1 Introduction and functional overview

The CanTSyn module handles the distribution of time information over CAN buses.

Just transmitting the time information from the master to the slaves in a broadcast CAN message has the disadvantage that the time value becomes inaccurate due to CAN specific effects like arbitration and BSW specific delays.

The concept proposes a two-step mechanism:

- In a first broadcast message (the so-called SYNC message), the second portion of the time information (t0r) is transmitted. The transmitting ECU, i.e. the Time Master, uses CAN low-level mechanisms like the “CAN transmit confirmation” to detect the point in time (t1r) when the message was actually transmitted, i.e. it takes a timestamp.
  A receiving ECU, i.e. the Time Slave, receives the message and uses CAN low-level mechanisms like the “CAN receive indication” to detect the point in time (t2r) when the message was actually received.
- In a second broadcast message (the so-called Follow-Up (FUP) message), the Time Master transmits the offset between the time information transmitted in the previous SYNC message and the actual detected transmission time. No timestamp is taken for the FUP message, neither on the transmitting nor on the receiving side.
- The Time Slave can now combine the information within the SYNC and within the FUP message and with its previously taken timestamp for the received SYNC message and determine the transmitted time information in a more precise way by just receiving one message and omitting timestamps.

The following Figure shows the CAN Time Synchronization mechanism.

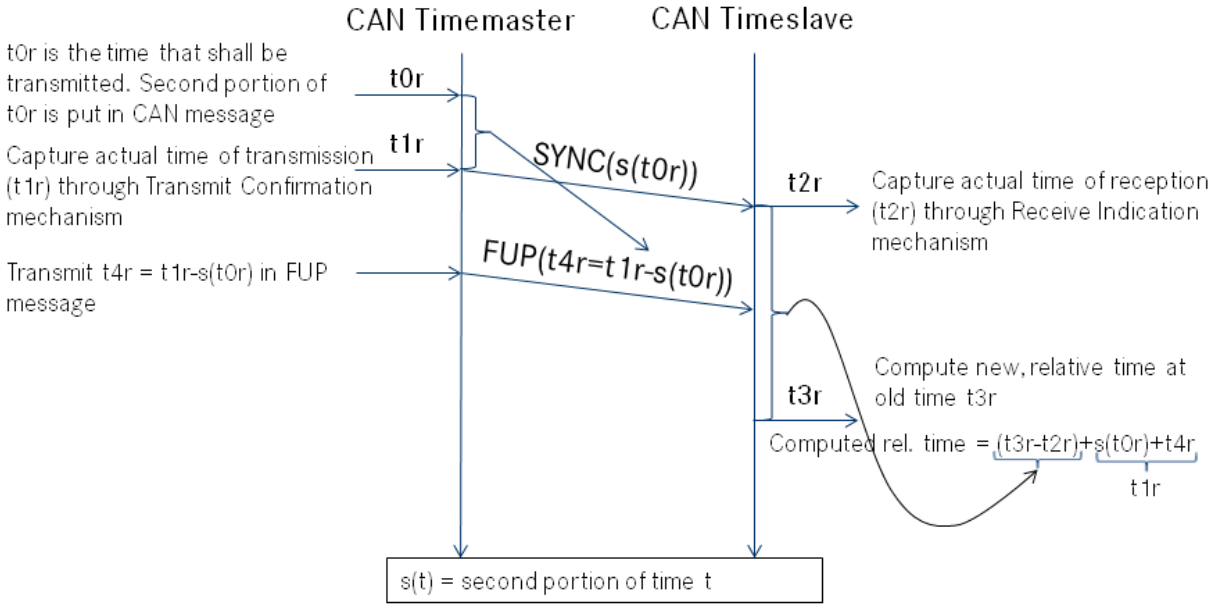

Figure 1: CAN Time Synchronization mechanism

2 Acronyms, Abbreviations and Definitions

This section lists module local Abbreviations and Definitions. For a complete set of Synchronized Time Base related Abbreviations and Definitions refer to the corresponding chapter in [4].

Abbreviation / Acronym:	Description
(G)TD	(Global) Time Domain
(G)TM	(Global)Time Master
<Bus>TSyn	A bus specific Time Synchronization module
CAN	Controller Area Network
CanTSyn	Time Synchronization module for CAN
CRC	Cyclic Redundancy Checksum
Debounce Time	Minimum gap between two Tx messages with the same PDU
DEM	Diagnostic Event Manager
DET	Default Error Tracer
DLC	Data Length Code
FUP message	Follow-Up message
OFNS message	Offset adjustment message
OFS message	Offset Synchronization message
StbM	Synchronized Time-Base Manager
SYNC message	Time Synchronization message
TG	Time Gateway
Timesync	Time Synchronization
TS	Time Slave
TSD	Time Sub-domain

3.2 Related specification

AUTOSAR provides a General Specification on Basic Software (SWS BSW General [3]) which is also valid for CanTSyn.

Thus, the General Specification on Basic Software (SWS BSW General) shall be considered additionally and as required specification for CanTSyn.

4 Constraints and assumptions

4.1 Limitations

The current version of CanTSyn does not support hardware timestamping capabilities. The first consequence is that the Time Synchronization is less accurate due to Rx-/Tx-ISR latencies and execution time until the Virtual Local Time is retrieved.
The second consequence is the need of not nested interrupts in the CAN driver for the Global Time PDUs (i.e., it is strongly recommended not to invoke the TX confirmation and RX indication functions in polling mode).

The Time Base in the SYNC and OFS messages is limited to 32 bit, wherefore the maximum supported time value is 4294967295 seconds (2^{32}-1).

Time Masters, Time Gateways and Time Slaves shall work with a Time Base reference clock with a worst-case accuracy of 2µs.

4.2 Applicability to car domains

Systems requiring a common Time Base to ECUs independent to which bus system the ECU is connected.

5 Dependencies to other modules

The Time Synchronization over CAN (CanTSyn) has interfaces towards the Synchronized Time-Base Manager (StbM), the CAN Interface (CanIf), the Basic Software Mode Manager (BswM) and the Default Error Tracer (DET).

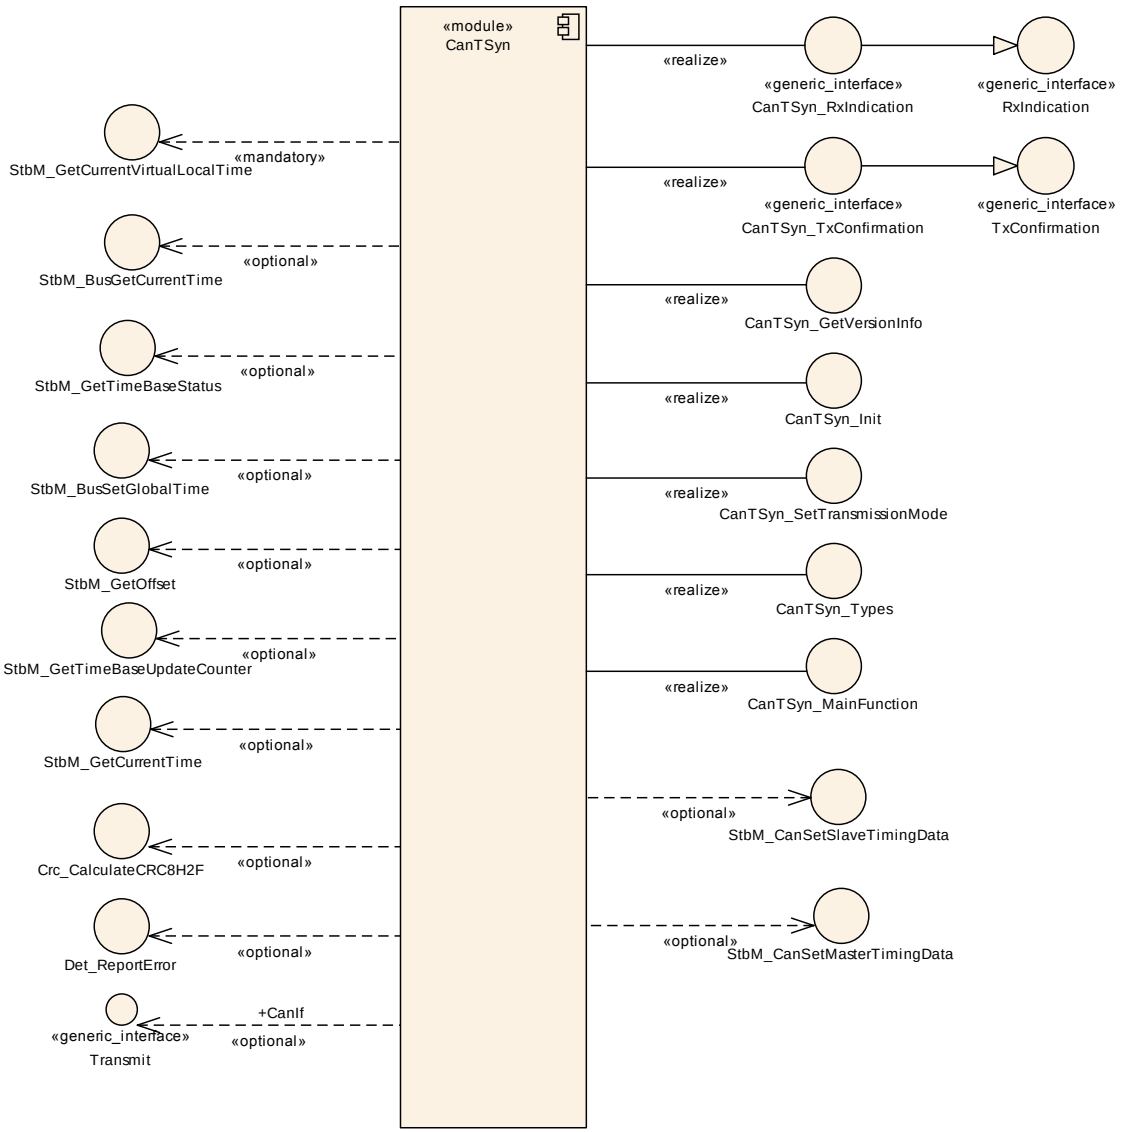

Figure 2: Module dependencies of the CanTSyn module

- StbM – Get and set the current time value
- CanIf – Receiving and transmitting messages
- BswM – Coordination of network access (via `CanTSyn_SetTransmissionMode()`)
- DET – Reporting of development errors

5.1 File structure

5.1.1 Code file structure

For details, refer to the section 5.1.6 "Code file structure" of the SWS BSW General [3].

5.1.2 Header file structure

For details, refer to the section 5.1.7 "Header file structure" of the SWS BSW General [3].

6 Requirements traceability

Requirement	Description	Satisfied by
RS_TS_00003	The Implementation of Time Synchronization shall initialize the Local Time Base with zero at startup	SWS_CanTSyn_00003, SWS_CanTSyn_00006
RS_TS_00004	The Implementation of Time Synchronization shall initialize the Global Time Base with a configurable startup value.	SWS_CanTSyn_00003, SWS_CanTSyn_00006
RS_TS_00034	The Implementation of Time Synchronization shall provide measurement data to the application	SWS_CanTSyn_00137, SWS_CanTSyn_00138, SWS_CanTSyn_00139, SWS_CanTSyn_00140, SWS_CanTSyn_00141, SWS_CanTSyn_00142
RS_TS_20031	The Timesync over CAN module shall trigger Time Base Synchronization transmission	SWS_CanTSyn_00025, SWS_CanTSyn_00026, SWS_CanTSyn_00028, SWS_CanTSyn_00032, SWS_CanTSyn_00035, SWS_CanTSyn_00036, SWS_CanTSyn_00038, SWS_CanTSyn_00043, SWS_CanTSyn_00044, SWS_CanTSyn_00117, SWS_CanTSyn_00118, SWS_CanTSyn_00119, SWS_CanTSyn_00120, SWS_CanTSyn_00121, SWS_CanTSyn_00122, SWS_CanTSyn_00123, SWS_CanTSyn_00124, SWS_CanTSyn_00125, SWS_CanTSyn_00136
RS_TS_20032	The Timesync over CAN module shall provide the Time Base after reception of a valid Timesync/TS messages	SWS_CanTSyn_00064, SWS_CanTSyn_00072, SWS_CanTSyn_00133, SWS_CanTSyn_00135
RS_TS_20033	The Timesync over CAN module shall support means to protect the Time synchronization protocol	SWS_CanTSyn_00007, SWS_CanTSyn_00015, SWS_CanTSyn_00016, SWS_CanTSyn_00017, SWS_CanTSyn_00018, SWS_CanTSyn_00031, SWS_CanTSyn_00041, SWS_CanTSyn_00048, SWS_CanTSyn_00049, SWS_CanTSyn_00050, SWS_CanTSyn_00054, SWS_CanTSyn_00055, SWS_CanTSyn_00056, SWS_CanTSyn_00111, SWS_CanTSyn_00112, SWS_CanTSyn_00126, SWS_CanTSyn_00127, SWS_CanTSyn_00128, SWS_CanTSyn_00129
RS_TS_20034	The Timesync over CAN module shall detect and handle timeout and integrity errors in the Time Synchronization protocol	SWS_CanTSyn_00027, SWS_CanTSyn_00033, SWS_CanTSyn_00037, SWS_CanTSyn_00042, SWS_CanTSyn_00057, SWS_CanTSyn_00060, SWS_CanTSyn_00061, SWS_CanTSyn_00062, SWS_CanTSyn_00063, SWS_CanTSyn_00064, SWS_CanTSyn_00065, SWS_CanTSyn_00068, SWS_CanTSyn_00071, SWS_CanTSyn_00072, SWS_CanTSyn_00076, SWS_CanTSyn_00077, SWS_CanTSyn_00078, SWS_CanTSyn_00079, SWS_CanTSyn_00080, SWS_CanTSyn_00084, SWS_CanTSyn_00085, SWS_CanTSyn_00087, SWS_CanTSyn_00088, SWS_CanTSyn_00109, SWS_CanTSyn_00110, SWS_CanTSyn_00113,

		SWS_CanTSyn_00114, SWS_CanTSyn_00115, SWS_CanTSyn_00116, SWS_CanTSyn_00133
RS_TS_20035	The Timesync over CAN module shall support a protocol for precise time measurement and synchronization over CAN	SWS_CanTSyn_00008, SWS_CanTSyn_00010, SWS_CanTSyn_00011, SWS_CanTSyn_00015, SWS_CanTSyn_00016, SWS_CanTSyn_00017, SWS_CanTSyn_00018, SWS_CanTSyn_00025, SWS_CanTSyn_00026, SWS_CanTSyn_00027, SWS_CanTSyn_00028, SWS_CanTSyn_00029, SWS_CanTSyn_00030, SWS_CanTSyn_00031, SWS_CanTSyn_00032, SWS_CanTSyn_00033, SWS_CanTSyn_00043, SWS_CanTSyn_00044, SWS_CanTSyn_00045, SWS_CanTSyn_00047, SWS_CanTSyn_00048, SWS_CanTSyn_00049, SWS_CanTSyn_00050, SWS_CanTSyn_00054, SWS_CanTSyn_00055, SWS_CanTSyn_00056, SWS_CanTSyn_00057, SWS_CanTSyn_00058, SWS_CanTSyn_00059, SWS_CanTSyn_00060, SWS_CanTSyn_00061, SWS_CanTSyn_00062, SWS_CanTSyn_00063, SWS_CanTSyn_00073, SWS_CanTSyn_00075, SWS_CanTSyn_00076, SWS_CanTSyn_00078, SWS_CanTSyn_00079, SWS_CanTSyn_00080, SWS_CanTSyn_00084, SWS_CanTSyn_00085, SWS_CanTSyn_00086, SWS_CanTSyn_00087, SWS_CanTSyn_00090, SWS_CanTSyn_00091, SWS_CanTSyn_00092, SWS_CanTSyn_00093, SWS_CanTSyn_00094, SWS_CanTSyn_00095, SWS_CanTSyn_00096, SWS_CanTSyn_00099, SWS_CanTSyn_00102, SWS_CanTSyn_00103, SWS_CanTSyn_00105, SWS_CanTSyn_00106, SWS_CanTSyn_00109, SWS_CanTSyn_00110
RS_TS_20036	The Timesync over CAN module shall use the time measurement and synchronization protocol to transmit and receive an offset value	SWS_CanTSyn_00030, SWS_CanTSyn_00035, SWS_CanTSyn_00036, SWS_CanTSyn_00037, SWS_CanTSyn_00038, SWS_CanTSyn_00039, SWS_CanTSyn_00040, SWS_CanTSyn_00041, SWS_CanTSyn_00042, SWS_CanTSyn_00043, SWS_CanTSyn_00044, SWS_CanTSyn_00046, SWS_CanTSyn_00048, SWS_CanTSyn_00049, SWS_CanTSyn_00050, SWS_CanTSyn_00054, SWS_CanTSyn_00055, SWS_CanTSyn_00056, SWS_CanTSyn_00065, SWS_CanTSyn_00066, SWS_CanTSyn_00067, SWS_CanTSyn_00068, SWS_CanTSyn_00069, SWS_CanTSyn_00070, SWS_CanTSyn_00071, SWS_CanTSyn_00074, SWS_CanTSyn_00077, SWS_CanTSyn_00078, SWS_CanTSyn_00079, SWS_CanTSyn_00080, SWS_CanTSyn_00085, SWS_CanTSyn_00086, SWS_CanTSyn_00087, SWS_CanTSyn_00111, SWS_CanTSyn_00112, SWS_CanTSyn_00113, SWS_CanTSyn_00114, SWS_CanTSyn_00126, SWS_CanTSyn_00127, SWS_CanTSyn_00128, SWS_CanTSyn_00129
RS_TS_20037	The Timesync over CAN module shall support user specific data within the time measurement and synchronization protocol	SWS_CanTSyn_00011, SWS_CanTSyn_00012, SWS_CanTSyn_00013, SWS_CanTSyn_00014

RS_TS_20038	The Timesync over CAN module configuration shall allow the Implementation of Time Synchronization for CAN to support different roles for a Time Base	SWS_CanTSyn_00108, SWS_CanTSyn_00135
RS_TS_20068	The Timesync over CAN module shall support classic CAN and CAN FD	SWS_CanTSyn_00010, SWS_CanTSyn_00015, SWS_CanTSyn_00016, SWS_CanTSyn_00017, SWS_CanTSyn_00018, SWS_CanTSyn_00036, SWS_CanTSyn_00041, SWS_CanTSyn_00055, SWS_CanTSyn_00071, SWS_CanTSyn_00072, SWS_CanTSyn_00077, SWS_CanTSyn_00085, SWS_CanTSyn_00111, SWS_CanTSyn_00112, SWS_CanTSyn_00130, SWS_CanTSyn_00131, SWS_CanTSyn_00132
SRS_BSW_00323	All AUTOSAR Basic Software Modules shall check passed API parameters for validity	SWS_CanTSyn_00088, SWS_CanTSyn_00097, SWS_CanTSyn_00100, SWS_CanTSyn_00134
SRS_BSW_00337	Classification of development errors	SWS_CanTSyn_00097, SWS_CanTSyn_00100, SWS_CanTSyn_00134
SRS_BSW_00385	List possible error notifications	SWS_CanTSyn_00089

7 Functional specification

This chapter defines the behavior of the Time Synchronization over CAN. The API of the module is defined in chapter 8, while the configuration is defined in chapter 10.

7.1 Overview

The Time Synchronization over CAN is responsible to realize the CAN specific Time Synchronization protocol.
Time Synchronization principles and common wording is described in [4].

7.2 Module Handling

This section contains description of auxiliary functionality of the Time Synchronization over CAN.

[SWS_CanTSyn_00135][
If CanTSyn calls an API of the StbM, it shall use the Time Base ID of the Time Base referenced via the parameter `CanTSynSynchronizedTimeBaseRef` of the corresponding Time Domain.
](RS_TS_20032, RS_TS_20038)

7.2.1 Interrupt Handling

When transmitting or receiving a SYNC message, the current value of the Virtual Local Time needs to be captured in the Rx Indication / Tx Confirmation callbacks

- either in interrupt mode in context of the Rx / Tx interrupt
- or in polling mode in the main function
  (Note: it is strongly recommended not to use polling mode for GTS).

Any delay between the occurrence of the interrupt itself and the determination of the current Virtual Local Time worsens the precision of either the transmitted or received Time Base.

Therefore, it is inevitable that these Rx Indication / Tx Confirmation callbacks establish a protection against interruptions immediately after being called (if called in context of the Rx / Tx interrupt with interrupt nesting disabled, this is implicitly ensured by the controller).

Thereafter only the necessary checks shall be made to determine that the message is a SYNC message (and to determine the Time Base ID if necessary). Once the Time Base ID and the SYNC message type are confirmed the current value of the Virtual Local Time is obtained from a function call to the StbM (still in the context of locked interrupts). Afterwards the interruption protection can be removed without having a negative impact on the precision.

As a consequence it might be possible that a snapshot of the Virtual Local Time is taken although the subsequent frame checks (e.g., CRC validation, SC validation) might fail and thus the snapshot becomes superfluous.

7.2.2 Initialization

The Time Synchronization over CAN is initialized via `CanTSyn_Init()`. Except for `CanTSyn_GetVersionInfo()` and `CanTSyn_Init()`, the API functions of the Time Synchronization over CAN may only be called when the module has been properly initialized.

[SWS_CanTSyn_00003][
A call to `CanTSyn_Init()` initializes all internal variables and sets the Time Synchronization over CAN to the initialized state.
](RS_TS_00003, RS_TS_00004)

[SWS_CanTSyn_00006][
When `CanTSyn_Init()` is called in initialized state, the Time Synchronization over CAN shall re-initialize its internal variables.
](RS_TS_00003, RS_TS_00004)

[SWS_CanTSyn_00007][
The Sequence Counter (*SC*) shall be initialized with 0.
](RS_TS_20033)

7.3 Message Format

SYNC, FUP, OFS and OFNS messages are assigned to a dedicated message type “TimeSync”.

SYNC, FUP, OFS and OFNS messages of the same Time Domain share the same CAN ID by using a multiplexed signal group. For different Time Domains the same CAN ID may be used if Timesync messages are sent by the same Time Master or Time Gateway. For different Time Domains different CAN IDs shall be used if Timesync messages are sent by different Time Masters or Time Gateways. The multiplexer is located at Byte 0, named as “*Type*”.

The usage of a *CRC* is optional. To ensure a great variability between several time observing units, the configuration decides of how to handle *CRC* secured Timesync messages if the receiver does not support the *CRC* calculation. Hence it might be possible, that a receiver is just using the given Time Base value without evaluating the *CRC*.

[SWS_CanTSyn_00008][
The byte order for time value signals in Time Synchronization messages is “Big Endian”.
](RS_TS_20035)

[SWS_CanTSyn_00010][
The DLC of SYNC, FUP, OFS and OFNS messages is 8 for classic CAN.

The DLC of SYNC, FUP, OFS and OFNS messages is 16 for CAN FD if `CanTSynUseExtendedMsgFormat` is `TRUE`.
](RS_TS_20035, RS_TS_20068)

[SWS_CanTSyn_00011][
Depending on its type Time Synchronization messages may contain User Data according to the given message format.
](RS_TS_20035, RS_TS_20037)

[SWS_CanTSyn_00012][
User Data shall be read consistently from incoming Time Synchronization messages that contain User Data Fields.
](RS_TS_20037)

[SWS_CanTSyn_00013][
User Data shall be written consistently to outgoing Time Synchronization messages that contain User Data Fields.

If the number of User Data Fields in a Time Synchronization message is greater than the number of User Data Bytes provided by the StbM, the remaining User Data Fields shall be set to 0 (default value).
](RS_TS_20037)

[SWS_CanTSyn_00014][
User Data shall be mapped to the `StbM_UserDataType`, whereas the byte number given in the message and by the `StbM_UserDataType` shall match (User Byte 0 mapped to `StbM_UserDataType.userByte0` etc.).
`StbM_UserDataType.userDataLength` shall be set to the Time Synchronization message type specific number of User Bytes.
](RS_TS_20037)

7.3.1 SYNC and FUP Message

[SWS_CanTSyn_00015][
SYNC not CRC secured message format:
Byte 0: *Type* = 0x10
Byte 1: User Byte 1, default: 0
Byte 2: *D* = Time Domain 0 to 15 (Bit 7 to Bit 4)
SC = Sequence Counter (Bit 3 to Bit 0)
Byte 3: User Byte 0, default: 0
Byte 4-7: *SyncTimeSec* = 32 bit LSB of the 48 bits seconds part of the time
If `CanTSynUseExtendedMsgFormat` = `TRUE`:
Byte 8-15: reserved, always 0
](RS_TS_20033, RS_TS_20035, RS_TS_20068)

[SWS_CanTSyn_00016][
FUP not CRC secured message format:
Byte 0: *Type* = 0x18
Byte 1: User Byte 2, default: 0
Byte 2: *D* = Time Domain 0 to 15 (Bit 7 to Bit 4)
SC = Sequence Counter (Bit 3 to Bit 0)
Byte 3: reserved (Bit 7 to Bit 3), default: 0
SGW (Bit 2)
SyncToGTM = 0
SyncToSubDomain = 1
OVS = Overflow of seconds (Bit 1 to Bit 0)
Byte 4-7: *SyncTimeNSec* = 32 Bit time value in nanoseconds
If `CanTSynUseExtendedMsgFormat` = `TRUE`:
Byte 8-15: reserved, always 0
](RS_TS_20033, RS_TS_20035, RS_TS_20068)

[SWS_CanTSyn_00017][
SYNC CRC secured message format:
Byte 0: *Type* = 0x20
Byte 1: *CRC*
Byte 2: *D* = Time Domain 0 to 15 (Bit 7 to Bit 4)
SC = Sequence Counter (Bit 3 to Bit 0)
Byte 3: User Byte 0, default: 0
Byte 4-7: *SyncTimeSec* = 32 bit LSB of the 48 bits seconds part of the time
If `CanTSynUseExtendedMsgFormat` = `TRUE`:
Byte 8-15: reserved, always 0
](RS_TS_20033, RS_TS_20035, RS_TS_20068)

[SWS_CanTSyn_00018][
FUP CRC secured message format:
Byte 0: *Type* = 0x28
Byte 1: *CRC*
Byte 2: *D* = Time Domain 0 to 15 (Bit 7 to Bit 4)
SC = Sequence Counter (Bit 3 to Bit 0)
Byte 3: reserved (Bit 7 to Bit 3), default: 0
SGW (Bit 2)
SyncToGTM = 0
SyncToSubDomain = 1
OVS = Overflow of seconds (Bit 1 to Bit 0)
Byte 4-7: *SyncTimeNSec* = 32 Bit time value in nanoseconds
If `CanTSynUseExtendedMsgFormat` = `TRUE`:
Byte 8-15: reserved, always 0
](RS_TS_20033, RS_TS_20035, RS_TS_20068)

7.3.2 Offset Messages

Offset messages can be multiplexed with the Time Synchronization messages (using the same PDU, etc.).

For Classic CAN (CAN 2.0) two different Offset messages are used, OFS and OFNS. For both of them there are variants with and without a CRC field.
For CAN FD, if `CanTSynUseExtendedMsgFormat` is `TRUE`, the content of OFS and OFNS is merged into a single Extended OFS message (variants with and without a CRC field exist as well).

[SWS_CanTSyn_00132][
`CanTSynUseExtendedMsgFormat` shall always be `FALSE` for CAN 2.0 buses.
](RS_TS_20068)

[SWS_CanTSyn_00130][
If `CanTSynUseExtendedMsgFormat` is `FALSE`, then the Normal Offset Message Format shall be used as specified in section 7.3.2.1.
](RS_TS_20068)

[SWS_CanTSyn_00131][
If `CanTSynUseExtendedMsgFormat` is `TRUE`, then the Extended Offset Message Format shall be used as specified in section 7.3.2.2.
](RS_TS_20068)

7.3.2.1 Normal Offset Messages

[SWS_CanTSyn_00126][
OFS not CRC secured message format:
Byte 0: *Type* = 0x34
Byte 1: User Byte 1, default: 0
Byte 2: *D* = Time Domain 16 to 31 (Bit 7 to Bit 4)
SC = Sequence Counter (Bit 3 to Bit 0)
Byte 3: User Byte 0, default: 0
Byte 4-7: *OfsTimeSec* = 32 Bit offset time value in seconds
](RS_TS_20033, RS_TS_20036)

[SWS_CanTSyn_00127][
OFNS not CRC secured message format:
Byte 0: *Type* = 0x3C
Byte 1: User Byte 2, default: 0
Byte 2: *D* = Time Domain 16 to 31 (Bit 7 to Bit 4)
SC = Sequence Counter (Bit 3 to Bit 0)
Byte 3: reserved (Bit 7 to Bit 1), default: 0
SGW (Bit 0)
SyncToGTM = 0
SyncToSubDomain = 1
Byte 4-7: *OfsTimeNSec* = 32 Bit offset time value in nanoseconds
](RS_TS_20033, RS_TS_20036)

[SWS_CanTSyn_00128][
OFS CRC secured message format:
Byte 0: *Type* = 0x44
Byte 1: *CRC*

Byte 2: *D* = Time Domain 16 to 31 (Bit 7 to Bit 4)
SC = Sequence Counter (Bit 3 to Bit 0)
Byte 3: User Byte 0, default: 0
Byte 4-7: *OfsTimeSec*= 32 Bit offset time value in seconds
](RS_TS_20033, RS_TS_20036)

[SWS_CanTSyn_00129][
OFNS CRC secured message format:
Byte 0: *Type* = 0x4C
Byte 1: *CRC*
Byte 2: *D* = Time Domain 16 to 31 (Bit 7 to Bit 4)
SC = Sequence Counter (Bit 3 to Bit 0)
Byte 3: reserved (Bit 7 to Bit 1), default: 0
SGW (Bit 0)
SyncToGTM = 0
SyncToSubDomain = 1
Byte 4-7: *OfsTimeNSec* = 32 Bit offset time value in nanoseconds
](RS_TS_20033, RS_TS_20036)

7.3.2.2 Extended Offset messages

If `CanTSynUseExtendedMsgFormat` is `TRUE`, the message layout of the Extended OFS message is as follows. A separate OFNS message is not required.

[**SWS_CanTSyn_00111**][**
OFS not CRC secured message format for CAN FD PDUs:
Byte 0: *Type* = 0x54
Byte 1: User Byte 2, default: 0
Byte 2: *D* = Time Domain 16 to 31 (Bit 7 to Bit 4)
SC = Sequence Counter (Bit 3 to Bit 0)
Byte 3: reserved (Bit 7 to Bit 1), default: 0
SGW (Bit 0)
SyncToGTM = 0
SyncToSubDomain = 1
Byte 4: User Byte 0, default: 0
Byte 5: User Byte 1, default: 0
Byte 6: reserved, default: 0
Byte 7: reserved, default: 0
Byte 8-11: *OfsTimeSec* = 32 Bit offset time value in seconds
Byte 12-15: *OfsTimeNSec* = 32 Bit offset time value in nanoseconds
](RS_TS_20033, RS_TS_20036, RS_TS_20068)

[**SWS_CanTSyn_00112**][**

Byte 12-15: *OfsTimeNSec* = 32 Bit offset time value in nanoseconds
](RS_TS_20033, RS_TS_20036, RS_TS_20068)

7.4 Acting as Time Master

A Time Master is an entity which is the master for a certain Time Base and which propagates this Time Base to a set of Time Slaves within a certain segment of a communication network, being a source for this Time Base.
If a Time Master is also the owner of the Global Time Base, the Time Base from which all further Time Bases are derived from, then it is the Global Time Master. A Time Gateway typically consists of one Time Master port which is connected to one or more Time Slaves. When mapping time entities to real ECUs it has to be noted, that an ECU could be Time Master (or even Global Time Master) for one Time Base and Time Slave for another Time Base.

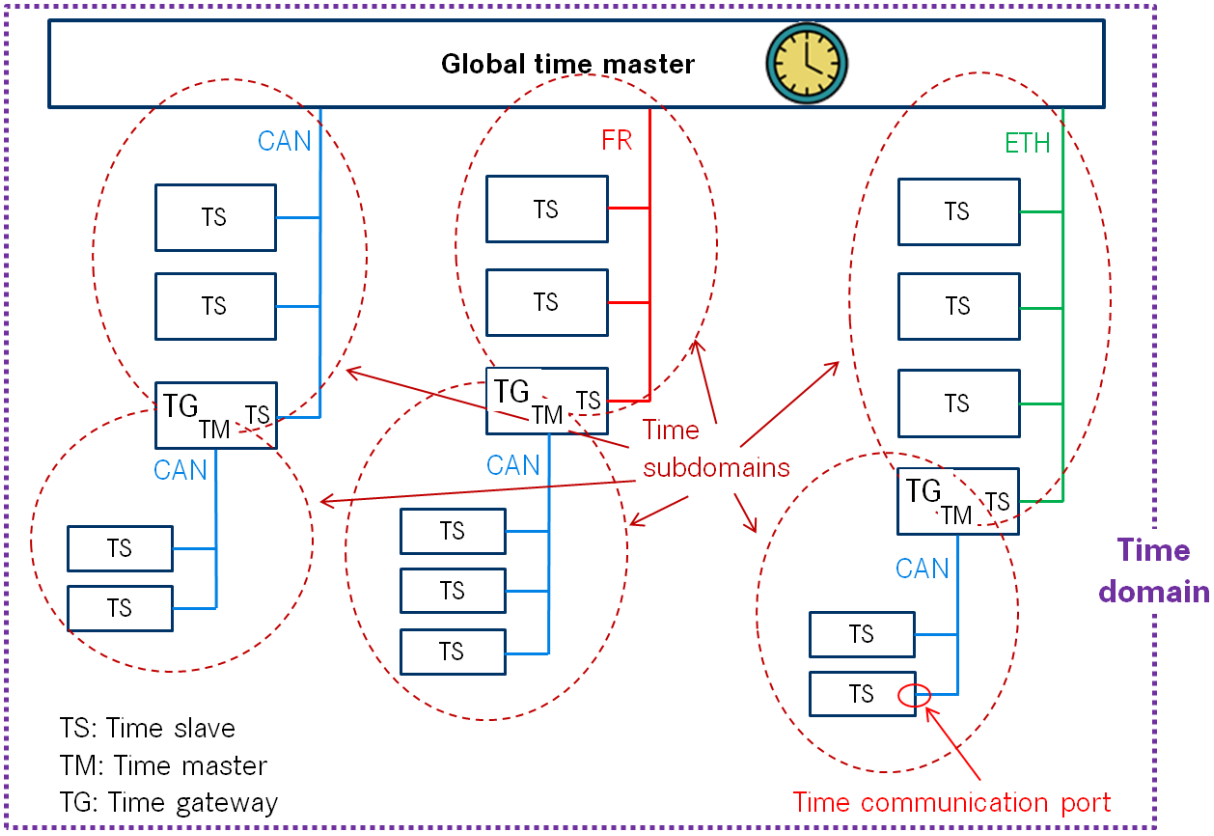

Figure 3: Terminology Example

[SWS_CanTSyn_00136][
A master shall transmit SYNC, FUP, OFS and OFNS messages by calling `CanIf_Transmit` with the PduId derived via `CanTSynGlobalTimePduRef` of the corresponding Time Domain.
](RS_TS_20031)

7.4.1 SYNC and FUP message processing

[SWS_CanTSyn_00025][
A Time Master shall start each Time Synchronization sequence for a Synchronized Time Base with a SYNC message.
](RS_TS_20031, RS_TS_20035)

[SWS_CanTSyn_00026][
A Time Master shall finish each Time Synchronization sequence for a Synchronized Time Base with a FUP message.
](RS_TS_20031, RS_TS_20035)

[SWS_CanTSyn_00027][
Any timeout while waiting for `CanTSyn_TxConfirmation()` function resets the state machine to start with a new SYNC transmission again.
](RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00028][
If configured as Time Master of a Synchronized Time Domain (refer to `CanTSynGlobalTimeDomain`) the CanTSyn module shall periodically transmit SYNC messages (according to **Figure 4**) with the cycle `CanTSynGlobalTimeTxPeriod` **(**ECUC_CanTSyn_00017 : **)** if

- the `GLOBAL_TIME_BASE` bit within the timeBaseStatus is set
- and `CanTSynGlobalTimeTxPeriod` is unequal to 0
- and if the associated `cyclicMsgResumeCounter` is not running (see 7.4.5).

The cyclic transmission shall be started in the earliest possible CanTSyn_MainFunction() call once the requirements above are fulfilled.
](RS_TS_20031, RS_TS_20035)

Note: “earliest possible” means:

- In the next `CanTSyn_MainFunction()`, because `GLOBAL_TIME_BASE` is set outside the `CanTSyn_MainFunction()`.
- In the current `CanTSyn_MainFunction()`, when switching from immediate to cyclic transmission (because this decision is made inside the `CanTSyn_MainFunction()`).

[SWS_CanTSyn_00029][
The SYNC and FUP sequence shall not be interrupted, neither by Time Synchronization messages of the same Time Domain nor by Time Synchronization messages of other Time Domains if the same CAN ID is used for the Time Synchronization messages.
](RS_TS_20035)

[SWS_CanTSyn_00031][
Depending on `CanTSynGlobalTimeTxCrcSecured` (**ECUC_CanTSyn_00015 :**) the SYNC / FUP message shall be of type:

`CanTSynGlobalTimeTxCrcSecured`	SYNC	FUP
`CRC_NOT_SUPPORTED`	`0x10` SYNC not CRC secured message	`0x18` FUP not CRC secured message
`CRC_SUPPORTED`	`0x20` SYNC CRC secured message	`0x28` FUP CRC secured message

](RS_TS_20033, RS_TS_20035)

[SWS_CanTSyn_00032][
A transmitter of FUP messages (Time Master) is using as trigger condition for SYNC to FUP that the `debounceCounter` value reaches 0 as described in 7.4.4.
](RS_TS_20031, RS_TS_20035)

[SWS_CanTSyn_00033][
Each transmission request of a SYNC message shall be monitored for a transmit confirmation timeout `CanTSynMasterConfirmationTimeout` (**ECUC_CanTSyn_00020 :**). If the timeout occurs, the transmission request shall be revoked and no FUP message shall be sent.
](RS_TS_20034, RS_TS_20035)

7.4.2 OFS message processing

[SWS_CanTSyn_00035][
A Time Master shall start each Time Synchronization sequence for an Offset Time Base with an OFS message.
](RS_TS_20031, RS_TS_20036)

[SWS_CanTSyn_00036][
If `CanTSynUseExtendedMsgFormat` is `FALSE`, a Time Master shall finish each Time Synchronization sequence for an Offset Time Base with an OFNS message.
](RS_TS_20031, RS_TS_20036, RS_TS_20068)

Note: If `CanTSynUseExtendedMsgFormat` is `TRUE`, OFNS messages are not required.

[SWS_CanTSyn_00037][
Any Timeout while waiting for `CanTSyn_TxConfirmation()` function resets the state machine to start with a new OFS transmission again.
](RS_TS_20034, RS_TS_20036)

[SWS_CanTSyn_00038][

If configured as Time Master of an Offset Time Domain (refer to CanTSynGlobalTimeDomain) the CanTSyn module shall periodically transmit OFS messages with the cycle CanTSynGlobalTimeTxPeriod (**ECUC_CanTSyn_00017 :**) if

- the GLOBAL_TIME_BASE bit within the timeBaseStatus of the referenced Time Base CanTSynSynchronizedTimeBaseRef (refer **ECUC_CanTSyn_00022 :**) is set
- and CanTSynGlobalTimeTxPeriod is unequal to 0
- and if the associated cyclicMsgResumeCounter is not running (see 7.4.5).

The cyclic transmission shall be started in the earliest possible CanTSyn_MainFunction() call once the requirements above are fulfilled.
](RS_TS_20031, RS_TS_20036)

Note: “earliest possible” means:

- In the next CanTSyn_MainFunction(), because GLOBAL_TIME_BASE is set outside the CanTSyn_MainFunction().
- In the current CanTSyn_MainFunction(), when switching from immediate to cyclic transmission (because this decision is made inside the CanTSyn_MainFunction()).

[SWS_CanTSyn_00039][
The OFS and OFNS sequence shall not be interrupted, neither by Time Synchronization messages of the same Time Domain nor by Time Synchronization messages of other Time Domains if the same CAN ID is used for the Time Synchronization messages.
](RS_TS_20036)

[SWS_CanTSyn_00040][
A transmitter of OFNS messages (Time Master) is using as trigger condition for OFS to OFNS that the debounceCounter value reaches 0 as described in 7.4.4.
](RS_TS_20036)

[SWS_CanTSyn_00041][
Depending on CanTSynGlobalTimeTxCrcSecured (**ECUC_CanTSyn_00015 :**) the OFS / OFNS message shall be of type:

	CanTSynGlobalTimeTxCrcSecured	OFS	OFNS
CAN	CRC_NOT_SUPPORTED	0x34 OFS not CRC secured message	0x3C OFNS not CRC secured message
	CRC_SUPPORTED	0x44 OFS CRC secured message	0x4C OFNS CRC secured message
CAN FD (CanTSynUseExtendedMsgFo	CRC_NOT_SUPPORTED	0x54 OFS not CRC secured message	Not available
	CRC_SUPPORTED	0x64	

rmat = TRUE)		OFS CRC secured message	

](RS_TS_20033, RS_TS_20036, RS_TS_20068)

[SWS_CanTSyn_00042][
Each OFS transmission request shall be monitored for a transmit confirmation timeout `CanTSynMasterConfirmationTimeout` (**ECUC_CanTSyn_00020 :**). If the timeout occurs, the transmission request shall be revoked and no OFNS message shall be sent.
](RS_TS_20034, RS_TS_20036)

7.4.3 Transmission mode

[SWS_CanTSyn_00043][
If `CanTSyn_SetTransmissionMode(Controller, Mode)` is called and parameter `Mode` equals `CANTSYN_TX_OFF`, all transmit request from CanTSyn shall be omitted on this CAN channel.
](RS_TS_20031, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00044][
If `CanTSyn_SetTransmissionMode(Controller, Mode)` is called and parameter `Mode` equals `CANTSYN_TX_ON`, all transmit request from CanTSyn on this CAN channel shall be able to be transmitted.
](RS_TS_20031, RS_TS_20035, RS_TS_20036)

7.4.4 Debounce Time

The debounce time shall inhibit transmission bursts of a specific CAN PDU. Inhibiting transmission bursts of Timesync messages on a specific CAN bus is not possible if multiple PDUs are used for multiple Time Domains since there is no inter-PDU debounce time configurable within the CanTSyn module.

[SWS_CanTSyn_00123][
If `CanTSynGlobalTimeDebounceTime` (**ECUC_CanTSyn_00045 :**) is greater than 0 for a Time Base, CanTSyn shall always do debouncing for the corresponding Timesync PDUs as described below, otherwise CanTSyn shall not do any debouncing.
](RS_TS_20031)

[SWS_CanTSyn_00124][
`CanTSynGlobalTimeDebounceTime` (**ECUC_CanTSyn_00045 :**) represents the debounce value of a PDU specific `debounceCounter` that shall be started after the Timesync PDU has been sent. CanTSyn shall decrement the `debounceCounter` value on each invocation of `CanTSyn_MainFunction()`, if no Timesync PDU is transmitted.
](RS_TS_20031)

[SWS_CanTSyn_00125][
A new Timesync PDU shall only be sent if the corresponding `debounceCounter` has a value equal or less than 0.
](RS_TS_20031)

Note: Since the decrement of the `debounceCounter` takes place in the `CanTSyn_MainFunction()` call but the start of the counter takes place when the Timesync PDU has been sent (either in the subsequent `CanTSyn_MainFunction()` call or in the transmit confirmation callback function) the effective debounce time will be equal or larger than `CanTSynGlobalTimeDebounceTime`. The extension of the debounce time shall be limited to the value of `CanTSynMainFunctionPeriod`.

7.4.5 Immediate Time Synchronization

In addition to the cyclic Timesync message transmission, an immediate message transmission might be required.
Depending on configuration, the CanTSyn module checks on each `CanTSyn_MainFunction()` call the necessity for a Timesync message transmission for each Time Base, where a Master Port belongs to.

[SWS_CanTSyn_00117][
If `CanTSynImmediateTimeSync` (**ECUC_CanTSyn_00043 :**) is set to `TRUE` for a Time Base, CanTSyn shall check on each `CanTSyn_MainFunction()` call by calling `StbM_GetTimeBaseUpdateCounter()`, if the `timeBaseUpdateCounter` of the corresponding Time Base has changed.
](RS_TS_20031)

[SWS_CanTSyn_00118][
If `CanTSynImmediateTimeSync` (**ECUC_CanTSyn_00043 :**) is set to `TRUE` and the `timeBaseUpdateCounter` of a Time Base has changed and the `GLOBAL_TIME_BASE` bit of the `timeBaseStatus` is set, CanTSyn shall trigger an immediate transmission of Time Synchronization messages for the corresponding Time Base.
](RS_TS_20031)

Note: `timeBaseStatus` can be obtained by `StbM_GetTimeBaseStatus()`, `StbM_BusGetCurrentTime()` or `StbM_GetCurrentTime()`.

Note: The `debounceTimer` as described in 7.4.4 shall always be considered.

[SWS_CanTSyn_00119][
If `CanTSynImmediateTimeSync` (**ECUC_CanTSyn_00043 :**) is set to `TRUE`, `cyclicMsgResumeCounter` and `CanTSynCyclicMsgResumeTime` (**ECUC_CanTSyn_00044 :**) shall be considered.
](RS_TS_20031)

[SWS_CanTSyn_00120][
`CanTSynCyclicMsgResumeTime` (**ECUC_CanTSyn_00044 :**) represents the timeout value of a `cyclicMsgResumeCounter` that shall be started when either a SYNC or OFS message has been sent immediately, asynchronous to the cyclic Timesync message transmission. `cyclicMsgResumeCounter` shall be decremented on each invocation of `CanTSyn_MainFunction()`, if no Timesync PDU is transmitted asynchronously.
](RS_TS_20031)

[SWS_CanTSyn_00121][
If the `cyclicMsgResumeCounter` has reached a value equal or less than zero, CanTSyn shall resume cyclic Timesync message transmission by sending either a SYNC or OFS message.
](RS_TS_20031)

[SWS_CanTSyn_00122][
If the `cyclicMsgResumeCounter` is started CanTSyn shall stop cyclic Timesync message transmission.
](RS_TS_20031)

7.4.6 Calculation and Assembling of Time Synchronization Messages

This chapter describes the workflow, how the items of a Time Synchronization message will be calculated (1st step) and how the message will be assembled (2nd step).

7.4.6.1 Global Time Calculation

[SWS_CanTSyn_00045][
The transmitter of a Synchronized Time Base (Time Master) shall perform the following steps to distribute the Synchronized Time Base exactly (refer to 9.1):

1. On transmission of SYNC message
   a. Get current Synchronized Time Base's Time Tuple as [$T0_{SYNC}$;$T0_{VLT}$] via `StbM_BusGetCurrentTime()` and write second portion of $T0_{SYNC}$ to *SyncTimeSec*

2. On SYNC message TX confirmation
   a. Immediately establish a protection against interruptions and run the next step:
   b. Retrieve current Virtual Local Time value as $T1_{VLT}$ via `StbM_GetCurrentVirtualLocalTime()`
   c. The protection against interruptions may be released
   d. Calculate T4 for FUP message as $T4 = T0_{SYNCns} + (T1_{VLT} - T0_{VLT})$ with $T0_{SYNCns}$ as nanosecond portion of $T0_{SYNC}$

3. On transmission of FUP message

a. Write second portion of T4 (T4 >= 1s) to *OVS*
b. Write nanosecond portion of T4 to *SyncTimeNSec*

](RS_TS_20035)

With these steps, the Synchronized Time Base value at the transmitter side has been calculated ($T0_{SYNC}$ + T4).

Note:
When using interrupt mode with interrupt nesting disabled, the CanTSyn does not need to explicitly establish a protection against interruptions in the Tx confirmation callback. This is typically done implicitly by the controller.

[SWS_CanTSyn_00046][
The transmitter of an Offset Time Base (Time Master) shall perform the following steps to distribute the Offset Time Base exactly:

1. Retrieve current Offset Time via `StbM_GetOffset()`
2. Write second portion of the Offset Time to *OfsTimeSec*
3. Write nanosecond portion of the Offset Time to *OfsTimeNSec*

](RS_TS_20036)

Note: OFS and OFNS messages shall not be time stamped.

7.4.6.2 OVS Calculation

[SWS_CanTSyn_00047][
OVS shall be set within FUP messages if the transmitter detects a nanosecond overflow greater than the defined range of `StbM_TimeStampType.nanoseconds` **[SWS_CanTSyn_00045]** whereas the left over part of seconds which does not fit into `StbM_TimeStampType.nanoseconds` shall be written to *OVS*.
](RS_TS_20035)

7.4.6.3 SGW Calculation

[SWS_CanTSyn_00030][
The *SGW* value (Time Gateway synchronization status) shall be retrieved from the Time Base synchronization status. If the `STBM_SYNC_TO_GATEWAY` bit within `timeBaseStatus` is not set the *SGW* value shall be *SyncToGTM*. Otherwise the *SGW* value shall be set to *SyncToSubDomain*.
](RS_TS_20035, RS_TS_20036)

7.4.6.4 Sequence Counter Calculation

[SWS_CanTSyn_00048][
A Sequence Counter (*SC*) of 4 bit is representing numbers from 0 to 15 per Time Domain. The Sequence Counter shall be independent between SYNC and OFS messages and shall be incremented by 1 continuously on every transmission request of a SYNC or OFS message. It shall wrap around at 15 to 0 again.
](RS_TS_20033, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00049][
The Sequence Counter (*SC*) value for a FUP message shall be set to the *SC* value of the corresponding SYNC message. The *SC* value for an OFNS message shall be set to the *SC* value of the corresponding OFS message.
](RS_TS_20033, RS_TS_20035, RS_TS_20036)

7.4.6.5 CRC Calculation

[SWS_CanTSyn_00050][
The function `Crc_CalculateCRC8H2F()` as defined in [5] shall be used to calculate the *CRC* if configured.
](RS_TS_20033, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00054][
The `DataID` shall be calculated as `DataID = DataIDList[`*SC*`]`, where `DataIDList` (**ECUC_CanTSyn_00024 : ECUC_CanTSyn_00025 : ECUC_CanTSyn_00026 : ECUC_CanTSyn_00041 :**) is given by configuration for each message *Type*.
](RS_TS_20033, RS_TS_20035, RS_TS_20036)

Note: A specific `DataID` out of a predefined `DataIDList` ensures the identification of data elements of Time Synchronization messages.

[SWS_CanTSyn_00055][
If `CanTSynUseExtendedMsgFormat` is `FALSE`, the *CRC* shall be calculated over Time Synchronization message *Byte 2* to *Byte 7* and `DataID`, where Byte 2 is applied first, followed by the other bytes in ascending order, and `DataID` last.

If `CanTSynUseExtendedMsgFormat` is `TRUE`, the *CRC* shall be calculated over Time Synchronization message *Byte 2* to *Byte 15* and `DataID` for Extended Timesync message formats, where Byte 2 is applied first, followed by the other bytes in ascending order, and `DataID` last.
](RS_TS_20033, RS_TS_20035, RS_TS_20036, RS_TS_20068)

7.4.6.6 Message Assembling

[SWS_CanTSyn_00056][
For each transmission of a Time Synchronization message the CanTSyn module shall assemble the message as follows:

1. Calculate *OVS* (FUP only)
2. Calculate *SGW* (FUP, OFNS and Extended OFS)
3. Calculate *SC*
4. Copy all data to the appropriate position within the related message
5. Calculate *CRC* (configuration dependent)

](RS_TS_20033, RS_TS_20035, RS_TS_20036)

7.5 Acting as Time Slave

A Time Slave is an entity, which is the recipient for a certain Time Base within a certain segment of a communication network, being a consumer for this Time Base.

7.5.1 SYNC and FUP message processing

[SWS_CanTSyn_00057][
The CanTSyn shall only accept a SYNC message with *Type* equal to `0x20` and a correct *CRC* value if `CanTSynRxCrcValidated` is configured to `CRC_VALIDATED`.
](RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00058][
The CanTSyn shall only accept a SYNC message with *Type* equal to `0x10` if `CanTSynRxCrcValidated` is configured to `CRC_NOT_VALIDATED`.
](RS_TS_20035)

[SWS_CanTSyn_00059][
The CanTSyn shall only accept a SYNC message with *Type* equal to `0x10` or `0x20` if `CanTSynRxCrcValidated` is configured to `CRC_IGNORED`.
](RS_TS_20035)

[**SWS_CanTSyn_00109**][
The CanTSyn shall only accept a SYNC message with *Type* equal to `0x10` or a SYNC message with *Type* equal to `0x20` and a correct *CRC* value if `CanTSynRxCrcValidated` is configured to `CRC_OPTIONAL`.
](RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00060][
The CanTSyn shall only accept a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and *Type* equal to `0x28` and a correct *CRC* value if `CanTSynRxCrcValidated` is configured to `CRC_VALIDATED`.
](RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00061][
The CanTSyn shall only accept a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and *Type* equal to `0x18` if `CanTSynRxCrcValidated` is configured to `CRC_NOT_VALIDATED`.
](RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00062][
The CanTSyn shall only accept a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and *Type* equal to `0x18` or `0x28` if `CanTSynRxCrcValidated` is configured to `CRC_IGNORED`.
](RS_TS_20034, RS_TS_20035)

[**SWS_CanTSyn_00110**][
The CanTSyn shall only accept a FUP message with an identical Sequence Counter to the value of the corresponding SYNC message and *Type* equal to `0x18` or a FUP message with an identical sequence counter to the value of the corresponding SYNC message and *Type* equal to `0x28` and a correct *CRC* value if `CanTSynRxCrcValidated` is configured to `CRC_OPTIONAL`.
](RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00063][
For each configured Time Slave (`CanTSynGlobalTimeSlave`) the CanTSyn module shall observe the *reception timeout* `CanTSynGlobalTimeFollowUpTimeout` (**ECUC_CanTSyn_00006 :**) between the SYNC and its FUP message. If the *reception timeout* occurs the sequence shall be reset (i.e., waiting for a new SYNC message).
](RS_TS_20034, RS_TS_20035)

Note: The general timeout monitoring for the Time Base update is located in the StbM and not in the Timesync modules.

[SWS_CanTSyn_00064][
For a valid pair of SYNC and FUP messages a new Time Tuple, consisting of the Global Time value and the associated value of the Virtual Local Time, shall be calculated and forwarded to the StbM module via `StbM_BusSetGlobalTime()` (according to 9.2).
](RS_TS_20032, RS_TS_20034)

7.5.2 OFS and OFNS message processing

[SWS_CanTSyn_00065][
The CanTSyn shall only accept an OFS message with *Type* equal to `0x44` or `0x64` and a correct *CRC* value if `CanTSynRxCrcValidated` is configured to `CRC_VALIDATED`.
](RS_TS_20034, RS_TS_20036)

[SWS_CanTSyn_00066][
The CanTSyn shall only accept an OFS message with *Type* equal to `0x34` or `0x54` if `CanTSynRxCrcValidated` is configured to `CRC_NOT_VALIDATED`.
](RS_TS_20036)

[SWS_CanTSyn_00067][
The CanTSyn shall only accept an OFS message with *Type* equal to `0x34`, `0x44`, `0x54` or `0x64` if `CanTSynRxCrcValidated` is configured to `CRC_IGNORED`.
](RS_TS_20036)

[**SWS_CanTSyn_00113**][

The CanTSyn shall only accept an OFS message with *Type* equal to `0x34` or `0x54` or an OFS message with *Type* equal to `0x44` or `0x64` and a correct CRC value if `CanTSynRxCrcValidated` is configured to `CRC_OPTIONAL`.
](RS_TS_20034, RS_TS_20036)

[SWS_CanTSyn_00068][
The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and *Type* equal to `0x4C` and a correct *CRC* value if `CanTSynRxCrcValidated` is configured to `CRC_VALIDATED`.
](RS_TS_20034, RS_TS_20036)

[SWS_CanTSyn_00069][
The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and *Type* equal to `0x3C` if `CanTSynRxCrcValidated` is configured to `CRC_NOT_VALIDATED`.
](RS_TS_20036)

[SWS_CanTSyn_00070][
The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and *Type* equal to `0x3C` or `0x4C` if `CanTSynRxCrcValidated` is configured to `CRC_IGNORED`.
](RS_TS_20036)

[**SWS_CanTSyn_00114**][**
The CanTSyn shall only accept an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and *Type* equal to `0x3C` or an OFNS message with an identical Sequence Counter to the value of the corresponding OFS message and *Type* equal to `0x4C` and a correct CRC value if `CanTSynRxCrcValidated` is configured to `CRC_OPTIONAL`.
](RS_TS_20034, RS_TS_20036)

[SWS_CanTSyn_00071][
If `CanTSynUseExtendedMsgFormat` is `FALSE`, the CanTSyn shall observe for each configured Time Slave (`CanTSynGlobalTimeSlave`) the *reception timeout* `CanTSynGlobalTimeFollowUpTimeout` (**ECUC_CanTSyn_00006 :**) between the OFS and its OFNS message. If the *reception timeout* occurs the sequence shall be reset (i.e. waiting for a new OFS message).
](RS_TS_20034, RS_TS_20036, RS_TS_20068)

Note: The general timeout monitoring for the Time Base update is located in the StbM and not in the Timesync modules.

[SWS_CanTSyn_00072][
For a valid pair of OFS and OFNS messages and if `CanTSynUseExtendedMsgFormat` is `FALSE`, the CanTSyn shall calculate a new Time Tuple, consisting of the Offset Time value and the associated value of the

Virtual Local Time, (according to **[SWS_CanTSyn_00074]**) and forward it to the StbM module via `StbM_BusSetGlobalTime()`.

If `CanTSynUseExtendedMsgFormat` is `TRUE`, the CanTSyn shall calculate a new Time Tuple, consisting of the Offset Time value and the associated value of the Virtual Local Time, (according to **[SWS_CanTSyn_00074]**) after receiving a valid OFS message and forward it to the StbM module via `StbM_BusSetGlobalTime()`.
](RS_TS_20032, RS_TS_20034, RS_TS_20068)

[SWS_CanTSyn_00116][
On an invocation of `StbM_BusSetGlobalTime()` the parameter `PathDelay` of the `measureDataPtr` structure shall be set to 0.
](RS_TS_20034)

7.5.3 Validation and Disassembling of Time Synchronization Messages

This chapter describes the workflow, how the items of a Time Synchronization message will be validated (1st step) and how the message will be disassembled (2nd step).

7.5.3.1 Global Time Calculation

[SWS_CanTSyn_00073][
The receiver of a Synchronized Time Base shall perform the following steps to retrieve the Synchronized Time Base exactly (refer to 9.2):

1. On SYNC message RX indication, which delivers Synchronized Time Base part T0:
   a. Immediately establish a protection against interruptions and run the next step directly afterwards:
   b. Retrieve the current Virtual Local Time value as $T2_{VLT}$ via `StbM_GetCurrentVirtualLocalTime()`
   c. The protection against interruptions may be released

2. On FUP message reception (either in RX indication or in the subsequent `MainFunction` invocation), which delivers Synchronized Time Base part T4 = (*OVS* + *SyncTimeNSec*), retrieve current Virtual Local Time value as $T5_{VLT}$ via `StbM_GetCurrentVirtualLocalTime()`

3. Calculate the Time Tuple [T5; $T5_{VLT}$] to update the Time Slave's Local Time Base:
   $T5 = T0 + T4 + (T5_{VLT} – T2_{VLT})$.

](RS_TS_20035)

Note: Immediately protecting against interruptions means that there shall be no frame checks before. If called in context of the Rx interrupt **with interrupt nesting**

disabled, this is typically implicitly ensured by the controller. Once the interrupts are locked, it is ok to check whether the received message is a SYNC message for which a snapshot of the Virtual Local Time shall be taken, but no other frame checks (e.g., CRC validation, SC validation, etc.) shall be done before taking the snapshot. Once the snapshot has been taken it is ok to remove the protection against interruptions and to make the necessary validations. This means that a snapshot of the Virtual Local Time shall be taken even if the succeeding validations fail and thus making the snapshot superfluous.

[SWS_CanTSyn_00074][
The receiver of an Offset Time Base shall perform the following steps to assemble the Offset Time:

1. Get second portion of the Offset Time out of *OfsTimeSec*
2. Get nanosecond portion of the Offset Time out of *OfsTimeNSec*
3. Retrieve current Virtual Local Time value via `StbM_GetCurrentVirtualLocalTime()`

](RS_TS_20036)

Note: OFS and OFNS messages are not time stamped.

7.5.3.2 OVS Consideration

[SWS_CanTSyn_00075][
OVS (FUP only) shall be considered on the receiver side to retrieve the second portion of the received Synchronized Time Base.
](RS_TS_20035)

7.5.3.3 SGW Calculation

[SWS_CanTSyn_00133][
If the *SGW* value (FUP, OFNS and Extended OFS) is set to `SyncToSubDomain`, the `SYNC_TO_GATEWAY` bit within `timeBaseStatus` shall be set to `TRUE`. Otherwise, it shall be set to `FALSE`.
](RS_TS_20032, RS_TS_20034)

7.5.3.4 Sequence Counter Validation

[SWS_CanTSyn_00076][
The Sequence Counter of each SYNC message must match to the Sequence Counter of the next incoming FUP message of the same Time Domain. Otherwise, the contents of the already received SYNC message shall be discarded and the received FUP message shall be ignored.
](RS_TS_20034, RS_TS_20035)

[SWS_CanTSyn_00077][
If `CanTSynUseExtendedMsgFormat` is `FALSE`, the Sequence Counter of each OFS message must match to the Sequence Counter of the next incoming OFNS message of the same Time Domain. If the *SC*s do not match, the received OFNS message

shall be ignored and the contents of the already received OFS message shall be discarded.
](RS_TS_20034, RS_TS_20036, RS_TS_20068)

[SWS_CanTSyn_00078][
The Sequence Counter Jump Width between two consecutive SYNC or two consecutive OFS messages of the same Time Domain shall be greater than 0 and smaller than or equal to `CanTSynGlobalTimeSequenceCounterJumpWidth`. Otherwise, a Time Slave shall ignore the respective SYNC / OFS message.
The `CanTSynGlobalTimeSequenceCounterJumpWidth` value 0 is not allowed.
](RS_TS_20034, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00079][
Upon reception of a SYNC (or OFS) message a Time Slave shall check the Sequence Counter of the received message per Time Domain against the configured value of `CanTSynGlobalTimeSequenceCounterJumpWidth` (according to **[SWS_CanTSyn_00078]**), unless it is the first message

- at Startup or
- after a Time Base update timeout has been detected (`TIMEOUT` bit set in Time Base synchronization status `timeBaseStatus`).

](RS_TS_20034, RS_TS_20035, RS_TS_20036)

Note: There are scenarios when it makes sense to skip the check of the Sequence Counter Jump Width, e.g. at startup (Time Slaves start asynchronously to the Time Master) or after a message timeout to allow for Sequence Counter (re-)synchronization. In case of a timeout the error has been detected already by the timeout monitoring, there is no benefit in generating a subsequent error by the jump width check.

Note: According to **[SWS_CanTSyn_00078]** the Sequence Counter validation will still discard messages with a Sequence Counter Jump Width being zero (i.e., stuck Sequence Counter) during Time Base update timeout.

7.5.3.5 CRC Validation

[SWS_CanTSyn_00080][
The function `Crc_CalculateCRC8H2F()` as defined in [5] shall be used to validate the *CRC* if configured.
](RS_TS_20034, RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00084][
The DataID shall be calculated as `DataID = DataIDList[`*SC*`]`, where `DataIDList` is given by configuration for each message *Type*.
](RS_TS_20034, RS_TS_20035)

Note: A specific `DataID` out of a predefined `DataIDList` ensures the identification of data elements of time synchronization messages.

[SWS_CanTSyn_00085][

If `CanTSynUseExtendedMsgFormat` is `FALSE`, the *CRC* shall be calculated over Time Synchronization message *Byte 2* to *Byte 7* and `DataID`, where Byte 2 is applied first, followed by the other Bytes in ascending order, and `DataID` last.

If `CanTSynUseExtendedMsgFormat` is `TRUE`, the *CRC* shall be calculated over Time Synchronization message *Byte 2* to *Byte 15* and `DataID` for Extended Timesync message formats, where Byte 2 is applied first, followed by the other bytes in ascending order, and `DataID` last.
](RS_TS_20034, RS_TS_20035, RS_TS_20036, RS_TS_20068)

7.5.3.6 Message Disassembling

[SWS_CanTSyn_00086][
For each received Time Synchronization message the CanTSyn shall validate the message as follows (all conditions must match):

1. *Type* matches depending on the `CanTSynRxCrcValidated` parameter
2. *SC* value is within the accepted range (refer to **[SWS_CanTSyn_00078]** and **[SWS_CanTSyn_00079]**)
3. *D* matches to the defined Time Domain range for each *Type*
4. *D* matches to one of the configured Time Domains (given by parameter `CanTSynGlobalTimeDomainId`)
5. *SyncTimeNSec* (FUP / OFNS / Extended OFS only) matches the defined range of `StbM_TimeStampType.nanoseconds`.
6. *CRC* (including `DataID`) matches depending on the `CanTSynRxCrcValidated` parameter

](RS_TS_20035, RS_TS_20036)

[SWS_CanTSyn_00087][
For each received Time Synchronization message the CanTSyn shall disassemble the message after successful validation (refer to **[SWS_CanTSyn_00086]**).
](RS_TS_20034, RS_TS_20035, RS_TS_20036)

7.6 Time Recording

7.6.1 Global Time Precision Measurement

[SWS_CanTSyn_00115][
On an invocation of `StbM_BusSetGlobalTime()` the parameter `PathDelay` of the `measureDataPtr` structure shall be set to 0.
](RS_TS_20034)

7.6.2 Time Validation

[SWS_CanTSyn_00137][
The CanTSyn shall support Time Validation, if `CanTSynTimeValidationSupport` (**ECUC_CanTSyn_00050**) set to `TRUE`.
] (RS_TS_00034)

[SWS_CanTSyn_00138][
If

- `CanTSynTimeValidationSupport` is enabled and
- `CanTSynEnableTimeValidation` for the Time Domain is enabled

CanTSyn shall do time recording for Time Validation for that Time Domain

] (RS_TS_00034)

[SWS_CanTSyn_00139]{DRAFT}[
If

- time recording for Time Validation is enabled for a Time Domain (refer to **[SWS_CanTSyn_00115]** and **[SWS_CanTSyn_00116]**) and
- CanTSyn is configured as Time Slave for that Time Domain,

CanTSyn shall call `StbM_CanSetSlaveTimingData()` upon successful reception of a `FUP` message (refer to Figure 5).

`StbM_CanSetSlaveTimingData()` shall be called after `StbM_BusSetGlobalTime()`.
] (RS_TS_00034)

Note: `StbM_BusSetGlobalTime()` shall be called first, because it updates the Synclocal Time Tuple (refer to [4]), which is required by `StbM_CanSetSlaveTimingData()`.

[SWS_CanTSyn_00140]{DRAFT}[
Upon invocation of `StbM_CanSetSlaveTimingData()`
CanTSyn shall pass following values

- the sequence counter value from the transmitter (Time Master),

- $T2_{VLT}$ as syncIngressTimestamp for the `SYNC` Message (refer to step 1 in **[SWS_CanTSyn_00073]**),
- T0 + T4 as preciseOriginTimestamp received from the Time Master (refer to **[SWS_CanTSyn_00073]**)

to the function by the parameter `measureDataPtr`.

Struct members

- `measureDataPtr->referenceLocalTimestamp` and
- `measureDataPtr->refrenceGlobalTimestamp`

shall be passed as 0.
] (RS_TS_00034)

Note: The CanTSyn passes 0 to avoid undefined values. The structure members `referenceLocalTimestamp` and `referenceGlobalTimestamp` will be set by the StbM `StbM_CanSetSlaveTimingData()` internally (refer to **SWS_StbM_00471** in [4]).

[SWS_CanTSyn_00141]{DRAFT}[
If

- time recording for Time Validation is enabled for a Time Domain (refer to **[SWS_CanTSyn_00115]** and **[SWS_CanTSyn_00116]**) and
- CanTSyn is configured as Time Master for that Time Domain

CanTSyn shall call `StbM_CanSetMasterValidationData()` upon successful transmission of a `SYNC` message message (refer to Figure 4).
] (RS_TS_00034)

[SWS_CanTSyn_00142]{DRAFT}[
Upon invocation of `StbM_CanSetMasterValidationData()` CanTSyn shall pass the following data

- the sequence counter as sent in the `Sync` message
- T1vlt as the syncEgressTimestamp of `SYNC` Message (refer to step 2 in **[SWS_CanTSyn_00045]**),
- $T0_{SYN}$ + ($T1_{VLT}$ - $T0_{VLT}$) as preciseOriginTimestamp (refer to **[SWS_CanTSyn_00045]**),

to the function by the parameter `measureDataPtr`.
] (RS_TS_00034)

7.7 Error Classification

This chapter lists and classifies all errors that can be detected by this software module. Each error is classified to relevance (development / production) and the related error code (unique label for the error). For development errors this table also specifies the unique values, which correspond to the error codes.

[SWS_CanTSyn_00088][

On errors and exceptions, the CanTSyn module shall not modify its current module state but shall simply report the error event.
](RS_TS_20034, SRS_BSW_00323)

7.7.1 Development Errors

The detection of development errors is configurable (see section 10.2, `CanTSynDevErrorDetect`).

[SWS_CanTSyn_00089][
CanTSyn shall use the following errors:

Type or error	*Related error code*	*Value [hex]*
API service called with wrong PDU or SDU	`CANTSYN_E_INVALID_PDUID`	`0x01`
API service used in un-initialized state	`CANTSYN_E_UNINIT`	`0x02`
A pointer is NULL	`CANTSYN_E_NULL_POINTER`	`0x03`
CanTSyn initialization failed	`CANTSYN_E_INIT_FAILED`	`0x04`
API called with invalid parameter	`CANTSYN_E_PARAM`	`0x05`
Invalid Controller index	`CANTSYN_E_INV_CTRL_IDX`	`0x06`

](SRS_BSW_00385)

7.7.2 Runtime Errors

No Runtime Errors defined.

7.7.3 Transient Faults

No Transient Faults defined.

7.7.4 Production Errors

No Production Errors defined.

7.7.5 Extended Production Errors

No Extended Production Errors defined.

8 API specification

8.1 API

8.1.1 Imported types

In this section all types included from the following files are listed:

[SWS_CanTSyn_00090][

Module	*Header File*	*Imported Type*
ComStack_Types	ComStack_Types.h	PduIdType
	ComStack_Types.h	PduInfoType
	ComStack_Types.h	PduLengthType
StbM	Rte_StbM_Type.h	StbM_CanTimeMasterMeasurementType
	Rte_StbM_Type.h	StbM_CanTimeSlaveMeasurementType
	Rte_StbM_Type.h	StbM_SynchronizedTimeBaseType
	Rte_StbM_Type.h	StbM_TimeBaseStatusType
	Rte_StbM_Type.h	StbM_TimeStampShortType
	Rte_StbM_Type.h	StbM_TimeStampType
	Rte_StbM_Type.h	StbM_UserDataType
	StbM.h	StbM_MeasurementType
	StbM.h	StbM_VirtualLocalTimeType
Std	Std_Types.h	Std_ReturnType
	Std_Types.h	Std_VersionInfoType

](RS_TS_20035)

8.1.2 Type definitions

8.1.2.1 CanTSyn_ConfigType

[SWS_CanTSyn_00091][

Name	CanTSyn_ConfigType
Kind	Structure

Elements	implementation specific	
	Type	--
	Comment	--
Description	This is the base type for the configuration of the Time Synchronization over CAN. A pointer to an instance of this structure will be used in the initialization of the Time Synchronization over CAN. The content of this structure is defined in chapter 10 Configuration specification.	
Available via	CanTSyn.h	

](RS_TS_20035)

8.1.2.2 CanTSyn_TransmissionModeType

[SWS_CanTSyn_00092][

Name	CanTSyn_TransmissionModeType		
Kind	Enumeration		
Range	CANTSYN_TX_OFF	--	Transmission Disabled
	CANTSYN_TX_ON	--	Transmission Enabled
Description	Handles the enabling and disabling of the transmission mode		
Available via	CanTSyn.h		

](RS_TS_20035)

8.1.3 Function definitions

8.1.3.1 CanTSyn_Init

[SWS_CanTSyn_00093][

Service Name	CanTSyn_Init	

Syntax	`void CanTSyn_Init (`
	`  const CanTSyn_ConfigType* configPtr`
	`)`	

Service ID [hex]	0x01	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	configPtr	Pointer to selected configuration structure
Parameters (inout)	None	

Parameters (out)	None
Return value	None
Description	This function initializes the Time Synchronization over CAN.
Available via	CanTSyn.h

](RS_TS_20035)

`CANTSYN_E_INIT_FAILED` is reported as specified in [reference to SWS BSW General] by SWS_BSW_00050.

See section 7.2.1 for details.

8.1.3.2 CanTSyn_GetVersionInfo

[SWS_CanTSyn_00094][

Service Name	CanTSyn_GetVersionInfo	
Syntax	`void CanTSyn_GetVersionInfo ( Std_VersionInfoType* versioninfo )`	
Service ID [hex]	0x02	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	versioninfo	Pointer to where to store the version information of this module.
Return value	None	
Description	Returns the version information of this module.	
Available via	CanTSyn.h	

](RS_TS_20035)

8.1.3.3 CanTSyn_SetTransmissionMode

[SWS_CanTSyn_00095][

Service Name	CanTSyn_SetTransmissionMode
Syntax	`void CanTSyn_SetTransmissionMode ( uint8 CtrlIdx, CanTSyn_TransmissionModeType Mode )`

Service ID [hex]	0x03	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CtrlIdx	Index of the CAN channel
	Mode	CANTSYN_TX_OFF CANTSYN_TX_ON
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This API is used to turn on and off the TX capabilities of the CanTSyn.	
Available via	CanTSyn.h	

](RS_TS_20035)

[SWS_CanTSyn_00134][
The function `CanTSyn_SetTransmissionMode()` shall inform the DET, if development error detection is enabled (`CanTSynDevErrorDetect` is set to TRUE) and if function call has failed because of the following reasons:

- Invalid `CtrlIdx` (`CANTSYN_E_INV_CTRL_IDX`)
- Invalid `Mode` (`CANTSYN_E_PARAM`)

](SRS_BSW_00323, SRS_BSW_00337)

8.1.4 Call-back notifications

This is a list of functions provided for other modules.

8.1.4.1 CanTSyn_RxIndication

[SWS_CanTSyn_00096][

Service Name	CanTSyn_RxIndication	
Syntax	`void CanTSyn_RxIndication ( PduIdType RxPduId, const PduInfoType* PduInfoPtr )`	
Service ID [hex]	0x42	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId.	
Parameters (in)	RxPduId	ID of the received PDU.

	Pdu InfoPtr	Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Indication of a received PDU from a lower layer communication interface module.	
Available via	CanTSyn.h	

](RS_TS_20035)

Note: The callback function `CanTSyn_RxIndication()` called by the CAN Interface and implemented by the CanTSyn module. It is called in case of a receive indication event of the CAN Driver.

[SWS_CanTSyn_00097][
The callback function `CanTSyn_RxIndication()` shall inform the DET, if development error detection is enabled (`CanTSynDevErrorDetect` is set to `TRUE`) and if function call has failed because of the following reasons:

- Invalid PDU ID (`CANTSYN_E_INVALID_PDUID`)
- `PduInfoPtr` or `SduDataPtr` equals `NULL_PTR` (`CANTSYN_E_NULL_POINTER`)

](SRS_BSW_00323, SRS_BSW_00337)

Caveats of `CanTSyn_RxIndication()`:

- Until this service returns, the CAN Interface will not access `canSduPtr`. The `canSduPtr` is only valid and can be used by upper layers until the indication returns. The CAN Interface guarantees that the number of configured bytes for this `CanTSynRxPduId` is valid. The call context is either on interrupt level (interrupt mode) or on task level (polling mode). This callback service is re-entrant for multiple CAN controller usage.
  Note: Using polling mode as call context significantly increases the latency and thus reduces the precision. It is therefore highly recommended to only use interrupt mode.
- The CanTSyn module is initialized correctly.

8.1.4.2 CanTSyn_TxConfirmation

[SWS_CanTSyn_00099][

Service Name	CanTSyn_TxConfirmation
Syntax	`void CanTSyn_TxConfirmation ( PduIdType TxPduId, Std_ReturnType result`

	)	
Service ID [hex]	0x40	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId.	
Parameters (in)	TxPduId	ID of the PDU that has been transmitted.
	result	E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU.	
Available via	CanTSyn.h	

](RS_TS_20035)

Note: The callback function `CanTSyn_TxConfirmation()` is called by the CAN Interface and implemented by the CanTSyn module.

[SWS_CanTSyn_00100][
The callback function `CanTSyn_TxConfirmation()` shall inform the DET, if development error detection is enabled (`CanTSynDevErrorDetect` is set to `TRUE`) and if the function call has failed because of the following reason:

- Invalid PDU ID (`CANTSYN_E_INVALID_PDUID`), i.e., a PDU ID not configured by parameter CanTSynGlobalTimeMasterConfirmationHandleId

](SRS_BSW_00323, SRS_BSW_00337)

Caveats of `CanTSyn_TxConfirmation()`:

- The call context is either on interrupt level (interrupt mode) or on task level (polling mode). This callback service is re-entrant for multiple CAN controller usage.
  Note: Using polling mode as call context significantly increases the latency and thus reduces the precision. It is therefore highly recommended to only use interrupt mode.
- The CanTSyn module is initialized correctly.

8.1.5 Scheduled functions

These functions are directly called by the Basic Software Scheduler. The following functions shall have no return value and no parameters. All functions shall be non-reentrant.

8.1.5.1 CanTSyn_MainFunction

[SWS_CanTSyn_00102][

Service Name	CanTSyn_MainFunction

Syntax	`void CanTSyn_MainFunction (`
	`  void`
	`)`

Service ID [hex]	0x06
Description	Main function for cyclic call / resp. Timesync message transmission
Available via	CanTSyn_SchM.h

](RS_TS_20035)

[SWS_CanTSyn_00103][
The frequency of invocations of `CanTSyn_MainFunction()` is determined by the configuration parameter `CanTSynMainFunctionPeriod` (refer to **ECUC_CanTSyn_00019 :**).
](RS_TS_20035)

8.1.6 Expected Interfaces

In this section, all interfaces required by other modules are listed.

8.1.6.1 Mandatory Interfaces

This section defines all interfaces that are required to fulfill a mandatory functionality of the module.

[SWS_CanTSyn_00105][

API Function	*Header File*	*Description*
StbM_GetCurrentVirtualLocal-Time	StbM.h	Returns the Virtual Local Time of the referenced Time Base.

](RS_TS_20035)

8.1.6.2 Optional Interfaces

This section defines all interfaces that are required to fulfill an optional functionality of the module.

[SWS_CanTSyn_00106][

API Function	*Header File*	*Description*
CanIf_Transmit	CanIf.h	Requests transmission of a PDU.
Crc_CalculateC-RC8H2F	Crc.h	This service makes a CRC8 calculation with the Polynomial 0x2F on Crc_Length
Det_ReportError	Det.h	Service to report development errors.
StbM_BusGet-CurrentTime	StbM.h	Returns the current Time Tuple, status and User Data of the Time Base.
StbM_BusSet-GlobalTime	StbM.h	Allows the Time Base Provider Modules to forward a new Global Time tuple (i.e., the Received Time Tuple) to the StbM.
StbM_CanSet-MasterTiming-Data	StbM_ Can TSyn.h	Provides CAN Timesyn module specific data for a Time Master to the StbM. **Tags:**atp.Status=draft
StbM_CanSet-SlaveTimingData	StbM_ Can TSyn.h	Allows the CanTSyn Module to forward CAN specific details to the StbM. **Tags:**atp.Status=draft
StbM_Get-CurrentTime	StbM.h	Returns a time value (Local Time Base derived from Global Time Base) in standard format. Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).
StbM_GetOffset	StbM.h	Allows the Timesync Modules to get the current Offset Time and

		User Data.
StbM_GetTime-BaseStatus	StbM.h	Returns detailed status information for a Synchronized (or Pure Local) Time Base and, if called for an Offset Time Base, for the Offset Time Base and the underlying Synchronized Time Base.
StbM_GetTime-BaseUpdate-Counter	StbM.h	Allows the Timesync Modules to detect, whether a Time Base should be transmitted immediately in the subsequent <Bus>TSyn_Main Function() cycle.

](RS_TS_20035)

9.2 CAN Time Synchronization (Time Slave)

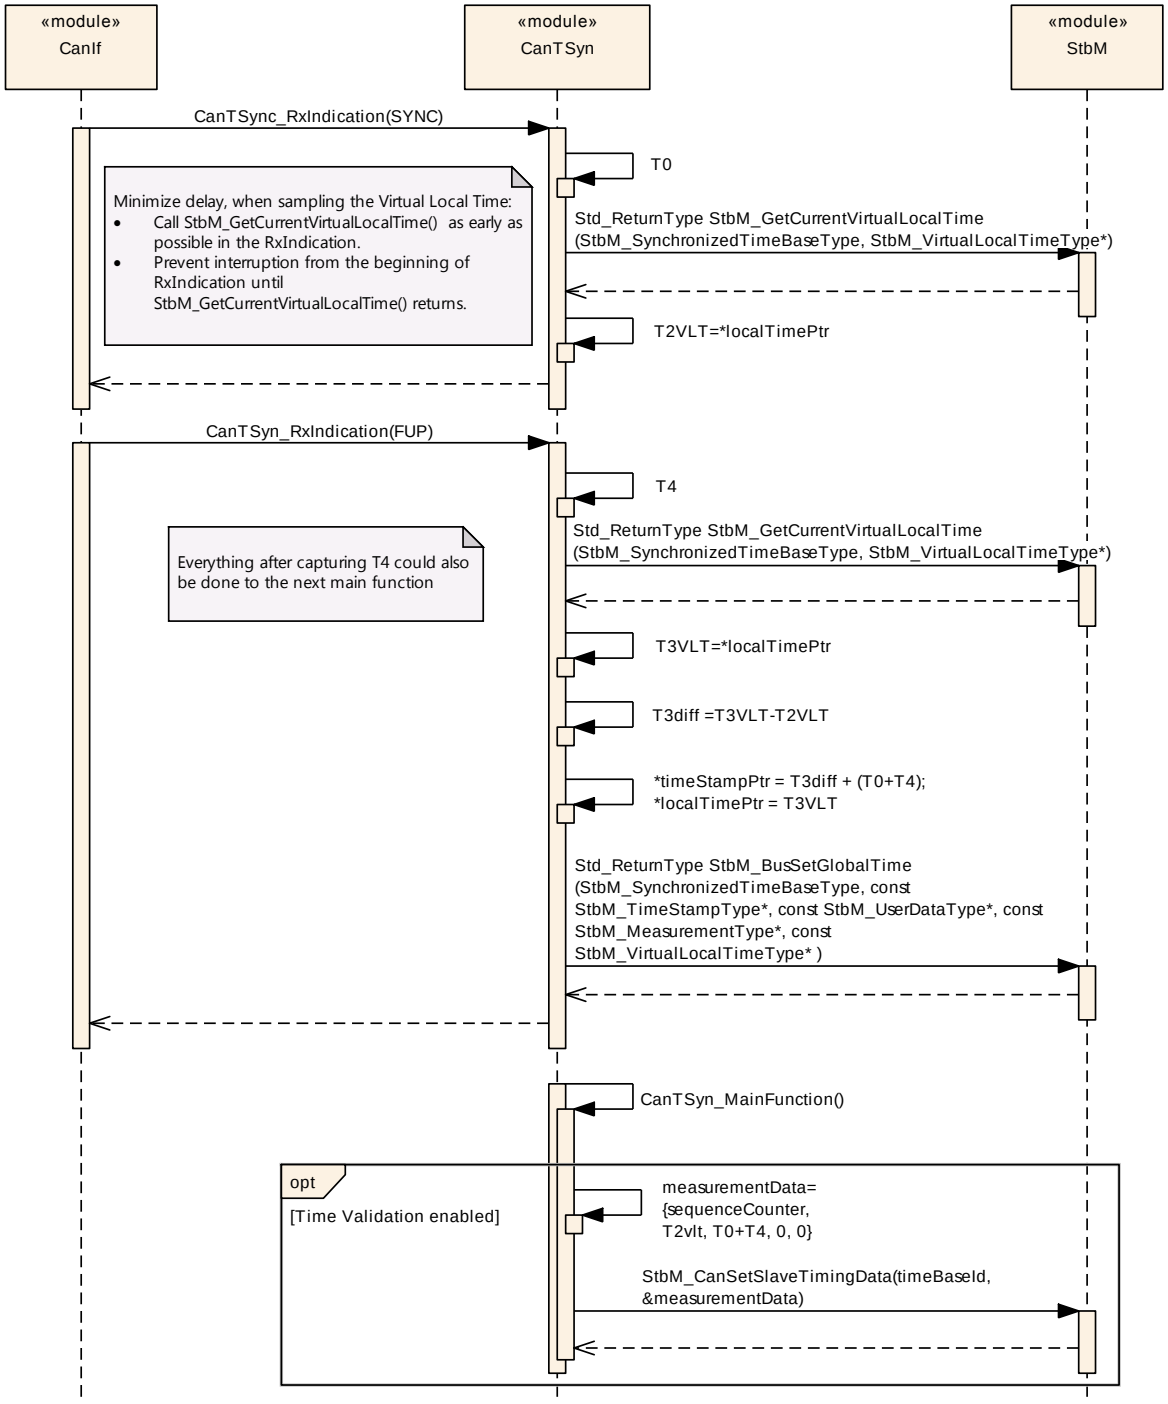

Figure 5: CAN Time Synchronization (Time Slave)

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification section 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave section 10.1 in the specification to guarantee comprehension.

Section 10.2 specifies the structure (containers) and the parameters of the Time Synchronization over CAN.

Section 10.2.16 specifies published information of the Time Synchronization over CAN.

10.1 How to read this chapter

For details, refer to the chapter 10.1 “Introduction to configuration specification” in *SWS_BSWGeneral*.

10.2 Containers and configuration parameters

The following sections summarize all configuration parameters of the Time Synchronization over CAN. The detailed meaning of the parameters is described in chapters 7 and 8.

10.2.1 Variants

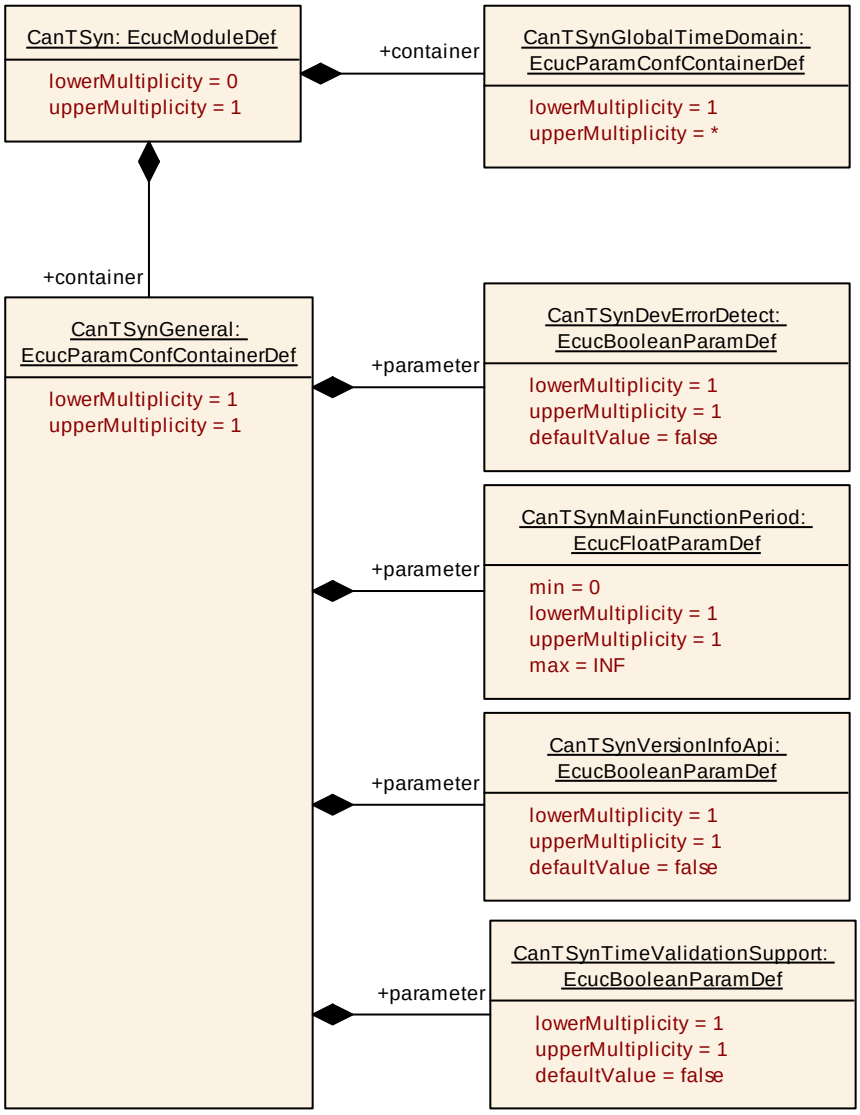
[SWS_CanTSyn_00108][
The Time Synchronization over CAN shall support the configuration for Time Master, Time Slave and Time Gateway.
](RS_TS_20038)

The module supports different post-build variants (previously known as post-build selectable configuration sets), but not post-build loadable configuration.

10.2.2 CanTSyn

SWS Item	**ECUC_CanTSyn_00001 :**
Module Name	*CanTSyn*
Module Description	Configuration of the Synchronized Time-base Manager (StbM) module with respect to global time handling on CAN.
Post-Build Variant Support	true
Supported Config Variants	VARIANT-PRE-COMPILE

Included Containers		
Container Name	***Multiplicity***	***Scope / Dependency***
CanTSynGeneral	1	This container holds the general parameters of the CAN-specific Synchronized Time-base Manager
CanTSynGlobalTimeDomain	1..*	This represents the existence of a global time domain on CAN. The CanTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains. If the CanTSyn exists it is assumed that at least one global time domain exists.



10.2.3 CanTSynGeneral

SWS Item	**ECUC_CanTSyn_00003 :**
Container Name	CanTSynGeneral
Parent Container	CanTSyn
Description	This container holds the general parameters of the CAN-specific Synchronized Time-base Manager
Configuration Parameters	

SWS Item	**ECUC_CanTSyn_00002 :**
Name	CanTSynDevErrorDetect
Parent Container	CanTSynGeneral
Description	Switches the development error detection and notification on or off. • true: detection and notification is enabled. • false: detection and notification is disabled.
Multiplicity	1

Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00019 :**		
Name	CanTSynMainFunctionPeriod		
Parent Container	CanTSynGeneral		
Description	Schedule period of the main function CanTSyn_MainFunction. Unit: [s].		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	]0 .. INF[		
Default value	--		
Post-Build Variant Value	false		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00050 :**		
Name	CanTSynTimeValidationSupport		
Parent Container	CanTSynGeneral		
Description	Switches support for Time Validation on or off. ▪ true: Time Validation is enabled. ▪ false: Time Validation is disabled		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00023 :**		
Name	CanTSynVersionInfoApi		
Parent Container	CanTSynGeneral		
Description	Activate/Deactivate the version information API (CanTSyn_GetVersionInfo). True: version information API activated False: version information API deactivated.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

No Included Containers

10.2.4 CanTSynGlobalTimeDomain

SWS Item	**ECUC_CanTSyn_00004 :**		
Container Name	CanTSynGlobalTimeDomain		
Parent Container	CanTSyn		
Description	This represents the existence of a global time domain on CAN. The CanTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains. If the CanTSyn exists it is assumed that at least one global time domain exists.		
Configuration Parameters			

SWS Item	**ECUC_CanTSyn_00051 :**		
Name	CanTSynEnableTimeValidation		
Parent Container	CanTSynGlobalTimeDomain		
Description	Enables/disables time recording for Time Validation for a specific Time Domain.		
Multiplicity	0..1		
Type	EcucBooleanParamDef		
Default value	--		
Post-Build Variant Value	false		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local dependency: Only valid if CanTSynTimeValidationSupport is TRUE. Value set according to parameter StbMEnableTimeValidation of the referenced Time Base in the StbM.		

SWS Item	**ECUC_CanTSyn_00005 :**		
Name	CanTSynGlobalTimeDomainId		
Parent Container	CanTSynGlobalTimeDomain		
Description	The global time domain ID.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 31		
Default value	--		
Post-Build Variant Value	false		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00046 :**		
Name	CanTSynGlobalTimeSecureTmacLength		
Parent Container	CanTSynGlobalTimeDomain		
Description	Represents the number of bytes for the used Truncated Message Authentication Code (TMAC). If 0, no message authentication will be used. **Tags:** atp.Status=draft		
Multiplicity	1		
Type	EcucIntegerParamDef		

Range	0 .. 16		
Default value	0		
Post-Build Variant Value	false		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00042 :**		
Name	CanTSynUseExtendedMsgFormat		
Parent Container	CanTSynGlobalTimeDomain		
Description	Switches support for 16 Byte Timesync messages on or off (for CAN FD only) • true: CAN FD support is active: use at least 16 byte for Timesync messages (depending on configuration) • false: Classic CAN support is active: use always 8 byte for Timesync messages		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00022 :**		
Name	CanTSynSynchronizedTimeBaseRef		
Parent Container	CanTSynGlobalTimeDomain		
Description	Mandatory reference to the required synchronized time-base.		
Multiplicity	1		
Type	Symbolic name reference to [StbMSynchronizedTimeBase]		
Post-Build Variant Value	false		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

Included Containers		
Container Name	***Multiplicity***	***Scope / Dependency***
CanTSynGlobalTimeFupDataIDList	0..1	The DataIDList for FUP messages ensures the identification of data elements due to CRC calculation and message authentication process.
CanTSynGlobalTimeMaster	0..1	Configuration of the global time master. Each global time domain is required to have exactly one global time master. This master may or may not exist on the configured ECU.
CanTSynGlobalTimeOfnsDataIDList	0..1	The DataIDList for OFNS messages ensures the identification of data elements due to CRC calculation and message authentication process.
CanTSynGlobalTimeOfsDataIDList	0..1	The DataIDList for OFS messages ensures the identification of data elements due to CRC calculation and message authentication process.
CanTSynGlobalTimeSlave	0..1	Configuration of a global time slave. Each global time

		domain is required to have at least one time slave. The configured ECU may or may not represent a time slave.
CanTSynGlobalTimeSyncDataIDList	0..1	The DataIDList for SYNC messages ensures the identification of data elements due to CRC calculation and message authentication process.

10.2.13 CanTSynGlobalTimeMaster

SWS Item	**ECUC_CanTSyn_00007 :**		
Container Name	CanTSynGlobalTimeMaster		
Parent Container	CanTSynGlobalTimeDomain		
Description	Configuration of the global time master. Each global time domain is required to have exactly one global time master. This master may or may not exist on the configured ECU.		
Post-Build Variant Multiplicity	true		
Multiplicity Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Configuration Parameters			

SWS Item	**ECUC_CanTSyn_00044 :**
Name	CanTSynCyclicMsgResumeTime

Parent Container	CanTSynGlobalTimeMaster		
Description	Defines the time where the 1st regular cycle time based message transmission takes place, after an immediate transmission before. Unit: seconds		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	[0 .. INF]		
Default value	--		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00045 :**		
Name	CanTSynGlobalTimeDebounceTime		
Parent Container	CanTSynGlobalTimeMaster		
Description	This represents the configuration of a TX debounce time for SYNC, FUP, OFS and OFNS messages compared to a message before with the same PDU. Unit: seconds		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	[0 .. INF]		
Default value	--		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00015 :**		
Name	CanTSynGlobalTimeTxCrcSecured		
Parent Container	CanTSynGlobalTimeMaster		
Description	This represents the configuration of whether or not CRC is supported.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	CRC_NOT_SUPPORTED		This represents a configuration where CRC is not supported.
	CRC_SUPPORTED		This represents a configuration where CRC is supported.
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00017 :**		
Name	CanTSynGlobalTimeTxPeriod		
Parent Container	CanTSynGlobalTimeMaster		
Description	This represents configuration of the TX period. Unit: seconds		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	[0 .. INF]		

Default value	--		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00043 :**		
Name	CanTSynImmediateTimeSync		
Parent Container	CanTSynGlobalTimeMaster		
Description	Enables/Disables the cyclic polling of StbM_GetTimeBaseUpdateCounter() within CanTSyn_MainFunction().		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	--		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00020 :**		
Name	CanTSynMasterConfirmationTimeout		
Parent Container	CanTSynGlobalTimeMaster		
Description	This represents the confirmation timeout after transmission of each Timesync message. Unit: seconds.		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	[0 .. INF]		
Default value	--		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants

10.2.14 CanTSynGlobalTimeMasterPdu

SWS Item	**ECUC_CanTSyn_00009 :**
Container Name	CanTSynGlobalTimeMasterPdu
Parent Container	CanTSynGlobalTimeMaster
Description	This container encloses the configuration of the PDU that is supposed to contain the global time information.
Configuration Parameters	

SWS Item	**ECUC_CanTSyn_00008 :**		
Name	CanTSynGlobalTimeMasterConfirmationHandleId		
Parent Container	CanTSynGlobalTimeMasterPdu		
Description	This represents the handle ID of the PDU that contains the global time information.		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 65535		
Default value	--		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants

Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00049 :**		
Name	CanTSynGlobalTimeMinMsgGap		
Parent Container	CanTSynGlobalTimeSlave		
Description	This parameter represents the configuration of a minimum message gap time for received Timesync messages compared to a message before with the same PDU. If PDUs are received more often in between than this parameter allows, they shall be ignored. Unit: seconds **Tags:** atp.Status=draft		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	[0 .. INF[		
Default value	0		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00011 :**		
Name	CanTSynGlobalTimeSequenceCounterJumpWidth		
Parent Container	CanTSynGlobalTimeSlave		
Description	The SequenceCounterJumpWidth specifies the maximum allowed gap of the Sequence Counter between two SYNC resp. two OFS messages.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	1 .. 15		
Default value	--		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00021 :**
Name	CanTSynRxCrcValidated
Parent Container	CanTSynGlobalTimeSlave
Description	Definition of whether or not validation of the CRC is supported.
Multiplicity	1
Type	EcucEnumerationParamDef

Range	CRC_IGNORED	The Timesync module accepts Time Synchronization messages, which are CRC secured (without actually validating the CRC) and those, which are not CRC secured. That means, the Timesync module ignores the CRC.	
	CRC_NOT_VALIDATED	The Timesync module accepts only Time Synchronization messages, which are not CRC secured. All other Time Synchronization messages are ignored.	
	CRC_OPTIONAL	The Timesync module accepts only Time Synchronization messages which are not CRC secured and Time Synchronization messages which are CRC secured and have the correct CRC. All other Time Synchronization messages are ignored.	
	CRC_VALIDATED	The Timesync module accepts only Time Synchronization messages, which are CRC secured and have the correct CRC. All other Time Synchronization messages are ignored.	
Post-Build Variant Value	true

SWS Item	**ECUC_CanTSyn_00048 :**		
Name	CanTSynRxTmacValidated		
Parent Container	CanTSynGlobalTimeSlave		
Description	This parameter controls whether or not TMAC validation shall be supported. **Tags:** atp.Status=draft		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	TMAC_NOT_VALIDATED	The Timesync module shall not validate the TMAC.	
	TMAC_VALIDATED	The Timesync module shall validate the TMAC.	
Post-Build Variant Value	true

10.2.16 CanTSynGlobalTimeSlavePdu

SWS Item	**ECUC_CanTSyn_00014 :**
Container Name	CanTSynGlobalTimeSlavePdu
Parent Container	CanTSynGlobalTimeSlave
Description	This container encloses the configuration of the PDU that is supposed to contain the global time information.
Configuration Parameters	

SWS Item	**ECUC_CanTSyn_00013 :**		
Name	CanTSynGlobalTimeSlaveHandleId		
Parent Container	CanTSynGlobalTimeSlavePdu		
Description	This represents the handle ID of the PDU that contains the global time information.		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 65535		
Default value	--		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

SWS Item	**ECUC_CanTSyn_00040 :**		
Name	CanTSynGlobalTimePduRef		
Parent Container	CanTSynGlobalTimeSlavePdu		
Description	This represents the reference to the Pdu taken to transmit the global time information. The global time master of a global time domain acts as the sender of the Pdu while all the time slaves are supposed to receive the Pdu.		
Multiplicity	1		
Type	Reference to [Pdu]		
Post-Build Variant Value	true		
Value Configuration Class	***Pre-compile time***	X	All Variants
	Link time	--	
	Post-build time	--	
Scope / Dependency	scope: local		

No Included Containers
