1 Introduction and functional overview

This specification describes the functionality, API and the configuration for the AUTOSAR Basic Software module CAN State Manager.

The AUTOSAR BSW stack specifies for each communication bus a bus specific state manager. This module shall implement the control flow for the respective bus. Like shown in the figure below, the CAN State Manager (CanSM) is a member of the Communication Service Layer. It interacts with the Communication Hardware Abstraction Layer and the System Service Layer.

3.3 Related specification

AUTOSAR provides a General Specification on Basic Software modules [21] (SWS BSW General), which is also valid for CAN State Manager.

Thus, the specification SWS BSW General shall be considered as additional and required specification for CAN State Manager.

4 Constraints and assumptions

4.1 Limitations

The CanSM module can be used for CAN communication only. Its task is to operate with the CanIf module to control one or multiple underlying CAN Controllers and CAN Transceiver Drivers. Other protocols than CAN (i.e. LIN or FlexRay) are not supported.

4.2 Applicability to car domains

The CAN State Manager module can be used for all domain applications whenever the CAN protocol is used.

5 Dependencies to other modules

The next sections give a brief description of configuration information and services the CanSM module requires from other modules.

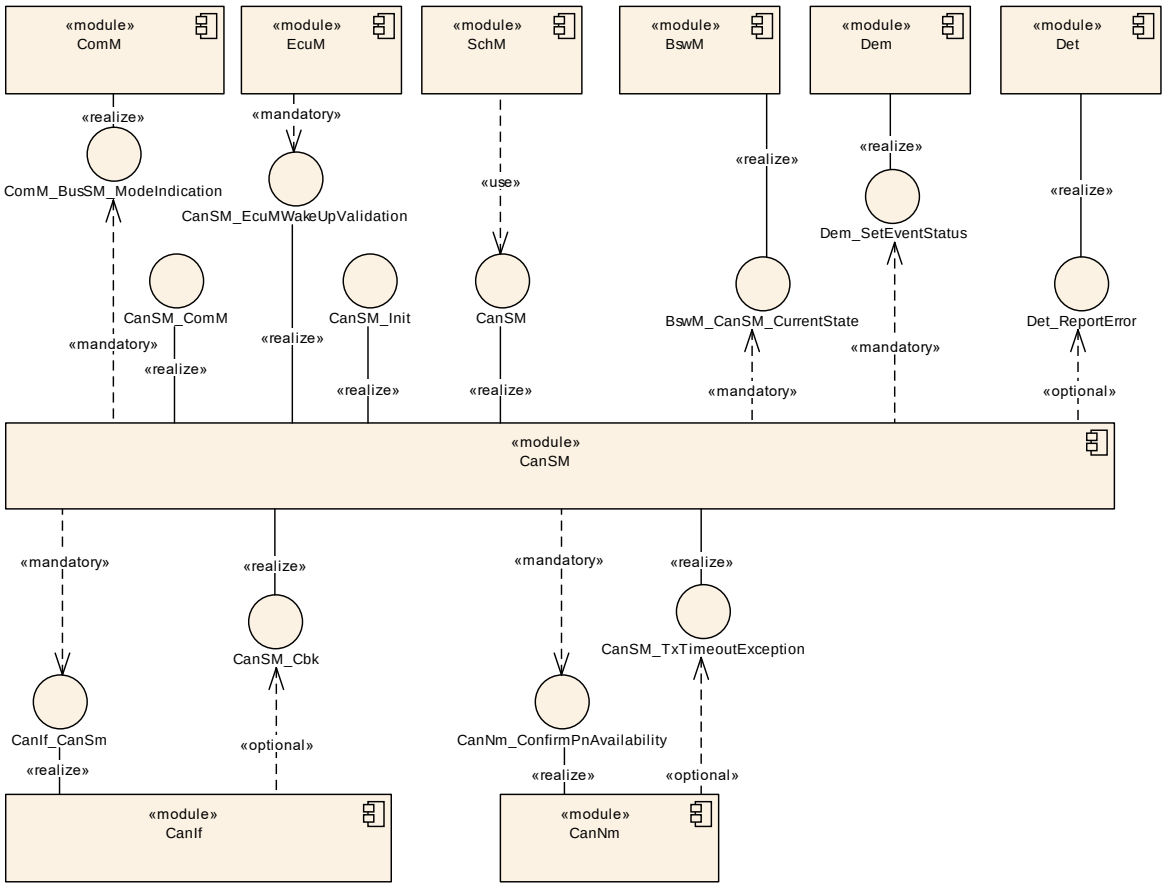

Figure 5-1: Module dependencies of the CanSM module

5.1 ECU State Manager (EcuM)

The EcuM module initializes the CanSM module and interacts with the CanSM module for the CAN wakeup validation (refer to [11] for a detailed specification of this module).

5.2 BSW Scheduler (SchM)

The BSW Scheduler module calls the main function of the CanSM module, which is necessary for the cyclic processes of the CanSM module (refer to [14] for a detailed specification of this module).

5.3 Communication Manager (ComM)

The ComM module uses the API of the CanSM module to request communication modes of CAN networks, which are identified with unique network handles (refer to [10] for a detailed specification of this module).

The CanSM module notifies the current communication mode of its CAN networks to the ComM module.

5.4 CAN Interface (CanIf)

The CanSM module uses the API of the CanIf module to control the operating modes of the CAN controllers and CAN transceivers assigned to the CAN networks (refer to [13] for a detailed specification of this module).

The CanIf module notifies the CanSM module about peripheral events.

5.5 Diagnostic Event Manager (DEM)

The CanSM module reports bus specific production errors to the DEM module (refer to [12] for a detailed specification of this module).

5.6 Basic Software Mode Manager (BswM)

The CanSM need to notify bus specific mode changes to the BswM module (refer to [18] for a detailed specification of this module).

5.7 CAN Network Management (CanNm)

The CanSM module needs to notify the partial network availability to the CanNm module and shall handle notified CanNm timeout exceptions in case of partial networking (ref. to [19] for a detailed specification of this module).

5.8 Default Error Tracer (DET)

The CanSM module reports development and runtime errors to the DET module. Development Errors are only reported if development error handling is switched on by configuration (refer to [15] for a detailed specification of this module).

5.9 File structure

5.9.1 Code file structure

For details refer to the chapter 5.1.6 “Code file structure” in *SWS_BSWGeneral*

5.9.2 Header file structure

[SWS_CanSM_00008] ⌈The header file CanSM.h shall export CanSM module specific types and the APIs `CanSM_GetVersionInfo` and `CanSM_Init`.⌋(SRS_BSW_00447)

5.9.3 Version check

For details refer to the chapter 5.1.8 “Version Check” in *SWS_BSWGeneral.*

7 Functional specification

This chapter specifies the different functions of the CanSM module in the AUTOSAR BSW architecture.

An ECU can have different communication networks. Each network has to be identified with an unique network handle. The ComM module requests communication modes from the networks. It knows by its configuration, which handle is assigned to what kind of network. In case of CAN, it uses the CanSM module.

The CanSM module is responsible for the control flow abstraction of CAN networks:

It changes the communication modes of the configured CAN networks depending on the mode requests from the ComM module.

Therefore the CanSM module uses the API of the CanIf module. The CanIf module is responsible for the control flow abstraction of the configured CAN Controllers and CAN Transceivers (the data flow abstraction of the CanIf module is not relevant for the CanSM module). Any change of the CAN Controller modes and CAN Transceiver modes will be notified by the CanIf module to the CanSM module. Depending on this notifications and state of the CAN network state machine, which the CanSM module shall implement for each configured CAN network, the CanSM module notifies the ComM and the BswM (ref. to chapter 7.2 for details).

Note:
CanSM module will not notify ComM about its communication mode after initialization, unless a communication mode has explicitly been requested by ComM.

7.1 General requirements

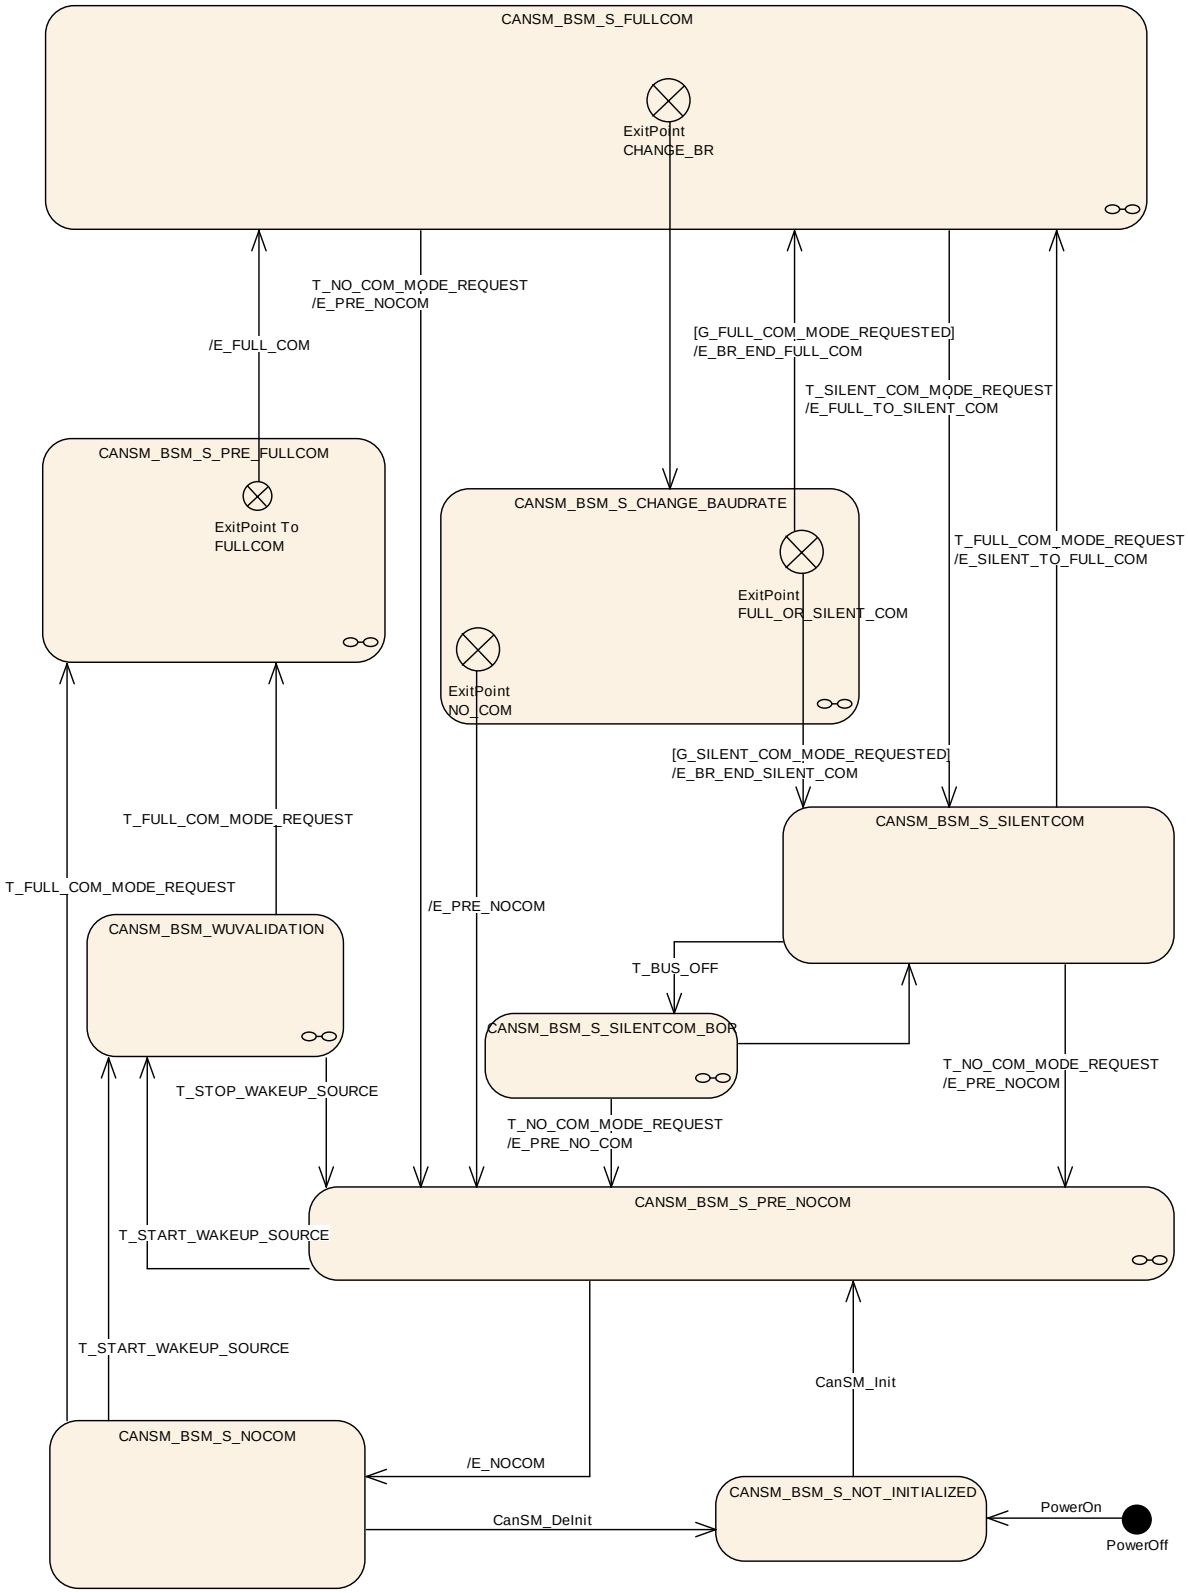

Figure 7-1 : CANSM_BSM, state machine diagram for one CAN network

[SWS_CanSM_00266] ⌈The CanSM module shall store the current network mode for each configured CAN network internally (ref. to to ECUC_CanSM_00126).⌋(SRS_Can_01142)

[SWS_CanSM_00284] ⌈The internally stored network modes of the CanSM module can have the values `COMM_NO_COMMUNICATION`, `COMM_SILENT_COMMUNICATION`, `COMM_FULL_COMMUNICATION`.⌋(SRS_Can_01142)

[SWS_CanSM_00428] ⌈All effects of the CanSM state machine CANSM_BSM (ref. to Figure 7-1) shall be operated in the context of the CanSM main function (ref. to SWS_CanSM_00065).⌋(SRS_Can_01142, SRS_Can_01145)

[SWS_CanSM_00278] ⌈If the CanSM state machine `CANSM_BSM` (ref. to Figure 7-1) is in the state `CANSM_BSM_S_NOT_INITIALIZED`, it shall deny network mode requests from the ComM module (ref. to SWS_CanSM_00062).⌋(SRS_Can_01142)

[SWS_CanSM_00385] ⌈If CanSM has repeated one of the CanIf API calls `CanIf_SetControllerMode`, `CanIf_SetTrcvMode`, `CanIf_ClearTrcvWufFlag` or `CanIf_CheckTrcvWakeFlag` more often than CanSMModeRequestRepetitionMax (ref. to ECUC_CanSM_00335) without getting the return value `E_OK` or without getting the corresponding mode indication callbacks `CanSM_ControllerModeIndication`, `CanSM_TransceiverModeIndication`, `CanSM_ClearTrcvWufFlagIndication` or `CanSM_CheckTransceiverWakeFlagIndication`, CanSM shall call the function Det_ReportRuntimeError with ErrorId parameter `CANSM_E_MODE_REQUEST_TIMEOUT`.⌋(SRS_Can_01142)

[SWS_CanSM_00422] ⌈If the CanIf module notifies PN availability for a configured CAN Transceiver to the CanSM module with the callback function CanSM_ConfirmPnAvailability (ref. to SWS_CanSM_00419), then the CanSM module shall call the API `CanNm_ConfirmPnAvailability` (ref. to chapter 8.5.1) with the related CAN network as `channel` to confirm the PN availability to the CanNm module.⌋(SRS_Can_01142)

[SWS_CanSM_00560] ⌈If no `CanSMTransceiverId` (ref. to ECUC_CanSM_00137) is configured for a CAN Network, then the CanSM module shall bypass all specified `CanIf_SetTrcvMode` (e. g. SWS_CanSM_00446) calls for the CAN Network and proceed in the different state transitions as if it has got the supposed `CanSM_TransceiverModeIndication` already (e. g. SWS_CanSM_00448).⌋(SRS_Can_01145)

[**SWS_CanSM_00635**]⌈ The CanSM module shall store for each configured CAN network (ref. to ECUC_CanSM_00126) the latest communication mode request, which has been accepted by returning E_OK in the API request `CanSM_RequestComMode` (ref. to SWS_CANSM_00062, SWS_CANSM_00182) and use it as trigger for the state machine of the related CAN network (ref. to Figure 7-1), SWS_CanSM_00427, SWS_CanSM_00429, SWS_CanSM_00499, SWS_CanSM_00542, SWS_CanSM_00543, SWS_CANSM_00425, SWS_CANSM_00426, SWS_CANSM_00554).⌋(SRS_Can_01142)

[**SWS_CanSM_00638**]⌈The CanSM module shall store after every successful CAN controller mode change (ref. to SWS_CANSM_00396) or bus-off conditioned change to `CAN_CS_STOPPED` (ref. to SWS_CANSM_00064), the changed mode internally for each CAN controller.⌋(SRS_Can_01145)

[SWS_CanSM_00423] ⌈If the CanSM module is requested with the function `CanSM_Init` (ref. to chapter 8.3.1), this shall trigger the CanSM state machines (ref. to Figure 7-1) for all configured CAN Networks (ref. to ECUC_CanSM_00126) with the trigger `CanSM_Init`.⌋(SRS_Can_01142, SRS_Can_01145)

8.5 Expected Interfaces

In this chapter all interfaces required from other modules are listed.

8.5.1 Mandatory Interfaces

This chapter defines all interfaces, which are required to fulfill the core functionality of the module.[]([

API Function	*Header File*	*Description*
BswM_CanSM_-CurrentState	BswM_ CanSM.h	Function called by CanSM to indicate its current state.
CanIf_Check-TrcvWakeFlag	CanIf.h	Requests the CanIf module to check the Wake flag of the designated CAN transceiver.
CanIf_Clear-TrcvWufFlag	CanIf.h	Requests the CanIf module to clear the WUF flag of the designated CAN transceiver.
CanIf_GetPdu-Mode	CanIf.h	This service reports the current mode of a requested PDU channel.
CanIf_GetTx-Confirmation-State	CanIf.h	This service reports, if any TX confirmation has been done for the whole CAN controller since the last CAN controller start.
CanIf_Set-ControllerMode	CanIf.h	This service calls the corresponding CAN Driver service for changing of the CAN controller mode.
CanIf_SetPdu-Mode	CanIf.h	This service sets the requested mode at the L-PDUs of a predefined logical PDU channel.
CanIf_SetTrcv-Mode	CanIf.h	This service changes the operation mode of the tansceiver TransceiverId, via calling the corresponding CAN Transceiver Driver service.
CanNm_-ConfirmPn-Availability	Can Nm.h	Enables the PN filter functionality on the indicated NM channel. Availability: The API is only available if CanNmGlobalPnSupport is TRUE.
ComM_BusSM-_ModeIndication	ComM.h	Indication of the actual bus mode by the corresponding Bus State Manager. ComM shall propagate the indicated state to the users with means of the RTE and BswM.
Dem_SetEvent-Status	Dem.h	Called by SW-Cs or BSW modules to report monitor status information to the Dem. BSW modules calling Dem_SetEventStatus can safely ignore the return value. This API will be available only if ({Dem/DemConfigSet/DemEventParameter/DemEventReportingType} == STANDARD_REPORTING)
Det_Report-RuntimeError	Det.h	Service to report runtime errors. If a callout has been configured then this callout shall be called.

]()

8.5.1.1 Remark: Usage of CanIf_SetPduMode

Although the CanIf module provides more requestable PDU modes, the CanSM module only uses the parameters `CANIF_ONLINE`, `CANIF_TX_OFFLINE_ACTIVE` and `CANIF_TX_OFFLINE` for the call of the API `CanIf_SetPduMode`.

The `CANIF_OFFLINE` mode is assumed automatically by CanIf and needs not to be set by CanSM.

8.5.2 Optional Interfaces

This chapter defines all interfaces, which are required to fulfill an optional functionality of the module.**[]**[

API Function	*Header File*	*Description*
CanIf_Set-Baudrate	CanIf.h	This service shall set the baud rate configuration of the CAN controller. Depending on necessary baud rate modifications the controller might have to reset.
Det_Report-Error	Det.h	Service to report development errors.

]()

8.5.3 Configurable Interfaces

In this chapter all interfaces are listed where the target functions could be configured. The target function is usually a callback function. The names of these kind of interfaces is not fixed because they are configurable.

8.5.3.1 <User_GetBusOffDelay>

9 Sequence diagrams

All interactions of the CanSM module with the depending modules CanIf, ComM, BswM, Dem and CanNm are specified in the state machine diagrams (ref. to Figure 7-1- Figure 7-10). Therefore the CanSM SWS provides only some exemplary sequences for the use case to start and to stop the CAN controller(s) of a CAN network.

Remark: For the special use case of CAN network deinitialization with partial network support please refer to chapter 9 of [9] (Specification of CAN Transceiver Driver).

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.
Chapter 10.2 specifies the structure (containers) and the parameters of the module CanSM.

Chapter 10.3 specifies published information of the module CanSM.

SWS Item	**ECUC_CanSM_00130 :**		
Name	CanSMBorTimeTxEnsured		
Parent Container	CanSMManagerNetwork		
Description	This parameter defines in seconds the duration of the bus-off event check. This check assesses, if the recovery has been successful after the recovery reenables the transmit path. If a new bus-off occurs during this time period, the CanSM assesses this bus-off as sequential bus-off without successful recovery. Because a bus-off only can be detected, when PDUs are transmitted, the time has to be great enough to ensure that PDUs are transmitted again (e. g. time period of the fastest cyclic transmitted PDU of the COM module / ComTxModeTimePeriodFactor).
