SWS_CORE_00002]

7 Functional Specification

This chapter describes the concepts that are introduced with this Functional Cluster, which only consists of data types and helper functions. Particular emphasis is put on error handling.

7.1 Error handling

7.1.1 Types of errors

During execution of an implementation of Adaptive Platform APIs, different error conditions might be detected and need to be handled and/or reported. Based on the nature and the handling of these errors, the following two types of errors can be distinguished:

Fatal Error: This kind of error cannot be handled properly by the Adaptive Application and thus leads to termination of the Adaptive Application. Typical examples for this kind of errors are:

- `Unchecked Exceptions` (according to [3, AUTOSAR CPP14 guidelines]), thrown by internal methods used to implement Adaptive Platform APIs (e.g., due to out of memory situations)
- errors which prevent any further operation of the respective process (e.g., encrypted communication channel not available)
- errors which are effectively configuration or programming errors (e.g., a violated pre- or post-condition of a function)

Non-Fatal Error: This kind of error can and should be handled by the Adaptive Application and usually does not lead to termination of the Adaptive Application. In many cases, this kind of error is even explicitly modeled in the Manifest by means of `Checked Errors` (see section 7.1.3).

An example might be a failure to read data from a network socket.

7.1.2 Traditional error handling in C and C++

The C language largely relies on error codes for any kind of error handling. While it also has the `setjmp/longjmp` facility for performing “non-local gotos”, its use for error handling is not widespread, mostly due to the difficulty of reliably avoiding resource leaks.

Error codes in C come in several flavors:

- return values
- out parameters

- error singletons (e.g. `errno`)

Typically, these error codes in C are plain `int` variables, making them a very low-level facility without any type safety.

C++ inherited these approaches to error handling from C (not least due to the inheritance of the C standard library as part of the C++ standard), but it also introduced exceptions as an alternative means of error propagation. There are many advantages of using exceptions for error propagation, which is why the C++ standard library generally relies on them for error propagation.

Notwithstanding the advantages of exceptions, error codes are still in widespread use in C++, even within the standard library. Some of that can be explained with concerns about binary compatibility with C, but many new libraries still prefer error codes to exceptions. Reasons for that include:

- with exceptions, it can be difficult to reason about a program's control flow
- exceptions have much higher runtime cost than error codes (either in general, or only in the case of failure, i.e. exception-thrown)

The first of these reasons concerns both humans and code analysis tools. Because exceptions are, in effect, a kind of hidden control flow, a C++ function that seems to contain only a single `return` statement might in fact have many additional function returns due to exceptions. That can make such a function hard to review for humans, but also hard to analyse for static code analysis tools.

The second one is even more critical in the context of developing safety-critical software. The specification of C++ exceptions pose significant problems for C++ compiler vendors that want their products be certified for development of safety-critical software. In fact, ASIL-certified C++ compilers generally do not support exceptions at all. One particular problem with exceptions is that exception handling, as specified for C++, implies the use of dynamic memory allocation, which generally has non-predictable or even unbounded execution time. This makes exceptions currently unsuitable for development of certain safety-critical software in the automotive industry.

7.1.3 Checked versus Unchecked Exceptions

In [3, AUTOSAR CPP14 guidelines], there is a strict separation between `Checked Exception` and `Unchecked Exception`. These terms are inspired by the Java Programming Language's use of exceptions.

`Unchecked Exceptions` can occur in almost any API call (except for API calls that are marked with `noexcept`, of course); they are never formally modeled in the AUTOSAR Manifest and are implementation specific. An `Unchecked Exception` represents an error from which a program typically cannot recover. It is an instance of `Fatal Error`, as defined in section 7.1.1.

In contrast, `Checked Exceptions` only occur in specific API calls, and their occurrence is formally specified in the API. A `Checked Exception` represents an error that is expected and from which the application can reasonably be expected to recover. It is an instance of `Non-Fatal Error`, as defined in section 7.1.1.

7.1.4 Error handling in the Adaptive Platform

In contrast to released versions of this document prior to R18-10 of the Adaptive Platform, `Checked Exception` errors are not directly reported via C++ exceptions. Therefore, they will henceforth be referenced as `Checked Errors`.

A `Checked Error` can be viewed as a generalization of `Checked Exception`; it is an abstract “error” that “contains” both an error code and an exception, and it can be “realized” as either of them. The same holds for `Unchecked Error` and `Unchecked Exception`.

Within the Adaptive Platform, synchronous `Checked Errors` are reported via `ara::core::Result` objects containing an `ara::core::ErrorCode`. Asynchronous `Checked Errors` are reported via `ara::core::Future` objects that effectively contain `ara::core::Result` objects.

In case a `Fatal Error` is detected during execution of Adaptive Platform APIs, the following error handling shall be performed:

[SWS_CORE_00001]{DRAFT} Handling of Fatal Errors [The incident shall be logged (if logging is enabled for the respective Functional Cluster of the Adaptive Platform implementation), and the operation shall be terminated by either:

- raising an `Unchecked Exception` (which in turn shall lead to the respective process to be terminated by a call to `std::terminate()`, possibly after execution of cleanup code), or by
- explicitly terminating the process abnormally (e.g., by calling `std::terminate` or `std::abort`)

]([RS_AP_00128](#))

In case a `Non-Fatal Error` is detected during execution of Adaptive Platform APIs, the following error handling shall be performed:

[SWS_CORE_00002]{DRAFT} Handling of Non-Fatal Errors [The error shall be returned from the function as an instance of `ara::core::Result`.]([RS_AP_00128](#))

7.1.4.1 ErrorCode

As its name implies, `ara::core::ErrorCode` is a form of error code; however, it is a class type, loosely modeled on `std::error_code`, and thus allows much more sophisticated handling of errors than the simple error codes as used in typical C APIs.

It always contains a low-level `error code` value and a reference to an `error domain`.

The `error code` value is an enumeration, typically a scoped one. When stored into a `ara::core::ErrorCode`, it is type-erased into an integral type and thus handled similarly to a C-style error code. The `error domain` reference defines the context for which the `error code` value is applicable and thus provides some measure of type safety.

An `ara::core::ErrorCode` also contains a `support data` value, which *can* be defined by an implementation of the Adaptive Platform to give a vendor-specific additional piece of data about the error.

In addition to that, `ara::core::ErrorCode` can also optionally contain a user-defined message string. This is stored in the form of a non-owning pointer, so the lifetime of this string must match or exceed that of the `ara::core::ErrorCode` object. Typically, a string literal should be used, to ensure it has static storage duration.

`ara::core::ErrorCode` instances are usually not created directly, but only via the forwarding form of the function `ara::core::Result::FromError`.

An `ara::core::ErrorCode` is not restricted to any known set of error domains. Its internal type erasure of the enumeration makes sure that it is a simple (i.e., non-templated) type which can contain arbitrary errors from arbitrary domains.

However, comparison of two `ara::core::ErrorCode` instances only considers the `error code` value and the `error domain` reference; the user-defined message and the `support data` value members are not considered for checking equality. This is due to the way `ara::core::ErrorCode` instances are usually compared against a known set of errors for which to check:

```
1 ErrorCode ec = ...
2 if (ec == MyEnum::some_error)
3     // ...
4 else if (ec == AnotherEnum::another_error)
5     // ...
```

Each of these comparisons will create a temporary `ara::core::ErrorCode` object for the right-hand side of the comparison, and then compare `ec` against that. Such automatically created instances naturally do not contain any meaningful user-defined message or `support data` value.

As `ara::core::ErrorCode` is fully `constexpr`-capable, creation of this temporary instance is usually free of any runtime cost (assuming that the `ErrorDomain` subclass has also been made `constexpr`-capable, see below).

7.1.4.2 ErrorDomain

`ara::core::ErrorDomain` is the abstract base class for concrete error domains that are defined within Functional Clusters or even Adaptive Applications. This class is loosely based on `std::error_category`, but differs significantly from it.

An error domain has an associated error code enumeration and an associated base exception type. Both these are usually defined in the same namespace as the `ara::core::ErrorDomain` subclass. For normalized access to these associated types, type aliases with standardized names are defined within the `ara::core::ErrorDomain` subclass. This makes the `ErrorDomain` subclass the root of all data about errors.

Identity of error domains is defined in terms of unique identifiers. AUTOSAR-defined error domains are given standardized identifiers; user-defined error domains are also required to define unique identifiers.

The `ara::core::ErrorDomain` class definition requires this unique identifier to be of unsigned 64 bit integer type (`std::uint64_t`). The range of possible values is large enough to apply UUID-like generation patterns (for `UID-64`) even if typical UUIDs have 128 bits and are thus larger than that. When a new error domain is created (either an AUTOSAR defined or an user defined one) an according `Id` shall be randomly generated, which represents this error domain. The uniqueness and standardization of such an `Id` per error domain is mandatory, since the exchange of information on occurred errors between callee and caller (potentially located at different ECUs) is based on this `Id`.

Given this definition of identity of error domains, it usually makes sense to have only one single instance of each `ara::core::ErrorDomain` subclass. While new instances of these subclasses can be created by calling their constructors, the recommended way to gain access to these subclasses is to call their global accessor functions. For instance, the error domain class `ara::core::FutureErrorDomain` is referenced by calling `ara::core::GetFutureDomain`; within any process space, this will always return a reference to the same global instance of this class.

For error domains that are modelled in ARXML (as `ApApplicationErrorDomain`), the C++ language binding will create a C++ class for each such `ApApplicationErrorDomain`. This C++ class will be a subclass of `ara::core::ErrorDomain`, and its name will follow a standard scheme.

`ara::core` has two pre-defined error domains, called `PosixErrorDomain` (containing the set of errors defined by the POSIX standard; these are equivalent to `std::errc` from [4]) and `FutureErrorDomain` (containing errors equivalent to those defined by `std::future_errc`).

Application programmers usually do not interact with class `ara::core::ErrorDomain` or its subclasses directly; most access is done via `ara::core::ErrorCode`.

7.1.4.3 Result

The `ara::core::Result` type follows the `ValueOrError` concept from the C++ proposal p0786 [5]. It either contains a value (of type `ValueType`), or an error (of type `ErrorType`). Both `ValueType` and `ErrorType` are template parameters of `ara::core::Result`, and due to their templated nature, both value and error can be of any type. However, `ErrorType` is defaulted to `ara::core::ErrorCode`, and it is expected that this assignment is kept throughout the Adaptive Platform.

`ara::core::Result` acts as a “wrapper type” that connects the exception-less API approach using `ara::core::ErrorCode` with C++ exceptions. As there is a direct mapping between `ara::core::ErrorCode` and a domain-specific exception type, `ara::core::Result` allows to “transform” its embedded `ara::core::ErrorCode` into the appropriate exception type, by calling `ara::core::Result::ValueOrThrow`.

7.1.4.4 Future and Promise

`ara::core::Future` and its companion class `ara::core::Promise` are closely modeled on `std::future` and `std::promise`, but have been adapted to interoperate with `ara::core::Result`. Similar to `ara::core::Result` described in section 7.1.4.3, the class `ara::core::Future` either contains a value, or an error (the `Future` first has to be in “ready” state, though). Class `ara::core::Promise` has been adapted in two aspects: `Promise::set_exception` has been removed, and `Promise::SetError` has been introduced in its stead. For `ara::core::Future`, there is a new member function `Future::GetResult` that is similar to `Future::get`, but never throws an exception and returns a `ara::core::Result` instead.

Thus, `ara::core::Future` as return type allows the same dual approach to error handling as `ara::core::Result`, in that it either works exception-based (with `Future::get`), or exception-free (with `Future::GetResult`).

`ara::core::Result` is a type used for returning values or errors from a *synchronous* function call, whereas `ara::core::Future` is a type used for returning values or errors from an *asynchronous* function call.

7.1.5 Duality of ErrorCode and exceptions

By using the classes listed above, all APIs of the Adaptive Platform can be used with either an exception-based or an exception-less workflow. No API function will ever throw a `Checked Exception`; it will always return a `Checked Error` in the form of a `ara::core::Result` return value instead. The class `ara::core::Result` then allows “converting” an `ara::core::ErrorCode` into an exception.

When working with a C++ compiler that does not support exceptions at all (or one that has been configured to disable them with an option such as g++'s `-fno-exceptions`), all API functions still show the same behavior. What *does* differ then is that `ara::core::Result::ValueOrThrow` is not defined - this member function is only defined when the compiler does support exceptions.

Any `Unchecked Exceptions` thrown from code from such a compiler will be transformed into calls to `std::terminate`. As an `Unchecked Error` is not assumed to be recoverable, termination of the application is the logical consequence. Orderly shutdown of the application in this case can be done through a C++ `terminate` handler.

7.1.6 Exception hierarchy

The Adaptive Platform defines a base exception type `ara::core::Exception` for all exceptions defined in the standard. This exception takes a `ara::core::ErrorCode` object as mandatory constructor argument, similar to the way `std::system_error` takes a `std::error_code` argument for construction.

Below this exception base type, there an additional layer of exception base types, one for each error domain.

For error domains that are modelled in ARXML, the C++ language binding will generate an exception class in addition to the `ErrorDomain` subclass (which is described in section 7.1.4.2). This exception class also conforms to a standard naming scheme: `<shortname>` of `ApApplicationErrorDomain` plus "Exception" suffix (this makes it distinguishable from the `ErrorDomain` subclass itself). It is located in the same namespace as the corresponding `ErrorDomain` subclass.

7.1.7 Creating new error domains

Any new software module with significant logical separation from all existing modules of the Adaptive Platform should define one or more own error domains.

Defining an own error domain firstly consists of defining an enumeration describing all known error situations of the new software module. Then, a new class must be created that derives from `ara::core::ErrorDomain` and defines all the mandatory members. One of these members is a type alias (called `Errc`) for the enumeration; another member is a type alias (called `Exception`) for an exception base class for this new error domain.

In addition, a global accessor function for the new error domain class should be defined. For an error domain class `MyErrorDomain`, the accessor function should be named something like `GetMyErrorDomain`. This accessor function should return a reference to a single global instance of that class. This accessor function should be

fully `constexpr`-capable; this in turn implies that the `ErrorDomain` subclass also should be `constexpr`-constructible.

And finally, a global factory function `ara::core::MakeErrorCode` should be defined, which is implicitly used by the convenience constructors of class `ara::core::ErrorCode`. This factory function will make use of the global accessor function for the error domain subclass, and call the type-erased constructor of class `ara::core::ErrorCode`.

Each error domain has an identifier that is used to determine equality of error domains. The error domains that are pre-defined by the Adaptive Platform have standardized identifiers. Application-specific error domains should make sure their identifiers are system-wide unique.

The following C++ pseudo code illustrates how these definitions come together:

```
1
2 // How to define <ApApplicationErrorDomain.SN>?
3 // How to define enum values?
4
5 enum class <ApApplicationErrorDomain.SN>Errc : ara::core::ErrorDomain::
   CodeType
6 {
7     // ...
8 };
9
10 class <ApApplicationErrorDomain.SN>Exception : public ara::core::
   Exception
11 {
12 public:
13     <ApApplicationErrorDomain.SN>Exception(ara::core::ErrorCode&& err);
14 };
15
16 class <ApApplicationErrorDomain.SN>ErrorDomain : public ara::core::
   ErrorDomain
17 {
18 public:
19     using Errc = <ApApplicationErrorDomain.SN>Errc;
20     using Exception = <ApApplicationErrorDomain.SN>Exception;
21
22     constexpr <ApApplicationErrorDomain.SN>ErrorDomain() noexcept;
23     char const* Name() const noexcept override;
24     char const* Message(ara::core::ErrorDomain::CodeType errorCode) const
       noexcept override;
25     void ThrowAsException(ara::core::ErrorCode errorCode) const noexcept (
       false) override;
26 };
27
28 constexpr ErrorDomain const& <ApApplicationErrorDomain.SN>ErrorDomain()
   ;
29
30 constexpr ErrorCode MakeErrorCode(<ApApplicationErrorDomain.SN>Errc
   code, ara::core::ErrorDomain::SupportDataType data, char const*
   message);
```

7.1.8 AUTOSAR error domains

[SWS_CORE_00010]{DRAFT} AUTOSAR error domain range [All error domains shall have a system-wide unique identifier that is represented as a 64-bit unsigned integer value. Identifiers that have their top bit (i.e. bit #63) set are reserved for AUTOSAR-defined error domains; all user-defined error domains shall have the top bit of their identifier set to 0.]([RS_AP_00130](#))

[SWS_CORE_00012]{DRAFT} The POSIX error domain [There shall be an error domain `ara::core::PosixErrorDomain` for errors defined by POSIX.1 in terms of `errno` values. It shall have the shortname `Posix` and the identifier `0x8000'0000'0000'0012`.]([RS_AP_00130](#))

[SWS_CORE_00013]{DRAFT} The Future error domain [There shall be an error domain `ara::core::FutureErrorDomain` for all errors originating from the interaction of the classes `ara::core::Future` and `ara::core::Promise`. It shall have the shortname `Future` and the identifier `0x8000'0000'0000'0013`.]([RS_AP_00130](#))

7.2 Advanced data types

7.2.1 Types derived from the C++ standard

In addition to AUTOSAR-devised data types, which are mentioned in the previous sections, the Adaptive Platform also contains a number of generic data types and helper functions.

[SWS_CORE_00040]{DRAFT} Errors originating from C++ standard classes [For the classes `Array`, `Vector`, `Map`, `Variant`, `String`, and `StringView` specified below in terms of the corresponding classes of the C++ standard, all functions that are specified by [4, the C++11 standard], [6, the C++17 standard], or [7, the draft C++20 standard] to throw any exceptions, are instead specified to generate an `Unchecked Error`, which shall be handled as described in [\[SWS_CORE_00001\]](#). The exact type of a thrown exception is unspecified in these cases.]([RS_AP_00130](#))

7.2.1.1 Types taken from the C++11 standard

These types are already contained in the [4, C++11 standard]; however, types with almost identical behavior are re-defined within the `ara::core` namespace. The reason for this is that the memory allocation behavior of the `std::` types is often unsuitable for automotive purposes. Thus, the `ara::core` ones define their own memory allocation behavior.

Examples for such data types are: `Vector`, `Map`, and `String`.

7.2.1.2 Types taken from newer C++ standards

These types have been defined in or proposed for a newer C++ standard, and the Adaptive Platform includes them into the `ara::core` namespace, usually because they are necessary for certain constructs of the Manifest.

Examples for such data types are: `StringView`, `Span`, `Optional`, and `Variant`.

7.3 Text encoding

The Adaptive Platform strongly encourages developers to use UTF-8 for all non-ASCII text – or, rather, because ASCII is a strict subset of UTF-8, to use UTF-8 for all text resources. The types `ara::core::String` and `ara::core::StringView` are well-suited for this purpose, as they allow arbitrary 8-bit code units as their content. Please note, however, that e.g. `ara::core::String::size()` follows C++ tradition and returns the number of *code units* (i.e. bytes for UTF-8), not anything like the number of *code points* or *grapheme clusters*.

There currently is no support within the `ara::core` namespace for "wide character" strings, including UTF-16-encoded ones. It is recommended to convert any textual data into a `ara::core::String` object with UTF-8 encoding for further processing.

8 API specification

All symbols described in this chapter reside within the namespace `ara::core`. All symbols have `public` visibility unless otherwise noted.

8.1 ErrorDomain data type

This section describes the `ara::core::ErrorDomain` type that constitutes a base class for error domain implementations.

[SWS_CORE_00110]{DRAFT} [

Kind:	class
Symbol:	<code>ara::core::ErrorDomain</code>
Scope:	namespace <code>ara::core</code>
Syntax:	<code>class ErrorDomain {...};</code>
Header file:	<code>#include "ara/core/error_domain.h"</code>
Description:	Encapsulation of an error domain. An error domain is the controlling entity for <code>ErrorCode</code> 's error code values, and defines the mapping of such error code values to textual representations. This class is a literal type, and subclasses are strongly advised to be literal types as well.

] ([RS_AP_00130](#))

[SWS_CORE_00121]{DRAFT} [

Kind:	type alias
Symbol:	<code>ara::core::ErrorDomain::IdType</code>
Scope:	class <code>ara::core::ErrorDomain</code>
Derived from:	<code>std::uint64_t</code>
Syntax:	<code>using ara::core::ErrorDomain::IdType = std::uint64_t;</code>
Header file:	<code>#include "ara/core/error_domain.h"</code>
Description:	Alias type for a unique <code>ErrorDomain</code> identifier type .

] ([RS_AP_00130](#))

[SWS_CORE_00122]{DRAFT} [

Kind:	type alias
Symbol:	<code>ara::core::ErrorDomain::CodeType</code>
Scope:	class <code>ara::core::ErrorDomain</code>
Derived from:	<code>std::int32_t</code>
Syntax:	<code>using ara::core::ErrorDomain::CodeType = std::int32_t;</code>

Header file:	#include "ara/core/error_domain.h"
Description:	Alias type for a domain-specific error code value .

](RS_AP_00130)

[SWS_CORE_00123]{DRAFT} [

Kind:	type alias
Symbol:	ara::core::ErrorDomain::SupportDataType
Scope:	class ara::core::ErrorDomain
Derived from:	std::int32_t
Syntax:	using ara::core::ErrorDomain::SupportDataType = std::int32_t;
Header file:	#include "ara/core/error_domain.h"
Description:	Alias type for vendor-specific supplementary data .

](RS_AP_00130)

[SWS_CORE_00131]{DRAFT} [

Kind:	function
Symbol:	ara::core::ErrorDomain::ErrorDomain(ErrorDomain const &)
Scope:	class ara::core::ErrorDomain
Syntax:	ErrorDomain (ErrorDomain const &)=delete;
Header file:	#include "ara/core/error_domain.h"
Description:	Copy construction shall be disabled. .

](RS_AP_00130)

[SWS_CORE_00132]{DRAFT} [

Kind:	function

Symbol:	ara::core::ErrorDomain::operator=(ErrorDomain &&)	
Scope:	class ara::core::ErrorDomain	
Syntax:	ErrorDomain& operator= (ErrorDomain &&)=delete;	

Header file:	#include "ara/core/error_domain.h"
Description:	Move assignment shall be disabled. .

](RS_AP_00130)

[SWS_CORE_00137]{DRAFT} [

Kind:	function	
Symbol:	ara::core::ErrorDomain::operator==(ErrorDomain const &other)	
Scope:	class ara::core::ErrorDomain	
Syntax:	constexpr bool operator== (ErrorDomain const &other) const noexcept;	
Parameters (in):	other	the other instance
Return value:	bool	true if other is equal to *this, false otherwise
Exception Safety:	noexcept	
Header file:	#include "ara/core/error_domain.h"	
Description:	Compare for equality with another ErrorDomain instance. Two ErrorDomain instances compare equal when their identifiers (returned by Id()) are equal.	

](RS_AP_00130)

[SWS_CORE_00138]{DRAFT} [

Kind:	function	
Symbol:	ara::core::ErrorDomain::operator!=(ErrorDomain const &other)	
Scope:	class ara::core::ErrorDomain	
Syntax:	constexpr bool operator!= (ErrorDomain const &other) const noexcept;	
Parameters (in):	other	the other instance
Return value:	bool	true if other is not equal to *this, false otherwise
Exception Safety:	noexcept	
Header file:	#include "ara/core/error_domain.h"	
Description:	Compare for non-equality with another ErrorDomain instance.	

](RS_AP_00130)

[SWS_CORE_00151]{DRAFT} [

Kind:	function	
Symbol:	ara::core::ErrorDomain::Id()	
Scope:	class ara::core::ErrorDomain	
Syntax:	constexpr IdType Id () const noexcept;	
Return value:	IdType	the identifier
Exception Safety:	noexcept	
Header file:	#include "ara/core/error_domain.h"	

Description:	Return the unique domain identifier.
---------------------	--------------------------------------

](RS_AP_00130)

[SWS_CORE_00152]{DRAFT} [

Kind:	function
Symbol:	ara::core::ErrorDomain::Name()
Scope:	class ara::core::ErrorDomain
Syntax:	virtual char const* Name () const noexcept=0;
Return value:	char const * the name as a null-terminated string, never nullptr
Exception Safety:	noexcept
Header file:	#include "ara/core/error_domain.h"
Description:	Return the name of this error domain. The returned pointer remains owned by class ErrorDomain and shall not be freed by clients.

](RS_AP_00130)

[SWS_CORE_00153]{DRAFT} [

Kind:	function
Symbol:	ara::core::ErrorDomain::Message(CodeType errorCode)
Scope:	class ara::core::ErrorDomain
Syntax:	virtual char const* Message (CodeType errorCode) const noexcept=0;
Parameters (in):	errorCode the domain-specific error code
Return value:	char const * the text as a null-terminated string, never nullptr
Exception Safety:	noexcept
Header file:	#include "ara/core/error_domain.h"
Description:	Return a textual representation of the given error code. The return value is undefined if the errorCode did not originate from this error domain. The returned pointer remains owned by class ErrorDomain and shall not be freed by clients.

](RS_AP_00130)

[SWS_CORE_00154]{DRAFT} [

Kind:	function
Symbol:	ara::core::ErrorDomain::ThrowAsException(ErrorCode const &errorCode)
Scope:	class ara::core::ErrorDomain
Syntax:	virtual void ThrowAsException (ErrorCode const &errorCode) const noexcept (false)=0;
Parameters (in):	errorCode the ErrorCode
Return value:	None

Exception Safety:	noexcept
Header file:	#include "ara/core/error_domain.h"
Description:	Throw the given error as exception. This function will determine the appropriate exception type for the given ErrorCode and throw it. The thrown exception will contain the given ErrorCode.

](RS_AP_00130)

8.2 ErrorCode data type

This section describes the `ara::core::ErrorCode` type that describes a domain-specific error.

[SWS_CORE_00501]{DRAFT} [

Kind:	class
Symbol:	ara::core::ErrorCode
Scope:	namespace ara::core
Syntax:	<code>class ErrorCode {...};</code>
Header file:	#include "ara/core/error_code.h"
Description:	Encapsulation of an error code. An ErrorCode contains a raw error code value and an error domain. The raw error code value is specific to this error domain.

](RS_AP_00130)

[SWS_CORE_00511]{DRAFT} [

Kind:	function	
Symbol:	<code>ara::core::ErrorCode::ErrorCode(EnumT e, ErrorDomain::SupportDataType data=0, char const *userMessage=nullptr)</code>	
Scope:	class ara::core::ErrorCode	
Syntax:	<code>template <typename EnumT> constexpr ErrorCode (EnumT e, ErrorDomain::SupportDataType data=0, char const *userMessage=nullptr) noexcept;</code>	
Template param:	EnumT	an enum type that contains error code values
Parameters (in):	e	a domain-specific error code value
	data	optional vendor-specific supplementary error context data
	userMessage	an optional user-defined custom static message text (null-terminated)
Exception Safety:	noexcept	
Header file:	#include "ara/core/error_code.h"	

Description:	<p>Construct a new ErrorCode instance with parameters.</p> <p>This constructor does not participate in overload resolution unless EnumT is an enum type.</p> <p>The lifetime of the text pointed to by userMessage must exceed that of all uses of ErrorCode::UserMessage() on this instance.</p>
---------------------	---

](RS_AP_00130)

[SWS_CORE_00512]{DRAFT} [

Kind:	function	
Symbol:	ara::core::ErrorCode::ErrorCode(EnumT e, char const *userMessage, ErrorDomain::SupportDataType data=0)	
Scope:	class ara::core::ErrorCode	
Syntax:	<pre>template <typename EnumT> constexpr ErrorCode (EnumT e, char const *userMessage, Error Domain::SupportDataType data=0) noexcept;</pre>	
Template param:	EnumT	an enum type that contains error code values
Parameters (in):	e	a domain-specific error code value
	userMessage	a user-defined custom static message text (null-terminated)
	data	optional vendor-specific supplementary error context data
Exception Safety:	noexcept	
Header file:	#include "ara/core/error_code.h"	
Description:	<p>Construct a new ErrorCode instance with parameters.</p> <p>The lifetime of the text pointed to by userMessage must exceed that of all uses of ErrorCode::UserMessage() on this instance.</p> <p>This constructor does not participate in overload resolution unless EnumT is an enum type.</p>	

](RS_AP_00130)

[SWS_CORE_00513]{DRAFT} [

Kind:	function	
Symbol:	ara::core::ErrorCode::ErrorCode(ErrorDomain::CodeType value, ErrorDomain const &domain, ErrorDomain::SupportDataType data=0, char const *userMessage=nullptr)	
Scope:	class ara::core::ErrorCode	
Syntax:	<pre>constexpr ErrorCode (ErrorDomain::CodeType value, ErrorDomain const &domain, ErrorDomain::SupportDataType data=0, char const *user Message=nullptr) noexcept;</pre>	
Parameters (in):	value	a domain-specific error code value
	domain	the ErrorDomain associated with value
	data	optional vendor-specific supplementary error context data
	userMessage	a user-defined custom static message text (null-terminated)
Exception Safety:	noexcept	

Header file:	#include "ara/core/error_code.h"
Description:	Construct a new ErrorCode instance with parameters. The lifetime of the text pointed to by userMessage must exceed that of all uses of ErrorCode::UserMessage() on this instance.

](RS_AP_00130)

[SWS_CORE_00514]{DRAFT} [

Kind:	function
Symbol:	ara::core::ErrorCode::Value()
Scope:	class ara::core::ErrorCode
Syntax:	constexpr ErrorDomain::CodeType Value () const noexcept;
Return value:	ErrorDomain::CodeType the raw error code value
Exception Safety:	noexcept
Header file:	#include "ara/core/error_code.h"
Description:	Return the raw error code value.

](RS_AP_00130)

[SWS_CORE_00515]{DRAFT} [

Kind:	function
Symbol:	ara::core::ErrorCode::Domain()
Scope:	class ara::core::ErrorCode
Syntax:	constexpr ErrorDomain const& Domain () const noexcept;
Return value:	ErrorDomain const & the ErrorDomain
Exception Safety:	noexcept
Header file:	#include "ara/core/error_code.h"
Description:	Return the domain with which this ErrorCode is associated.

](RS_AP_00130)

[SWS_CORE_00516]{DRAFT} [

Kind:	function
Symbol:	ara::core::ErrorCode::SupportData()
Scope:	class ara::core::ErrorCode
Syntax:	constexpr ErrorDomain::SupportDataType SupportData () const noexcept;
Return value:	ErrorDomain::SupportDataType the supplementary error context data
Exception Safety:	noexcept
Header file:	#include "ara/core/error_code.h"

Description:	Return the supplementary error context data. The meaning of the returned value is implementation-defined.
---------------------	--

](RS_AP_00130)

[SWS_CORE_00517]{DRAFT} [

Kind:	function	
Symbol:	ara::core::ErrorCode::UserMessage()	
Scope:	class ara::core::ErrorCode	
Syntax:	constexpr StringView UserMessage () const noexcept;	
Return value:	StringView	the user-specified message text, or an empty string if none was given
Exception Safety:	noexcept	
Header file:	#include "ara/core/error_code.h"	
Description:	Return the user-specified message text.	

](RS_AP_00130)

[SWS_CORE_00518]{DRAFT} [

Kind:	function	
Symbol:	ara::core::ErrorCode::Message()	
Scope:	class ara::core::ErrorCode	
Syntax:	StringView Message () const noexcept;	
Return value:	StringView	the error message text
Exception Safety:	noexcept	
Header file:	#include "ara/core/error_code.h"	
Description:	Return a textual representation of this ErrorCode.	

](RS_AP_00130)

8.3 Exception data type

This section describes the `ara::core::Exception` type that constitutes the base type for all exception types defined by the Adaptive Platform.

[SWS_CORE_00601]{DRAFT} [

Kind:	class
Symbol:	ara::core::Exception
Scope:	namespace ara::core
Base class:	exception
Syntax:	<code>class Exception : public exception {...};</code>
Header file:	<code>#include "ara/core/exception.h"</code>
Description:	Base type for all AUTOSAR exception types.

](RS_AP_00130)

[SWS_CORE_00611]{DRAFT} [

Kind:	function
Symbol:	ara::core::Exception::Exception(ErrorCode err)
Scope:	class ara::core::Exception
Syntax:	<code>explicit Exception (ErrorCode err) noexcept;</code>
Parameters (in):	err the ErrorCode
Exception Safety:	noexcept
Header file:	<code>#include "ara/core/exception.h"</code>
Description:	Construct a new Exception object with a specific ErrorCode.

](RS_AP_00130)

[SWS_CORE_00612]{DRAFT} [

Kind:	function
Symbol:	ara::core::Exception::what()
Scope:	class ara::core::Exception
Syntax:	<code>char const* what () const noexcept override;</code>
Return value:	char const * a null-terminated string
Exception Safety:	noexcept
Header file:	<code>#include "ara/core/exception.h"</code>
Description:	Return the explanatory string. This function overrides the virtual function <code>std::exception::what</code> . All guarantees about the lifetime of the returned pointer that are given for <code>std::exception::what</code> are preserved.

](RS_AP_00130)

[SWS_CORE_00613]{DRAFT} [

Kind:	function
Symbol:	ara::core::Exception::Error()
Scope:	class ara::core::Exception
Syntax:	<code>ErrorCode const& Error () const noexcept;</code>

△

Return value:	ErrorCode const &	reference to the embedded ErrorCode
Exception Safety:	noexcept	
Header file:	#include "ara/core/exception.h"	
Description:	Return the embedded ErrorCode that was given to the constructor.	

](RS_AP_00130)

8.4 Result data type

This section describes the `ara::core::Result<T, E>` type (and its specialization for `T=void`) that contains a value of type `T` or an error of type `E`.

[SWS_CORE_00701]{DRAFT} [

Kind:	class	
Symbol:	ara::core::Result	
Scope:	namespace ara::core	
Syntax:	<pre>template <typename T, typename E = ErrorCode> class Result {...};</pre>	
Template param:	T	typename
	E = ErrorCode	typename
Header file:	#include "ara/core/result.h"

8.4.1 Result<void, E> template specialization

This section defines the interface of the `ara::core::Result` template specialization where the type `T` is "void".

This specialization omits these member functions that are defined in the generic template:

- `operator*` and `operator->`
- `ValueOr`
- `Resolve`
- `Bind`

In addition, a number of function overloads collapse to a single, no-argument one.

[SWS_CORE_00801]{DRAFT} [

8.4.2 Global function overloads

[SWS_CORE_00796]{DRAFT} [

Kind:	function	
Symbol:	ara::core::swap(Result< T, E > &lhs, Result< T, E > &rhs)	
Scope:	namespace ara::core	
Syntax:	template <typename T, typename E> void swap (Result< T, E > &lhs, Result< T, E > &rhs) noexcept(noexcept(lhs.Swap(rhs)));	
Parameters (in):	lhs	one instance
	rhs	another instance
Return value:	None	
Exception Safety:	noexcept	
Header file:	#include "ara/core/result.h"	
Description:	Swap the contents of the two given arguments.	

](RS_AP_00130)

8.5 Posix Error Domain

This section describes the `ara::core::PosixErrorDomain` type that derives from `ara::core::ErrorDomain` and contains the `errno`-based errors that can occur in a POSIX system. It is a reformulation of `std::generic_category`.

8.5.1 POSIX error codes

[SWS_CORE_00200]{DRAFT} [

Kind:	enumeration	
Symbol:	ara::core::PosixErrc	
Scope:	namespace ara::core	
Values:	address_family_not_supported= 97	address family not supported (EAFNOSUPPORT)
	address_in_use= 98	address in use (EADDRINUSE)
	address_not_available= 99	address not available (EADDRNOTAVAIL)
	already_connected= 106	already connected (EISCONN)
	argument_list_too_long= 7	argument list too long (E2BIG)
	argument_out_of_domain= 33	argument out of domain (EDOM)
	bad_address= 14	bad address (EFAULT)
	bad_file_descriptor= 9	bad file descriptor (EBADF)
	bad_message= 74	bad message (EBADMSG)
	broken_pipe= 32	broken pipe (EPIPE)
	connection_aborted= 103	connection aborted (ECONNABORTED)
	connection_already_in_progress= 114	connection already in progress (EALREADY)
	connection_refused= 111	connection refused (ECONNREFUSED)
	connection_reset= 104	connection reset (ECONNRESET)
	cross_device_link= 18	cross-device link (EXDEV)
	destination_address_required= 89	destination address required (EDESTADDRREQ)
	device_or_resource_busy= 16	device or resource busy (EBUSY)
	directory_not_empty= 39	directory not empty (ENOTEMPTY)
	executable_format_error= 8	executable format error (ENOEXEC)
	file_exists= 17	file exists (EEXIST)
	file_too_large= 27	file too large (EFBIG)
	filename_too_long= 36	filename too long (ENAMETOOLONG)
	function_not_supported= 38	function not supported (ENOSYS)
	host_unreachable= 113	host unreachable (EHOSTUNREACH)
	identifier_removed= 43	identifier removed (EIDRM)
	illegal_byte_sequence= 84	illegal byte sequence (EILSEQ)
	inappropriate_io_control_operation= 25	inappropriate io control operation (ENOTTY)
	interrupted= 4	interrupted (EINTR)

invalid_argument= 22	invalid argument (EINVAL)
invalid_seek= 29	invalid seek (ESPIPE)
io_error= 5	I/O error (EIO)
is_a_directory= 21	is a directory (EISDIR)
message_size= 90	message size (EMSGSIZE)
network_down= 100	network down (ENETDOWN)
network_reset= 102	network reset (ENETRESET)
network_unreachable= 101	network unreachable (ENETUNREACH)
no_buffer_space= 105	no buffer space (ENOBUFS)
no_child_process= 10	no child process (ECHILD)
no_link= 67	no link (ENOLINK)
no_lock_available= 37	no lock available (ENOLCK)
no_message_available= 61	no message available (ENODATA)
no_message= 42	no message (ENOMSG)
no_protocol_option= 92	no protocol option (ENOPROTOOPT)
no_space_on_device= 28	no space on device (ENOSPC)
no_stream_resources= 63	no stream resources (ENOSR)
no_such_device_or_address= 6	no such device or address (ENXIO)
no_such_device= 19	no such device (ENODEV)
no_such_file_or_directory= 2	no such file or directory (ENOENT)
no_such_process= 3	no such process (ESRCH)
not_a_directory= 20	not a directory (ENOTDIR)
not_a_socket= 88	not a socket (ENOTSOCK)
not_a_stream= 60	not a stream (ENOSTR)
not_connected= 107	not connected (ENOTCONN)
not_enough_memory= 12	not enough memory (ENOMEM)
not_supported= 202	not supported (ENOTSUP)
operation_canceled= 125	operation canceled (ECANCELED)
operation_in_progress= 115	operation in progress (EINPROGRESS)
operation_not_permitted= 1	operation not permitted (EPERM)
operation_not_supported= 95	operation not supported (EOPNOTSUPP)
operation_would_block= 201	operation would block (EWOULDBLOCK)
owner_dead= 130	owner dead (EOWNERDEAD)
permission_denied= 13	permission denied (EACCES)
protocol_error= 71	protocol error (EPROTO)
protocol_not_supported= 93	protocol not supported (EPROTONOSUPPORT)
read_only_file_system= 30	read-only file system (EROFS)
resource_deadlock_would_occur= 35	resource deadlock would occur (EDEADLK)
resource_unavailable_try_again= 11	resource unavailable, try again (EAGAIN)
result_out_of_range= 34	result out of range (ERANGE)
state_not_recoverable= 131	state not recoverable (ENOTRECOVERABLE)

△

	stream_timeout= 62	stream timeout (ETIME)
	text_file_busy= 26	text file busy (ETXTBSY)
	timed_out= 110	timed out (ETIMEDOUT)
	too_many_files_open_in_system= 23	too many files open in system (ENFILE)
	too_many_files_open= 24	too many files open (EMFILE)
	too_many_links= 31	too many links (EMLINK)
	too_many_symbolic_link_levels= 40	too many symbolic link levels (ELOOP)
	value_too_large= 75	value too large (EOVERFLOW)
	wrong_protocol_type= 91	wrong protocol type (EPROTOTYPE)
Header file:	#include "ara/core/posix_error_domain.h"	
Description:	An enumeration that defines all errors from POSIX.1.

8.5.2 PosixException type

[SWS_CORE_00211]{DRAFT} [

Kind:	class
Symbol:	ara::core::PosixException
Scope:	namespace ara::core
Base class:	ara::core::Exception
Syntax:	<code>class PosixException : public Exception {...};</code>
Header file:	#include "ara/core/posix_error_domain.h"
Description:	Exception type thrown for POSIX errors.

](RS_AP_00130)

[SWS_CORE_00212]{DRAFT} [

Kind:	function
Symbol:	ara::core::PosixException::PosixException(ErrorCode err)
Scope:	class ara::core::PosixException
Syntax:	<code>explicit PosixException (ErrorCode err) noexcept;</code>
Parameters (in):	err the ErrorCode
Exception Safety:	noexcept
Header file:	#include "ara/core/posix_error_domain.h"
Description:	Construct a new PosixException from an ErrorCode.

](RS_AP_00130)

8.5.3 PosixErrorDomain type

[SWS_CORE_00221]{DRAFT} [

Kind:	class
Symbol:	ara::core::PosixErrorDomain
Scope:	namespace ara::core
Base class:	ara::core::ErrorDomain
Syntax:	<code>class PosixErrorDomain final : public ErrorDomain {...};</code>
Header file:	<code>#include "ara/core/posix_error_domain.h"</code>
Description:	An error domain for POSIX.1 errors.

](RS_AP_00130)

[SWS_CORE_00231]{DRAFT} [

Kind:	type alias
Symbol:	ara::core::PosixErrorDomain::Errc
Scope:	class ara::core::PosixErrorDomain
Derived from:	PosixErrc
Syntax:	<code>using ara::core::PosixErrorDomain::Errc = PosixErrc;</code>
Header file:	<code>#include "ara/core/posix_error_domain.h"</code>
Description:	Alias for the error code value enumeration.

](RS_AP_00130)

[SWS_CORE_00232]{DRAFT} [

Kind:	type alias
Symbol:	ara::core::PosixErrorDomain::Exception
Scope:	class ara::core::PosixErrorDomain
Derived from:	PosixException
Syntax:	<code>using ara::core::PosixErrorDomain::Exception = PosixException;</code>
Header file:	<code>#include "ara/core/posix_error_domain.h"</code>
Description:	Alias for the exception base class.

](RS_AP_00130)

[SWS_CORE_00241]{DRAFT} [

Kind:	function
Symbol:	ara::core::PosixErrorDomain::PosixErrorDomain()
Scope:	class ara::core::PosixErrorDomain
Syntax:	<code>constexpr PosixErrorDomain () noexcept;</code>
Exception Safety:	noexcept

Header file:	#include "ara/core/posix_error_domain.h"
Description:	Default constructor.

](RS_AP_00130)

[SWS_CORE_00242]{DRAFT} [

Kind:	function
Symbol:	ara::core::PosixErrorDomain::Name()
Scope:	class ara::core::PosixErrorDomain
Syntax:	char const* Name () const noexcept override;
Return value:	char const * "Posix"
Exception Safety:	noexcept
Header file:	#include "ara/core/posix_error_domain.h"
Description:	Return the "shortname" ApApplicationErrorDomain.SN of this error domain.

](RS_AP_00130)

[SWS_CORE_00243]{DRAFT} [

Kind:	function
Symbol:	ara::core::PosixErrorDomain::Message(ErrorDomain::CodeType errorCode)
Scope:	class ara::core::PosixErrorDomain
Syntax:	char const* Message (ErrorDomain::CodeType errorCode) const noexcept override;
Parameters (in):	errorCode the error code value
Return value:	char const * the text message, never nullptr
Exception Safety:	noexcept
Header file:	#include "ara/core/posix_error_domain.h"
Description:	Translate an error code value into a text message.

](RS_AP_00130)

[SWS_CORE_00244]{DRAFT} [

Kind:	function
Symbol:	ara::core::PosixErrorDomain::ThrowAsException(ErrorCode const &errorCode)
Scope:	class ara::core::PosixErrorDomain
Syntax:	void ThrowAsException (ErrorCode const &errorCode) const noexcept(false) override;
Parameters (in):	errorCode the ErrorCode instance
Return value:	None
Exception Safety:	noexcept
Header file:	#include "ara/core/posix_error_domain.h"

△

Description:	Throw the exception type corresponding to the given ErrorCode.
---------------------	--

8.5.4 GetPosixDomain accessor function

[SWS_CORE_00280]{DRAFT} [

Kind:	function	
Symbol:	ara::core::GetPosixDomain()	
Scope:	namespace ara::core	
Syntax:	constexpr ErrorDomain const& GetPosixDomain () noexcept;	
Return value:	ErrorDomain const &	the PosixErrorDomain
Exception Safety:	noexcept	
Header file:	#include "ara/core/posix_error_domain.h"	
Description:	Return a reference to the global PosixErrorDomain.	

](RS_AP_00130)

8.5.5 MakeErrorCode overload for PosixErrorDomain

[SWS_CORE_00290]{DRAFT} [

Kind:	function	
Symbol:	ara::core::MakeErrorCode(PosixErrc code, ErrorDomain::SupportDataType data, char const *message)	
Scope:	namespace ara::core	
Syntax:	constexpr ErrorCode MakeErrorCode (PosixErrc code, Error Domain::SupportDataType data, char const *message) noexcept;	
Parameters (in):	code	the PosixErrorDomain-specific error code value
	data	optional vendor-specific error data
	message	optional user-provided message string
Return value:	ErrorCode	a new ErrorCode instance
Exception Safety:	noexcept	
Header file:	#include "ara/core/posix_error_domain.h"	
Description:	<p>Create a new ErrorCode within PosixErrorDomain.</p> <p>This function is used internally by constructors of ErrorCode. It is usually not used directly by users.</p> <p>The lifetime of the text pointed to by message must exceed that of all uses of ErrorCode::User Message() on the new instance.</p>	

](RS_AP_00130)

8.6 Future and Promise data types

This section describes the `Future` and `Promise` class templates used in `ara::core` to provide and retrieve the results of asynchronous method calls.

Whenever there is a mention of a standard C++11 item (class, class template, enum or function) such as `std::future` or `std::promise`, the implied source material is [4]. Whenever there is a mention of an experimental C++ item such as `std::experimental::future::is_ready`, the implied source material is [8].

Futures are technically referred to as “asynchronous return objects”, and Promises are referred to as “asynchronous providers”. Their interaction is made possible by a “shared state”. The “shared state” concept is described in [4], section 30.6.4. The description also applies to the shared state behind `ara::core::Future` and `ara::core::Promise`, with the following changes:

- The text “, as used by `async` when policy is `launch::deferred`” is removed from paragraph 2.
- Paragraph 10, referring to “`promise::set_value_at_thread_exit`”, is removed.

8.6.1 `future_errc` enumeration

[SWS_CORE_00400]{DRAFT} [

Kind:	enumeration	
Symbol:	<code>ara::core::future_errc</code>	
Scope:	namespace <code>ara::core</code>	
Values:	<code>broken_promise= 101</code>	the asynchronous task abandoned its shared state
	<code>future_already_retrieved= 102</code>	the contents of the shared state were already accessed
	<code>promise_already_satisfied= 103</code>	attempt to store a value into the shared state twice
	<code>no_state= 104</code>	attempt to access <code>Promise</code> or <code>Future</code> without an associated state
Header file:	#include "ara/core/future_error_domain.h"	
Description:	Specifies the types of internal errors that can occur upon calling <code>Future::get</code> or <code>Future::GetResult</code> .	
	These definitions are equivalent to the ones from <code>std::future_errc</code> .	

](RS_AP_00130)

8.6.2 `FutureException` type

[SWS_CORE_00411]{DRAFT} [

Kind:	class
Symbol:	ara::core::FutureException
Scope:	namespace ara::core
Base class:	ara::core::Exception
Syntax:	<code>class FutureException : public Exception {...};</code>
Header file:	<code>#include "ara/core/future_error_domain.h"</code>
Description:	Exception type thrown by Future and Promise classes.

](RS_AP_00130)

[SWS_CORE_00412]{DRAFT} [

Kind:	function
Symbol:	ara::core::FutureException::FutureException(ErrorCode err)
Scope:	class ara::core::FutureException
Syntax:	<code>explicit FutureException (ErrorCode err) noexcept;</code>
Parameters (in):	err the ErrorCode
Exception Safety:	noexcept
Header file:	<code>#include "ara/core/future_error_domain.h"</code>
Description:	Construct a new FutureException from an ErrorCode.

](RS_AP_00130)

8.6.3 FutureErrorDomain type

[SWS_CORE_00421]{DRAFT} [

Kind:	class
Symbol:	ara::core::FutureErrorDomain
Scope:	namespace ara::core
Base class:	ara::core::ErrorDomain
Syntax:	<code>class FutureErrorDomain final : public ErrorDomain {...};</code>
Header file:	<code>#include "ara/core/future_error_domain.h"</code>
Description:	Error domain for errors originating from classes Future and Promise.

](RS_AP_00130)

[SWS_CORE_00431]{DRAFT} [

Kind:	type alias
Symbol:	ara::core::FutureErrorDomain::Errc
Scope:	class ara::core::FutureErrorDomain

Derived from:	future_errc
Syntax:	using ara::core::FutureErrorDomain::Errc = future_errc;
Header file:	#include "ara/core/future_error_domain.h"
Description:	Alias for the error code value enumeration.

|(RS_AP_00130)

[SWS_CORE_00432]{DRAFT} [

Kind:	type alias
Symbol:	ara::core::FutureErrorDomain::Exception
Scope:	class ara::core::FutureErrorDomain
Derived from:	FutureException
Syntax:	using ara::core::FutureErrorDomain::Exception = FutureException;
Header file:	#include "ara/core/future_error_domain.h"
Description:	Alias for the exception base class.

|(RS_AP_00130)

[SWS_CORE_00441]{DRAFT} [

Kind:	function
Symbol:	ara::core::FutureErrorDomain::FutureErrorDomain()
Scope:	class ara::core::FutureErrorDomain
Syntax:	constexpr FutureErrorDomain () noexcept;
Exception Safety:	noexcept
Header file:	#include "ara/core/future_error_domain.h"
Description:	Default constructor.

|(RS_AP_00130)

[SWS_CORE_00442]{DRAFT} [

Kind:	function
Symbol:	ara::core::FutureErrorDomain::Name()
Scope:	class ara::core::FutureErrorDomain
Syntax:	char const* Name () const noexcept override;
Return value:	char const * "Future"
Exception Safety:	noexcept
Header file:	#include "ara/core/future_error_domain.h"
Description:	Return the "shortname" ApApplicationErrorDomain.SN of this error domain.

|(RS_AP_00130)

[SWS_CORE_00443]{DRAFT} [

Kind:	function	
Symbol:	ara::core::FutureErrorDomain::Message(ErrorDomain::CodeType errorCode)	
Scope:	class ara::core::FutureErrorDomain	
Syntax:	char const* Message (ErrorDomain::CodeType errorCode) const noexcept override;	
Parameters (in):	errorCode	the error code value
Return value:	char const *	the text message, never nullptr
Exception Safety:	noexcept	
Header file:	#include "ara/core/future_error_domain.h"	
Description:	Translate an error code value into a text message.	

](RS_AP_00130)

[SWS_CORE_00444]{DRAFT} [

Kind:	function	
Symbol:	ara::core::FutureErrorDomain::ThrowAsException(ErrorCode const &errorCode)	
Scope:	class ara::core::FutureErrorDomain	
Syntax:	void ThrowAsException (ErrorCode const &errorCode) const noexcept(false) override;	
Parameters (in):	errorCode	the ErrorCode instance
Return value:	None	
Exception Safety:	noexcept	
Header file:	#include "ara/core/future_error_domain.h"	
Description:	Throw the exception type corresponding to the given ErrorCode.	

](RS_AP_00130)

8.6.4 GetFutureDomain accessor function

[SWS_CORE_00480]{DRAFT} [

Kind:	function	
Symbol:	ara::core::GetFutureDomain()	
Scope:	namespace ara::core	
Syntax:	constexpr ErrorDomain const& GetFutureDomain () noexcept;	
Return value:	ErrorDomain const &	reference to the FutureErrorDomain instance
Exception Safety:	noexcept	
Header file:	#include "ara/core/future_error_domain.h"	
Description:	Obtain the reference to the single global FutureErrorDomain instance.	

](RS_AP_00130)

8.6.5 MakeErrorCode overload for FutureErrorDomain

[SWS_CORE_00490]{DRAFT} [

Kind:	function	
Symbol:	ara::core::MakeErrorCode(future_errc code, ErrorDomain::SupportDataType data, char const *message)	
Scope:	namespace ara::core	
Syntax:	constexpr ErrorCode MakeErrorCode (future_errc code, Error Domain::SupportDataType data, char const *message) noexcept;	
Parameters (in):	code	an enumeration value from future_errc
	data	a vendor-defined supplementary value
	message	a user-defined context message (can be nullptr)
Return value:	ErrorCode	the new ErrorCode instance
Exception Safety:	noexcept	
Header file:	#include "ara/core/future_error_domain.h"	
Description:	Create a new ErrorCode for FutureErrorDomain with the given support data type and message. The lifetime of the text pointed to by message must exceed that of all uses of ErrorCode::User Message() on the new instance.	

](RS_AP_00130)

8.6.6 future_status enumeration

[SWS_CORE_00361]{DRAFT} [

Kind:	enumeration	
Symbol:	ara::core::future_status	
Scope:	namespace ara::core	
Values:	ready	the shared state is ready
	timeout	the shared state did not become ready before the specified timeout has passed
Header file:	#include "ara/core/future.h"	
Description:	Specifies the state of a Future as returned by wait_for() and wait_until(). These definitions are equivalent to the ones from std::future_status. However, no item equivalent to std::future_status::deferred is available here. The numerical values of the enum items are implementation-defined.	

](RS_AP_00130)

8.6.7 Future data type

[SWS_CORE_00321]{DRAFT} [

Kind:	class	
Symbol:	ara::core::Future	
Scope:	namespace ara::core	
Syntax:	template <typename T, typename E = ErrorCode> class Future {...};	
Template param:	T	typename
	E = ErrorCode	typename
Header file:	#include "ara/core/future.h"	
Description:	Provides ara::core specific Future operations to collect the results of an asynchronous call.	

](RS_AP_00130)

[SWS_CORE_00322]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::Future()	
Scope:	class ara::core::Future	
Syntax:	ara::core::Future< T, E >::Future () noexcept=default;	
Exception Safety:	noexcept	
Header file:	#include "ara/core/future.h"	
Description:	Default constructor. This function shall behave the same as the corresponding std::future function.	

](RS_AP_00130)

[SWS_CORE_00334]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::Future(Future const &)	
Scope:	class ara::core::Future	
Syntax:	ara::core::Future< T, E >::Future (Future const &)=delete;	
Header file:	#include "ara/core/future.h"	
Description:	Copy constructor shall be disabled.	

](RS_AP_00130)

[SWS_CORE_00323]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::Future(Future &&other)	
Scope:	class ara::core::Future	
Syntax:	ara::core::Future< T, E >::Future (Future &&other) noexcept;	
Parameters (in):	other	the other instance
Exception Safety:	noexcept	

△

Header file:	#include "ara/core/future.h"
Description:	Move construct from another instance. This function shall behave the same as the corresponding std::future function.

](RS_AP_00130)

[SWS_CORE_00333]{DRAFT} [

Kind:	function
Symbol:	ara::core::Future::~Future()
Scope:	class ara::core::Future
Syntax:	ara::core::Future< T, E >::~Future ();
Header file:	#include "ara/core/future.h"
Description:	Destructor for Future objects. This function shall behave the same as the corresponding std::future function.

](RS_AP_00130)

[SWS_CORE_00335]{DRAFT} [

Kind:	function
Symbol:	ara::core::Future::operator=(Future const &)
Scope:	class ara::core::Future
Syntax:	Future& ara::core::Future< T, E >::operator= (Future const &)=delete;
Header file:	#include "ara/core/future.h"
Description:	Copy assignment operator shall be disabled.

](RS_AP_00130)

[SWS_CORE_00325]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::operator=(Future &&other)	
Scope:	class ara::core::Future	
Syntax:	Future& ara::core::Future< T, E >::operator= (Future &&other) noexcept;	
Parameters (in):	other	the other instance
Return value:	Future &	*this
Exception Safety:	noexcept	
Header file:	#include "ara/core/future.h"	
Description:	Move assign from another instance. This function shall behave the same as the corresponding std::future function.	

](RS_AP_00130)

[SWS_CORE_00326]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::get()	
Scope:	class ara::core::Future	
Syntax:	T ara::core::Future< T, E >::get ();	
Return value:	T	value of type T Domain:error the error that has been put into the corresponding Promise via Promise::setError
Header file:	#include "ara/core/future.h"	
Description:	<p>Get the value.</p> <p>This function shall behave the same as the corresponding std::future function.</p> <p>This function does not participate in overload resolution when the compiler toolchain does not support C++ exceptions.</p>	

](RS_AP_00130)

[SWS_CORE_00336]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::GetResult()	
Scope:	class ara::core::Future	
Syntax:	Result<T, E> ara::core::Future< T, E >::GetResult () noexcept;	
Return value:	Result< T, E >	a Result with either a value or an error Domain:error the error that has been put into the corresponding Promise via Promise::setError
Exception Safety:	noexcept	
Header file:	#include "ara/core/future.h"	
Description:	<p>Get the result.</p> <p>Similar to get(), this call blocks until the value or an error is available. However, this call will never throw an exception.</p>	

](RS_AP_00130)

[SWS_CORE_00327]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::valid()	
Scope:	class ara::core::Future	
Syntax:	bool ara::core::Future< T, E >::valid () const noexcept;	
Return value:	bool	true if the Future is usable, false otherwise
Exception Safety:	noexcept	
Header file:	#include "ara/core/future.h"	
Description:	<p>Checks if the Future is valid, i.e. if it has a shared state.</p> <p>This function shall behave the same as the corresponding std::future function.</p>	

](RS_AP_00130)

[SWS_CORE_00328]{DRAFT} [

Kind:	function
Symbol:	ara::core::Future::wait()
Scope:	class ara::core::Future
Syntax:	void ara::core::Future< T, E >::wait () const ;
Return value:	None
Header file:	#include "ara/core/future.h"
Description:	Wait for a value or an error to be available. This function shall behave the same as the corresponding std::future function.

](RS_AP_00130)

[SWS_CORE_00329]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::wait_for(std::chrono::duration< Rep, Period > const &timeoutDuration)	
Scope:	class ara::core::Future	
Syntax:	template <typename Rep, typename Period> future_status ara::core::Future< T, E >::wait_for (std::chrono::duration< Rep, Period > const &timeoutDuration) const ;	
Parameters (in):	timeoutDuration	maximal duration to wait for
Return value:	future_status	status that indicates whether the timeout hit or if a value is available
Header file:	#include "ara/core/future.h"	
Description:	Wait for the given period, or until a value or an error is available. This function shall behave the same as the corresponding std::future function.	

](RS_AP_00130)

[SWS_CORE_00330]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::wait_until(std::chrono::time_point< Clock, Duration > const &deadline)	
Scope:	class ara::core::Future	
Syntax:	template <typename Clock, typename Duration> future_status ara::core::Future< T, E >::wait_until (std::chrono::time_point< Clock, Duration > const &deadline) const ;	
Parameters (in):	deadline	latest point in time to wait
Return value:	future_status	status that indicates whether the time was reached or if a value is available
Header file:	#include "ara/core/future.h"	
Description:	Wait until the given time, or until a value or an error is available. This function shall behave the same as the corresponding std::future function.	

](RS_AP_00130)

[SWS_CORE_00331]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::then(F &&func)	
Scope:	class ara::core::Future	
Syntax:	<pre>template <typename F> auto ara::core::Future< T, E >::then (F &&func) -> Future< SEE_BELOW >;</pre>	
Parameters (in):	func	a callable to register
Return value:	auto	a new Future instance for the result of the continuation
Header file:	#include "ara/core/future.h"	
Description:	<p>Register a callable that gets called when the Future becomes ready.</p> <p>When func is called, it is guaranteed that get() and GetResult() will not block.</p> <p>func may be called in the context of this call or in the context of Promise::set_value() or Promise::SetError() or somewhere else.</p> <p>The return type of then depends on the return type of func (aka continuation).</p> <p>Let U be the return type of the continuation (i.e. a type equivalent to std::result_of<std::decay<F>::type(Future<T,E>)::type>). If U is Future<T2,E2> for some types T2, E2, then the return type of then() is Future<T2,E2>. This is known as implicit Future unwrapping. If U is Result<T2,E2> for some types T2, E2, then the return type of then() is Future<T2,E2>. This is known as implicit Result unwrapping. Otherwise it is Future<U,E>.</p>	

](RS_AP_00130)

[SWS_CORE_00332]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Future::is_ready()	
Scope:	class ara::core::Future	
Syntax:	<pre>bool ara::core::Future< T, E >::is_ready () const ;</pre>	
Return value:	bool	true if the Future contains a value or an error, false otherwise
Header file:	#include "ara/core/future.h"	
Description:	<p>Return whether the asynchronous operation has finished.</p> <p>If this function returns true, get(), GetResult() and the wait calls are guaranteed not to block.</p>	

](RS_AP_00130)

8.6.8 Promise data type

[SWS_CORE_00340]{DRAFT} [

Kind:	class	
Symbol:	ara::core::Promise	
Scope:	namespace ara::core	
Syntax:	<pre>template <typename T , typename E = ErrorCode> class Promise {...};</pre>	

Template param:		typename T
	= ErrorCode	typename E
Header file:	#include "ara/core/future.h"	
Description:	ara::core specific variant of std::promise class	

|(RS_AP_00130)

[SWS_CORE_00341]{DRAFT} [

Kind:	function
Symbol:	ara::core::Promise::Promise()
Scope:	class ara::core::Promise
Syntax:	ara::core::Promise< T, E >::Promise ();
Header file:	#include "ara/core/promise.h"
Description:	Default constructor. This function shall behave the same as the corresponding std::promise function.

|(RS_AP_00130)

[SWS_CORE_00350]{DRAFT} [

Kind:	function
Symbol:	ara::core::Promise::Promise(Promise const &)
Scope:	class ara::core::Promise
Syntax:	ara::core::Promise< T, E >::Promise (Promise const &)=delete;
Header file:	#include "ara/core/promise.h"
Description:	Copy constructor shall be disabled.

|(RS_AP_00130)

[SWS_CORE_00342]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Promise::Promise(Promise &&other)	
Scope:	class ara::core::Promise	
Syntax:	ara::core::Promise< T, E >::Promise (Promise &&other) noexcept;	
Parameters (in):	other	the other instance
Exception Safety:	noexcept	
Header file:	#include "ara/core/promise.h"	
Description:	Move constructor. This function shall behave the same as the corresponding std::promise function.	

|(RS_AP_00130)

[SWS_CORE_00349]{DRAFT} [

Kind:	function
Symbol:	ara::core::Promise::~~Promise()
Scope:	class ara::core::Promise
Syntax:	ara::core::Promise< T, E >::~~Promise ();
Header file:	#include "ara/core/promise.h"
Description:	Destructor for Promise objects. This function shall behave the same as the corresponding std::promise function.

](RS_AP_00130)

[SWS_CORE_00351]{DRAFT} [

Kind:	function
Symbol:	ara::core::Promise::operator=(Promise const &)
Scope:	class ara::core::Promise
Syntax:	Promise& ara::core::Promise< T, E >::operator= (Promise const &)=delete;
Header file:	#include "ara/core/promise.h"
Description:	Copy assignment operator shall be disabled.

](RS_AP_00130)

[SWS_CORE_00343]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Promise::operator=(Promise &&other)	
Scope:	class ara::core::Promise	
Syntax:	Promise& ara::core::Promise< T, E >::operator= (Promise &&other) noexcept;	
Parameters (in):	other	the other instance
Return value:	Promise &	*this
Exception Safety:	noexcept	
Header file:	#include "ara/core/promise.h"	
Description:	Move assignment. This function shall behave the same as the corresponding std::promise function.	

](RS_AP_00130)

[SWS_CORE_00352]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Promise::swap(Promise &other)	
Scope:	class ara::core::Promise	
Syntax:	void ara::core::Promise< T, E >::swap (Promise &other) noexcept;	
Parameters (in):	other	the other instance

Return value:	None
Exception Safety:	noexcept
Header file:	#include "ara/core/promise.h"
Description:	Swap the contents of this instance with another one's. This function shall behave the same as the corresponding std::promise function.

](RS_AP_00130)

[SWS_CORE_00344]{DRAFT} [

Kind:	function
Symbol:	ara::core::Promise::get_future()
Scope:	class ara::core::Promise
Syntax:	Future<T, E> ara::core::Promise< T, E >::get_future ();
Return value:	Future< T, E > a Future for types T and E
Header file:	#include "ara/core/promise.h"
Description:	Return the associated Future for type T and E. The returned Future is set as soon as this Promise receives the result or an error. This method must only be called once as it is not allowed to have multiple Futures per Promise.

](RS_AP_00130)

[SWS_CORE_00345]{DRAFT} [

Kind:	function
Symbol:	ara::core::Promise::set_value(T const &value)
Scope:	class ara::core::Promise
Syntax:	void ara::core::Promise< T, E >::set_value (T const &value);
Parameters (in):	value the value to store
Return value:	None
Header file:	#include "ara/core/promise.h"
Description:	Copy result into the Future. This function shall behave the same as the corresponding std::promise function.

](RS_AP_00130)

[SWS_CORE_00346]{DRAFT} [

Kind:	function
Symbol:	ara::core::Promise::set_value(T &&value)
Scope:	class ara::core::Promise
Syntax:	void ara::core::Promise< T, E >::set_value (T &&value);
Parameters (in):	value the value to store

Return value:	None
Header file:	#include "ara/core/promise.h"
Description:	Move the result into the Future. This function shall behave the same as the corresponding std::promise function.

](RS_AP_00130)

[SWS_CORE_00353]{DRAFT} [

Kind:	function
Symbol:	ara::core::Promise::SetError(E &&error)
Scope:	class ara::core::Promise
Syntax:	void ara::core::Promise< T, E >::SetError (E &&error);
Parameters (in):	error the error to store
Return value:	None
Header file:	#include "ara/core/promise.h"
Description:	Move an error into the Future.

](RS_AP_00130)

[SWS_CORE_00354]{DRAFT} [

Kind:	function
Symbol:	ara::core::Promise::SetError(E const &error)
Scope:	class ara::core::Promise
Syntax:	void ara::core::Promise< T, E >::SetError (E const &error);
Parameters (in):	error the error to store
Return value:	None
Header file:	#include "ara/core/promise.h"
Description:	Copy an error into the Future.

](RS_AP_00130)

8.7 Array data type

This section describes the `ara::core::Array` type that represents a container which encapsulates fixed size arrays.

[SWS_CORE_01201]{DRAFT} **Array class template** [The namespace `ara::core` shall provide a class template `Array`:

```
template <typename T, std::size_t N>
class Array { ... };
```

](RS_AP_00130)

All members of this class and supporting constructs (such as global relational operators) shall behave identical to those of header `<array>` from [4] section 23.3. All supporting symbols shall be contained within namespace `ara::core`.

[SWS_CORE_01296]{DRAFT} swap overload for Array [There shall be an overload of the `swap` function within the namespace `ara::core` for arguments of type `Array`. Its interface shall be equivalent to:

```
template <typename T, std::size_t N>
void swap(Array<T, N>& lhs, Array<T, N>& rhs);
```

This function shall exchange the state of `lhs` with that of `rhs`.]([RS_AP_00130](#))

8.8 Vector data type

This section describes the `ara::core::Vector` type that represents a container which can change in size.

[SWS_CORE_01301]{DRAFT} Vector class template [The namespace `ara::core` shall provide a class template `Vector`:

```
template <typename T, typename Allocator = /* implementation-defined */>
class Vector { ... };
```

]([RS_AP_00130](#))

All members of this class shall behave identical to those of `std::vector` from [4] section 23.3.6, except that the default value for the `Allocator` template argument is implementation-defined.

[SWS_CORE_01390]{DRAFT} Global operator== for Vector [The namespace `ara::core` shall provide a function template `operator==` for `Vector`:

```
template <typename T, typename Allocator>
bool operator==(Vector<T, Allocator> const& lhs,
                Vector<T, Allocator> const& rhs);
```

]([RS_AP_00130](#))

[SWS_CORE_01391]{DRAFT} Global operator!= for Vector [The namespace `ara::core` shall provide a function template `operator!=` for `Vector`:

```
template <typename T, typename Allocator>
bool operator!=(Vector<T, Allocator> const& lhs,
                Vector<T, Allocator> const& rhs);
```

]([RS_AP_00130](#))

[SWS_CORE_01392]{DRAFT} Global operator< for Vector [The namespace `ara::core` shall provide a function template `operator<` for `Vector`:

```
template <typename T, typename Allocator>
bool operator<(Vector<T, Allocator> const& lhs,
              Vector<T, Allocator> const& rhs);
```

]([RS_AP_00130](#))

[SWS_CORE_01393]{DRAFT} Global operator<= for Vector [The namespace `ara::core` shall provide a function template `operator<= for Vector`:

```
template <typename T, typename Allocator>
bool operator<=(Vector<T, Allocator> const& lhs,
               Vector<T, Allocator> const& rhs);
```

]([RS_AP_00130](#))

[SWS_CORE_01394]{DRAFT} Global operator> for Vector [The namespace `ara::core` shall provide a function template `operator> for Vector`:

```
template <typename T, typename Allocator>
bool operator>(Vector<T, Allocator> const& lhs,
              Vector<T, Allocator> const& rhs);
```

]([RS_AP_00130](#))

[SWS_CORE_01395]{DRAFT} Global operator>= for Vector [The namespace `ara::core` shall provide a function template `operator>= for Vector`:

```
template <typename T, typename Allocator>
bool operator>=(Vector<T, Allocator> const& lhs,
               Vector<T, Allocator> const& rhs);
```

]([RS_AP_00130](#))

[SWS_CORE_01396]{DRAFT} swap overload for Vector [There shall be an overload of the `swap` function within the namespace `ara::core` for arguments of type `Vector`. Its interface shall be equivalent to:

```
template <typename T, typename Allocator>
void swap(Vector<T, Allocator>& lhs, Vector<T, Allocator>& rhs);
```

This function shall exchange the state of `lhs` with that of `rhs`.]([RS_AP_00130](#))

8.9 Map data type

This section describes the `ara::core::Map` type that represents a container which contains key-value pairs with unique keys.

[SWS_CORE_01400]{DRAFT} Map class template [The namespace `ara::core` shall provide a class template `Map`:

```
template <
    typename K,
```

```

    typename V,
    typename C = std::less<K>,
    typename Allocator = /* implementation-defined */
>
class Map { ... };
](RS_AP_00130)

```

All members of this class and supporting constructs (such as global relational operators) shall behave identical to those of `std::map` in header `<map>` from [4] section 23.4.2, except that the default value for the `Allocator` template argument is implementation-defined. All supporting symbols shall be contained within namespace `ara::core`.

[SWS_CORE_01496]{DRAFT} swap overload for Map [There shall be an overload of the `swap` function within the namespace `ara::core` for arguments of type `Map`. Its interface shall be equivalent to:

```

template <
    typename K,
    typename V,
    typename C,
    typename Allocator
>
void swap(Map<K, V, C, Allocator>& lhs, Map<K, V, C, Allocator>& rhs);

```

This function shall exchange the state of `lhs` with that of `rhs`.](RS_AP_00130)

8.10 Optional data type

This section describes the class template `ara::core::Optional` that provides access to optional record elements of a Structure Implementation data type. Whenever there is a mention of the standard C++17 item `std::optional`, the implied source material is [6].

The class template `ara::core::Optional` manages optional values, i.e. values that may or may not be present. The existence can be evaluated during both compile-time and runtime.

Note: Mandatory record elements are declared directly with the corresponding `ImplementationDataType` without using `ara::core::Optional`.

[SWS_CORE_01033]{DRAFT} Optional class template [The namespace `ara::core` shall provide a class template `Optional`:

```

template <typename T>
class Optional { ... };
](RS_AP_00130)

```

All members of this class and supporting constructs (such as global relational operators) shall behave identical to those of header `<optional>` from [6] section 23.6, with the exceptions as given below. All supporting symbols shall be contained within namespace `ara::core`.

[SWS_CORE_01030]{DRAFT} value member function overloads [Contrary to the description in [6], no member functions with this name exist in `ara::core::Optional`.]([RS_AP_00130](#))

[SWS_CORE_01031]{DRAFT} class bad_optional_access [No class named `bad_optional_access` is defined in the `ara::core` namespace.]([RS_AP_00130](#))

[SWS_CORE_01096]{DRAFT} swap overload for Optional [There shall be an overload of the `swap` function within the namespace `ara::core` for arguments of type `Optional`. Its interface shall be equivalent to:

```
template <typename T>
void swap(Optional<T>& lhs, Optional<T>& rhs);
```

This function shall exchange the state of `lhs` with that of `rhs`.]([RS_AP_00130](#))

8.11 Variant data type

This section describes the `ara::core::Variant` type that represents a type-safe union.

[SWS_CORE_01601]{DRAFT} Variant class template [The namespace `ara::core` shall provide a class template `Variant`:

```
template <typename... Ts>
class Variant { ... };
```

]([RS_AP_00130](#))

All members and supporting constructs (such as global relational operators) of this class shall behave identical to those of header `<variant>` from [6] section 23.7. All supporting symbols shall be contained within namespace `ara::core`.

[SWS_CORE_01696]{DRAFT} swap overload for Variant [There shall be an overload of the `swap` function within the namespace `ara::core` for arguments of type `Variant`. Its interface shall be equivalent to:

```
template <typename... Ts>
void swap(Variant<Ts...>& lhs, Variant<Ts...>& rhs);
```

This function shall exchange the state of `lhs` with that of `rhs`.]([RS_AP_00130](#))

8.12 `StringView` data type

This section describes the `ara::core::StringView` type that constitutes a read-only view over a contiguous sequence of characters, the storage of which is owned by another object.

[SWS_CORE_02001]{DRAFT} `StringView` class [The namespace `ara::core` shall provide a class `StringView`:

```
class StringView { ... };
```

]([RS_AP_00130](#))

All members of this class and supporting constructs (such as global relational operators) shall behave identical to those of header `<string_view>` from [6] section 24.4, except that non-`const` member functions are never declared with `constexpr`. (Note: This makes them compatible to C++11's semantics of `constexpr` member functions, which are always implicitly `const`.)

All supporting symbols shall be contained within namespace `ara::core`.

8.13 `String` data type

This section describes the `ara::core::String` type that represents sequences of characters.

This class is closely modeled on `std::string` with a number of additions which come from [6].

[SWS_CORE_03001]{DRAFT} `String` class [The namespace `ara::core` shall provide a class `String`:

```
class String { ... };
```

]([RS_AP_00130](#))

All members of this class and supporting constructs (such as global relational operators) shall behave identical to those of `std::string` in header `<string>` from [4] section 21.3, except that this class's Allocator is implementation-defined. All supporting symbols shall be contained within namespace `ara::core`.

[SWS_CORE_03301]{DRAFT} `Implicit conversion to StringView` [An operator shall be defined that provides implicit conversion to `StringView`:

```
operator StringView() const noexcept;
```

]([RS_AP_00130](#))

[SWS_CORE_03302]{DRAFT} `Constructor from StringView` [A constructor shall be defined that accepts a `StringView` argument by value:

```
explicit String(StringView sv);
```

](RS_AP_00130)

[SWS_CORE_03303]{DRAFT} Constructor from implicit `stringView` [A constructor shall be defined that accepts any type that is implicitly convertible to `StringView`:

```
template <typename T>
String(T const& t, size_type pos, size_type n);
```

](RS_AP_00130)

[SWS_CORE_03304]{DRAFT} operator= from `stringView` [An operator= member function shall be defined that accepts a `StringView` argument by value:

```
String& operator=(StringView sv);
```

](RS_AP_00130)

[SWS_CORE_03305]{DRAFT} Assignment from `stringView` [A member function shall be defined that allows assignment from `StringView`:

```
String& assign(StringView sv);
```

](RS_AP_00130)

[SWS_CORE_03306]{DRAFT} Assignment from implicit `stringView` [A member function shall be defined that allows assignment from any type that is implicitly convertible to `StringView`:

```
template <typename T>

[SWS_CORE_03296]{DRAFT} swap overload for String [There shall be an overload of the `swap` function within the namespace `ara::core` for arguments of type `String`. Its interface shall be equivalent to:

```
void swap(String& lhs, String& rhs);
```

This function shall exchange the state of `lhs` with that of `rhs`.](RS_AP_00130)

8.14 Span data type

This section describes the `ara::core::Span` type that constitutes a view over a contiguous sequence of objects, the storage of which is owned by another object.

This specification is based on the draft standard of `std::span` from [7] section 21.7, but has been adapted in several ways:

- `Span::operator()` has been removed.
- All symbols from section 21.7.3.7 (`span.comparison`) have been removed.
- All symbols from section 21.7.3.8 (`span.objectrep`) have been removed.
- All references to `std::array` have been replaced with `ara::core::Array`; support for `std::array` still exists with the generic Container-based functions, with only a slight performance degradation.
- `constexpr` has been removed from the assignment operator, because it would make the operator implicitly `const` in C++11.
- An additional type alias `Span::size_type` has been added.
- A number of global `MakeSpan` function overloads have been added.

[SWS_CORE_01901]{DRAFT} [

Kind:	variable
Symbol:	<code>ara::core::dynamic_extent</code>
Scope:	namespace <code>ara::core</code>
Type:	<code>std::ptrdiff_t</code>
Syntax:	<code>constexpr std::ptrdiff_t ara::core::dynamic_extent= -1;</code>
Header file:	<code>#include "ara/core/span.h"</code>

Description:	A constant for creating Spans with dynamic sizes. The constant is always set to <code>std::ptrdiff_t(-1)</code> .
---------------------	--

8.15 InstanceSpecifier data type

This section describes the `ara::core::InstanceSpecifier` type. `ara::core::InstanceSpecifiers` are used to identify service port prototype instances within the AUTOSAR meta-model and are therefore used in the `ara::com` API. A detailed description and background can be found in [9] chapter 8.4.4.

`ara::core::InstanceSpecifier` is basically a wrapper for a valid meta-model related string in the form: `<shortname context1>/<shortname context2>/.../<shortname contextN>/<shortname of PortPrototype>`. "Valid" is meant here according to the syntax: The string has to be a valid `shortname` path in terms of AUTOSAR meta model definitions, i.e. a row of valid AUTOSAR `shortnames` separated by "/" as path delimiter.

`ara::core::InstanceSpecifier` is designed to be either constructed from a string representation via a factory method `makeInstanceSpecifier`, which provides an exception-free solution by using a construction token pattern, or directly by using the `ctor` overload with a string parameter, which might throw an exception, if the string representation is invalid.

[SWS_CORE_08001]{DRAFT} [

Kind:	class
Symbol:	<code>ara::core::InstanceSpecifier</code>
Scope:	namespace <code>ara::core</code>
Syntax:	<code>class InstanceSpecifier {...};</code>
Header file:	<code>#include "ara/core/instance_specifier.h"</code>
Description:	class representing an AUTOSAR Instance Specifier, which is basically an AUTOSAR shortname-path wrapper.

]([RS_Main_00320](#))

[SWS_CORE_08021]{DRAFT} [

Kind:	function	
Symbol:	<code>ara::core::InstanceSpecifier::InstanceSpecifier(StringView metaModelIdentifier)</code>	
Scope:	class <code>ara::core::InstanceSpecifier</code>	
Syntax:	<code>explicit InstanceSpecifier (StringView metaModelIdentifier);</code>	
Parameters (in):	metaModelIdentifier	stringified meta model identifier (short name path) where path separator is '/'. Lifetime of underlying string has to exceed the lifetime of the constructed InstanceSpecifier.
Exceptions:	InstanceSpecifierException	in case the given metamodel_identifier isn't a valid meta-model identifier/short name path.
Header file:	<code>#include "ara/core/instance_specifier.h"</code>	
Description:	throwing ctor from meta-model string

8.17 Initialization and Shutdown

This section describes the global initialization and shutdown functions that initialize resp. deinitialize data structures and threads of the AUTOSAR Runtime for Adaptive Applications.

[SWS_CORE_10001]{DRAFT} [

Kind:	function	
Symbol:	ara::core::Initialize()	
Scope:	namespace ara::core	

Syntax:	<code>Result<void> Initialize ();</code>	
Return value:	<code>ara::core::Result< void ></code>	A Result object that indicates whether the AUTOSAR Adaptive Runtime for Applications was successfully initialized. Note that this is the only way for the ARA to report an error that is guaranteed to be available, e.g., in case <code>ara::log</code> failed to correctly initialize. The user is not expected to be able to recover from such an error. However, the user may have a project-specific way of recording errors during initialization without <code>ara::log</code> .
Header file:	<code>#include "ara/core/initialization.h"</code>	
Description:	<p>Initializes data structures and threads of the AUTOSAR Adaptive Runtime for Applications.</p> <p>Prior to this call, no interaction with the ARA is possible. This call must be made inside of <code>main()</code>, i.e., in a place where it is guaranteed that static memory initialization has completed. Depending on the individual functional cluster specification, the calling application may have to provide additional configuration data (e.g., set an Application ID for Logging) or make additional initialization calls (e.g., start a <code>FindService</code> in <code>ara::com</code>) before other API calls to the respective functional cluster can be made. Such calls must be made after the call to <code>Initialize()</code>. Calls to ARA APIs made before static initialization has completed lead to undefined behavior. Calls made after static initialization has completed but before <code>Initialize()</code> was called will be rejected by the functional cluster implementation with an error or, if no error to be reported is defined, lead to undefined behavior.</p>

[SWS_CORE_10002]{DRAFT} [

Kind:	function	
Symbol:	<code>ara::core::Deinitialize()</code>	
Scope:	namespace <code>ara::core</code>	
Syntax:	<code>Result<void> Deinitialize ();</code>	
Return value:	<code>ara::core::Result< void ></code>	A Result object that indicates whether the ARA was successfully destroyed. Typical error cases to be reported here are that the user is still holding some resource inside the ARA. Note that this Result is the only way for the ARA to report an error that is guaranteed to be available, e.g., in case <code>ara::log</code> has already been deinitialized. The user is not expected to be able to recover from such an error. However, the user may have a project-specific way of recording errors during deinitialization without <code>ara::log</code> .
Header file:	<code>#include "ara/core/initialization.h"</code>	
Description:	<p>Destroy all data structures and threads of the AUTOSAR Adaptive Runtime for Applications.</p> <p>After this call, no interaction with the ARA is possible. This call must be made inside of <code>main()</code>, i.e., in a place where it is guaranteed that the static initialization has completed and destruction of statically initialized data has not yet started. Calls made to ARA APIs after a call to <code>ara::core::Deinitialize()</code> but before destruction of statically initialized data will be rejected with an error or, if no error is defined, lead to undefined behavior. Calls made to ARA APIs after the destruction of statically initialized data will lead to undefined behavior.</p>
