Document Change History			
Date	Release	Changed by	Change Description
2020-11-30	R20-11	AUTOSAR Release Management	 Added optional feature for dynamic PNC-to-channel mapping Added optional handling to transfer kind of communication request (either active or passive) to lower layers Extend ComM service interface ComM_GetCurrentComMode, to obtain the PNC state of the mapped ComMUser Added restriction for ComM users according the assignment of
2019-11-28	R19-11	AUTOSAR Release Management	 managed and managing channels Introduce handling of PNC coordinator if serval ComM channels have the same PNC assignment but PncGatewayTypeEnum is set to "none." Enabled ComM to be used for BSW distribution (multicore use case) Minor corrections Changed Document Status from Final to published
2018-10-31	4.4.0	AUTOSAR Release Management	 Introduce "managing" and "managed" ComM channels Remove relations to EcuMfixed completely Minor corrections

	Document Change History			
Date	Release	Changed by	Change Description	
2017-12-08	4.3.1	AUTOSAR Release Management	 Clarification regarding communication inhibition and bus wake up inhibition 	
2016-11-30	4.3.0	AUTOSAR Release Management	 Added the possiblity to switch ehternet switch ports according to ComM channel request / release Added the wake up handling in case of a ECU which is controlling a Ethernet switch and using PNCs. Minor corrections 	
2015-07-31	4.2.2	AUTOSAR Release Management	 Chapter added to explain partial network usecase Minor corrections 	
2014-10-31	4.2.1	AUTOSAR Release Management	 Release of PNC related FULL_COM request already upon leaving PNC_REQUESTED Several clarifications Minor corrections 	
2014-03-31	4.1.3	AUTOSAR Release Management	 Max. number of supported PNCs by ComM now 56 ComM supports VariantPostBuild instead of VariantPostBuildSelectable Restrictions for PNCs with ComMChannels of ComMNmVariant "PASSIVE" 	
2013-10-31	4.1.2	AUTOSAR Release Management	 Introduced modeling of Service Interfaces in Chapt. 8 Repair the reset after forcing NO_COM Feature Editorial changes Removed chapter(s) on change documentation 	
2013-03-15	4.1.1	AUTOSAR Administration	 ComM allows configuration of arbitrary bus names for Bus SMs Nm Variant Passive not configurable on individual channels anymore Assignment of ComMPncId to Nm UserData bits specified 	

	Document Change History			
Date	Release	Changed by	Change Description	
2011-12-22	4.0.3	AUTOSAR Administration	 Partial Network Cluster Management Improved/Corrected illustration of start-up sequences (chap 9) Forbid assigning ComM users to channels with NmVariant=PASSIVE Removed re-request of unchanged communication mode in case of mismatch with BusStateManager (ComM901) Removed remains of DEM error reporting 	
2009-12-18	4.0.1	AUTOSAR Administration	 Table for interaction between ComM and NM added Production error COMM_E_NET_START_IND_CHA NNEL removed Lower range of configuration parameter "ComMMainFunctionPeriod" modified 	
2010-02-02	3.1.4	AUTOSAR Administration	 Changed interaction between ComM and ECU State Manager (EcuM) Changed interaction between ComM and Diagnostic Communication Manager (DCM) Added dependencies to new modules Basic Software Mode Manager (BswM) and Ethernet State Manager Legal disclaimer revised 	
2008-08-13	3.1.1	AUTOSAR Administration	Legal disclaimer revised	

	Document Change History			
Date	Release	Changed by	Change Description	
2007-07-24	2.1.18	AUTOSAR Administration	 Bus specific error handling (e.g. bus off handling) removed Control of the actual bus states removed PDU group handling removed Initialization of Communication stack removed Document meta information extended Small layout adaptations made 	
2007-01-24	2.1.19	AUTOSAR Administration	 Changed features Changed features Restart (silent com> full com.) now possible even if mode limitation is active Channel state machine changed Sequence diagrams changed New services to upper layers Mode indication API to RTE changed New calls to other modules Usage of channel specific API (EcuM and ComM) to indicate that a communication channel has been woken up and has gone to sleep API for NM control canged (Nm_PassiveStartUp, Nm_NetworkRequest, Nm_NetworkRelease) Legal disclaimer revised Release Notes added "Advice for users" revised "Revision Information" added 	
2005-05-31	1.0	AUTOSAR Administration	Initial Release

1 Introduction and functional overview

The Communication Manager Module (COM Manager, ComM) is a component of the Basic Software (BSW). It is a Resource Manager, which encapsulates the control of the underlying communication services. The ComM module controls basic software modules relating to communication and not software components or runnable entities. The ComM module collects the bus communication access requests from communication requestors (see definition of term "User" in Chapter 2) and coordinates the bus communication access requests.

The purpose of the ComM module is:

Simplifying the usage of the bus communication stack for the user. This includes a simplified network management handling.

Coordinating the availability of the bus communication stack (allow sending and receiving of signals) of multiple independent software components on one ECU.

Comment: A user should not have any knowledge about the hardware (e.g. on which channel to communicate). A user simply requests a "Communication Mode" and ComM module switches the communication capability of the corresponding channel on/off.

Offer an API to disable sending of signals to prevent the ECU from (actively) waking up the communication bus.

Comment: On CAN every message wakes up the bus, on FlexRay it is only possible to wake up the bus with a so called wake-up pattern.

Controlling of more than one communication bus channel of an ECU by implementing a channel state machine for every channel.

Comment: The ComM module requests a Communication Mode from the corresponding Bus State Manager module. The actual bus states are controlled by the corresponding Bus State Manager module.

Offering the possibility to force an ECU that keeps the bus awake to the 'No Communication' mode (see Section 7.4.1.2 for details).

Simplifying the resource management by allocating all resources necessary for the requested Communication Mode.

Comment: E.g. check if communication is allowed when a user requests 'Full Communication' mode, and prevent the ECU from shutdown during communication.

2 Acronyms and definitions

Abbreviation / Acronym:	Description:
BSW	Basic Software
BswM	Basic Software Mode Manager
ComM	Communication Manager
DCM	Diagnostic Communication Manager
Det	Default Error Tracer
EcuM	ECU State Manager module
I-PDU	Information Protocol Data Unit
NM	Network Management
PDU	Protocol Data Unit
SW-C	Software Component
VMM	Vehicle Message Matrix
OA TC10	Open Alliance TC10 specification (see [33])

Term:	Description:
DCM_ActiveDiagnostic	The DCM module indicates an active diagnostic session. DCM need
indication	"full communication" = COMM FULL COMMUNICATION for diagnostic
	purpose
Active wake-up	Wake-up caused by the hosting ECU e.g. by a sensor.
Application signal scheduling	Sending of application signals according to the VMM. Scheduling of
	CAN application signals is performed by the Communication Module,
	scheduling of LIN application I-PDUs (a PDU containing signals) is
	performed by the LIN interface and scheduling of FlexRay application
	PDUs is performed by the FlexRay Interface module.
Bus sleep	No activity required on the communication bus (e.g. CAN bus sleep).
Bus communication	Bus communication messages are all messages that are sent on the
messages	communication bus. This can be either a diagnostic message or an
	application message.
COM Inhibition status	Defines whether full communication, silent communication or wake-
	up is allowed or not.
Communication Channel	The medium used to convey information from a sender (or
	transmitter) to a receiver.
Communication Mode	Mode determining which kind of communication are allowed:
	"full communication" = COMM_FULL_COMMUNICATION
	"no communication" = COMM_NO_COMMUNICATION
	"silent communication" = COMM_SILENT_COMMUNICATION
	Note: COMM_SILENT_COMMUNICATION can not be requested by a
	user. Internal mode for synchronizing network at shutdown
Diagnostic PDU scheduling	Sending of diagnostic PDUs. Scheduling of CAN diagnostic PDUs is
	performed by the diagnostic module, scheduling of LIN diagnostic
	PDUs is performed by the diagnostic module and the LIN interface
	and scheduling of FlexRay diagnostic PDUs is performed by the diagnostic module and the FlexRay Interface module.
ECU shut down	See ECU State Manager specification [6].
Fan-out	
	Same message/indication are sent to multiple destinations/receivers
Independent software	A separately developed software component performing a coherent set of functions with a minimum amount of interfaces to other
component	software applications on an ECU. This can be e.g. a basic software
	component or an application software component.
Passive wake-up	Wake-up by another ECU and propagated (e.g. by bus or wake-up-
	line) to the ECU currently in focus.
System User	An administration functionality (a specific "user", which is generated
- ,	within the internal context of the ComM) for making a default request
	and for overriding the user requests.
1	

User	Concept for requestors of the ECU State Manager module and of the Communication Manager Module. A user may be the BswM, a runnable entity, a SW-C or a group of SW-Cs, which act as a single unit towards the ECU State Manager module and the Communication Manager Module.
User Request	A User can request different Communication Modes from ComM
Managed channel	A ComM channel that references another ComM channel by ECUC parameter ComMManageReference (see ECUC ComM 00893).
Managing channel	A ComM channel that is referenced from at least one other channels by ECUC parameter ComMManageReference (see <u>ECUC ComM 00893</u>).

3.2 Related standards and norms

[33] OPEN ALIANCE Sleep/Wake-up Specification Version 2.0 (Rel Feb 21, 2017), http://www.opensig.org/Automotive-Ethernet-Specifications/

3.3 Related specification

AUTOSAR provides a General Specification on Basic Software modules [30] (SWS BSW General), which is also valid for COM Manager.

Thus, the specification SWS BSW General shall be considered as additional and required specification for COM Manager.

4 Constraints and assumptions

4.1 Limitations

No limitations.

4.2 Applicability to car domains

No restrictions.

5 Dependencies to other modules

A context view which shows the Communication Manager Module and the dependencies to other modules is shown in Figure 1:

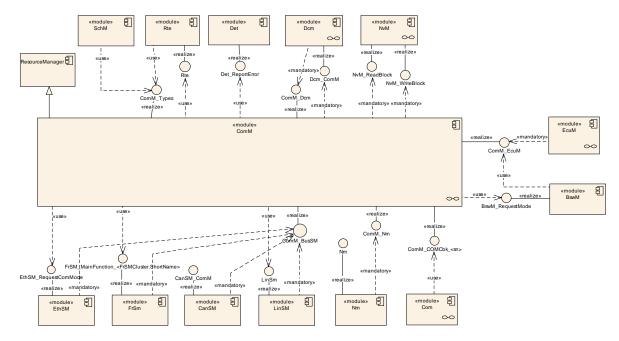

Figure 1: Communication Manager Module context view

The Communication Manager Module requests the communication capabilities, requested from the users, from the Bus State Manager modules.

5.1 File structure

5.2 AUTOSAR Runtime Environment (RTE)

Every user can request a Communication Mode. The RTE propagates the user request to the ComM module and the Communication Mode indications from the ComM to the users (for details refer to [8]).

5.3 ECU State Manager (EcuM)

EcuM is responsible to validate wake-up events and send an indication to ComM if a wake-up is validated.

Communication allowed and shutdown of ECU is handled by EcuM together with BswM. (see [6] for details)

5.4 Basic Software Mode Manager (BswM)

The BswM realizes two functionalities Mode Arbitration and Mode Control to allow the application of an Application Mode Management and a Vehicle Mode Management.

The BswM propagates user requests to the ComM module, if configured in the action lists of BswM to be able to request ComM modes via BswM.

The BswM controls the PDU Groups in the AUTOSAR Communication Module (COM), if the call of Com_lpduGroupControl is configured in the action list.

[**SWS_ComM_00976**] [ComM indicates all channel main state changes and all PNC state changes to the BswM.]()

If EcuM-Flex is used, BswM will indicate to ComM if communication is allowed or not.

5.5 NVRAM Manager

The ComM module uses the NVRAM Manager to store and read non-volatile data. For details on initial values of the NVRAM data refer to Chapter 10.

Comment: The NVRAM Manager must be initialized after a power up or reset of the ECU. It must be initialized before ComM, as when ComM is initialized, ComM assumes that NVRAM is ready to be used, and that it can read back non-volatile configuration data. When ComM is de-initialized, it writes non-volatile data to NVRAM.

5.6 Diagnostic Communication Manager (DCM)

The DCM performs the scheduling of diagnostic PDUs. The DCM acts as a user by requesting Communication Mode <code>COMM_FULL_COMMUNICATION</code> via a "DCM_ActiveDiagnostic" indication if diagnostics shall be performed. The DCM does not provide an API to start/stop sending and receiving but guarantees that the communication capabilities are according to the ComM module Communication Modes.

5.7 LIN State Manager

The LIN State Manager controls the actual states of the LIN bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the LIN State Manager and the LIN State Manager maps the Communication Mode to a bus state.

5.8 CAN State Manager

The CAN State Manager controls the actual states of the CAN bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the CAN State Manager and the CAN State Manager maps the Communication Mode to a bus state.

5.9 FlexRay State Manager

The FlexRay State Manager controls the actual states of the FlexRay bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the FlexRay State Manager and the FlexRay State Manager maps the Communication Mode to a bus state.

5.10 Ethernet State Manager

The Ethernet State Manager controls the actual states of the Ethernet bus that correspond to a Communication Mode of the ComM module. The ComM module requests a Communication Mode from the Ethernet State Manager and the Ethernet State Manager maps the Communication Mode to a bus state.

5.11 Network Management (NM)

The ComM module uses the NM to synchronize the control of communication capabilities across the network (synchronous start-up and shutdown).

5.12 Default Error Tracer (DET)

The DET provides services for reporting development, runtime, and transient errors. (see Section 7.9)

5.13 Communication (COM)

[SWS_ComM_00975] [The AUTOSAR Communication module (COM) shall be used to distribute the status information about PNCs using COM signals.]()

7 Functional specification

The Communication Manager (ComM) module simplifies the resource management for the users, whereat users may be runnable entities, SW-Cs, the BswM (e.g. SW-C request via BswM) or DCM (communication needed to diagnostic purpose).

[SWS_ComM_00867] [The ComM shall provide three different Communication Modes. The highest Communication Mode shall be COMM_FULL_COMMUNICATION. The lowest Communication Mode shall be COMM_NO_COMMUNICATION.](SRS_ModeMgm_09083)

[SWS_ComM_00151] [For a user it shall only be possible to request the Communication Modes COMM_NO_COMMUNICATION and COMM_FULL_COMMUNICATION (see ComM_RequestComMode(), SWS_ComM_00110).]()

Rationale for <u>SWS_ComM_00151</u>:

- 1. The Communication Mode COMM_SILENT_COMMUNICATION and submodes/sub-states are only necessary for synchronization with AUTOSAR NM.
- 2. The Communication Mode COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST is only necessary to **request the lower layer** to trigger a wake-up on the network (e.g. Ethernet hardware compliant to OA TC10 [see 33]). This mode could not be requested by a user.

[SWS_ComM_00868] [The Communication Mode COMM_SILENT_COMMUNICATION shall only be used for network synchronization.](SRS_ModeMgm_09083)

Note: The possibility to request COMM_SILENT_COMMUNICATION mode is removed since release 2.0.

Comment:

- The ComM module allows querying the Communication Mode requested by a particular user (see ComM_GetRequestedComMode(), <u>SWS ComM 00079</u>).
- The ComM module allows querying the actual Communication Mode of a channel if the user is assigned to channel(see ComM GetCurrentComMode(), <u>SWS ComM 00083</u>)
- The ComM module allows querying for the current PNC mode if the user is assigned to a PNC (see ComM_GetCurrentPNCComMode(), <u>SWS ComM 91002</u>)

[SWS_ComM_00845] [In COMM_FULL_COMMUNICATION mode, the ComM module shall allow transmission and reception on the affected physical channel.](SRS_ModeMgm_09083)

[SWS_ComM_00846] [In COMM_NO_COMMUNICATION mode, the ComM module shall prevent transmission and reception on the affected physical channel.](SRS_ModeMgm_09083)

[SWS_ComM_00686] [If at least one of multiple independent user requests demands a higher Communication Mode (see <u>SWS_ComM_00867</u> and <u>SWS_ComM_00868</u>), the ComM module shall set this higher Communication Mode as the target Communication Mode.](SRS_ModeMgm_09078)

Rationale for <u>SWS_ComM_00686</u>: ComM coordinates multiple independent user requests according to the "highest wins" strategy: COMM_FULL_COMMUNICATION Communication Mode overrules COMM_NO_COMMUNICATION.

[SWS_ComM_00500] [The ComM module shall not queue user requests. The latest user request of the same user shall overwrite an old user request even if the request is not finished.]()

[SWS ComM 00866] [**If** configuration parameter (ECUC_ComM_00568), ComMNmVariant=FULL | LIGHT | NONE an DCM_ActiveDiagnostic indication shall be treated а as COMM FULL COMMUNICATION request for the specified communication channel (see ComM DCM ActiveDiagnostic(channel), SWS_ComM_00873). ()

Rationale for <u>SWS_ComM_00866</u>: If more channels needed for diagnostic purpose, DCM needs to indicate DCM_ActiveDiagnostic for each channel.

[SWS_ComM_00092] [There shall be one Communication Mode target state (evaluated according to <u>SWS_ComM_00686</u>) per communication channel. This target mode can differ temporarily from the actual mode controlled by the corresponding Bus State Manager module.]()

Comment: Mode switching by the corresponding Bus State Manager module takes time and a mode inhibition can be active.

[SWS_ComM_00084] [The ComM module shall propagate a call of ComM_GetCurrentComMode() (see <u>SWS_ComM_00083</u>) to the Bus State Manager module(s) for the channel(s) the user are configured to (see also <u>SWS_ComM_00176</u> and <u>SWS_ComM_00798</u>)]()

Rationale for <u>SWS ComM 00084</u>: State requests have to be propagated to the corresponding Bus State Manager module since the ComM module does not control the actual bus state.

Comment: This feature is not used by a "normal SW-C" because they don't have knowledge about channels. This feature is necessary for privileged SW-Cs, which (have to) know about the system topology, e.g. system diagnostic functions.

[SWS_ComM_00884] [The ComM module shall store status if communication for a channel is allowed or not allowed in separate CommunicationAllowed boolean flags for all supported channels. The default value after ComM initialization shall be communication is not allowed, i.e. CommunicationAllowed=FALSE.]()

[SWS_ComM_00885] [Status changes for communication allowed or not allowed in <u>SWS_ComM_00884</u> shall be provided to ComM in ComM_CommunicationAllowed(<channel>, TRUE|FALSE)(<u>SWS_ComM_00871</u>) indications.]()

7.1 Partial Network Cluster Management

7.1.1 Overview

ComM implements a state machine for each partial network cluster (PNC) to represent the communication mode of a PNC.

Each PNC has its own state. The state definitions are related to the states of ComM for a simple mapping.

ComM users are used to request and release the PNCs.

The status of all PNCs on the nodes of a system channel is exchanged via network management user data.

Each PNC uses a dedicated bit position within a bit vector in the NM user data on CAN, FlexRay and Ethernet. If a PNC is requested by a local ComM user on the node, the node sets the corresponding bit in the NM user data to 1. If the PNC is not requested anymore; the node sets the corresponding bit in the NM user data to 0. The BusNms collect and aggregate the NM user data for the PNCs and provide the status via a COM bit vector by means of a COM signal to ComM.

Each PNC uses the same bit position in the NM user data on every system channel with NM. ComM uses two types of bit vector named EIRA and ERA to exchange PNC status information. The definition of "EIRA" and "ERA" are located in the AUTOSAR SWS CAN NM, AUTOSAR SWS FlexRay NM and AUTOSAR SWS UDP NM.

ComM requests and releases the system communication bus channels needed for a PNC on a node.

Enabling or disabling the partial network cluster management in the node shall be post-build configurable.

Partial networking shall be supported on the bus types CAN, FlexRay and Ethernet. Activation and deactivation of the I-PDU groups of the PNCs on a Can, FlexRay and Ethernet node is required to avoid false timeouts. Starting and Stopping of I-PDU groups in COM are handled in BSWM. Deactivation of single FlexRay ECUs is not possible.

7.1.2 Partial Network Cluster Management Functionality

[SWS_ComM_00910] [PNC functionality shall only exist if the parameter ComMPncSupport is set to TRUE. (see <u>ECUC_ComM_00839</u>).]()

[SWS_ComM_00911] [Enabling or disabling of the PNC functionality shall be postbuild configurable using the parameter ComMPncEnabled (see <u>ECUC_ComM_00878</u>).]()

Comment: The ComM module notifies the BswM about every state change of the PNC state machine by calling BswM_ComM_CurrentPncMode(). (refer to SWS_ComM_00908)

[SWS_ComM_00982] [For exchanging PNC status information, bit vectors shall be used. (i.e. only one signal containing a maximum of 504 PNC status information bits).]()

Comment: ComM expects that the PNC bit vector is configured as an array of type uint8 n, see config parameter ComMPncComSignalRef.

[SWS_ComM_00825] [The byteIndex and bitIndex, in which a bit corresponding to one ComMPncId resides, shall be determined as follows: byteIndex=(ComMPncId div 8) - <PNC Vector Offset> bitIndex=(ComMPncId mod 8)]()

Hint: The value of <PNC Vector Offset> (and <PNC Vector Length>, if needed) can be obtained from the <Bus> Network Management modules configuration. *Comment.* SWS_ComM_00825 defines only the calculation of the byteIndex and bitIndex, not how it shall be implemented.

[SWS_ComM_00984] [ComM receives the bit vectors (signals) which can be ComMPncComSignalKind EIRA or ERA using Com_ReceiveSignal().]()

[SWS_ComM_00986] [The ComM shall provide the API ComM_COMCbk_<sn>() to indicate a change of signal(s) within the module communication.]()

[SWS_ComM_00916] [The ComM module shall be able to distribute the status of a PNC (result of the PNC state machine) via one or more communications busses using one or more COM signals ,as a bit vector, containing a bit which represents the status of the PNC with ComMPncComSignalDirection "TX" assigned to this PNC. (For more details, refer to Figure 2: PNC State Machine)]()

7.1.3 ComM PNC state machine

[SWS_ComM_00953] [If the PNC functionality is enabled using the configuration parameter ComMPncEnabled set to TRUE (see <u>ECUC_ComM_00878</u>), all actions related to PNC changes shall be executed before the channel related actions (channel related actions, see Chapter 7.3).]()

[SWS_ComM_00909] [For every Partial Network, only one PNC state machine shall be implemented (i.e. One PNC state machine per PNC, independent of the amount of ComMChannels).]()

[SWS_ComM_00920] [The ComM module shall support up to 504 PNC state machines.]()

[SWS_ComM_00924] [The PNC state machine shall consist of the two main states COMM_PNC_FULL_COMMUNICATION and COMM_PNC_NO_COMMUNICATION.]()

[SWS_ComM_00907] [The PNC main state COMM_PNC_FULL_COMMUNICATION shall consist of the sub states COMM_PNC_PREPARE_SLEEP, COMM_PNC_READY_SLEEP and COMM_PNC_REQUESTED.]()

[SWS_ComM_00908] [Every state change (listed within the ComM_PncModeType), excluding entering of the main state COMM_PNC_NO_COMMUNICATION coming from PowerOff, shall be notified by the API call BswM_ComM_CurrentPncMode() with the entered PNC state.] ()

[SWS_ComM_00978] [State transitions of the PNC state machines in ComM, triggered by a call to ComM_RequestComMode() shall be executed in the ComM MainFunction <Channel.ShortName>only.]()

Comment: Every PN activation triggers sending of the PN-vector n-times thus it would increase the busload without debouncing.

[SWS_ComM_00944] [If at least one bit corresponding to the PNC within the Rx bitvectors with signal type "EIRA" equals '1', then the bit corresponding to this PNC whithin EIRA in ComM shall be set to '1']()

[SWS_ComM_00945] [If the configuration parameter ComMPncGatewayEnabled (see <u>ECUC_ComM_00840</u>) is true and the parameter ComMPncGatewayType is set for a ComMChannel and at least one bit corresponding to the PNC within the Rx bitvectors with signal type "ERA" equals '1', then the bit corresponding to this PNC within ERA in ComM shall be set to '1'.]()

Note: ComM aggregates the EIRA / ERA vectors from different bus systems resulting in one EIRA generally and one ERA per ComM channel.

[SWS_ComM_00971] [The trigger ComM_COMCbk represents a notification by the AUTOSAR Communication module about a received signal containing PNC status information called ERA of EIRA.]()

 $\label{eq:stcommunication} \begin{array}{l} \mbox{[SWS_ComM_00972]} \ \mbox{[The trigger "ComMUser" represents a notification about a communication request of a ComMUser by calling the API ComM_RequestComMode().]() \end{array}$

[SWS_ComM_00987] [Within the ComM_MainFunction_<Channel.ShortName> of a channel that is mapped to one or more PNCs, the requested state shall be handled in the following order:

- 1. ComM user requests of ComM users mapped to one or more PNCs of that channel
- 2. ComM user requests of ComM users mapped to that channel
- 3. ERA (if the configuration switch ComMPncGatewayEnabled is set to TRUE)

4. EIRAJ()

Comment. Requests are handled in main functions of those channels they affect.

[SWS_ComM_00919] [It shall be possible to assign more than one COM signal containing bits representing the PNC to one PNC using the configuration container ComMPncComSignal (see <u>ECUC ComM_00881</u>).]()

Rational: This allows the configurator to assign e.g. one EIRA and n ERAs to one PNC.

Comment. The different IDs of EIRA can be configured to the physical supported channels FlexRay, Can1, Can2 ...

[SWS_ComM_00827] [Regarding "Communication allowed" and mode inhibitions, requests originating from a pnc state machine shall be treated like user requests for the according channels.]()

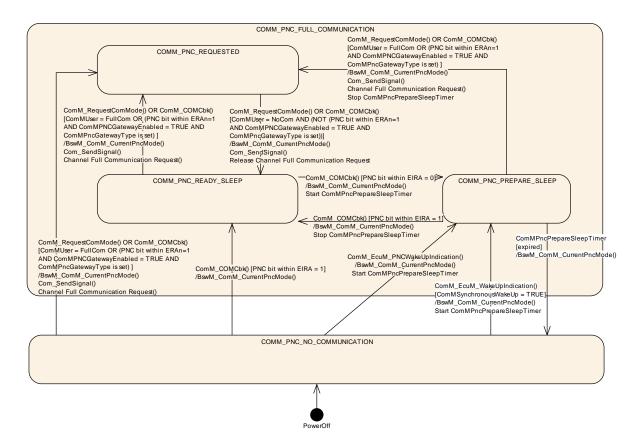

Figure 2: PNC State Machine

7.1.3.1 Behavior in PNC main state COMM_PNC_NO_COMMUNICATION

[SWS_ComM_00926] [The PNC main state COMM_PNC_NO_COMMUNICATION shall be the default PNC state from power off.]()

The main state COMM_PNC_NO_COMMUNICATION is the target state as long as the PNC is neither requested ECU internally nor requested externally.

[SWS_ComM_00931] [If the API ComM_EcuM_WakeUpIndication() is called in PNC state COMM_PNC_NO_COMMUNICATION, and the configuration switch ComMSynchronousWakeUp is set to TRUE (see <u>ECUC_ComM_00695</u>), the PNC main state COMM_PNC_NO_COMMUNICATION shall be left and the PNC sub state COMM_PNC_PREPARE_SLEEP shall be entered.]()

[SWS_ComM_00990] [If the API ComM_EcuM_WakeUpIndication() is called in PNC state COMM_PNC_NO_COMMUNICATION, and the configuration switch ComMSynchronousWakeUp is set to FALSE, the PNC main state COMM_PNC_NO_COMMUNICATION shall be the current state.]()

Comment: In case of asynchronous wake up, the PNC state shall stay in COMM_PNC_NO_COMMUNICATION until the PNC request is received (PNC bit in EIRA is set to '1').

[SWS_ComM_00964][If the API ComM_EcuM_PNCWakeUpIndication(<PNC>) (see <u>SWS_ComM_91001</u>) is called in PNC state PNC_NO_COMMUNICATION, the PNC main state PNC_NO_COMMUNICATION shall be left and the PNC sub state PNC_PREPARE_SLEEP shall be entered.]()

[SWS_ComM_00932] [When at least one ComMUser assigned to this PNC requests "Full Communication" in PNC main state COMM_PNC_NO_COMMUNICATION, this state shall be left and the sub state COMM_PNC_REQUESTED of the main state COMM_PNC_FULL_COMMUNICATION shall be entered.]()

[SWS_ComM_00933] [When in main state COMM_PNC_NO_COMMUNICATION at least one bit representing this PNC in EIRA changes to '1', the main state COMM_PNC_NO_COMMUNICATION shall be left and the COMM_PNC_READY_SLEEP shall be entered.]()

[SWS_ComM_00934] [When in main state COMM_PNC_NO_COMMUNICATION at least one bit representing this PNC in an ERAn changes to '1', the main state COMM PNC NO COMMUNICATION shall be left and the sub state COMM PNC REQUESTED if the parameter shall be entered ComMPncGatewayEnabled (ECUC ComM 00840) equals TRUE and ComMPncGatewayType is set for the according ComMChannels of these ERAs. ()

7.1.3.2 On entry of PNC main state COMM_PNC_NO_COMMUNICATION from PowerOff

[SWS_ComM_00927] [After switching on the power supply, main state COMM_PNC_NO_COMMUNICATION shall be entered from PowerOff.]()

7.1.3.3 Behavior in PNC main state COMM_PNC_FULL_COMMUNICATION

PNC [SWS ComM 00929] [As long а is in state as COMM PNC FULL COMMUNICATION all its channels assigned (see ECUC_ComM_00880) shall be in COMM_FULL_COMMUNICATION. ()

7.1.3.4 On entry of PNC sub state COMM_PNC_REQUESTED

[SWS ComM 01053] DRAFT PNC [When entering the sub state COMM_PNC_REQUESTED from COMM_PNC_NO_COM or COMM_PNC_PREPARE_SLEEP, and ComMPncWakeupSleepRequestEnabled of this PNC is set to TRUE, BswM ComM CurrentPNCMode shall be called with COMM_PNC_REQUESTED_WITH_WAKEUP_REQUEST, instead of calling BswM ComM CurrentPNCMode with COMM_PNC_REQUESTED. ()

Note: Notification towards the BswM with

COMM_PNC_REQUESTED_WITH_WAKEUP_REQUEST is used for Ethernet switch port switching to trigger a wake-up on the network where the used Ethernet hardware is compatible to the OA TC10 (see[33])

[SWS_ComM_00930] [When entering the PNC sub state COMM_PNC_REQUESTED and if ComMPncGatewayEnabled = FALSE or on all ComMChannels the PNC belongs to the ComMPncGatewayType is not set, the API Com_SendSignal() shall be called with the value '1' for the bit representing this PNC for the Com signal assigned to this PNC with ComMPncComSignalDirection "TX".]()

PNC [SWS ComM 00992] [When entering the sub state COMM PNC REQUESTED and if ComMPncGatewayEnabled = TRUE, the API Com SendSignal() shall be called with the value '1' for the bits representing this PNC for the Com signals assigned to this PNC with ComMPncComSignalDirection "TX" for all ComM channels related to this PNC and having ComMPncGatewayType == COMM_GATEWAY_TYPE_ACTIVE.()

[SWS_ComM_00993] [Every time the sub state COMM_PNC_REQUESTED is entered from other states, ComM shall request COMM_FULL_COMMUNICATION for all configured ComM channels for this PNC, where ComMWakeupSleepRequestEnabled is set to FALSE or not available, even if the channel is already requested.]()

[SWS_ComM_01054] DRAFT [Every time the sub state COMM_PNC_REQUESTED is entered from COMM_PNC_NO_COM or COMM_PNC_PREPARE_SLEEP, ComM shall request COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST for all configured ComM channels for this PNC, where

ComMWakeupSleepRequestEnabled is set to TRUE, even if the channel is already requested.]()

[SWS_ComM_01055] DRAFT [Every time the sub state COMM_PNC_REQUESTED is entered from COMM_PNC_READY_SLEEP, ComM shall request COMM_FULL_COMMUNICATION for all configured ComM channels for this PNC, where ComMWakeupSleepRequestEnabled is set to TRUE, even if the channel is already requested.](SRS_ModeMgm_09268)

Comment on **[SWS_ComM_01055]**: Entering from COMM_PNC_READY_SLEEP should not result in a wake-up on the network, since the PNC is already requested remotely by another ECU

7.1.3.5 Behavior in PNC sub state COMM_PNC_REQUESTED

[SWS_ComM_00164] [If ComMPncGatewayEnabled == TRUE and either on entering COMM_PNC_REQUESTED or within COMM_PNC_REQUESTED, the API Com_SendSignal() shall be called with the value "1" for the bit representing this PNC for the Com signal assigned to this PNC with ComMPncComSignalDirection == "TX" on all ComM channels related to this PNC where ComMPncGatewayType == COMM_GATEWAY_TYPE_PASSIVE

if at least one ComM user assigned to this PNC request "Full Com" or at least one ComMPncComSignal received by Com ReceiveSignal() from a channel where ComMPncComSignalDirection "RX" the signal attributes == and ComMPncComSignalKind "ERA" and the attribute == channel ComMPncGatewayType "COMM GATEWAY TYPE ACTIVE" set to == is "1". ((SRS_ModeMgm_09243)

[SWS_ComM_00959] [If ComMPncGatewayEnabled == TRUE and within COMM_PNC_REQUESTED, the API Com_SendSignal() shall be called with the value "0" for the bit representing this PNC for the Com signal assigned to this PNC with ComMPncComSignalDirection == "TX" on all ComM channels related to this PNC where ComMPncGatewayType == COMM_GATEWAY_TYPE_PASSIVE if all ComM users assigned to this PNC request "No Com" and all ComMPncComSignals received by Com_ReceiveSignal() from a channel where the signal attributes ComMPncComSignalDirection == "RX" and ComMPncComSignalKind == "ERA" and the channel attribute ComMPncGatewayType == "COMM_GATEWAY_TYPE_ACTIVE" are set to "0".](SRS_ModeMgm_09243)

As long as at least one ComMUser assigned to this PNC requests "Full Communication", COMM_PNC_REQUESTED will be the current PNC state.

[SWS_ComM_01050] DRAFT [If a request to forward a synchronized PNC shutdown has been indicated via call а of ComM Nm ForwardSynchronizedPncShutdown(<channel>), the indicated channel is assigned to this PNC, this PNC is qualified to be released for the indicated channel (ComMPncComSignal received by Com ReceiveSignal() with signal attributes ComMPncComSignalDirection == "RX" and ComMPncComSignalKind == "ERA" changed to "0"), the indicated channel has ComMPncGatewayType set to COMM GATEWAY TYPE PASSIVE, ComMSynchronizedPncShutdownEnabled is set to TRUE and all ComM channels which are assigned to this PNC reside in

COMM_FULL_COMMUNICATION, then the ComM module shall perform the following actions:

- If all ComM users assigned to this PNC request "No Com", all ComMPncComSignals received by Com ReceiveSignal() from all channels which are assigned to this PNC where the signal attributes ComMPncComSignalDirection == "RX" and ComMPncComSignalKind == "ERA" attribute and the channel ComMPncGatewayType == "COMM GATEWAY TYPE ACTIVE" are set to "0", ComM shall call Nm RequestSynchronizedPncShutdown (<channel>, <PncId>) for each of those <channel> with <PncId> of the current handled PNC
- The sub state COMM_PNC_REQUESTED shall be left and the sub state COMM_PNC_READY_SLEEP shall be entered

J(SRS_ModeMgm_09269)

Comment on [SWS_ComM_01050]:

Every time an intermediate PNC coordinator (PNC coordinator which have at least one ComMChannel with ComMPncGatewayType set to COMM_GATEWAY_TYPE_PASSIVE) receive an top-level PNC coordinator Nm frame, the ComM shall immediately release the PNC, forward the PN information of the top-level PNC coordination Nm frame and request an top-level PNC coordination Nm frame on all active coordinated ComMChannels which are assgined to the affected PNC

ComM has to ensure that the procedure upon the reception of a top-level PNC coordination Nm frame has to be performed as fast as possible, to minimize the delay of the synchronized PNC shutdown

[SWS ComM 01051] DRAFT [If a request to forward a synchronized PNC shutdown has been indicated via а call of ComM Nm ForwardSynchronizedPncShutdown (<channel>) for this PNC, the PNC is gualified to be released and the precondition to forward the synchronized PNC request are not fullfield (at least one ComM user request Full Com for this PNC or at least one ComM channel assigned to this PNC has ComMPncComSignal set to "1" where the signal attributes ComMPncComSignalDirection == "RX" andComMPncComSignalKind "ERA" and the channel attribute == ComMPncGatewayType "COMM_GATEWAY_TYPE_ACTIVE", see == [SWS ComM 01050]), then the ComM modul shall reject to perform the forwarding **PNC** of а synchronized shutdown and stay in sub state COMM_PNC_REQUESTED. (SRS_ModeMgm_09269)

Comment on **[SWS_ComM_01051]***:* The forwarding of a synchronized PNC shutdown shall be rejected if a local user has indicated to request the affected PNC or a PNC request was received via an active coordinated channel. The request for a PNC either local requested or remotely requested shall always cancel a request for a synchronized PNC shutdown.

[SWS_ComM_01052] DRAFT [If ComMSynchronizedPncShutdownEnabled is set to TRUE, all ComM channels which are assigned to this PNC have ComMPncGatewayType set to COMM_GATEWAY_TYPE_ACTIVE, all ComM channels which are assigned to this PNC reside in

COMM_FULL_COMMUNICATION, the according PNC bit in all ERAn is equal to 0 and all ComMUsers assigned to this PNC request "No Communication", the API Nm_RequestSynchronizedPncShutdown (<channel>, <PncId>) shall be called , whereat <channel> represent the current handled ComMChannel and <PncId> the ComMPncId of this PNC.](SRS_ModeMgm_09269)

Comment on [SWS_ComM_01052]:

Everytime a PNC is released, synchronized PNC shutdown is configured and the ECU act as an top-level PNC coordinator (all coordinated PNC are mapped to ComMChannels where ComMPncGatewayType is set to COMM_GATEWAY_TYPE_ACTIVE) a PN shutdown message has to be triggered. Therefore ComM forward the PN information regarding the detection of a released PNC to Nmlf by calling Nm_RequestSynchronizedPncShutdown for each ComMChannel the PNC is assigned to. Nmlf is forwarding the call to the affected <Bus>Nm. The PN shutdown message is transmitted within the <Bus>Nm_Mainfunction.

ComM has to ensure that all affected ComMChannels reside in COMM_FULL_COMMUNICATION to ensure a synchronized PNC shut down across the whole network. Otherwise the functionality of synchronized PNC shutdown cannot be guaranteed.

[SWS_ComM_00966] [If ComM0PncVectorAvoidance is set to TRUE and if all signals are set to '0' (because of <u>SWS ComM 00959</u>) for the referenced ComMChannel(s), the ComM module shall release this ComMChannel.

As soon as at least one signal is set back to '1' again, the ComM module shall request this ComMChannel again.]()

As long as a PNC is requested remotely (i.e. at least one bit within the ERA signal PNC equals '1') and configuration assigned to this the switch ECUC_ComM_00840), ComMPncGatewayEnabled is set TRUE (see to COMM PNC REQUESTED will be the current PNC state.

[SWS_ComM_00938] [When all ComMUsers assigned to this PNC request "No Communication", the sub state COMM_PNC_REQUESTED shall be left and the sub state COMM_PNC_READY_SLEEP shall be entered, if the configuration switch ComMPncGatewayEnabled is set to FALSE or on all channels the PNC belongs to the ComMPncGatewayType is not set.]()

[SWS_ComM_00991] [When all ComMUsers assigned to this PNC request "No Communication" and the PNC bit in all ERAn is equal to 0, the sub state COMM_PNC_REQUESTED shall be left and the sub state COMM_PNC_READY_SLEEP shall be entered, if the configuration switch ComMPncGatewayEnabled is set to TRUE and ComMPncGatewayType is set for the according ComMChannels of these ERAs.]()

7.1.3.6 On entry PNC sub state COMM_PNC_READY_SLEEP

[SWS_ComM_00960] [When entering the PNC sub state COMM_PNC_READY_SLEEP from COMM_PNC_REQUESTED, the API 38 of 173 Document ID 79: AUTOSAR_SWS_COMManager

Com_SendSignal() shall be called with the value '0' for the bit representing this PNC for all Com signals assigned to this PNC with ComMPncComSignalDirection "TX".]()

[SWS_ComM_00961] [When entering the PNC sub state COMM_PNC_READY_SLEEP from COMM_PNC_REQUESTED, ComM shall release the COMM_FULL_COMMUNICATION request for all configured ComM channels for this PNC.]()

7.1.3.7 Behavior in PNC sub state COMM_PNC_READY_SLEEP

As long as the PNC is requested (i.e. at least one PNC bit within EIRA equals '1') and no ComMUser assigned to this PNC requests "Full Communication", COMM_PNC_READY_SLEEP will be the current state.

[SWS_ComM_00940] [If the PNC is released (i.e. all PNC bits within EIRA equals '0'), the sub state COMM_PNC_READY_SLEEP shall be left and the sub state COMM_PNC_PREPARE_SLEEP shall be entered. |()

[SWS_ComM_00165][In PNC sub state COMM_PNC_READY_SLEEP when at least one ComMUser assigned to this PNC requests "Full Communication" or ComMPncGatewayEnabled (<u>ECUC_ComM_00887</u>) equals TRUE, one bit representing this PNC in an ERAn changes to '1' and ComMPncGatewayType is set for the according ComMChannels of these ERAs, this state shall be left and the sub state COMM_PNC_REQUESTED shall be entered.](SRS_ModeMgm_09246, SRS_ModeMgm_09247, SRS_ModeMgm_09248)

7.1.3.8 On entry of PNC sub state COMM_PNC_PREPARE_SLEEP

[SWS_ComM_00952] [If the sub state COMM_PNC_PREPARE_SLEEP is entered, the timer ComMPncPrepareSleepTimer (see <u>ECUC_ComM_00841</u>) shall be started with the configured initial value.]()

7.1.3.9 Behavior in PNC sub state COMM_PNC_PREPARE_SLEEP

As long as the timer ComMPncPrepareSleepTimer (see <u>ECUC ComM 00841</u>) is running and no changes in ComMUser, EIRA or ERAn occur, COMM_PNC_PREPARE_SLEEP will be the current state.

[SWS_ComM_00947] [When the timer ComMPncPrepareSleepTimer (see <u>ECUC_ComM_00841</u>) expires, the PNC sub state COMM_PNC_PREPARE_SLEEP shall be left and the PNC main state COMM_PNC_NO_COMMUNICATION shall be entered.]()

[SWS_ComM_00948] [When in COMM_PNC_PREPARE_SLEEP at least one ComMUser assigned to this PNC requests "Full Communication", the

COMM PNC PREPARE SLEEP shall left. The state be timer shall ComMPncPrepareSleepTimer be stopped and the sub state COMM PNC REQUESTED state shall be entered. ()

ISWS ComM 009501 [When in COMM PNC PREPARE SLEEP at least one PNC bit within EIRA changes to '1', the sub state COMM_PNC_PREPARE_SLEEP shall be left. The timer ComMPncPrepareSleepTimer shall be stopped and the sub state COMM PNC READY SLEEP shall be entered. (()

[SWS_ComM_00951] [When in sub state COMM_PNC_PREPARE_SLEEP at least one PNC bit within ERAn changes to '1', the parameter ComMPncGatewayEnabled equals TRUE and ComMPncGatewayType is set for the according ComMChannels of these ERAs, the sub state COMM PNC PREPARE SLEEP shall be left. The timer ComMPncPrepareSleepTimer shall be stopped and the sub state COMM PNC REQUESTED shall be entered. ()

7.1.4 PNC Gateway

The PNC Gateway feature is used to coordinate PNC requests on multiple channels. Therefore, the PNC Gateway ensures, that all received PNC requests are forwarded to the according channels. Channels that are mapped to a specific PNC are activated and kept alive for the time of the request.

Additionally, the PNC Gateway mirrors back PNC requests on all its active coordinated channels (ComMPncGatewayType set to COMM GATEWAY TYPE ACTIVE) to support consistent behavior if PNC Gateways are connected in a cascaded way.

The ComM needs therefore a PNC-to-channel-mapping to manage the PNC features (e.g. active and passive PNC requests, PNC coordination). The following figure shows this PNC-to-channel-mapping exemplarily:

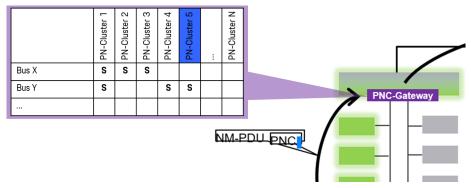

Figure 3 PNC-to-channel-mapping

This mapping is provided statically by configuration. Additionally, the optional feature Dynamic PNC-to-channel-mapping (see chapter 7.1.5) could be used to extend the PNC-to-channel mapping during run-time.

Note that when PNC Gateway is active and even if a PNC is only assigned to one channel, coordination might occur when request comes in from another channel

where PNC is not assigned to. This is intended as there might be only PNC-requestor on the other channel which is not interested in being kept awake by this PNC.

7.1.4.1 Support for not coordinated PNCs assigned to multiple channels

When a Partial Network is connected to more than one ComMChannel than it is coordinated either on all channels or not at all (see AUTOSAR_TPS_SystemTemplate [constr_5094]).

Note: If PNCs are assigned to different ComMChannels and those channels are not coordinated by a PncGateway, then it has to be ensured, that the affected ComMChannels are requested and released to the same point in time. Because an application should not care about channel states, if PNCs are used. Or in other words, if a PNC is requested (passively) then also all referenced ComMChannels shall be requested, because an application expects that all ComMChannels assigned to this PNCs are requested.

7.1.4.2 Active PNC Gateway

Note: Even if the configuration parameter ComMPncGatewayEnabled (see <u>ECUC ComM 00840</u>) is TRUE and the parameter ComMPncGatewayType is set to COMM_GATEWAY_TYPE_ACTIVE for a ComMChannel (see <u>ECUC ComM 00842</u>), the active PNC gateway still behaves as shown in Figure 2: PNC State Machine.

Comment: An active PNC gateway on a system channel shall be the last node on a system channel that releases a PNC.

Comment. If the bit for a PNC is equal to zero in all ERAn, no other node than the PNC gateway is requesting the PNC.

7.1.4.3 Passive PNC Gateway

Comment. The passively coordinated channels exist only if they are connected to more than one PNC gateway. If the PNC gateway functionality of ComM is enabled (ComMPncGatewayEnabled = true) ComM channels mapped to this gateway can be (COMM GATEWAY TYPE ACTIVE set to tvpe active or passive or COMM_GATEWAY_TYPE_PASSIVE). If a ComM channel is mapped to two different PNC gateways, only one gateway coordinates this channel actively, while the other passively. That means, a PNC gateway is always mapped to at least one ComM channel type active and may be mapped to one or some ComM channels type passive.

Comment: A PNC gateway requests the PNC if a local ComM user requests the PNC or at least one PNC bit within ERA originate from the actively coordinated system channels of a passive PNC gateway is not equal to 0.

Comment to <u>SWS ComM 00959</u>: A PNC gateway calculates the PNCs bit value in the ERA Tx bitvectors to be sent for a passively coordinated channel, in the same manner as the bit value in ERA for an actively coordinated channel, but sets the PNC's bit to '0' according to the rules of <u>SWS ComM 00959</u>.

7.1.4.4 Synchronized PNC shutdown

A PN topology always reflects a hierarchical topology, were the so-called top-level PNC coordinator is located on the highest level. On the subordinated levels multiple so-called intermediate PNC coordinators and subordinated PNC nodes could reside.

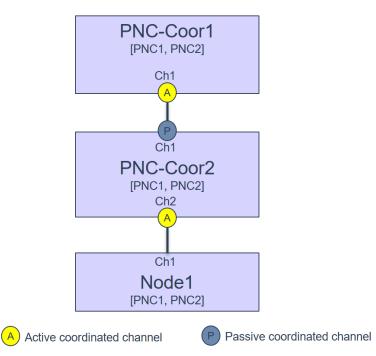

Figure 4 Example for a partial network (PN) topology that reflect the hierarchy

Figure 4 shows PNC-Coor1 as top-level PNC coordinator, PNC-Coor2 as intermediate PNC coordinator and Node1 as subordinated PNC node which resides on the lowest level of the PN topology. For example, if Node1 requests PNC1, then the PNC request is propagated across the PN to the top-level PNC coordinator. The top-level PNC coordinator "takes over" the PNC request and mirrors back the PNC request to the whole PN. If for example Node1 releases PNC1 and no other ECU in the network has PNC1 requested, then Node1 will still receive Nm frames from the top-level PNC coordinator where the PNC1 is requested. The release of the subordinate PNC node is not forwarded immediately across the PN topology from the subordinated PNC node to the top-level PNC coordinator. The release of a PNC is delayed by the PN reset time on each PN topology level. If the top-level PNC coordinator detect that a PN reset timer for a particular PNC expires, then no other ECU in the PN request this PNC. The top-level PNC coordinator resets the PN reset timer of the released PNC once more and transmits a so-called PN shutdown message to ensure a nearly synchronized shutdown of the PNC, across all PN levels from the top-level PNC coordinator down to the subordinated PNC node. An intermediate PNC coordinator reacts immediately upon reception on a PN shutdown message. Therefor the intermediate PNC coordinator releases the indicated PNC,

resets the PN reset timer once more and forwards the PN shutdown message on all ComMChannels which are actively coordinated and assigned to the affected PNC. Thus, all PNC state machines of the released PNC across all PN level from the toplevel PNC coordinator down to the subordinated PNC nodes reside in COMM_PNC_READY_SLEEP and reset the corresponding PN reset timer nearly in the same point in time. This will lead to a synchronized PNC shutdown to avoid timeouts on application level.

Please refer also to the sequence diagrams Figure 15 and Figure 16 which depict the handling of a synchronized PNC shutdown in the role of a top-level PNC coordinator and an intermediate PNC coordinator.

7.1.5 Dynamic PNC-to-channel-mapping (optional)

This feature adds the possibility to update the PNC-to-channel-mapping of the PNC Gateway during runtime. This update works via a request-response-based learning process of all participating Nodes. When Partial Network learning is requested within the Nm PDUs, all participating Nodes will respond their current PNC membership on the corresponding channel and the PNC Gateway then updates the current PNC-to-channel-mapping accordingly.

[SWS_ComM_01026] DRAFT [If the function ComM_Nm_PncLearningBitIndication has been called on a channel where ComMDynamicPncToChannelMappingEnabled is set to TRUE or when ComM calls Nm_PnLearningRequest on a channel ComM shall set the PNC Learning Phase to active for the according channel.](SRS_ModeMgm_09260)

[SWS_ComM_01028] DRAFT [If ComMPncGatewayEnabled is set to TRUE and the function ComM Nm PncLearningBitIndication has been called on a channel where ComMDynamicPncToChannelMappingEnabled is set to TRUE ComM shall forward the Learning Request by calling Nm PnLearningRequest on where ComMPncGatewayType all further ComM channels is set to COMM_GATEWAY_TYPE_ACTIVE and ComMDynamicPncToChannelMappingEnabled is to set TRUE. (SRS ModeMgm 09261)

Note: Forwarding only on all active coordinated channels where the request has not been received is sufficient as due to there is only one master gateway (see AUTOSAR_TPS_SystemTemplate [constr_5094] the information is spread over the whole system. The initial request is started by the application of one node in the network with a call of ComM_PnLearningRequest (refer to [SWS_ComM_01046]).

[SWS_ComM_01029] DRAFT [If ComMDynamicPncToChannelMappingEnabled is set to TRUE and function ComM_Nm_RepeatMessageLeftIndication has been called ComM shall set the PNC Learning Phase to inactive for the according channel.](SRS_ModeMgm_09265)

[SWS_ComM_01030] DRAFT [If ComMPncGatewayEnabled and ComMPncDynamicMappingSupport are set to TRUE and when the PNC Learning Phase is active, then ComM shall forward received ERA Rx information on channels 43 of 173 Document ID 79: AUTOSAR_SWS_COMManager

where ComMPncDynamicMappingEnabled is set to TRUE. Therefore, ComM shall set the affected PN bit(s) to the assigned Com signals with "TX" ComMPncComSignalDirection on all other channels where ComMPncDynamicMappingEnabled is set to TRUE. (SRS_ModeMgm_09261)

7.1.5.1 Update PNC-to-channel-mapping

The PNC Gateway needs to be capable to update its PNC-to-channel Mapping on runtime.

[SWS_ComM_01031] DRAFT [If ComMPncGatewayEnabled is set to TRUE and when the PNC Learning Phase is active and an ERA Rx Signal is received on a channel where ComMDynamicPncToChannelMappingEnabled is set to TRUE ComM shall set PNC-to-channel Mapping to 1 for every ComMPnc on the according channel where this ERA Rx Signal has been received with 1 for the according PNC.](SRS_ModeMgm_09258)

7.1.5.2 PNC Membership Forwarding

Every participating Node has to transmit its current PNC membership during PNC Learning phase. The PNC Gateway needs additionally also forward PNC memberships received from other channels.

[SWS_ComM_01032] DRAFT [If ComMPncGatewayEnabled is set to FALSE and when the PNC Learning Phase is active, the ComM shall send for all ComM channels where ComMDynamicPncToChannelMappingEnabled is set to TRUE the assigned Com signals with ComMPncComSignalDirection "TX" with the value of the current PNC membership.](SRS_ModeMgm_09262)

[SWS_ComM_01033] DRAFT [If ComMPncGatewayEnabled is set to TRUE and when the PNC Learning Phase is active, the ComM shall send for all ComM channels where ComMDynamicPncToChannelMappingEnabled is set to TRUE the assigned Com signals with ComMPncComSignalDirection "TX" with the value of the current PNC membership merged with the PNC information that needs to be forwarded according to [SWS_ComM_01030].](SRS_ModeMgm_09261)

7.1.6 Partial Networking Configuration Hints

Typically, every PNCSignal is sent / received on ComMChannels which are linked to this PNC.

However, this is not mandatory, but it is also allowed having a configuration where:

- PNCSignal can be sent on a ComMChannel which is _NOT_ linked to this PNC.
- A PNCSignal can be received via a ComMChannel which is _NOT_ linked to this PNC.

7.2 ComM channel state machine

[SWS_ComM_00979] [If the optional PNC functionality is enabled (see <u>ECUC_ComM_00883</u>), all PNC actions shall be performed before the channel related actions are executed.]()

[SWS_ComM_00980] [If the parameter ComMPncNmRequest equals TRUE (see <u>ECUC_ComM_00886</u>), if the "FULL Communication" is requested due to a change in the PNC state machine to COMM_PNC_REQUESTED (see <u>SWS_COMM_00993</u>) API Nm_NetworkRequest() shall be called, even if the current state is already "Full communication".]()

Rationale: It is the trigger to enable the NM to transmit the NM message immediately n-times (n=configurable) to ensure a wake up and a synchronization of the PNC transceiver.

[SWS_ComM_00051] [ComM shall implement one channel state machine as shown in Figure 5 with requirements as listed in Table 1 for every communication channel independently.](SRS_ModeMgm_09080)

Rationale for <u>SWS ComM 00051</u>: Needed communication capability of channels may be different, thus the controlling must be independent.

Use Case for <u>SWS_ComM_00051</u>: On an ECU with CAN and LIN channel, only the LIN requires full communication to request e.g. sensor values while the CAN remains inactive.

COMM_NO_COMMUNICATION → COMM_FULL_COMMUNICATION COMM_FULL_COM_NETWORK_REQUESTED → COMM_FULL_COM_READY_SLEEP → COMM_FULL_COM_NETWORK_REQUESTED COMM_FULL_COM_NETWORK_REQUESTED COMM_FULL_COM_NETWORK_REQUESTED COMM_FULL_COMMUNICATION → COMM_NO_COMMUNICATION → COMM_NO_COMMUNICATION → COMM_SILENT_COMMUNICATION → COMM_FULL_COMMUNICATION → COMM_FULL_COMMUNICATION →	SWS ComM 00893, SWS ComM 00894, SWS ComM 00694, SWS ComM 00875 SWS ComM 00876, SWS ComM 00875 SWS ComM 01015 SWS ComM 01015 SWS ComM 00865 SWS ComM 00882, SWS ComM 00883 SWS ComM 00826 SWS ComM 00610, SWS ComM 00671 SWS ComM 00637 SWS ComM 00877, SWS ComM 00878

Table 1: Link to detailed explanation of the channel state machine resp. transition

[SWS_ComM_00879] [The ComM channel state machine shall consist of the three main states corresponding to the Communication Modes: COMM_NO_COMMUNICATION, COMM_SILENT_COMMUNICATION and COMM FULL COMMUNICATION.]()

[SWS_ComM_00880] [The COMM_FULL_COMMUNICATION state shall have two sub-states COMM_FULL_COM_NETWORK_REQUESTED and COMM_FULL_COM_READY_SLEEP.]()

[SWS_ComM_00881] [The COMM_NO_COMMUNICATION state shall have two sub-states COMM_NO_COM_REQUEST_PENDING and COMM_NO_COM_NO_PENDING_REQUEST]()

Rationale for <u>SWS ComM 00879</u> and <u>SWS ComM 00880</u>: COMM_FULL_COM_READY_SLEEP and COMM_SILENT_COMMUNICATION are necessary to synchronize a communication shutdown on the bus. If only one ECU switches the communication off, the others store errors because this ECU stops sending application signals.

Comment. The main states present an abstracted status of communication capabilities per channel, which are in focus of the users' interests. The sub-states represent intermediate states, which perform activities to support a synchronized transition with external partners and managing protocols (e.g. NM)

[SWS_ComM_00485] [The default state for each ComM channel state machine shall be COMM NO COMMUNICATION.]()

[SWS_ComM_00896] [Each ComM channel state machine shall only evaluate its corresponding communication status flag CommunicationAllowed according to SWS_ComM_00884 in sub-state COMM_NO_COM_REQUEST_PENDING.]()

Rationale for <u>SWS_ComM_00896</u>:

A ComM_CommunicationAllowed(<channel>, FALSE) (<u>SWS_ComM_00871</u>) indication has no visible effect if the channel is not in sub-state COMM_NO_COM_REQUEST_PENDING, i.e. ComM channel state machine will not immediately change to state COMM_NO_COMMUNICATION if in another state as e.g. COMM_FULL_COMMUNICATION

[SWS_ComM_00472] [Main state changes (see <u>SWS_ComM_00879</u>) shall be indicated to the users with the corresponding notifications (see section 8.6.1.5 and 8.6.1.6). Exception: Default state after initialization, see <u>SWS_ComM_00313</u>.]()

Comment. If more than one user is related to the corresponding channel state machine, the ComM module has to perform a Fan-out to all users.

[SWS_ComM_00191] [The internal functionality of the ComM channel state machine(s) shall be invisible for the users. The user neither needs nor shall get any information about the internal mechanisms and rules (e.g. "highest wins" strategy) of the ComM channel state machine.]()

An overview of the requested communication capabilities in the Corresponding Mode is shown in Table 2.

Communication Mode	Message Transmission	Message Reception	NM (COMM_NM_VARIANT=FULL)	Wake-up/Restart capability
COMM_FULL_COMMUNICATION	On	On	Bus communication requested	N/A
COMM_FULL_COMMUNICATION_WIT H_WAKEUP_REQUEST	On	On	Bus communication requested	Request the lower layer to trigger a wake-up on the network
COMM_SILENT_COMMUNICATION	Off	On	Bus communication released	 User/diagnostic request Network indication
COMM_NO_COMMUNICATION	Off	Off	Bus communication released	User/diagnostic request Passive wake-up

Table 2: Granted communication capabilities in the corresponding modes

[SWS_ComM_01056] DRAFT [Requests for communication mode COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST shall be handled as request for COMM_FULL_COMMUNICATION within the ComM channel state machine. Deviations of ComM channel machine state transitions and behavior within the states are specified explicitly.](SRS_ModeMgm_09268)

Note for section 7.1.1 - 7.1.3: Each ComM channel state machine is responsible to handle one channel/network with a connected Bus State Manager ("corresponding" = the channel/network the ComM channel state machine is responsible for).

Note for section 7.1.1 - 7.1.3: The ComM module contains one or several ComM channel state machine(s). ComM channel state machine communicates directly with its connected Bus State Manager, other interfaces are handled by the ComM module.

7.2.1 ComM managed and managing channels

A ComM channel could reference other ComM channels. The reference is configurable by setting ComMManageReference (see <u>ECUC ComM 00893</u>). The source ComM channel of a ComMManageReference is called "managing channel" and the target ComM channel is called "managed channel". A managing channel could reference 0..n managed channel. A managed channel could only be referenced by 0..1 managing channel.

This is used to support use cases, were a managing channel handle the interaction with the NM module and the managed channel has no NM.

Note: The following limitation have to be considered for a managing channel:

• ComMNmVariant of a managing channel is set to FULL (see <u>ECUC ComM 00568</u>)

Note: The following limitations have to be considered for a managed channel:

- ComMNmVariant of a managed channel is set to LIGHT, since the managing channel is responsible for the interaction with the NmChannel (see <u>ECUC_ComM_00568</u>)
- ComMPncGatewayType of a managed channel is neither set to COMM_GATEWAY_TYPE_ACTIVE nor COMM_GATEWAY_TYPE_PASSIVE (see <u>ECUC_ComM_00842</u>)

7.2.2 Behavior in state COMM_NO_COMMUNICATION

[SWS_ComM_00898] [On entering state COMM_NO_COMMUNICATION the ComM channel state machine shall go to sub-state COMM NO COM NO PENDING REQUEST.]()

[SWS_ComM_00313] [On entering state COMM_NO_COMMUNICATION by default after initialization, ComM module shall not indicate the mode change to users via RTE or BswM.]()

Rationale for <u>SWS_ComM_00313</u>: The RTE is not yet initialized at this point in time.

[SWS_ComM_00073] [On entering state COMM_NO_COMMUNICATION the ComM channel state machine shall switch off the transmission and reception capability. This shall be performed by the ComM channel state machine requesting the corresponding Communication Mode from the Bus State Manager module (XXSM_RequestComMode(network:=<channel state machine's network>, mode:= COMM NO COMMUNICATION, see SWS_ComM_00829)).]()

Rationale for <u>SWS_ComM_00073</u>: The COMM_NO_COMMUNICATION mode forbids sending and receiving of bus communication PDUs for the corresponding channels.

[SWS_ComM_00288] [On entering state COMM_NO_COMMUNICATION and configuration parameter ComMNmVariant=FULL (see <u>ECUC ComM 00568</u>) the ComM module shall request release of the network from the Network Management module, Nm NetworkRelease().]()

Note: Nm_NetworkRelease is needed if ComM has requested the Nm (Nm_NetworkRequest or Nm_PassiveStartup) for that channel before and has not yet released it.

Rationale for <u>SWS_ComM_00073</u>, <u>SWS_COMM_00288</u>, <u>SWS_ComM_00875</u> and <u>SWS_ComM_00876</u>: FlexRay shutdown cannot be interrupted to avoid partial networks.

Comment: In state COMM_NO_COMMUNICATION ComM channel state machine may not request bus communication for the configured channel from the Bus State Manager module.

Use Case for above Comment: The ECU is performing control functions locally without participation in bus communication.

Comment: The communication mode is local for one channel, thus the ECU may still communicate via other channels.

7.2.2.1 COMM_NO_COM_NO_PENDING_REQUEST sub-state

[SWS_ComM_00875] [In sub-state COMM_NO_COM_NO_PENDING_REQUEST and user requests COMM_FULL_COMMUNICATION and communication limitation is disabled (see Section 7.4.1), the ComM channel state machine shall immediately switch to sub-state COMM_NO_COM_REQUEST_PENDING.]()

[SWS_ComM_00876] [In sub-state COMM_NO_COM_NO_PENDING_REQUEST , configuration parameter ComMNmVariant=FULL|LIGHT|NONE (see ECUC ComM_00568) and DCM indicate ComM_DCM_ActiveDiagnostic (see SWS_ComM_00873), the ComM channel state machine shall immediately switch to sub-state COMM_NO_COM_REQUEST_PENDING.]()

Rationale for <u>SWS_ComM_00876</u>: A potential communication limitation (see Section 7.4.1) shall temporarily be inactive during an active diagnostic session (see <u>SWS_ComM_00182</u>)

Note for <u>SWS ComM 00876</u>: For diagnostic activation it is assumed that diagnostic tester keeps the bus awake, therefore no special handling needed for managed channels.

[SWS_ComM_00893] [If ComM_EcuM_WakeUpIndication is called in sub-state COMM_NO_COM_NO_PENDING_REQUEST and configuration parameter ComMSynchronousWakeUp=FALSE (see <u>ECUC_ComM_00695</u>), the ComM module shall switch the requested ComM channel state machine (resp. channels) to substate COMM_NO_COM_REQUEST_PENDING. If the indicated ComM channel is a managed channel, then the ComM channel state machine of the referencing managing channel (see <u>ECUC_ComM_00893</u>) shall also be switched to sub-state COMM_NO_COM_REQUEST_PENDING.](SRS_ModeMgm_09087)

[SWS_ComM_00894] [In sub-state COMM_NO_COM_NO_PENDING_REQUEST and the NM module indicates a restart, ComM_Nm_RestartIndication() SWS_ComM_00792, the ComM channel state machine shall immediately switch to sub-state COMM_NO_COM_REQUEST_PENDING.](SRS_ModeMgm_09087)

Rationale for <u>SWS_ComM_00893</u> and <u>SWS_ComM_00894</u>: It must be guaranteed that communication starts as soon as possible after a bus wake up.

Comment. The ComM channel state machine switches immediately to sub-stateCOMM_FULL_COM_NETWORK_REQUESTEDafterenteringtheCOMM_FULL_COMMUNICATIONstate.IfnouserrequestsCOMM_FULL_COMMUNICATIONmode, the AUTOSAR NM resp. the ComMmodule

timer for ComMTMinFullComModeDuration (<u>ECUC_ComM_00557</u>) prevent toggling between COMM_NO_COMMUNICATION and COMM_FULL_COMMUNICATION to overcome the init-/start-up time of the system, before possible user requests occur.

[SWS_ComM_00694] [If ComM_EcuM_WakeUpIndication is called in sub-state COMM_NO_COM_NO_PENDING_REQUEST and configuration parameter ComMSynchronousWakeUp=TRUE (ECUC_ComM_00695), the ComM module shall switch all ComM channel state machines (resp. channels) to sub-state COMM_NO_COM_REQUEST_PENDING.] (SRS_ModeMgm_09248)

[SWS_ComM_01014] [If ComM EcuM PNCWakeUpIndication(<PNC>) (see <u>SWS_ComM_91001</u>) is called in sub-state COMM NO COM NO PENDING REQUEST configuration parameters ComMSynchronousWakeUp=FALSE and (ECUC ComM 00695) and ComMPncSupport=TRUE (ECUC ComM 00839), the ComM module shall switch these ComM channel state machines (resp. channels) by referenced the PNC which are to sub-state COMM NO COM REQUEST PENDING. |(SRS_ModeMgm_09248)

Note for <u>SWS ComM 01014</u>: This includes ComM channel state machines of managing channels, which are referenced by the indicated managed channels, as ComMPncS reference always both types (see [31] constr_3484)

[SWS_ComM_01015] [If ComM_EcuM_PNCWakeUpIndication(<PNC>) (see <u>SWS_ComM_91001</u>) is called in sub-state COMM_NO_COM_NO_PENDING_REQUEST and configuration parameters ComMSynchronousWakeUp=TRUE (<u>ECUC_ComM_00695</u>) and ComMPncSupport=TRUE (see <u>ECUC_ComM_00839</u>), the ComM module shall switch all ComM channel state machines (resp. channels) to sub-state COMM_NO_COM_REQUEST_PENDING.](SRS_ModeMgm_09248)

7.2.2.2 COMM_NO_COM_REQUEST_PENDING sub-state

[SWS_ComM_00895] [In sub-state COMM_NO_COM_REQUEST_PENDING the ComM channel state machine shall evaluate its corresponding CommunicationAllowed flag, stored and set according to SWS_ComM_00884 and SWS_ComM_00885. If evaluated to CommunicationAllowed=TRUE, the ComM channel state machine shall immediately switch to state COMM_FULL_COMMUNICATION.]()

[SWS_ComM_00897] [In sub-state COMM_NO_COM_REQUEST_PENDING and no longer any valid pending request for COMM_FULL_COMMUNICATION, the ComM channel state machine shall switch back to default sub-state COMM NO COM NO PENDING REQUEST.]()

Rationale for <u>SWS_ComM_00897</u>: This enable the possibility to switch back to default sub-state if communication for some reason was never allowed. E.g. transition to COMM_NO_COM_REQUEST_PENDING triggered by user request for ComM_RequestComMode (<user>, COMM_FULL_COMMUNICATION) (see SWS_ComM_00871) or DCM indicated

ComM_DCM_ActiveDiagnostic(<channel>)(seeSWS_ComM_00873), butnowcanceledwithComM_RequestComMode(<user>, COMM_NO_COMMUNICATION)(seeSWS_ComM_00871)orDCMComM_DCM_InactiveDiagnostic(<channel>)(seeSWS_ComM_00874).SWS_ComM_00874).

7.2.3 Behaviour in state COMM_SILENT_COMMUNICATION

[SWS_ComM_00071] [On entering state COMM_SILENT_COMMUNICATION the ComM channel state machine shall switch off the transmission capability (and keep reception capability on). This shall be performed by the ComM channel state machine requesting the corresponding Communication Mode from the Bus State Manager module (XXSM_RequestComMode(network:=<channel state machine's network>, mode:= COMM_SILENT_COMMUNICATION) SWS ComM_00829).]()

Rationale for <u>SWS_ComM_00071</u>: The COMM_SILENT_COMMUNICATION mode permits receiving of bus communication PDUs and forbids sending of bus communication PDUs.

Comment: It may happen that nothing is received (e.g. during bus off) despite receiving capability is switched on.

Use Case: Shut down coordination with means of the NM module (prepare bus sleep state).

[SWS_ComM_00877] [In state COMM_SILENT_COMMUNICATION and user requests COMM_FULL_COMMUNICATION and communication limitation is disabled (see Section 7.4.1), the ComM channel state machine shall switch to state COMM_FULL_COMMUNICATION.]()

[SWS_ComM_00878] [In state COMM_SILENT_COMMUNICATION , configuration parameter ComMNmVariant=FULL|LIGHT|NONE (ECUC_ComM_00568) and DCM indicate ComM_DCM_ActiveDiagnostic(SWS_ComM_00873), the ComM channel state machine shall switch to state COMM_FULL_COMMUNICATION.]()

Rationale for <u>SWS ComM 00878</u>: A potential communication limitation (see Section 7.4.1) shall temporarily be inactive during an active diagnostic session, see <u>SWS ComM 00182</u>

[SWS_ComM_00295] [In state COMM_SILENT_COMMUNICATION and the Network Manager module indicates ComM_Nm_BusSleepMode() (SWS_ComM_00392), the ComM channel state machine shall switch to state COMM_NO_COMMUNICATION.]()

[SWS_ComM_00296] [In state COMM_SILENT_COMMUNICATION and the Network Manager module indicates ComM_Nm_NetworkMode() (SWS_ComM_00390), the

ComM channel state machine shall switch to state COMM_FULL_COMMUNICATION and sub-state COMM_FULL_COM_READY_SLEEP.J()

7.2.4 Behaviour in state COMM_FULL_COMMUNICATION

[SWS_ComM_00899] [On entering state COMM_FULL_COMMUNICATION the ComM channel state machine shall go to sub-state COMM_FULL_COM_NETWORK_REQUESTED, if not a specific sub-state is specified in the transition.]()

Rationale for <u>SWS ComM 00899</u>: When switching from COMM_SILENT_COMMUNICATION, the ComM channel state machine can switch directly to sub-state COMM_FULL_COM_READY_SLEEP, if specified in the transition, see <u>SWS ComM 00296</u>.

[SWS_ComM_00069] [On entering state COMM_FULL_COMMUNICATION the ComM channel state machine shall switch on the <u>transmission</u> and <u>reception</u> capability. This shall be performed by the ComM channel state machine requesting the corresponding Communication Mode from the Bus State Manager module:

- COMM FULL COMMUNICATION WITH WAKEUP REQUEST was requested and ComMWakeupSleepRequestEnabled of the ComM channel is set to TRUE, <Bus>SM RequestComMode(network:=<channel then state machine's network>, mode:= COMM FULL COMMUNICATION WITH WAKEUP REQUEST) shall be called Communication lf Mode COMM FULL COMMUNICATION WITH WAKEUP REQUEST was requested and ComMWakeupSleepRequestEnabled of the ComM channel is set to FALSE or not available, then <Bus>SM RequestComMode (network:=<channel state machine's network>, mode:= COMM FULL COMMUNICATION) shall be called

J(SRS_ModeMgm_09268)

Rationale for <u>SWS ComM 00069</u>: The COMM_FULL_COMMUNICATION or COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST mode permits sending and receiving of bus communication PDUs for the corresponding channels.

[SWS_ComM_01057] DRAFT [Every time a ComM channel is requested with COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST and ComMWakeupSleepRequestEnabled of the ComM channel is set to TRUE, ComM shall request the corresponding network of the ComM channel by calling

<Bus>SM_RequestComMode(COMM_FULL_COMMUNICATION_WITH_WAKEUP_ _REQUEST), even if the ComM channel is already in state COMM_FULL_COMMUNICATION. If ComMWakeupSleepRequestEnabled of the ComM channel is set to FALSE or not available, the ComM shall ignore the request.J(SRS_ModeMgm_09268)

Note: The re-trigger of the <Bus>SM state machine is used to trigger a wake-up on the network, if the used hardware is supporting such a functionality (e.g. Ethernet hardware compliant to OA TC10 (see [33]))

[SWS_ComM_00637] [In state COMM_FULL_COMMUNICATION and the Network Manager module indicates ComM_Nm_BusSleepMode() (SWS_ComM_00392), the ComM channel state machine shall switch to state COMM_NO_COMMUNICATION.]()

Rationale for <u>SWS_ComM_00637</u>: A user may request to keep the bus awake "too late" (NM is not able to send a vote to keep the bus awake because the cluster already agreed to shutdown).

[SWS_ComM_01018][In state COMM_FULL_COMMUNICATION and configuration parameter ComMNmVariant=SLAVE_ACTIVE | SLAVE_PASSIVE and the Bus State Manager module indicates ComM_BusSm_BusSleepMode() (see SWS ComM_91000), the ComM channel state machine shall switch to state COMM_NO_COMMUNICATION.](SRS_ModeMgm_09266, SRS_ModeMgm_09267)

[SWS ComM 00826] COMM FULL COMMUNICATION configuration In and parameter ComMNmVariant=FULL|PASSIVE (ECUC_ComM_00568) and the Network Manager module indicates ComM Nm PrepareBusSleepMode() (SWS ComM 00391). the ComM state machine shall switch state to COMM SILENT COMMUNICATION. ()

Rationale for <u>SWS_ComM_00826</u>: ComM_Nm_PrepareBusSleepMode() cannot be received before an active request is released via Nm_NetworkRelease(), and a PASSIVE channel cannot be woken up by an active wake-up, therefore it is safe to assume that the transition is always valid.

7.2.4.1 COMM_FULL_COM_NETWORK_REQUESTED sub-state

[SWS_ComM_00886] [On entering sub-state COMM_FULL_COM_NETWORK_REQUESTED and configuration parameter ComMNmVariant=LIGHT|NONE (ECUC_ComM_00568), the timer for ComMTMinFullComModeDuration (ECUC_ComM_00557) shall be started.]()

[SWS ComM 00665] [On entering sub-state COMM FULL COM NETWORK REQUESTED from COMM NO COM REQUEST PENDING module and EcuM has indicated а wake-up by ComM EcuM WakeUpIndication (<channel>) (see SWS_ComM_00275) or by ComM EcuM PNCWakeUpIndication (<PNC>) (see SWS_ComM_91001), the

ComM module shall request Nm_PassiveStartup(<channel>) from the Network Management. If the indicated ComM channel is a managed channel, the ComM module shall request Nm_PassiveStartup(<referencing managing channel>) (see <u>ECUC ComM 00893</u>) from the Network Management.]()

[SWS_ComM_01016][If the indicated ComM channel is a managed channel, the ComM module shall request Nm_PassiveStartup(<referencing managing channel>) (see ECUC ComM_00893) from the Network Management.]()

[SWS_ComM_00902] [On entering sub-state COMM_FULL_COM_NETWORK_REQUESTED and Nm module has indicated a restart, ComM_Nm_RestartIndication(<channel>) (SWS_ComM_00792), the ComM module shall request Nm_PassiveStartup(<channel>) from the Network Management]()

[SWS_ComM_00903] [On entering sub-state COMM_FULL_COM_NETWORK_REQUESTED and Nm module has indicated a Network start, ComM_Nm_NetworkStartIndication(<channel>) (SWS_ComM_00383), the ComM module shall request Nm_PassiveStartup(<channel>) from the Network Management]()

Comment for <u>SWS_ComM_00903</u>:

This is not a "normal" transition to COMM_FULL_COMMUNICATION, ComM handle ComM_Nm_NetworkStartIndication() as "race condition" error (see section 7.7.1)

[SWS ComM 00869] [On entering sub-state COMM FULL COM NETWORK REQUESTED from another state or substate, if configuration parameter ComMNmVariant=FULL (ECUC_ComM_00568) and if a user has requested ComM RequestComMode (<user>, COMM FULL COMMUNICATION) (SWS ComM 00110) the ComM module shall request Nm NetworkRequest (<channel>) from the Network Management for the corresponding NM channel. (SRS_ModeMgm_00049)

Note: Additionally Nm_NetworkRequest may be invoked due to SWS ComM 00980.

[SWS_ComM_00870] [On entering sub-state COMM_FULL_COM_NETWORK_REQUESTED, if configuration parameter ComMNmVariant=FULL (ECUC_ComM_00568) and the DCM has indicated ComM_DCM_ActiveDiagnostic(<channel>) (SWS_ComM_00873), the ComM module shall request Nm_NetworkRequest(<channel>) from the Network Management for the corresponding NM channel.J(SRS_ModeMgm_00049)

[SWS_ComM_00889] [In sub-state COMM_FULL_COM_NETWORK_REQUESTED and configuration parameter ComMNmVariant=LIGHT|NONE (ECUC ComM 00568) and timer for ComMTMinFullComModeDuration(ECUC ComM 00557) has expired and no user request

ComM_RequestComMode (<user>, COMM_FULL_COMMUNICATION) and the DCM does not indicate ComM_DCM_ActiveDiagnostic (<channel>) (SWS_ComM_00873), the ComM channel state machine shall switch to sub-state COMM_FULL_COM_READY_SLEEP.J()

Rationale for <u>SWS_ComM_00889</u>:

As long as timer for ComMTMinFullComModeDuration has not expired the substate shall be kept, to prevent toggling.

[SWS_ComM_00888] [In sub-state COMM_FULL_COM_NETWORK_REQUESTED and configuration parameter ComMNmVariant=FULL (see <u>ECUC ComM_00568</u>) and no user request ComM_RequestComMode(<user>, COMM_FULL_COMMUNICATION) and the DCM does not indicate ComM_DCM_ActiveDiagnostic(<channel>) (see <u>SWS_ComM_00873</u>), the ComM channel state machine shall switch to sub-state COMM_FULL_COM_READY_SLEEP.]()

Rationale for <u>SWS_ComM_00888</u>:

No timer needed if AUTOSAR NM is used. This avoids redundant functionality because AUTOSAR NM also ensures this functionality

[SWS_ComM_01017] [In sub-state COMM FULL COM NETWORK REQUESTED and configuration parameter ComMNmVariant=SLAVE ACTIVE (ECUC_ComM_00568) and no user request ComM RequestComMode (<user>, COMM FULL COMMUNICATION), the ComM channel machine shall switch to sub-state state COMM FULL COM READY SLEEP. (SRS_ModeMgm_09266)

[SWS_ComM_00915] [In sub-state COMM_FULL_COM_NETWORK_REQUESTED and configuration parameter ComMNmVariant=PASSIVE | SLAVE_PASSIVE (ECUC_ComM_00568), the ComM channel state machine shall switch to sub-state COMM_FULL_COM_READY_SLEEP.](SRS_ModeMgm_09267)

[SWS ComM 00890] [In sub-state COMM FULL COM NETWORK REQUESTED and the DCM does not indicate ComM DCM ActiveDiagnostic (<channel>) (see SWS ComM 00873) and communication limitation is requested (see section 7.4.1), ComM channel state machine shall immediately switch to sub-state COMM FULL COM READY SLEEP cancel the timer and for ComMTMinFullComModeDuration. ()

7.2.4.2 COMM_FULL_COM_READY_SLEEP sub-state

[SWS_ComM_00133] [On entering sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMNWariant=FULL (see <u>ECUC_ComM_00568</u>), the ComM module shall request Nm_NetworkRelease() from the Network Management for the corresponding NM channels.]()

[SWS_ComM_00891] [On entering sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMNmVariant=LIGHT (see <u>ECUC_ComM_00568</u>), the timer for ComMNmLightTimeout (see <u>ECUC_ComM_00606</u>) shall be started.]()

[SWS_ComM_00610] [In sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMNmVariant=LIGHT (see <u>ECUC ComM_00568</u>) and the timer for ComMNmLightTimeout (see <u>ECUC ComM_00606</u>) has expired, the ComM channel state machine shall switch to state COMM_NO_COMMUNICATION.]()

[SWS_ComM_00671] [In sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMBusType=COMM_BUS_TYPE_INTERNAL (<u>ECUC_ComM_00567</u>), the ComM channel state machine shall immediately switch to state COMM_NO_COMMUNICATION.]()

[SWS_ComM_00882] [In sub-state COMM_FULL_COM_READY_SLEEP and a user request COMM_FULL_COMMUNICATION and communication limitation is disabled (see Section 7.4.1), the ComM channel state machine shall immediately switch to sub-state COMM FULL COM NETWORK REQUESTED.]()

[SWS_ComM_00883] [In sub-state COMM_FULL_COM_READY_SLEEP, configuration parameter ComMNmVariant=FULL|LIGHT|NONE (ECUC_ComM_00568) and DCM indicate ComM_DCM_ActiveDiagnostic(SWS_ComM_00873), the ComM channel state machine shall switch to sub-state COMM FULL COM NETWORK REQUESTED.]()

Rationale for <u>SWS_ComM_00883</u>: A potential communication limitation (see Section 7.4.1) shall temporarily be inactive during an active diagnostic session, see <u>SWS_ComM_00182</u>

[SWS_ComM_00892] [In sub-state COMM_FULL_COM_READY_SLEEP and configuration parameter ComMNmVariant=LIGHT (ECUC_ComM_00568) and a switch to sub-state COMM_FULL_COM_NETWORK_REQUESTED, due to request for COMM_FULL_COMMUNICATION according to requirements in SWS_ComM_00882 or SWS_ComM_00883, the timer for ComMNmLightTimeout (ECUC_ComM_00606) shall be canceled.]()

7.3 ComM User to PNC Relations

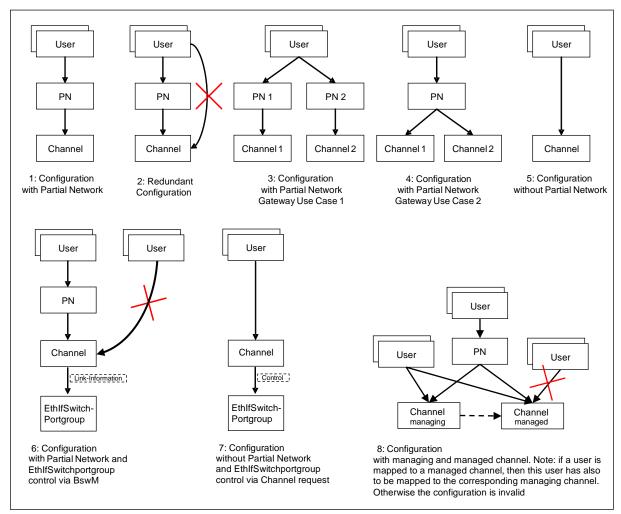

Figure 6: User to Partial network and channel Mapping Use Cases

[SWS_ComM_00994] [No restrictions from the configuration of the BusNm Filter for partial networking shall apply to ComM user assignment to PNCs.]()

Comment: The BusNM Filter configuration shall be independent from the ComM PNC configuration.

Rational: This enables waking up a PNC without being a member of the PNC, e.g. if a node just triggers a wake up of a PNC but the node is not kept awake by the PNC and other nodes keep the PNC awake

[SWS_ComM_00995] [It shall be possible to map a configurable amount of ComMUsers to one or more ComM channels using the parameter ComMUserPerChannel.](SRS_ModeMgm_09133, SRS_ModeMgm_09090)

Comment.

1.) The existing mapping of ComM users to system channels shall still be possible for backward compatibility. (i.e. the configuration containers will stay untouched)

2.) In a multi channel system each user can be assigned to one or more channels. If the user requests a mode, all channels assigned to this user, shall switch to the corresponding mode. All other channels shall not be affected.

[SWS_ComM_00912] [It shall be possible to map a configurable amount of ComMUsers to one or more PNCs using the parameter ComMUserPerPnc (see <u>ECUC_ComM_00876</u>).]()

[SWS_ComM_00913] [It shall be possible to map a configurable amount of PNC(s) to a configurable amount of ComM channels using the parameter ComMChannelPerPnc (see <u>ECUC ComM_00880</u>). The mapping shall be possible for all ComMChannels in combination with the following ComMNmVariants:

- ComMVariant=FULL
- ComMVariant=LIGHT, if the ComMChannel is in the role of a managed ComMChannel and the corresponding managing ComMChannel is also mapped to this PNC (see also 7.2.1)

]()

[SWS_ComM_00996] [It shall not be possible to map a ComMUsers to a PNC and in addition to a ComM channel which is already referenced by the PNC (see figure 6 Use Case 2)]()

Rational: Avoid redundant configuration since the channel is implicitly already referenced by the PNC.

[SWS_ComM_CONSTR_00001] [ComM channel's that are referenced by a PNC are not allowed to be referenced by any ComMUsers, if the PNC references at least one EthIfSwitchPortGroup (see figure 6 "use Case 6"). A configuration tool shall reject such a configuration as invalid (error). This constraint is only valid for a host ecu that control an Ethernet switch. In all other UseCases ComMChannels can be referenced by a PNC's and ComMUsers.]()

Rational: If using PNC and SwitchPortGroups were derived (EcuInstance.ethSwitchPortGroupDerivation==TRUE), then the SwitchPortGroups are switched by the EthIf_SwitchPortGroupRequestMode API and not by a channel request.

[SWS_ComM_CONSTR_00002] [If a ComM user reference a managed channel, then this ComM user shall also reference the corresponding managing channel. Otherwise the configuration is invalid. A configuration tool shall reject a configuration as invalid (error), if a user reference a managed channel without referencing the corresponding managing channel.]()

[SWS_ComM_CONSTR_00003] DRAFT [ComM channels with ComMNmVariant = SLAVE_PASSIVE are not allowed to be referenced by any ComMUser or PNC. A configuration tool shall reject such a configuration as invalid (error).] (SRS_ModeMgm_09266)

Rational: ComM channels with ComMNmVariant = SLAVE_PASSIVE shall always follow the communication request of their communication master and are not allowed to request the corresponding master to wake-up the communication channel.

7.4 Extended functionality

[SWS_ComM_00470] [The extended functionality described in this chapter shall be individually configurable during runtime per feature (e.g. enable wake up inhibition but disable limitation to no communication).]()

Rationale for <u>SWS ComM 00470</u>: During runtime a change in the inhibition / limitation strategy is required in order to cope with changing conditions.

Use Case: Change the wakeup inhibition via diagnostics.

Comment: Configurable with parameter ComMEcuGroupClassification (see <u>ECUC ComM 00563</u>).

7.4.1 Communication inhibition

Note:

- 1. The purpose of mode inhibition is to limit the communication capabilities. For details see Section 7.4.1.1 and Section 7.4.1.2.
- 2. The following parameters are relevant to communication inhibition and have relationship to APIs described below:
 - a. ComMNoCom: "request bit" of mode inhibition (limit to NoCom), can be controlled by ComM_LimitChannelToNoComMode() and ComM_LimitECUToNoComMode(), only if ComMEcuGroupClassification enable this functionality (see ECUC_ComM_00563, SWS_ComM_00163, SWS_ComM_00124).
 - b. ComMNoWakeup: "request bit" of mode inhibition (wakeup inhibition), can be controlled by ComM_PreventWakeUp(), only if ComMEcuGroupClassification enable this functionality (see <u>ECUC_ComM_00563</u>, SWS_ComM_00156).
 - c. ComMEcuGroupClassification: "mask bits" of mode inhibition behavior, can be controlled by ComM_SetECUGroupClassification(), regardless of ComMNoCom and ComMNoWakeup values

[SWS_ComM_00301] [The ComM module shall offer interfaces to request and release the corresponding mode inhibitions.]()

Comment: The ComM module doesn't care about who requests the mode inhibition but it is not a "normal" SW-C. It is a privileged SW-C or an OEM specific BSW.

[SWS_ComM_00488] [It shall be possible to enable and disable the mode inhibition for each channel (channel state machine) independently. This functionality shall not be used by the ComM module itself.]()

[SWS_ComM_00839] [The ComM module shall store the status of the user requests.]()

Comment: SWS_ComM_00839 describes the desired behaviour during an active mode limitation.

[SWS_ComM_00840] [The ComM module shall store the updated status of the user requests if a user releases a request during an active mode inhibition.]()

Rationale for <u>SWS_ComM_00840</u>: User requests shall be granted if the inhibition gets disabled.

Comment: Amount of active user requests from different users. <u>SWS_ComM_00840</u> describes the desired behaviour during an active mode limitation.

[SWS_ComM_00182] [The communication inhibition shall get temporarily inactive during an active diagnostic session.]()

Rationale for <u>SWS ComM 00182</u>: ECUs must not fall asleep during an active diagnostic session.

Comment: The DCM indicates the start of an active diagnostic session with
ComM_DCM_ActiveDiagnostic(<channel>)(SWS ComM_00873) and the end
of
a diagnostic
Session with
ComM_DCM_InactiveDiagnostic(<channel>)(SWS ComM_00874).

7.4.1.1 Bus wake up inhibition

Information: Bus wake up inhibition in context of the ComM module means that the ComM module should take precautions against awaking other ECUs by starting the communication.

Rationale: Awaking other ECUs by communication should be avoided because it is assumed that the ECU wakes up the bus because of an error (e.g. broken sensor).

Use Case: An error was detected on signal path of an active wake up line and this non reliable wake-up-source should not be able to awake the whole system anymore. An SW-C that controls error-reactions could set the wake up inhibition-status of related communication channels that usually get communication-requests from SW-Cs as the consequence of this event. This corrupts the forwarding of communication system-wide, based on unreliable wake up events. Or in case of application-specific system control, there is an SW-C that should switch off forwarding system wide wakeup's by communication under conditions like e.g. transport mode.

[SWS_ComM_00302] [Bus wake up Inhibition shall be performed by ignoring user requests.](SRS_ModeMgm_09089)

Comment. Ignoring user requests means accepting the requests but not executing them due to mode inhibition. The "highest win" strategy would apply immediately as soon as mode inhibition is switched off (see <u>SWS ComM 00839</u> and <u>SWS ComM 00840</u>).

[SWS_ComM_00218] [A communication request (COMM_FULL_COMMUNICATION) by a user shall be inhibited if the ComM Inhibition status is equal to ComMNoWakeup=TRUE (ECUC_ComM_00569) for the corresponding channel and the current state of the channel is COMM_NO_COMMUNICATION or COMM SILENT COMMUNICATION J()

Rationale for <u>SWS ComM 00218</u>: The inhibition should not get active, if the inhibition-status is set but the communication channel is already active.

[SWS_ComM_00219] [The inhibition shall not get active if the current communication state is COMM_FULL_COMMUNICATION.]()

Rationale for <u>SWS ComM 00219</u>: The bus is already awake if the current communication state is COMM FULL COMMUNICATION.

[SWS_ComM_00066] [The ComM module shall never inhibit the "passive wake-up" capability.]()

Rationale for <u>SWS_ComM_00066</u>: It must be always possible to react on bus wake ups indicated by the EcuM module.

Comment: Reception is switched off in COMM_NO_COMMUNICATION mode but the wake up capability is switched on.

[SWS_ComM_00157] [ComMNoWakeup status must be stored non volatile.]()

Rationale for <u>SWS ComM 00157</u>: Information must be available during start-up, before the communication is active ("Full Communication" mode entered). Changing or query is only possible after start-up with active communication (usually the "master", who decides if the inhibition is active or not, is not on the same ECU).

[SWS_ComM_00625] [The status of the user requests shall also be updated if a user releases a request.]()

7.4.1.2 Limit to COMM_NO_COMMUNICATION mode

[SWS_ComM_00303] [The ComM module shall perform the limit to COMM_NO_COMMUNICATION mode by switching to COMM_FULL_COM_READY_SLEEP state to initiate a shutdown despite user requests for COMM_FULL_COMMUNICATION mode and ignoring new COMM_FULL_COMMUNICATION mode requests.](SRS_ModeMgm_09071)

Rationale for <u>SWS_ComM_00303</u>: Forcing into COMM_NO_COMMUNICATION mode is needed to shut down software components, which keeps the bus awake.

[SWS_ComM_00355] ComM shall force an ECU reset by invoking BswM_ComM_InitiateReset() after entering "No Communication" mode if configured (ComMResetAfterForcingNoComm=TRUE).]()

Rationale: It is assumed that a faulty user will not release his "Full Communication" request without a re-initialization. Keeping the "Full Communication" request active leads to a toggling between network shutdown and network startup.

Use Case: It is assumed that a faulty ECU keeps the bus awake. As a consequence a "network master" decides to force all ECUs to go to sleep.

[SWS_ComM_00841] [The ComM module shall only perform the limit to COMM_NO_COMMUNICATION mode if the current state is COMM FULL COM NETWORK REQUESTED.]()

Note: <u>SWS COMM_00841</u> refers only to the state machine transitions. This means, other actions like update of the inhibition status due to a limit to COMM_NO_COMMUNICATION shall always be performed independent of the current state.

[SWS_ComM_00842] [The ComM module shall ignore requests for limit to COMM_NO_COMMUNICATION in other states than COMM FULL COM NETWORK REQUESTED.]()

Note: <u>SWS_COMM_00841</u> and <u>SWS_COMM_00842</u> describe the behaviour if a local ComM user requests FULL_COM (active request) for a dedicated ComM channel. This means, limit to COMM_NO_COMMUNICATION shall only be performed if a channel was request actively. The limit to no communication shall not be performed, if a ComM channel is remotely kept awake due to a passive wakeup.

[SWS_ComM_00215] [All active user requests for communication channel X shall be ignored if the ComM Inhibition ComMNoCom=TRUE (see <u>ECUC_ComM_00571</u>) for the corresponding channel to guarantee entering the COMM_NO_COMMUNICATION state for channel X.]()

[SWS_ComM_00582] [The ComM module shall clear the user requests after all the channels that belong to the corresponding user enter COMM_NO_COMMUNICATION mode.]()

Rationale for <u>SWS_ComM_00582</u>: Stored (faulty) user requests, which are assumed to keep the bus awake, must be cleared.

Description: The ComM module shall reload the default value of the ComM inhibition status from ComMNoCom (see <u>ECUC_ComM_00571</u>) during initialization.

Comment: The current ComMNoCom status for each channel shall not be stored persistently. SWS_ComM_00582 describes the desired behaviour after an executed mode limitation.

7.5 Bus communication management

[SWS_ComM_00402] [The ComM module shall use the corresponding interfaces of the Bus State Manager modules to control the communication capabilities.]()

[SWS_ComM_00664] [The ComM module shall omit calls to control the communication capabilities if configuration parameter ComMBusType=COMM_BUS_TYPE_INTERNAL (ECUC_ComM_00567).](SRS_ModeMgm_09168)

Rationale for <u>SWS_ComM_00664</u>: Internal communication has no corresponding bus interface.

7.6 Network management dependencies

[SWS_ComM_00599] [The ComM module shall support the shutdown synchronization variants (configured with ComMNmVariant, see ECUC_ComM_00568) LIGHT, SLAVE_ACTIVE, SLAVE_PASSIVE, PASSIVE and FULL described in Table 3.]()

Comment: Only variant FULL and PASSIVE guarantees a synchronized shutdown between all nodes of a network. Note that since the Nmlf cannot start the synchronized shutdown of coordinated networks before all networks are ready to go to sleep, requests from ComM to Nmlf to release network communication on such a coordinated bus will be considered, but not always acted on directly. The Nmlf will still answer with E_OK , but network will not be released until all coordinated networks are ready to go to sleep.

NM variant	Keep bus awake capability	Shutdown synchronization
NONE		No shutdown synchronization by ComM. Shutdown by switching off the power of the ECU.
SLAVE_ACTIVE	No (but the corresponding master could trigger a wake-up based on a slave request for a wake-up. E.g. the LIN State Manager of a LIN master restarts wake-up repetition)	Synchronized by its master (e.g. LIN master)
SLAVE_PASSIVE	No (the slave will always follow the communication request of the corresponding master. The slave has no possibility to request a wake-up on the corresponding communication channel.	Synchronized by its master (e.g. ComM channel with ComMBusType set to COMM_BUS_TYPE_ETH and used Ethernet hardware is compliant to OA TC10 (see [33]))
LIGHT		Shutdown synchronization by ComM with means of a timeout (configured with

		ComMNmLightTimeout, <u>ECUC_ComM_00606</u>)
PASSIVE	ECU is not allowed to keep the bus awake	Shutdown synchronization by ComM with means of AUTOSAR NM.
FULL	ECU is allowed to keep the bus awake.	Shutdown synchronization by ComM with means of AUTOSAR NM.

Table 3: Network management variants supported by the Communication Manager Module

Comment: A synchronized shutdown is not possible with the LIGHT variant thus the ECU may continuously restart ("toggle") because of a message from a node shutting down later.

[SWS_ComM_00602] [The ComM module shall omit calls of NM services if configuration parameter ComMNmVariant = LIGHT | SLAVE_ACTIVE | SLAVE PASSIVE | NONE (see ECUC ComM_00568).]()

Rationale for <u>SWS ComM 00602</u>: NM services are not available if no NM is available.

[SWS_ComM_00667] [The ComM module shall omit to call Nm_NetworkRequest() from NM if configuration parameter ComMNmVariant= LIGHT|SLAVE_ACTIVE|SLAVE_PASSIVE|NONE (see <u>ECUC_ComM_00568</u>).]()

Rationale for <u>SWS ComM 00667</u>: Service Nm_NetworkRequest() is not available.

7.7 Bus error management

7.7.1 Network Start Indication

[SWS_ComM_00583] [The ComM module shall switch channel X to COMM_FULL_COMMUNICATION if NM indicates ComM_Nm_NetworkStartIndication(<channel X>) and CommunicationAllowed flag is set to TRUE.]()

Use Case for <u>SWS ComM 00583</u>: A node sends an NM message in "Prepare Bus Sleep" state but other nodes are already in "Bus Sleep" state because of "race conditions".

7.8 Test support requirements

7.8.1 Inhibited Full Communication Request Counter

[SWS_ComM_00138] [The ComM module shall provide one Inhibit counter for all rejected COMM FULL COMMUNICATION mode requests. It shall count user requests,

which cannot be fulfilled because the system has inhibited communication modes.](SRS_ModeMgm_09155)

Rationale for <u>SWS ComM 00138</u>: The counter is used for detecting latent software problems related to unmotivated communication bus wake ups.

[SWS_ComM_00140] [The Inhibit counter (<u>SWS_ComM_00138</u>) for all rejected COMM_FULL_COMMUNICATION mode requests shall be stored in non-volatile memory.]()

[SWS_ComM_00141] [The range of the Inhibit counter (<u>SWS_ComM_00138</u>) for all rejected COMM_FULL_COMMUNICATION mode requests shall be 0 to 65535.]()

[SWS_ComM_00142] [The Inhibit counter (<u>SWS_ComM_00138</u>) for all rejected COMM_FULL_COMMUNICATION mode requests shall stop to increment if the maximum counter value is reached.]()

[SWS_ComM_00143] [It shall be possible to read out and reset the Inhibit counter (<u>SWS_ComM_00138</u>) for all rejected COMM_FULL_COMMUNICATION mode requests value by a ComM module API call.]()

Use Case for <u>SWS ComM 00143</u>: It shall be possible to read out and reset the current status of the counter by a diagnostic service.

7.9 Error classification

Section 7.2 "Error Handling" of the document "General Specification of Basic Software Modules" describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.9.1 Development errors

Type of error	Related error code	Error value
API service used without module initialization	COMM_E_UNINIT	0x1
API service used with wrong parameters	COMM_E_WRONG_PARAMETERS	0x2
API Service used with a null pointer	COMM_E_PARAM_POINTER	0x3
Initialization failed	COMM_E_INIT_FAILED	0x4

[SWS ComM 00234][

J(SRS_BSW_00323, SRS_BSW_00327, SRS_BSW_00337, SRS_BSW_00385, SRS_BSW_00386)

[SWS_ComM_00612] [If ComM is not initialized, all ComM module and all API service other than ComM_Init() (see <u>SWS_ComM_00146</u>),

ComM_GetVersionInfo() (see <u>SWS_COMM_00370</u>) and ComM_GetStatus() (see <u>SWS_COMM_00242</u>); shall:

- not execute their normal operation,
- and return E_NOT_OK, if it has a standard return type. J(SRS_BSW_00406)

[SWS_ComM_00858] [If development error detection is enabled by ComMDevErrorDetect (see <u>ECUC_ComM_00555</u>): the function shall check that the service ComM_Init was previously called. If the check fails, the function shall raise the development error COMM_E_UNINIT otherwise (if DET is disabled) return E_NOT_OK. J(SRS_BSW_00406)

7.9.2 Runtime Errors

There are no runtime errors.

7.9.3 Transient Faults

There are no transient faults.

7.9.4 Production Errors

There are no production errors.

7.9.5 Extended Production Errors

There are no extended production errors.

7.10 Communication Manager Module Services

This section defines the AUTOSAR Interfaces of the Communication Manager Module Service (ComM).

7.10.1 Architecture

The overall architecture of the Communication Manager Module service is depicted in Figure 7:

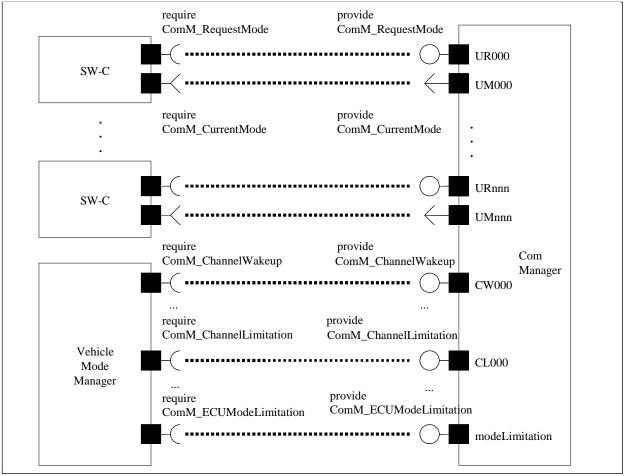

Figure 7: ARPackage of the Communication Manager Module

7.10.2 Use Cases

7.10.2.1 SW-Cs does not care about the ComM module at all

A SW-C that does not care about the Communication Manager Module will not require any of the interfaces defined in the ARPackage of the Communication Manager Module.

7.10.2.2 SW-Cs only cares about the state of its communication system

In this use case, a SW-C wants to know what communication capabilities it has (expressed by a communication mode 'none', 'silent' or 'full' - see ComM_ModeType). The SW-C finds out about that by defining a port requiring the Interface ComM_GetCurrentComMode. Depending on the available communication capabilities, the SW-C can specify that certain runnables of the SW-C should be executed or not. The Communication Manager Module must be configured correctly (with e.g. the physical channels that this SW-C uses for its logical communication) such that it has a port that provides this information about the current communication mode to the SW-C.

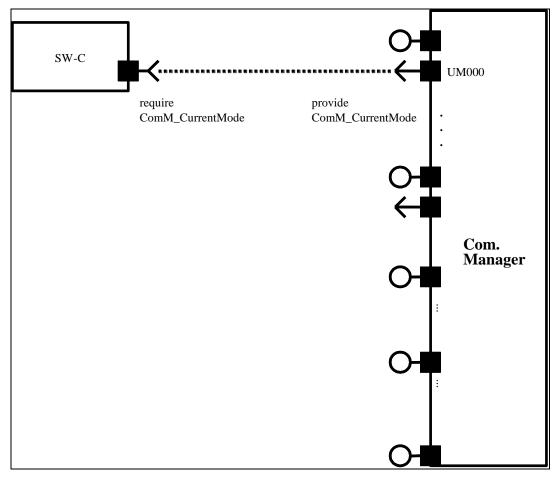

Figure 8: SW-C requests state changes to the Communication Manager Module

7.10.2.3 SW-Cs explicitly wants to take influence on its communication state

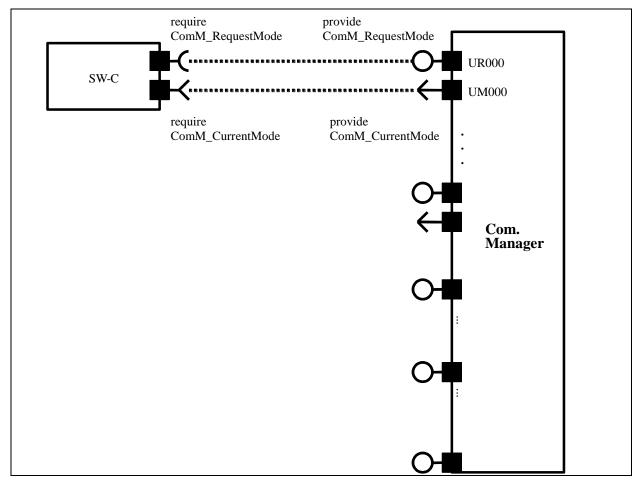

Figure 9: SW-C requires state changes within the Communication Manager Module and reads out current communication state

In this use case, the SW-C wants to explicitly take influence on the communicationstate of the physical channels it needs. The SW-C indicates this by a specific port. Through this port, the SW-C can then request the Communication Manager Module mode "No Communication" or "Full Communication". The Communication Manager Module will use these calls to request the corresponding communication mode from the corresponding Bus State Manager module.

[SWS_ComM_00848] The Communication Manager Module shall provide an AUTOSAR port to allow the request of an communication mode by calling 'ComM RequestComMode' (see <u>SWS_ComM_00110</u>).]()

For a SW-C using the "direct API" of the RTE, the SW-C could for example do the following:

```
MySW-C_Runnable_Init(self)
{
    // SW-C wants to send and receive data
    e = Rte_Call_comRequest_RequestComMode(COMM_FULL_COMMUNICATION);
```

```
if (e == RTE E OK)
     {
          // successfully requested the Com Manager Module to move to
          // full communication mode
     }
     else
     {
          // an error occurred when
          // interacting with the Com Manager module
          if (e == E MODE LIMITATION)
          {
               // a current ComMMode limitation forbids going into
               // that mode;
               // let's ask what the maximal allowed ComMMode is
               Rte Call comRequest GetMaxComMode(&max);
               if (max==COMM NO COMMUNICATION)
               {
                    ....
               };
          }
          else
          {
               // a more serious error occurred ...
          };
     };
     ...
};
MySW-C Runnable Loop(self)
     if (status == ready to sleep)
     {
          //no need to send; ready for shutdown communication
          Rte_Call_comRequest_RequestComMode(COMM_NO_COMMUNICATION);
          ...
     };
};
```

Comment. Note that these APIs do not require that the SW-C has knowledge of the channels that it needs.

7.10.2.4 SW-C wants to interact directly with physical channels activate **ECU Mode Limitation**

The SW-C shall request mode from BswM. BswM will handle the direct communication with ComM.

{

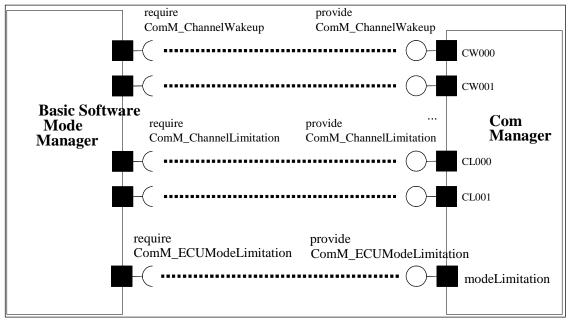

Figure 10: Interaction between BswM and the ComM module

7.10.3 Specification of Ports and Port Interfaces

This section specifies the Port Interfaces that are needed to operate the Communication Manager Module functionality over the RTE.

7.10.3.1 Types used by the interfaces

See 8.7.4 Implementation Data Types

7.10.3.2 Ports and Port Interface for User Requests

7.10.3.2.1 General Approach

A SW-C that wants to explicitly direct the local Communication Manager Module of the ECU towards a certain state requires the client-server interface ComM_UserRequest. Through this interface the SW-C can set the desired state of all communication channels that are relevant for that component, to "No Communication" or "Full Communication". In order to keep the SW-Cs code independent from the values of the handles that are used to identify the user towards the Communication Manager Module, these handles are not passed from the SW-C to the Communication Manager Module. Rather they are modeled as "port defined argument values" of the Provide Ports on the Communication Manager Module's side. As a consequence, these handles do not show up as arguments in the operations of the client-server interface ComM_UserRequest. As a further consequence of this approach, the Communication Manager Module has a separate port for each user.

7.10.3.2.2 Data Types

No data types are needed for this interface.

7.10.3.2.3 Port interface ComM_UserRequest

See 8.7.2.4 ComM_UserRequest

7.10.3.3 Ports and Port Interfaces for the current mode of the Communication Manager Module

7.10.3.3.1 General approach

[SWS_ComM_00847] [The Communication Manager Module shall have an AUTOSAR port providing the ModeSwitchInterface interface 'ComM_CurrentMode'.]()

[SWS_ComM_00733] [The Communication Manager Module shall have a separate port providing the ModeSwitchInterface interface 'ComM_CurrentMode' for each configured user, to which a SW-C is connected. |()

A SW-C that wants to get informed about its current Communication Manager Module Mode requires the ModeSwitchInterface interface ComM CurrentMode.

7.10.3.3.2 Port interface ComM_CurrentMode

See 8.7.3.1 ComM_CurrentMode.

7.10.3.4 Ports and Port Interfaces for the ComM users currently requesting COMM_FULL_COMMUNICATION

7.10.3.4.1 General approach

[SWS_ComM_00734] [The Communication Manager Module shall have an optional (see <u>ECUC ComM 00787</u>) separate port providing the sender-receiver interface 'ComM CurrentChannelRequest' for each configured ComM channel.]()

Rationale for SWS_ComM_00734: A SW-C that wants to get informed about, which users are currently requesting COMM_FULL_COMMUNICATION requires the sender-receiver interface ComM_CurrentChannelRequest'.

[SWS_ComM_00736] [Whenever the set of ComM users currently requesting COMM_FULL_COMMUNICATION for a channel changes, the Communication Manager Module shall update the data element fullComRequestors. A change shall update the data element only, when the Communication Manager Module accepts the communication request of the ComM user.]()

Rationale for SWS_ComM_00736: Requests rejected because of active ModeLimitations will not lead to an update of the data element.

7.10.3.4.2 Data Types

See 8.7.4.4 ComM_UserHandleArrayType.

7.10.3.4.3 Port Interface ComM_CurrentChannelRequest

See 8.7.1.1 ComM_CurrentChannelRequest.

7.10.3.5 Ports and Port Interface for ECU Mode Limitation

7.10.3.5.1 General approach

[SWS_ComM_00740] [The Communication Manager Module can be configured to have an AUTOSAR port providing the client-server interface ComM_ECUModeLimitation.]()

A SW-C, which plays the role of a "Mode Manager", can use this interface to change the behaviour of the entire ECU.

7.10.3.5.2 Port interface ComM_ECUModeLimitation

See 8.7.2.3 ComM_ECUModeLimitation.

7.10.3.6 Ports and Port Interface for Channel Wake up

7.10.3.6.1 General approach

[SWS_ComM_00747] [The Communication Manager Module can be configured to have an AUTOSAR port providing the Client-Server Interface ComM_ChannelWakeup.]()

A SW-C playing the role of a "Mode Manager" can use this interface to configure the Communication Manager Module to take precautions against awaking other ECU's by starting the communication. In order to keep the SW-Cs code independent from the values of the handles that are used to identify a specific handle towards the Communication Manager Module, these handles are **not** passed from the SW-C to the Communication Manager Module. Rather they are modeled as "port defined argument values" of the Provide Ports on the Communication Manager Module's side. As a consequence, these handles do not show up as arguments in the operations of the client-server interface <code>ComM_ChannelWakeup</code>. As a further consequence of this approach, the Communication Manager Module has separate ports for each channel.

7.10.3.6.2 Port interface ComM_ChannelWakeup

See 8.7.2.2 ComM_ChannelWakeup.

7.10.3.7 Ports and Port Interface for interface Channel Limitation

7.10.3.7.1 General approach

[SWS_ComM_00752] [The Communication Manager Module can be configured to have an AUTOSAR port providing the Client-Server Interface ComM_ChannelLimitation.]()

A SW-C playing the role of a "Mode Manager" can use this interface to configure the Communication Manager Module to inhibit communication mode for a given channel. In order to keep the SW-Cs code independent from the values of the handles that are used to identify a specific handle towards the Communication Manager Module, these handles are **not** passed from the SW-C to the Communication Manager Module. Rather they are modelled as "port defined argument values" of the Provide Ports on the Communication Manager Module side. As a consequence, these handles do not show up as arguments in the operations of the client-server interface ComM_ChannelLimitation. As a further consequence of this approach, the Communication Manager Module has separate ports for each channel.

7.10.3.7.2 Port interface ComM_ChannelLimitation

See 8.7.2.1 ComM_ChannelLimitation.

7.10.3.8 Definition of the Service of the Communication Manager Module

This section provides guidance on the definition of the Communication Manager Module service. There are ports on both sides of the RTE. This description of the Communication Manager Module service defines the ports below the RTE. Each SW-C, which uses the Service, must contain "service ports" in its own SW-C description which will be connected to the ports of the COM Manager module, so that the RTE can be generated.

Comment: Note that these definitions can only be completed during ECU configuration (because it depends on certain configuration parameters of the Communication Manager Module, which determine the number of ports provided by the Communication Manager Module service). Also note that the implementation of an SW-C does *not* depend on these definitions.

[SWS_ComM_00744]

```
/* This is the definition of the Communication Manager Module as a service.
This is the 'outside-view' of the Communication Manager Module */
Service ComM
{
    // port present if ComMModeLimitationEnabled (see <u>ECUC ComM 00560</u>)
    ProvidePort ComM ECUModeLimitation modeLimitation;
```

// port present for each channel // if ComMModeLimitationEnabled (see ECUC ComM 00560); // there are NC channels; ProvidePort ComM ChannelLimitation CL000; ProvidePort ComM ChannelLimitation CL<NC-1>; // port present for each channel // if COMM WAKEUP INHIBITION ENABLED (see ECUC ComM 00559) ProvidePort ComM ChannelWakeup CW000; ProvidePort ComM ChannelWakeup CW<NC-1>; // For each user the Communication Manager Module provides 2 ports. // To facilitate configuration, the index of this user shall // correspond to the index in the array COMM USER LIST used for the // configuration of the Communication Manager Module. // The number of users must correspond to the size of this array. ProvidePort ComM UserRequest UR000; // (see 7.10.3.2.2) ProvidePort ComM CurrentMode UM000; ProvidePort ComM UserRequest UR001; //(see 7.10.3.2.2) ProvidePort ComM CurrentMode UM001; ProvidePort ComM UserRequest UR<COMM USER LIST.size-1>; ProvidePort ComM CurrentMode UM<COMM USER LIST.size-1>; // port present for each channel if configured // (see ECUC ComM 00787) // there are NC channels; ProvidePort ComM CurrentChannelRequest CR000; ProvidePort ComM CurrentChannelRequest CR<NC-1>;

};**|()**

7.10.4 Runnables and Entry points

7.10.4.1 Internal behaviour

This is the inside description of the Communication Manager Module. This detailed description is only needed for the configuration of the local RTE.

[SWS ComM 00745]

```
InternalBehavior of the Communication Manager Module
{
    // Runnable entities of the Communication Manager Module
    RunnableEntity LimitECUToNoComMode
         symbol "ComM LimitECUToNoComMode" /* see SWS ComM 00124*/
         canbeInvokedConcurrently = FALSE
    RunnableEntity ReadInhibitCounter
         symbol "ComM ReadInhibitCounter" /* see SWS ComM 00224 */
         canbeInvokedConcurrently = FALSE
    RunnableEntity ResetInhibitCounter
         symbol "ComM ResetInhibitCounter" /* see SWS ComM 00108 */
         canbeInvokedConcurrently = FALSE
```

Specification of Communication Manager AUTOSAR CP R20-11

RunnableEntity SetECUGroupClassification symbol "ComM SetECUGroupClassification" /* see SWS ComM 00552 */ canbeInvokedConcurrently = FALSE RunnableEntity LimitChannelToNoComMode symbol "ComM_LimitChannelToNoComMode" /* see SWS ComM 00163 */ canbeInvokedConcurrently = FALSE RunnableEntity GetInhibitionStatus symbol "ComM GetInhibitionStatus" /*see SWS ComM 00619 */ canbeInvokedConcurrently = FALSE RunnableEntity PreventWakeup symbol "ComM PreventWakeup" canbeInvokedConcurrently = FALSE RunnableEntity RequestComMode symbol "ComM RequestComMode" /* see SWS ComM 00110 */ canbeInvokedConcurrently = TRUE RunnableEntity GetMaxComMode symbol "ComM GetMaxComMode" /* see SWS ComM 00085 */ canbeInvokedConcurrently = TRUE RunnableEntity GetRequestedComMode symbol "ComM GetRequestedComMode" canbeInvokedConcurrently = TRUE RunnableEntity GetCurrentComMode symbol "ComM GetCurrentComMode" /*see SWS ComM 00083 */ canbeInvokedConcurrently = TRUE // the following applies if ComMModeLimitationEnabled // (see ECUC ComM 00560) modeLimitation.LimitECUToNoComMode -> LimitECUToNoComMode modeLimitation.ReadInhibitCounter -> ReadInhibitCounter modeLimitation.ResetInhibitCounter -> ResetInhibitCounter modeLimitation.SetECUGroupClassification -> SetECUGroupClassification // per-channel behaviour only present // if ComMModeLimitationEnabled (see ECUC ComM 00560) // there are NC channels // To facilitate configuration, the names of the channels correspond // to the index of the channel in the "Channel" container used to // configure the Communication Manager Module CL000.LimitChannelToNoComMode -> LimitChannelToNoComMode CL000.GetInhibitionStatus -> GetInhibitionStatus PortArgument {port=CL000, value.type=NetworkHandleType, value.value=Channel[0].COMM CHANNEL ID} ... CLnnn.LimitChannelToNoComMode -> LimitChannelToNoComMode CLnnn.GetInhibitionStatus -> GetInhibitionStatus PortArgument {port=CLnnn, value.type=NetworkHandleType, value.value=Channel[nnn].COMM CHANNEL ID} // per-channel behaviour only present // if COMM WAKEUP INHIBITION ENABLED (see ECUC ComM 00559) CW000.preventWakeUp -> PreventWakeUp PortArgument {port=CW000,

```
value.type=NetworkHandleType,
                   value.value=Channel[0].COMM CHANNEL ID}
    CWnnn.preventWakeUp -> PreventWakeUp
    PortArgument {port=CWnnn,
                  value.type=NetworkHandleType,
                  value.value=Channel[nnn].COMM CHANNEL ID}
    // per-user behaviour
    // Note that the port-argument value must be consistent with the
    // value in the configuration COMM USER LIST
    // Note that the exact data-type of the UserHandleType must of course
    // be defined BEFORE RTE configuration, but does NOT affect the
    // API seen by the SW-Cs that use the service
    UR000.RequestComMode -> RequestComMode
    UR000.GetMaxComMode -> GetMaxComMode
    UR000.GetRequestedComMode -> GetRequestedComMode
    UR000.GetCurrentComMode -> GetCurrentComMode
    PortArgument {port=UR000,
                  value.type= ComM UserhandleType,
                  value.value=COMM USER LIST[0] }
    URnnn.RequestComMode -> RequestComMode
    URnnn.GetMaxComMode -> GetMaxComMode
    URnnn.GetRequestedComMode -> GetRequestedComMode
    URnnn.GetCurrentComMode -> GetCurrentComMode
    PortArgument {port=URnnn,
                  value.type= ComM UserhandleType,
                  value.value=COMM USER LIST[n] }
+;10
```

Comment.

'modeLimitation.LimitECUToNoComMode -> LimitECUToNoComMode' is supposed to define an OperationInvokedEvent that links the OperationPrototype to the runnable entity that is supposed to be executed.

7.10.4.2 Header file to be included by the Communication Manager Module The RTE deals with the Communication Manager Module as with any normal SW-C. The RTE will be able to generate a header-file based on the internal-behaviour description of the Communication Manager Module which contains for instance a definition of the API's (like Rte_Ports_CurrentMode_P) which are available to the Communication Manager Module. This implies that an implementation of the Communication Manager Module must include this generated header-file.

7.11 Multicore Distribution

In its role as central module dealing with different network types the ComM interaction spans across partitions in case the Com-Stack is distributed and so shall provide required multi-core features to ensure a clean architecture and keep the network dependent clusters free of multi-partition (multi-core) add-ons.

[SWS_ComM_01019] The ComM module shall apply appropriate mechanisms to allow calls of its APIs from other partitions than its main function, e.g. by providing a ComM satellite.](SRS_BSW_00459)

[SWS_ComM_01020] [ComM shall interact with <Bus>SM (i.e. call <Bus>SM APIs) only in the partition, where the respective <Bus>SM module is assigned to.](SRS_BSW_00459)

[SWS_ComM_01021][The ComM shall call signal related Com APIs (Com_SendSignal / Com_ReceiveSignal) only in the partition, where the respective ComSignal is handled by the Com module.](SRS_BSW_00459)

Hint: The partition assignment information of the ComSignals is available within Com module configuration.

Note: Even though the basic software (and the Com-Stack in particular) is distributed across several partitions, ComM and Nm Masters should reside in the same partition in order to keep mode interfaces between the two modules simple (for further information see chapter Master/Satellite-approach in [32] (Guide to BSW Distribution)).

7.12Non functional requirements

[SWS_ComM_00459] [It shall be possible to integrate the ComM module delivered as source or object code into the AUTOSAR stack. *Rationale:*

- Allow IP protection and guaranteed test coverage: object code
- Allow high efficiency and configurability at system generation time (by integrator): source code.](SRS_BSW_00342)

8 API specification

8.1 Imported types

8.1.1 Standard types

In this chapter all types included from the following modules are listed:

[SWS_ComM_00820][

Module	Header File	Imported Type
Com	Com.h	Com_SignalIdType
ComStool Turner	ComStack_Types.h	NetworkHandleType
ComStack_Types	ComStack_Types.h	PNCHandleType
NI- NA	Rte_NvM_Type.h	NvM_BlockIdType
N∨M	Rte_NvM_Type.h	NvM_RequestResultType
Std	Std_Types.h	Std_ReturnType
Siu	Std_Types.h	Std_VersionInfoType

J(SRS_BSW_00348, SRS_BSW_00357)

The ComM API uses the following extension to Std_ReturnType:

[SWS_ComM_00649]{OBSOLETE} [

8.2 Type definitions

[SWS_ComM_00863] [The following Data Types shall be used for the functions defined in this Specification.](SRS_BSW_00441)

8.2.1 ComM_InitStatusType

[SWS_ComM_00668][

Name	ComM_InitStatusType			
Kind	Enumeration			
Range	COMM_ UNINIT	= [0x00]		
Kange	COMM_ INIT	0x01	The COM Manager is initialized and usable.	
Description	Initialization status of ComM.			
Available via	ComM.h			

]()

8.2.2 ComM_PncModeType

[SWS_ComM_00673][

Name	ComM_PncModeType
Kind	Enumeration

Specification of Communication Manager AUTOSAR CP R20-11

	COMM_PNC_ REQUESTED	0x00	PNC is requested by a local ComM user
	COMM_PNC_READY_ SLEEP	0x01	PNC is requested by a remote ComM user
	COMM_PNC_ PREPARE_SLEEP	0x02	PNC is active with no deadline monitoring
Range	COMM_PNC_NO_ COMMUNICATION	0x03	PNC does not communicate
	COMM_PNC_ REQUESTED_WITH_ WAKEUP_REQUEST	0x04	PNC is requested by a local ComM user. The mode is used to indicate the BswM, that an active PNC request should trigger also a wake-up of the used communication hardware, if this is supported and configured (e.g. used for Ethernet switch port switching in combination with OA TC10 compliant Ethernet hardware). Tags: atp.Status=draft
Description	Current mode of a PNC		
Available via	ComM.h		

]()

8.2.3 ComM_StateType

[SWS_ComM_00674][

Name	ComM_StateType		
Hame	Commu_Otate Type		
Kind	Туре		
Derived from	uint8		
	COMM_NO_COM_NO_PENDING_REQUEST	0	
	COMM_NO_COM_REQUEST_PENDING	1	
Range	COMM_FULL_COM_NETWORK_REQUESTED		
	COMM_FULL_COM_READY_SLEEP	3	
	COMM_SILENT_COM	4	
Description	State and sub-state of ComM state machine ComM states vs. Communication Modes: COMM_NO_COM* : Communication Mode='No Communication' COMM_FULL_COM*: Communication Mode='Full Communication' COMM_SILENT_COM: Communicatio Mode='Silent Communication'		
Available via	ComM.h		

8.2.4 ComM_ConfigType

[SWS_ComM_00162][

Name	ComM_ConfigType			
Kind	Structure			
	implementa	tion specific		
Elements	Туре			
Comment The contents of the initialization data structure are implement specific		The contents of the initialization data structure are implementation specific		
Description	This type contains the implementation-specific post build configuration structure.			
Available via	ComM.h			

]()

8.3 Function definitions

This is a list of functions provided for upper layer modules.

Note: All functions in this chapter requires previous initialization (ComM_Init), except the following ones:

- ComM_Init
- ComM_GetVersionInfo

8.3.1 ComM_Init

[SWS_ComM_00146][

Service Name	ComM_Init			
Syntax	<pre>void ComM_Init (const ComM_ConfigType* ConfigPtr)</pre>			
Service ID [hex]	0x01			
Sync/Async	Synchronous			
Reentrancy	Non Reentrant			
Parameters (in)	ConfigPtr Pointer to post-build configuration data			
Parameters (inout)	None			
Parameters (out)	None			
Return value	None			

Description	Initializes the AUTOSAR Communication Manager and restarts the internal state machines.
Available via	ComM.h

J(SRS_BSW_00101, SRS_BSW_00358, SRS_BSW_00414)

[SWS_ComM_00793] [Caveats of ComM_Init(): The NVRAM Manager module has to be initialized to have the possibility to "direct" access the ComM module's parameters.]()

[SWS_ComM_00864] [In ComM_Init() ComM shall read non-volatile parameters specified in <u>SWS_ComM_00103</u> from NVRAM. If no parameters are available, ComM shall use the default values in the ComM configuration.]()

8.3.2 ComM_Delnit

Service Name	ComM_DeInit
Syntax	void ComM_DeInit (void)
Service ID [hex]	0x02
Sync/Async	Synchronous
Reentrancy	Non Reentrant
Parameters (in)	None
Parameters (inout)	None
Parameters (out)	None
Return value	None
Description	This API de-initializes the AUTOSAR Communication Manager.
Available via	ComM.h

[SWS_ComM_00147][

J(SRS_BSW_00336)

[SWS_ComM_00794] [De-initialization in ComM_DeInit() shall only be performed if all channels controlled by the ComM module are in COMM_NO_COMMUNICATION mode.]()

Rationale for <u>SWS ComM 00794</u>: Since the ComM_DeInit() API cannot return an error message, it must be assured that all channels are in COMM_NO_COMMUNICATION mode and COMM_NO_COM_NO_PENDING_REQUEST sub-state before ComM DeInit() is called.

[SWS_ComM_00865] [In ComM_Delnit ComM shall store non-volatile parameters specified in <u>SWS_ComM_00103</u> to NVRAM.]()

8.3.3 ComM_GetStatus

[SWS ComM 00242][

	<u> </u>			
Service Name	ComM_GetStatus			
Syntax		<pre>Std_ReturnType ComM_GetStatus (ComM_InitStatusType* Status)</pre>		
Service ID [hex]	0x03	0x03		
Sync/Async	Synchronous	3		
Reentrancy	Non Reentra	nt		
Parameters (in)	None			
Parameters (inout)	None			
Parameters (out)	Status	COMM_UNINIT: The ComM is not initialized or not usable. Default value after startup or after ComM_Delnit() is called. COMM_INIT: The ComM is initialized and usable.		
Return value	Std Return- Type	E_OK: Successfully return of initialization status E_NOT_OK: Return of initialization status failed		
Description	Returns the initialization status of the AUTOSAR Communication Manager. After a call to ComM_Delnit() ComM should have status COMM_UNINIT, and a new call to ComM_Init needed to make sure ComM restart internal state machines to defailt values.			
Available via	ComM.h	ComM.h		

J(SRS_BSW_00406)

8.3.4 ComM_GetInhibitionStatus

[SWS_ComM_00619][

Service Name	ComM_GetInhibitionStatus	
Syntax	<pre>Std_ReturnType ComM_GetInhibitionStatus (NetworkHandleType Channel, ComM_InhibitionStatusType* Status)</pre>	

Service ID [hex]	0x04	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	Channel	See NetworkHandleType
Parameters (inout)	None	
Parameters (out)	Status See ComM_InhibitionStatusType	
Return value	Std_ReturnType	E_OK: Successfully returned Inhibition Status E_NOT_OK: Return of Inhibition Status failed
Description	on Returns the inhibition status of a ComM channel.	
Available via ComM.h		

J()

8.3.5 ComM_RequestComMode

[SWS_ComM_00110][

Service Name	ComM_RequestComMode	
Syntax	<pre>Std_ReturnType ComM_RequestComMode (ComM_UserHandleType User, ComM_ModeType ComMode)</pre>	
Service ID [hex]	0x05	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters	User	Handle of the user who requests a mode
(in)	ComMode	COMM_FULL_COMMUNICATION COMM_NO_ COMMUNICATION
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_Return- Type	E_OK: Successfully changed to the new mode E_NOT_OK: Changing to the new mode failed COMM_E_MODE_LIMITATION: Mode can not be granted because of mode inhibition.
Description	Requesting of a Communication Mode by a user.	

	Note: The following modes are no vaild user requests, since they are used as internal modes: - COMM_SILENT_COMMUNICATION (this mode is used for synchronization at shutdown) - COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST (this mode is used internally within the ComM channel statemachine to trigger the lower layers to request a wakeup on the network if the used hardware support such a feature. (e.g. Ethernet hardware which is compatible with OA TC10). The following modes are valid user requests: - COMM_NO_COMMUNICATION - COMM_FULL_COMMUNICATION. The communication request could also be released due to a ComM communication inhibition
Available via	ComM.h

J(SRS_ModeMgm_09081)

[SWS_ComM_00795] [Configuration of ComM_RequestComMode: Relationship between users and channels. A user is statically mapped to one or more channels.]()

8.3.6 ComM_GetMaxComMode

Service Name	ComM_GetMaxComMode		
Syntax	<pre>Std_ReturnType ComM_GetMaxComMode (ComM_UserHandleType User, ComM_ModeType* ComMode)</pre>		
Service ID [hex]	0x06		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	User	Handle of the user who requests a mode	
Parameters (inout)	None		
Parameters (out)	ComMode	See ComM_ModeType	
Return value	Std_Return- Type	E_OK: Successfully returned maximum allowed Communication Mode E_NOT_OK: Return of maximum allowed Communication Mode failed	
Description	Function to query the maximum allowed Communication Mode of the corresponding user.		
Available via	ComM.h		

[SWS ComM 00085][

]()

Use Case: This function provides the possibility to request the maximum possible mode (e.g. user wants to check if it is possible to get "Full Communication" mode or if a limitation/inhibition is active). This is needed for diagnosis/debugging..

[SWS_ComM_00374] [If more than one channel is linked to one user request and the maximum allowed modes of the channels are different, then the function ComM_GetMaxComMode shall return the lowest mode (see <u>SWS_ComM_00867</u> and <u>SWS_ComM_00868</u>).]()

[SWS_ComM_00796] [Configuration of ComM_GetMaxComMode: Relationship between users and channels. A user is statically mapped to one or more channels.]()

8.3.7 ComM_GetRequestedComMode

Service Name	ComM_GetRequestedComMode		
Syntax	<pre>Std_ReturnType ComM_GetRequestedComMode (ComM_UserHandleType User, ComM_ModeType* ComMode)</pre>		
Service ID [hex]	0x07		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	User	Handle of the user who requests a mode	
Parameters (inout)	None		
Parameters (out)	ComMode Name of the requested mode		
Return value	Std_ReturnType	E_OK: Successfully returned requested Communication Mode E_NOT_OK: Return of requested Communication Mode failed	
Description	Function to query the currently requested Communication Mode of the corresponding user.		
Available via	ComM.h		

[SWS_ComM_00079][

J(SRS_ModeMgm_09149)

Rationale for <u>SWS ComM 00079</u>: The requested user "Communication Mode" has to be stored volatile within the Communication Manager Module itself, to prevent redundant storage of status information by the users.

Comment: If the Communication Manager Module would not have this service every user has to store the status on its own --> redundant and possibly inconsistent storage of the same data.

Note: A user is statically mapped to one or more channels. The relationship between users and channels is reflected by the configuration (see <u>ECUC_ComM_00658</u>).

8.3.8 ComM_GetCurrentComMode

Service Name	ComM_GetCurrentComMode		
Syntax	<pre>Std_ReturnType ComM_GetCurrentComMode (ComM_UserHandleType User, ComM_ModeType* ComMode)</pre>		
Service ID [hex]	0x08		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	User	Handle of the user who requests a mode	
Parameters (inout)	None		
Parameters (out)	ComMode See ComM_ModeType		
Return value	Std_ReturnType	E_OK: Successfully returned Communication Mode from Bus State Manager E_NOT_OK: Return of Communication Mode from Bus State Manager failed	
Description	Function to query the current Communication Mode. ComM shall use the corresponding interfaces of the Bus State Managers to get the current Communication Mode of the network. (Call to Bus State Manager API: XXXSM _Get CurrentComMode())		
Available via	ComM.h		

[SWS_ComM_00083][

J(SRS_ModeMgm_09084)

[SWS_ComM_00176] [If more than one channel is linked to one user request and the modes of the channels are different, the function ComM_GetCurrentComMode shall return the lowest mode (see <u>SWS_ComM_00867</u> and <u>SWS_ComM_00868</u>).](SRS_ModeMgm_09172)

[SWS_ComM_00798] [Configuration of ComM_GetCurrentComMode: Relationship between users and channels. A user is statically mapped to one or more channels.]()

8.3.9 ComM_GetCurrentPNCComMode

	_31002]		
Service Name	ComM_GetCurrentPNCComMode		
Syntax	<pre>Std_ReturnType ComM_GetCurrentPNCComMode (ComM_UserHandleType User, ComM_ModeType* ComMode)</pre>		
Service ID [hex]	0x6a		
Sync/Async	Synchronou	S	
Reentrancy	Reentrant		
Parameters (in)	User	Handle of the user who requests a mode	
Parameters (inout)	None		
Parameters (out)	ComMode	See ComM_ModeType	
Return value	Std Return- Type	E_OK: Successfully returned Communication Mode from Bus State Manager E_NOT_OK: Return of Communication Mode from Bus State Manager failed COMM_E_MULTIPLE_PNC_ASSIGNED: Function could not provide the current mode of the PNC, since multiple PNCs are assigned to the affected user COMM_E_NO_PNC_ASSIGNED: Function could not provide the current mode of the PNC, since no PNC is assigned to the affected user	
Description	The function returns the current Communication Mode of the corresponding PNC the affected user is assigned to.		
Available via	ComM.h		

[SWS_	ComM_	_91002][
-------	-------	----------

]()

[SWS_ComM_01022] [If more than one PNC is assigned to the affected user, the function ComM_GetCurrentPNCComMode shall return COMM_E_MULTIPLE_PNC_ASSIGNED as ComMode.]()

Comment to **[SWS_ComM_01022]***:* For multiple PNCs it is not possible to return a consistent communication mode since the PNCs could have different communication modes.

[SWS_ComM_01023] [If no PNC is assigned to the affected user, the function ComM_GetCurrentPNCComMode shall return COMM_E_NO_PNC_ASSIGNED as ComMode.]()

[SWS_ComM_01024] [If [SWS_ComM_01022] and [SWS_ComM_01023] do not apply, the function shall query for the current communication mode of the corresponding PNC statemachine the user is assigned to. If the corresponding PNC statemachine is in main state COMM PNC FULL COMMUNICATION, then the function shall return COMM FULL COMMUNICATION as ComMode. If the corresponding PNC statemachine main is state COMM_PNC_NO_COMMUNCATION, then the function shall return COMM NO COMMUNICATION as ComMode. ()

Note: The service interface ComM_UserRequest provides the possibility among others to query for the current mode of a channel and to query for the current mode of a PNC. Since the service interface has ComM_ModeType as a return value type, the main state of the ComM PNC statemachine has to be mapped to the main state of the ComM channel statemachine

[SWS_ComM_01025] [Configuration of ComM_GetCurrentPNCComMode: Relationship between users and PNCs. A user is statically mapped to one or more PNCs.]()

8.3.10 ComM_GetPncToChannelMapping

<u>[0110_0011111</u>				
Service Name	ComM_GetPncToChannelMapping (draft)			
Syntax	<pre>Std_ReturnType ComM_GetPncToChannelMapping (boolean* MappingTable, uint8* ChannelCnt, uint8* PncCnt)</pre>			
Service ID [hex]	0x68	0x68		
Sync/Async	Synchronous			
Reentrancy	Non Reentrant			
Parameters (in)	None			
Parameters (inout)	None			
Parameters (out)	Mapping Table	Pointer to two-dimensional array with the current Pnc-to-channel- mapping of the PNC Gateway where the first dimension covers all relevant channels and the second all relevant PNCs.		

[SWS_ComM_91013]{DRAFT} [

	Channel Cnt	Pointer to number of ComM channels that are passed in the Mapping Table parameter.
	PncCnt	Pointer to number of PNCs, that are passed in the MappingTable parameter.
Return value	Std Return- Type	E_OK: Successfully get PNC-to-channel-mapping entry E_NOT_OK: Getting of PNC-to-channel-mapping entry failed COMM_E_LEARNING_ACTIVE: Functionality cannot be executed because PNC learning phase is active.
Description	This function returns the current configuration of the ECUs PNC-to-channel- mapping. Tags:atp.Status=draft	
Available via	ComM.h	

J(SRS_ModeMgm_09259)

[SWS_ComM_01034] DRAFT [Function ComM_GetPncMappingTable shall be only available if ComMPncGatewayEnabled and ComMDynamicPncToChannelMappingSupport are set to TRUE.](SRS_ModeMgm_09258)

[SWS_ComM_01035] DRAFT [If ComMDynamicPncToChannelMappingEnabled is set to TRUE on at least one channel and when PNC learning phase is active, then the function ComM_GetPncMappingTable shall return with COMM_E_LEARNING_ACTIVE.](SWS_ModeMgm_09259)

[SWS_ComM_01036] DRAFT [If ComMDynamicPncToChannelMappingEnabled is set to TRUE on at least one channel and when PNC learning phase is not active, then the function ComM_GetPncMappingTable shall provide within MappingTable the current PNC-to-channel mapping as a two-dimensional array where on first dimension all ComM channels where ComMPncGatewayType is set are handled according to their derived order in ComM and on second dimension all configured ComMPnc according to their order given by their ComMPncId. ComM shall also set the parameter ChannelCnt and PncCnt accordingly and return with E_OK.](SWS_ModeMgm_09259)

Note: The content of this MappingTable can only be interpreted correctly by application or tester correctly if the number of Channels and PNCs and their order is known.

8.3.11 ComM_UpdatePncToChannelMapping

Service Name	ComM_UpdatePncToChannelMapping (draft)
Syntax	Std_ReturnType ComM_UpdatePncToChannelMapping (

[SWS_ComM_91015]{DRAFT} [

	<pre>const boolean* MappingTable, uint8 channelCnt, uint8 PncCnt)</pre>		
Service ID [hex]	0x62		
Sync/Async	Synchronou	s	
Reentrancy	Non Reentra	ant	
Parameters	Mapping Table	Pointer to two-dimensional array with the current Pnc-to-channel- mapping of the PNC Gateway where the first dimension covers all relevant channels and the second all relevant PNCs.	
(in)	channel Cnt	Number of physical channels passed in the MappingTable	
	PncCnt	Number of PNCs passed in the MappingTable	
Parameters (inout)	None		
Parameters (out)	None		
Return value	Std Return- Type	E_OK: Successfully set PNC-to-channel-mapping entry E_NOT_OK: Set of PNC-to-channel-mapping entry failed COMM_E_LEARNING_ACTIVE: Functionality cannot be executed because PNC learning phase is active.	
Description	This function can be used to set entries within the the ECUs PNC-to-channel- mapping Tags:atp.Status=draft		
Available via	ComM.h		

J(SRS_ModeMgm_09259)

[SWS_ComM_01037] DRAFT [Function ComM_UpdatePncMappingTable shall be only available if ComMPncGatewayEnabled and ComMDynamicPncToChannelMappingSupport are set to TRUE.](SRS_ModeMgm_09258)

[SWS_ComM_01038][DRAFT [If ComMDynamicPncToChannelMappingEnabled to TRUE least is set on at one channel and the function ComM UpdatePncMappingTable is called, ComM shall check if ChannelCnt matches the number of ComM channels where ComMPncGatewayType is set and PncCnt matches the number of configured ComMPnc. If one parameter does not match and ComMDevErrorDetect is set to TRUE ComM shall call Det ReportError with COMM_E_WRONG_PARAMETERS. If one parameter does not match ComM shall return with E_NOT_OK. (SWS_ModeMgm_09259)

[SWS_ComM_01039] DRAFT [If ComMDynamicPncToChannelMappingEnabled is set to TRUE on at least one channel, when passed parameters match (see [SWS_ComM_01038]) and when PNC learning phase is active, then the function ComM UpdatePncMappingTable shall return with COMM E LEARNING ACTIVE. (SWS ModeMgm 09259)

[SWS_ComM_01040] DRAFT [If ComMDynamicPncToChannelMappingEnabled is set to TRUE on at least one channel, when passed parameters match (see [SWS_ComM_01038]) and PNC learning phase is not active, then the function ComM UpdatePncMappingTable shall merge for all PNCs the provided information with their current PNC-to-channel mappings whereby MappingTable shall be interpreted as a two-dimensional array with on first dimension all ComM channels where ComMPncGatewayType is set are handled according to their derived order in ComM and on second dimension all configured ComMPnc according to their order ComMPncId. their Additionally it shall return with aiven bv E_OK. 8.4.1.8 ComM_Nm_ForwardSynchronizedPncShutdown [SWS_ComM_91003]{DRAFT} [

Service Name	ComM_Nm_ForwardSynchronizedPncShutdown (draft)		
Syntax	void ComM_Nm_ForwardSynchronizedPncShutdown (NetworkHandleType Channel)		
Service ID [hex]	0x6b		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	Channel	Channel	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		

Description	If an ECU in role of an intermediate PNC coordinator receives a PN shutdown message via a <bus>Nm, then ComM is immediately indicated via ComM_Nm_ ForwardSynchronizedPncShutdown to forward the request for a synchronized PNC shutdown of the affected PNCs. Therefore, ComM will immediately release the affected PNC state machines and forward the PN information to the affected ComM Channels and the corresponding NM channels, respectively. Note: This supports a nearly synchronized PNC shutdown across the PN topology from the top-level PNC coordinator down to the subordinated PNC node. Tags:atp.Status=draft</bus>
Available via	ComM_Nm.h

J(SRS_ModeMgm_09269)

8.4.2 AUTOSAR Diagnostic Communication Manager Interface

8.4.2.1 ComM_DCM_ActiveDiagnostic [SWS_ComM_00873][

Service Name	ComM_DCM_ActiveDiagnostic	
Syntax	<pre>void ComM_DCM_ActiveDiagnostic (NetworkHandleType Channel)</pre>	
Service ID [hex]	0x1f	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	Channel Channel needed for Diagnostic communication	
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Indication of active diagnostic by the DCM.	
Available via	ComM_Dcm.h	

」()

8.4.2.2 ComM_DCM_InactiveDiagnostic [SWS_ComM_00874][

Service Name ComM_DCM_InactiveDiagnostic	
Syntax	void ComM_DCM_InactiveDiagnostic (NetworkHandleType Channel)
Service ID [hex]	0x20

Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	Channel	Channel Channel no longer needed for Diagnostic communication	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Indication of inactive diagnostic by the DCM.		
Available via	ComM_Dcm.h		

」()

8.4.3 AUTOSAR ECU State Manager Interface

8.4.3.1 ComM_EcuM_WakeUpIndication [SWS_ComM_00275][

Service Name	ComM_EcuM_WakeUpIndication		
Syntax	<pre>void ComM_EcuM_WakeUpIndication (NetworkHandleType Channel)</pre>		
Service ID [hex]	0x2a		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	Channel Channel		
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Notification of a wake up on the corresponding channel.		
Available via	ComM_EcuM.h		

ן()

8.4.3.2 ComM_EcuM_PNCWakeUpIndication [SWS_ComM_91001][

Service Name	ComM_EcuM_PNCWakeUpIndication		
Syntax	void ComM_EcuM_PNCWakeUpIndication (

	PNCHandleType PNCid)		
Service ID [hex]	0x37		
Sync/Async	Synchronous		
Reentrancy	Reentrant		
Parameters (in)	PNCid Identifier of the partial network cluster		
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Notification of a wake up on the corresponding partial network cluster.		
Available via	ComM_EcuM.h

8.4.5 Bus State Manager Interface

8.4.5.1 ComM_BusSM_ModeIndication [SWS_ComM_00675][

Service Name	ComM_BusSM_ModeIndication		
Syntax	<pre>void ComM_BusSM_ModeIndication (NetworkHandleType Channel, ComM_ModeType ComMode)</pre>		
Service ID [hex]	0x33		
Sync/Async	Asynchronous		
Reentrancy	Reentrant		
Parameters	Channel	See NetworkHandleType	
(in)	ComMode	See ComM_ModeType	
Parameters (inout)	None		
Parameters (out)	None		
Return value	None		
Description	Indication of the actual bus mode by the corresponding Bus State Manager. ComM shall propagate the indicated state to the users with means of the RTE and BswM.		
Available via	ComM.h		

()∟

8.4.5.2 ComM_BusSM_BusSleepMode [SWS_ComM_91000][

Service Name	ComM_BusSM_BusSleepMode
Syntax	void ComM_BusSM_BusSleepMode (NetworkHandleType Channel)
Service ID	0x34

[hex]		
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	Channel	Identification of the channel
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Notification of the corresponding Bus State Manager that the actual bus mode is Bus-Sleep. Only applicable for ComM channels with ComMNmVariant set to SLAVE_ACTIVE or SLAVE_PASSIVE. E.g. LIN slaves (ComMNMVariant = SLAVE_ACTIVE) or Ethernet channels with OA TC10 compliant Ethernet hardware which act as passive communication slave (Com MNMVariant = SLAVE_PASSIVE and EthTrcvActAsSlavePassiveEnabled set to TRUE)	
Available via	ComM.h	

]()

8.4.6 COM Interface

[SWS_ComM_00819][

Service Name	ComM_COMCbk_ <sn></sn>
Syntax	<pre>void ComM_COMCbk_<sn> (void)</sn></pre>
Service ID [hex]	0x36
Sync/Async	Synchronous
Reentrancy	Non Reentrant
Parameters (in)	None
Parameters (inout)	None
Parameters (out)	None

Return value	None
Description	This callback is called when the EIRA or ERA was updated in COM. The call only informs the ComM about ERA and EIRA changes. The actual handling is done in the next call to ComM_MainFunction_ <commchannel.shortname> with changing the corresponding PN State machine.</commchannel.shortname>
Available via	ComM_Com.h

]()

8.5 Scheduled functions

These functions are directly called by Basic Software Scheduler. The following functions shall have no return value and no parameter. All functions shall be non reentrant.

8.5.1 ComM_MainFunction

[SWS_ComM_00429][

Service Name	ComM_MainFunction_ <commchannel.shortname></commchannel.shortname>		
Syntax	<pre>void ComM_MainFunction_<commchannel.shortname> (void)</commchannel.shortname></pre>		
Service ID [hex]	0x60		
Description	This function shall perform the processing of the AUTOSAR ComM activities that are not directly initiated by the calls e.g. from the RTE. There shall be one dedicated Main Function for each channel of ComM. Precondition: ComM shall be initialized		
Available via	SchM_ComM.h		

J(SRS_BSW_00373)

[SWS_ComM_00818] [Channel.ShortName shall be used to configure ComM_MainFunction_<ComMChannel.ShortName> (see section 10.2.2).]()

Note: ComMChannel.ShortName is the short name of the ComMChannel container that will be managed by the ComM_MainFunction_<ComMChannel.ShortName> function

8.6 Expected interfaces

In this chapter all interfaces required from other modules are shown. An overview of the required interfaces is shown in Figure 1. 114 of 173 Document ID 79: AUTOSAR_SWS_COMManager

8.6.1 Mandatory Interfaces

This chapter defines all interfaces which are required to fulfil the core functionality of the module.

[SWS_ComM_00828] [

API function	Header File	Description
Nm_PassiveStartUp	Nm	This function calls the <busnm>_PassiveStartUp function (e.g. CanNm_PassiveStartUp function is called if channel is configured as CAN).</busnm>
Nm_NetworkRequest	Nm	This function calls the <busnm>_NetworkRequest (e.g. CanNm_NetworkRequest function is called if channel is configured as CAN).</busnm>
Nm_NetworkRelease	Nm	This function calls the <busnm>_NetworkRelease bus specific function (e.g. CanNm_NetworkRelease function is called if channel is configured as CAN).</busnm>
Dcm_ComM_NoComModeEntered	Dcm	This call informs the Dcm module about a ComM mode change to COMM NO COMMUNICATION.
Dcm_ComM_SilentComModeEntered	Dcm	This call informs the Dcm module about a ComM mode change to COMM SILENT COMMUNICATION.
Dcm_ComM_FullComModeEntered	Dcm	This call informs the Dcm module about a ComM mode change to COMM FULL COMMUNICATION.
Rte_Ports_UserMode_P()[n].Switch_currentMode(RT E_MODE_ComMMode_COMM_NO_COMMUNICATI ON)	Rte	Indicate COMM_NO_COMMUNICATION mode to RTE
Rte_Ports_UserMode_P()[n].Switch_currentMode(RT E_MODE_ComMMode_COMM_SILENT_COMMUNI CATION)	Rte	Indicate COMM_SILENT_COMMUNICATION mode to RTE
Rte_Ports_UserMode_P()[n].Switch_currentMode(RT E_MODE_ComMMode_COMM_FULL_COMMUNICA TION)	Rte	Indicate COMM_FULL_COMMUNICATION mode to RTE
BswM_ComM_CurrentMode	BswM	Indicate Communication Mode to BswM
NvM_ReadBlock	N∨M	NVRAM manager API for Read block
NvM_WriteBlock	N∨M	NVRAM manager API for Write block
NvM_GetErrorStatus	N∨M	NVRAM manager API for Get status
<bussm>_GetCurrentComMode</bussm>	<bussm></bussm>	Function to query the actual communication mode from the <bus> State Manager.</bus>
<bussm>_RequestComMode</bussm>	<bussm></bussm>	Function to request a communication mode from the <bus> State Manager.</bus>

]()

8.6.1.1 AUTOSAR NVRAM Manager module

[SWS_ComM_00103] [The ComM module shall use the corresponding standardized services of the NVRAM Manager module (see <u>SWS_ComM_00828</u>) for storing and reading non-volatile configuration data ComMNoWakeup (see <u>ECUC_ComM_00569</u>), ComMEcuGroupClassification (see <u>ECUC_ComM_00563</u>), inhibition status (see <u>SWS_ComM_00157</u>), the Inhibit counter (see <u>SWS_ComM_00140</u>), the PNC-

to-channel Mapping (see **[SWS_ComM_01040]**) and the PNC membership (see **[SWS_ComM_01049]**).]()

Comment: See <u>SWS ComM 00864</u> and <u>SWS ComM 00865</u> when configuration data shall be read and stored For details refer to the AUTOSAR NVRAM Manager module Specification [7].

8.6.1.2 AUTOSAR Bus State Manager

[SWS_ComM_00962][The prefix for the StateManager APIs ("<BusSm>") shall be CanSM, LinSM, FrSM, EthSM if the Parameter ComMBusType is COMM_BUS_TYPE_CAN, COMM_BUS_TYPE_LIN, COMM_BUS_TYPE_FR or COMM_BUS_TYPE_ETH accordingly.]()

[SWS_ComM_00957][If ComMBusType = "COMM_BUS_TYPE_CDD" the API prefix ("<BusSm>") shall be configured in the Parameter "ComMCDDBusPrefix".]()

[SWS_ComM_00963][The Communication Manager module shall use <BusSm>_GetCurrentComMode() from the State Manager to query the current communication mode if necessary.]()

[SWS_ComM_00958] The Communication Manager module shall use <BusSm>_RequestComMode() from the State Manager to request a dedicated communication mode.]()

When it is necessary to request a dedicated communication mode depends on the current status of each instance of the channel state machine (see above).

For details of the functionality of the Bus State Manager modules refer to their Specification [23], [24], [25], [28].

Comment: Those APIs can be called re-entrant, as long as different channel & controller numbers are used.

8.6.1.3 AUTOSAR Network Management Interface

[SWS_ComM_00261] [The ComM module shall use the corresponding functions to synchronize the bus start-up and shutdown of the Network Management (see <u>SWS_ComM_00828</u>).

For details refer to the AUTOSAR NM Interface Specification [9].]()

8.6.1.4 AUTOSAR Diagnostic Communication Manager Module

[SWS_ComM_00266] [The ComM module shall use the corresponding functions provided by DCM (see <u>SWS_ComM_00828</u>) to control the communication capabilities of the DCM module.]()

Comment: DCM provides no functions to start/stop transmission and reception. DCM ensures to control communication according the indicated Communication Manager Module states.

For details refer to the AUTOSAR DCM Specification [11].

8.6.1.5 AUTOSAR RTE interface provided by RTE to ComM for the SW-C

[SWS_ComM_00091] [The ComM module shall use the corresponding function provided by RTE to indicate modes to the users. There shall be one indication per user. Fan-out in case of a mode indication related to more than one user shall be done by the Communication Manager Module.](SRS_ModeMgm_09085)

[SWS_ComM_00663] [If more than one channel is linked to one user request and the modes of the channels are different, the ComM module shall indicate the lowest mode to the user.]()

[SWS_ComM_00662] [The sequence of users shall start with user 0 up to user N and the name of the mode ports shall be UM000, UM001, ... UM<N>.]()

Rationale for <u>SWS_ComM_00662</u>: It shall be possible to use the port based API also to address specific users directly.

Comment. Within the array of ports, the ports are named alphabetically.

[SWS_ComM_00778] [The ComM module shall explicitly indicate changes in modes to each individual user, to which a SW-C is connected. The ComM module shall do this by calling the right API on the RTE through the ports "UMnnn".]()

Comment: There is one such port per configured user to which a SW-C is connected. For users not used by SW-Cs (e.g. the users created due to <u>ECUC_ComM_00840</u>) no mode port will be created.

Implementation Hint: An implementation of the ComM module could use any of the normal RTE-mechanisms to signal changes in the mode to the users. Given the specific configurability of the Communication Manager Module, using the RTE "Indirect API" seems most appropriate. This works as follows (consult the RTE specification for details).

An implementation of the Communication Manager Module can use the "Rte_Ports" API to obtain an array of the "UMnnn" ports at run-time:

/* Return an array of all ports that provide the interface ComM_CurrentMode. Because of the specific naming conventions chosen, the element n in this array of ports will reference to the port UM<nnn>. For example userModePorts[1] will be a handle on port UM001 */

```
userModePorts = Rte Ports ComM CurrentMode P();
```

The number of such userModePorts can be obtained through the call Rte_NPorts_ComM_CurrentMode_P(). This value corresponds to the size of the COMM_USER_LIST array.

To signal that a user n is in a new mode, the Communication Manager Module should: userModePorts[n].Switch_currentMode(newMode)

For details refer to the AUTOSAR RTE specification [8] and AUTOSAR Services Mode Management specification [21].

8.6.1.6 Basic Software Mode Manager (BswM)

[SWS_ComM_00861] The ComM module shall use the corresponding function provided by BswM to report the states of Communication Manager Module channels (see <u>SWS_ComM_00828</u>).]()

For details refer to AUTOSAR Basic Software Mode Manager module [29] .

8.6.2 Optional Interfaces

This chapter defines all interfaces which are required to fulfill an optional functionality of the module.

API Function	Header File	Description	
BswM_ComM CurrentPNCMode	BswM_ ComM.h	Function is called by ComM to indicate the current mode of the PNC.	
BswM_ComM InitiateReset	BswM_ ComM.h	Function is called by ComM to signal a shutdown.	
Com_Receive- Signal	Com.h	Com_ReceiveSignal copies the data of the signal identified by Signal Id to the location specified by SignalDataPtr.	
Com_SendSignal	Com.h	The service Com_SendSignal updates the signal object identified by SignalId with the signal referenced by the SignalDataPtr parameter.	
Nm_PnLearning- Request	Nm.h	Set Repeat Message Request Bit and Partial Network Learning Bit for NM messages transmitted next on the bus. For that purpose <bus Nm>_PnLearningRequest shall be called (e.g. CanNm_PnLearning Request function if channel is configured as CAN). This will force all nodes to enter the PNC Learning Phase and re-enter Repeat Message Stat. This is needed for the optional Dynamic PNC-to- channel-mapping feature. Tags:atp.Status=draft</bus 	
Nm_Request- Synchronized- PncShutdown	Nm.h	This function forward the request for a synchronized PNC shutdown of a particular PNC given by PncId to the affected <bus>Nm by calling <bus>Nm_RequestSynchronizedPncShutdown The function</bus></bus>	

[SWS_ComM_00829][

	call is only valid if NmStandardBusType is not set to NM_BUSNM_ LOCALNM (e.g. CanNm_RequestSynchronizedPncShutdown function is called for NM_BUSNM_CANNM). Tags: atp.Status=draft
--	---

]()

8.6.2.1 AUTOSAR DET

The Communication Manager module shall use Det_ReportError from the Default Error Tracer Module to report development errors.

8.6.3 Configurable Interfaces

None.

9 Sequence diagrams

9.1 Transmission and Reception start (CAN)

Figure 11 shows the sequence for starting transmission and reception on CAN. The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

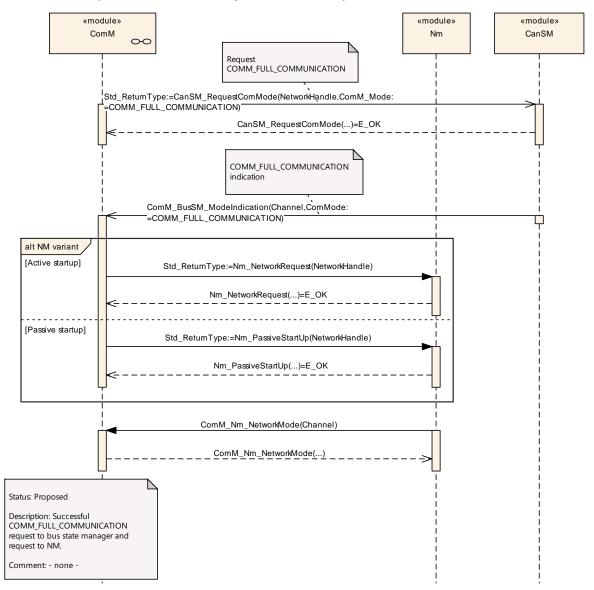

Figure 11: Starting transmission and reception on CAN

9.2 Passive Wake-up (CAN)

Figure 12 shows the behaviour after a wake-up indicated by the ECU State Manager module, or the Nm module for a CAN channel. The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

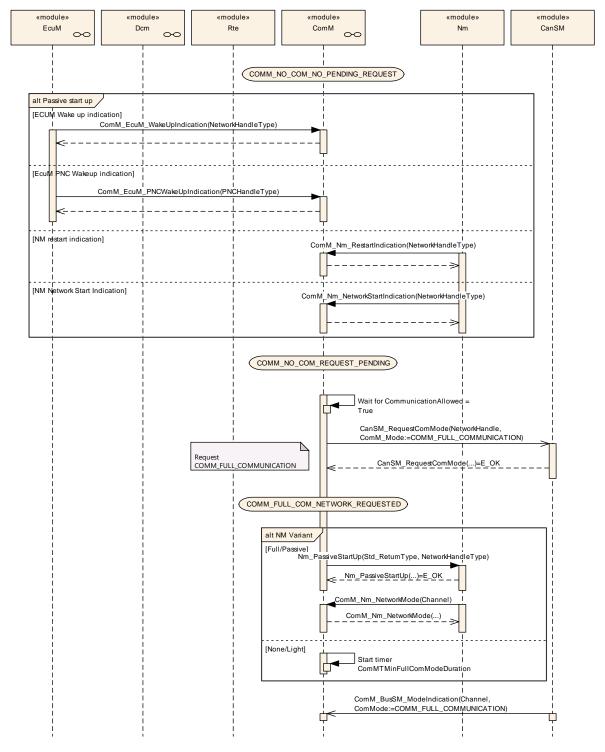

Figure 12: Reaction on a wake-up indicated by the ECU State Manager module

9.3 Network shutdown (CAN)

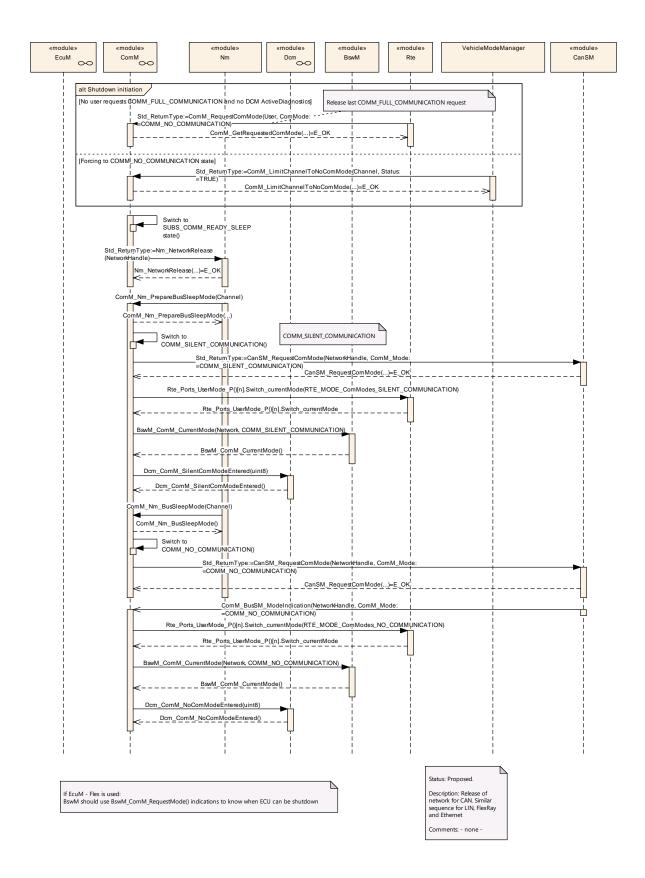

Figure 13 shows the possibilities to shutdown the CAN network. It can be either initiated if the last user releases his COMM_FULL_COMMUNICATION request or ComM_LimitChannelToNoComMode(...) (see <u>SWS ComM_00163</u>) is called. The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

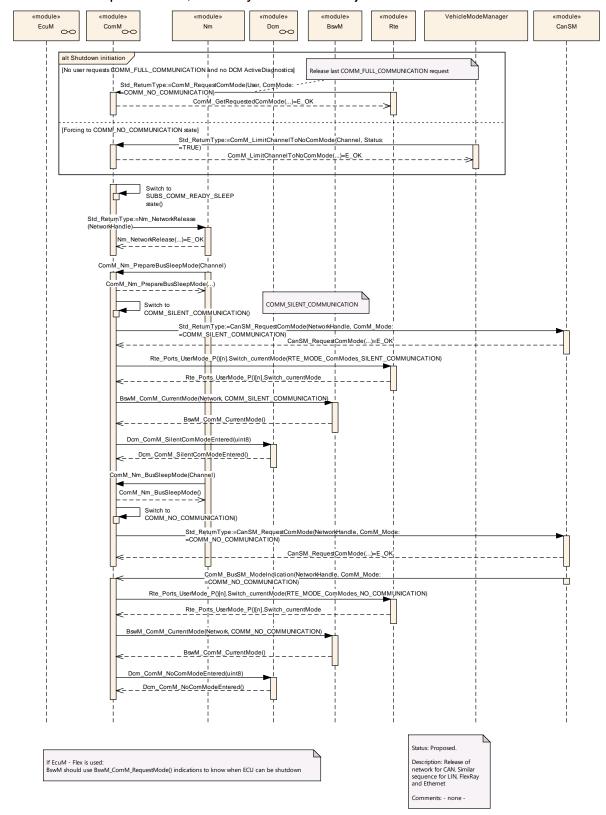

Figure 13: Network shutdown (CAN)

9.4 Communication request

Figure 14 shows the possibilities to start COMM_FULL_COMMUNICATION on CAN. It can be either initiated if a user requests COMM_FULL_COMMUNICATION request or DCM indicates *ComM_DCM_ActiveDiagnostic* (see <u>SWS ComM 00873</u>). The behaviour is equal for LIN, FlexRay and Ethernet just with different API names.

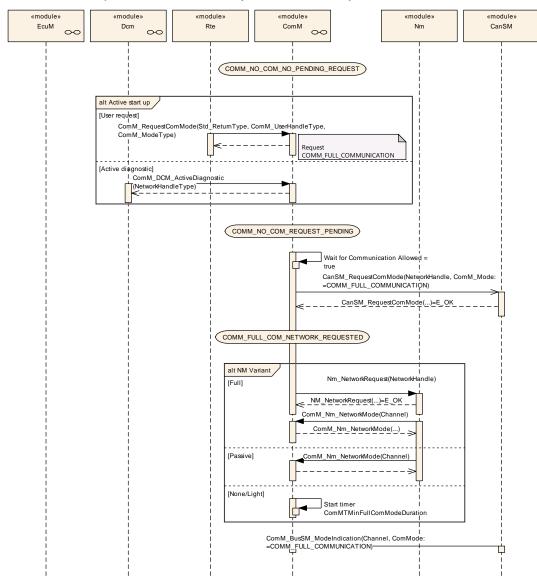

Figure 14: Request Communication

9.5 Synchronized PNC shutdown

Note: The sequence diagrams shows the expected behaviour, but not the implementation

Figure 15 shows the request for a synchronized PNC shutdown if an ECU in the role of a top-level PNC coordinator detects a release of a PNC.

Specification of Communication Manager AUTOSAR CP R20-11

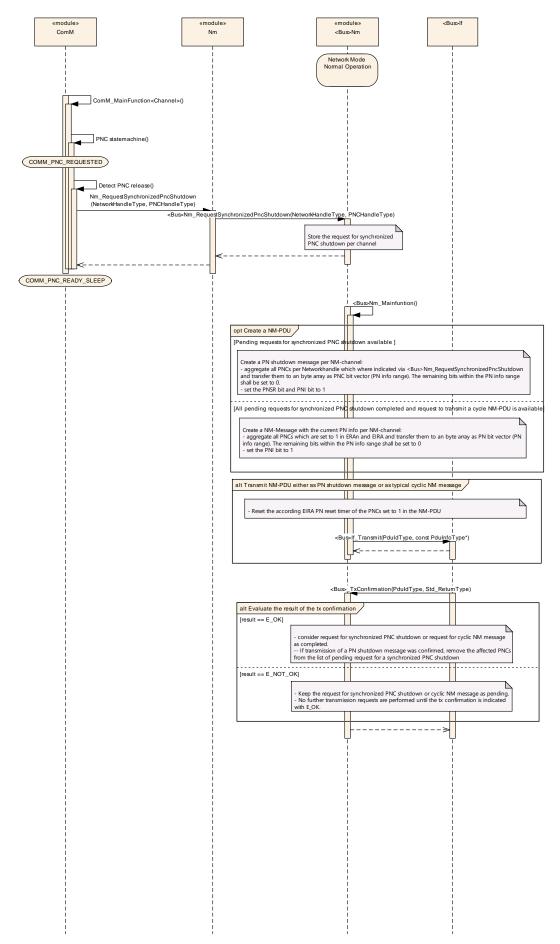

Figure 15 Request for a synchronized PNC shutdown in the role of a top-level PNC coordinator (TLPC)

Figure 16 shows the request to forward a received synchronized PNC shutdown if an ECU in role of an intermediate PNC coordinator receives a PN shutdown message.

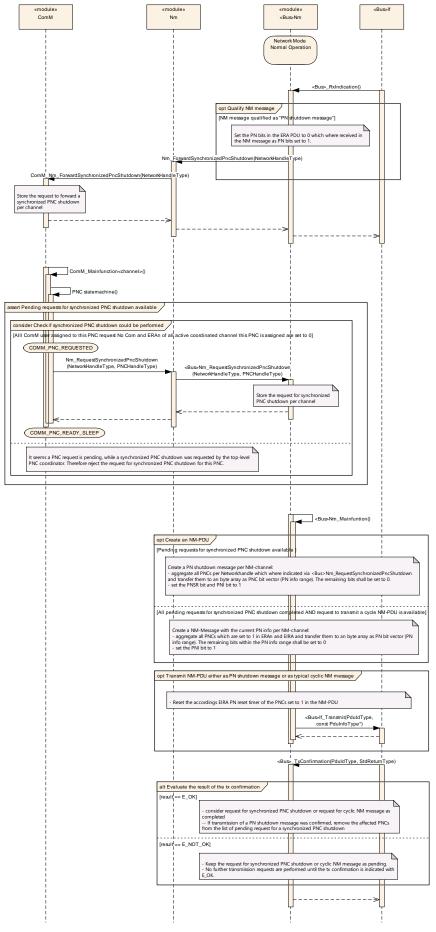

Figure 16 Request to forward a synchronized PNC shutdown in the role of an intermediate PNC coordinator

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals.

Chapter 10.2 specifies the structure (containers) and the parameters of the module Communication Manager Module.

Chapter 10.3 specifies published information of the Communication Manager Module.

10.1 How to read this chapter

For details refer to the chapter 10.1 "Introduction to configuration specification" in *SWS_BSWGeneral.*

10.2Containers and configuration parameters

[SWS_ComM_00419] [The ComM module pre-compile time and link time configuration parameters shall be checked statically (at the latest during link time) for correctness.](SRS_BSW_00167)

[SWS_ComM_00327] OBSOLETE [The ComM module configuration shall support the possibility to assign communication-channels to users by static configuration.](SRS_ModeMgm_09133)

[SWS_ComM_00159] OBSOLETE [The ComM module configuration shall support to configure several communication channels to a user.](SRS_ModeMgm_09090)

Rationale for <u>SWS_ComM_00159</u>: In a multi channel system each user can be assigned to one or more channels. If the user requests a mode, all channels assigned to this user, shall switch to the corresponding mode. All other channels shall not be affected.

[SWS_ComM_00160] OBSOLETE [ComMUsers shall be assignable to ComMChannels in combination with all ComMNmVariants except ComMNmVariant=PASSIVE.]()

[SWS_ComM_00161] OBSOLETE [ComMUsers shall be assignable to PNCs, which refer to ComMChannels in combination with all ComMNmVariants except ComMNmVariant=PASSIVE.]()

[SWS_ComM_00322] [The ComM module configuration shall support configuration of bus type for each channel.]()

Rationale for <u>SWS_ComM_00322</u>: Interfaces for controlling the communication stack depends on the bus type.

[SWS_ComM_00464] [The ComM module shall strictly separate configuration from implementation.](SRS_BSW_00158)

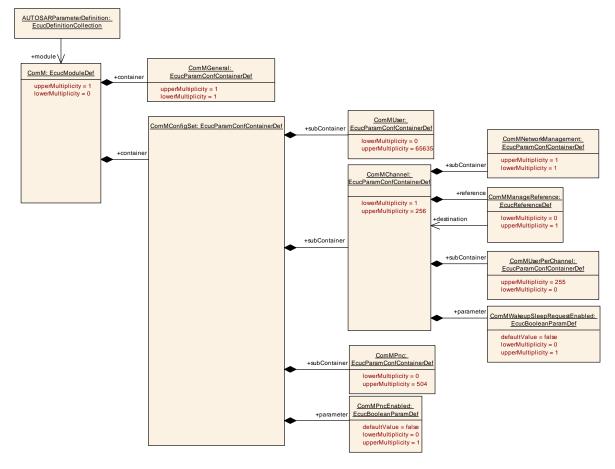

Rationale for <u>SWS_ComM_00464</u>: Easy and clear configuration.

10.2.1 ComM

SWS Item	ECUC_ComM_00890 :
Module Name	ComM
Module Description	Configuration of the ComM (Communications Manager) module.
Post-Build Variant Support	true
Supported Config Variants	VARIANT-POST-BUILD, VARIANT-PRE-COMPILE

Included Containers		
Container Name	Multiplicity	Scope / Dependency
ComMConfigSet		This container contains the configuration parameters and sub containers of the AUTOSAR ComM module.
ComMGeneral	-	General configuration parameters of the Communication Manager.

10.2.2 ComMGeneral

SWS Item	ECUC_ComM_00554 :
Container Name	ComMGeneral
Parent Container	ComM

Description	General configuration parameters of the Communication Manager.
Configuration Paramotors	

Configuration Parameters

SWS Item	ECUC_ComM_00892 :			
Name	ComM0PncVectorAvoidanc	e		
Parent Container	ComMGeneral			
Description	This parameter avoids sending of 0-PNC-Vectors in case ComMPncGatewayEnabled is enabled.			
Multiplicity	01
