# 1 Introduction

This document defines basic requirements that apply to all Functional Clusters of the Adaptive Platform.

To aid in this, it also defines functionality that applies to the entire framework, including a set of common data types used by multiple Functional Clusters as part of their public interfaces.

## 2 Acronyms and Abbreviations

The glossary below includes acronyms and abbreviations relevant to Adaptive Core that are not included in the [1, AUTOSAR glossary].

Term	Description
Explicit Operation Abortion	Immediate abortion of an API call, which is initiated by calling <code>ara::core::Abort</code> , usually as a consequence of the detection of a <code>Violation</code> .
UUID	<i>Universally Unique Identifier</i> , a 128-bit number used to identify information in computer systems

## 4 Constraints and assumptions

### 4.1 Limitations

- The specification of some data types (Array, Map, Optional, String, StringView, Variant) mentions “supporting constructs”, but lacks a precise scope definition of this term.
- The specification of some data types (Map, Vector, String) is lacking a comprehensive definition of memory allocation behavior; it currently only describes it as “implementation-defined”.
- Chapter [7.2](#) (“[Functional Specification](#)”) describes some behavior informally that should rather be given as specification items.

### 4.2 Applicability to car domains

No restrictions to applicability.

## 5 Dependencies to other modules

This Functional Cluster only depends on [\[2\]](#), in particular the C++ standard library.

## 6 Requirements Tracing

The following tables reference the requirements specified in <CITATIONS\_OF\_CONTRIBUTED\_DOCUMENTS> and links to the fulfillment of these. Please note that if column “Satisfied by” is empty for a specific requirement this means that this requirement is not fulfilled by this document.

Requirement	Description	Satisfied by
[RS_AP_00111]	The AUTOSAR Adaptive Platform shall support source code portability for AUTOSAR Adaptive applications.	<a href="#">[SWS_CORE_90001]</a> <a href="#">[SWS_CORE_90002]</a> <a href="#">[SWS_CORE_90003]</a> <a href="#">[SWS_CORE_90004]</a> <a href="#">[SWS_CORE_90005]</a> <a href="#">[SWS_CORE_90006]</a> <a href="#">[SWS_CORE_90020]</a>

## 7 Requirements Specification

### 7.1 General requirements for all Functional Clusters

The goal of this section is to define a common set of basic requirements that apply to all Functional Clusters of the Adaptive Platform. It adds a common part to the specifications and it needs to be respected by platform vendors.

**[SWS\_CORE\_90001] Include folder structure** [All `#include` directives in header files that refer to ARA libraries shall be written in the form

```
#include "ara/fc/header.h"
```

with “ara” as the first path element, “fc” being the remaining directory path of the implementation’s *installed* header file, starting with the Functional Cluster short name, and “header.h” being the filename of the header file.] ([RS\\_AP\\_00116](#), [RS\\_AP\\_00111](#))

The Functional Cluster short names are defined in [3].

Example: Execution Management (short name “exec”) provides class `ExecutionClient`, which can be accessed with:

```
#include "ara/exec/execution_client.h"
```

The “...” form of `#include` statements shall be used, due to the recommendation given in [4, the C++14 standard] section 16.2.7.

**[SWS\_CORE\_90002] Prevent multiple inclusion of header file** [All public header files shall prevent multiple inclusion by using `#include` guards that are likely to be system-wide unique.] ([RS\\_AP\\_00111](#))

While uniqueness can generally not be guaranteed, the likelihood of collisions can be decreased with a naming scheme that is regular and results in long symbol names.

The following `#include` guard naming scheme should be used by implementations for all header files that cover symbols within the `ara` namespace or a sub-namespace therein:

```
ARA_<PATH>_H_
```

where `<PATH>` is the relative path name of the header file within the location of the implementation’s *installed* header files, starting with the Functional Cluster name (and omitting the file extension), and with all components of `<PATH>` separated by underscore (“\_”) characters and containing only upper-case characters of the ASCII character set.

Example: The header file included with `#include "ara/log/logger.h"` should use the `#include` guard symbol `ARA_LOG_LOGGER_H_`.

**[SWS\_CORE\_90003]{DRAFT}** [C/C++ preprocessor symbols that start with `ARA` are reserved for use by AUTOSAR.] ([RS\\_AP\\_00111](#))

The Adaptive Platform generally avoids the use of C/C++ preprocessor macros. However, in case macros are introduced at some later point in time, any such macro will start with the prefix `ARA`. Platform vendors should thus not define any symbols (both macros and C/C++ ones) with this prefix, lest they conflict with such future additions to the standard.

**[SWS\_CORE\_90004]{DRAFT} Implementation-defined declaration classifiers** [All APIs shall be implemented with the exact same declaration classifiers that are specified, except for `inline` and `friend`, which may be added as necessary.] ([RS\\_AP\\_00111](#))

*Note: The order of declarations may be freely chosen.*

[4, The C++14 standard] defines in chapter 7.1 [dcl.spec] the specifiers that can be used in a declaration; these include, for instance, `static`, `virtual`, `constexpr`, `inline` and `friend`. An implementation that uses a different set of specifiers in its declaration of a specified API may be incompatible to the standard, or may allow non-standardized usage of that API, leading to portability concerns.

**[SWS\_CORE\_90005]{DRAFT} Custom declarations and definitions** [Implementation shall not add public declarations or definitions that are not specified in an SWS to the namespace `ara` or any of its direct sub-namespaces.] ([RS\\_AP\\_00111](#))

The Adaptive Platform is designed for source code portability. Wherefore any conformant implementation of the Adaptive Platform allows a successful compilation and linking of an Adaptive Application that uses `ARA` only as specified in the standard. No changes to the source code, and no conditional compilation constructs will be necessary for this if the application only uses constructs from the designated minimum C++ language version. The implementation may provide proprietary, non-`ARA` interfaces, as long as they are not contradicting the AP standard.

**[SWS\_CORE\_90006]{DRAFT}** [If a constructor in the `ara` framework is called with wrong or invalid `ara::core::InstanceSpecifier`, the Functional Cluster implementation shall treat this as a `Violation` with a standardized log message "Invalid InstanceSpecifier >passed InstanceSpecifier< in ctor >ctor.shortname<".] ([RS\\_AP\\_00111](#))

The rationale to treat this as a `Violation` is that this is seen as an integration error which anyway cannot be handled by the caller of the API. Aborting execution is in line with the strategy to fail early.

Any other error check within the constructors is defined within the respective SWS.

### 7.1.1 Initialize/Deinitialize

`ara::core::Initialize` allows a central initialization of all included shared libraries of the ARA framework. This could include static initializers or the setup of daemon links (details are up to the platform vendor).

The general advice for application developers is to call `ara::core::Initialize` right at the entry point of the application.

**[SWS\_CORE\_90020]{DRAFT}** [If functionality is called that depends on prior initialization via `ara::core::Initialize` and `ara::core::Initialize` has not been called, the Functional Cluster implementation shall treat this as a *Violation*.] (*RS-AP\_00111*)

The rationale to treat this as a *Violation* is that it cannot be handled by the caller of the API at the point in time where the error is detected. Aborting execution is the only way to signal this kind of systematic error and prevent later failures.

## 7.2 Functional Specification

This section describes the concepts that are introduced with this Functional Cluster. Particular emphasis is put on error handling.

### 7.2.1 Error handling

#### 7.2.1.1 Types of unsuccessful operations

During execution of an implementation of Adaptive Platform APIs, different abnormal conditions might be detected and need to be handled and/or reported. Based on their nature, the following types of unsuccessful operations are distinguished within the Adaptive Platform:

**[SWS\_CORE\_00020]{DRAFT} Semantics of an Error** [An `Error` is the inability of an assumed-bug-free API function to fulfill its specified purpose; it is often a consequence of invalid and/or unexpected (i.e. possibly valid, but received in unexpected circumstances) input data. An `Error` is recoverable.] ([RS\\_AP\\_00142](#))

**[SWS\_CORE\_00021]{DRAFT} Semantics of a Violation** [A `Violation` is the consequence of failed pre- or post-conditions of internal state of the application framework. They are the Adaptive Platform's analog to a failed assertion. A `Violation` is non-recoverable.] ([RS\\_AP\\_00142](#))

**[SWS\_CORE\_00022]{DRAFT} Semantics of a Corruption** [A `Corruption` is the consequence of the corruption of a system resource, e.g. stack or heap overflow, or a hardware memory flaw (including even, for instance, a detected bit flip). A `Corruption` is non-recoverable.] ([RS\\_AP\\_00142](#))

**[SWS\_CORE\_00023]{DRAFT} Semantics of a Failed Default Allocation** [A `Failed Default Allocation` is the inability of the framework's default memory allocation mechanism to satisfy an allocation request. A `Failed Default Allocation` is non-recoverable.] ([RS\\_AP\\_00142](#))

It is expected that a `Violation` or `Corruption` might occur during development of the framework, when new features are just coming together, but will not be experienced by a user (i.e. an application developer), unless there is something seriously wrong in the system's environment (e.g. faulty hardware: `Corruption`), or basic assumptions about resource requirements are violated (`Violation`), or possibly the user runs the framework in a configuration that is not supported by its vendor (`Violation`).

#### 7.2.1.2 Traditional error handling in C and C++

The C language largely relies on error codes for any kind of error handling. While it also has the `set jmp/long jmp` facility for performing "non-local gotos", its use for error

handling is not widespread, mostly due to the difficulty of reliably avoiding resource leaks.

Error codes in C come in several flavors:

- return values
- out parameters
- error singletons (e.g. `errno`)

Typically, these error codes in C are plain `int` variables, making them a very low-level facility without any type safety.

C++ inherited these approaches to error handling from C (not least due to the inheritance of the C standard library as part of the C++ standard), but it also introduced exceptions as an alternative means of error propagation. There are many advantages of using exceptions for error propagation, which is why the C++ standard library generally relies on them for error propagation.

Notwithstanding the advantages of exceptions, error codes are still in widespread use in C++, even within the standard library. Some of that can be explained with concerns about binary compatibility with C, but many new libraries still prefer error codes to exceptions. Reasons for that include:

- with exceptions, it can be difficult to reason about a program's control flow
- exceptions have much higher runtime cost than error codes (either in general, or only in the exception-thrown case)

The first of these reasons concerns both humans and code analysis tools. Because exceptions are, in effect, a kind of hidden control flow, a C++ function that seems to contain only a single `return` statement might in fact have many additional function returns due to exceptions. That can make such a function hard to review for humans, but also hard to analyze for static code analysis tools.

The second one is even more critical in the context of developing safety-critical software. The specification of C++ exceptions pose significant problems for C++ compiler vendors that want their products be certified for development of safety-critical software. In fact, ASIL-certified C++ compilers generally do not support exceptions at all. One particular problem with exceptions is that exception handling, as specified for C++, implies the use of dynamic memory allocation, which generally has non-predictable or even unbounded execution time. This makes exceptions currently unsuitable for development of certain safety-critical software in the automotive industry.

### 7.2.1.3 Handling of unsuccessful operations in the Adaptive Platform

The types of unsuccessful operations defined in section [7.2.1.1](#) (“[Types of unsuccessful operations](#)”) are to be treated in different ways.

**[SWS\_CORE\_00002] Handling of Errors** [An `Error` shall be returned from the function as an instance of `ara::core::Result` or `ara::core::Future`.] ([RS\\_AP\\_00142](#), [RS\\_AP\\_00139](#), [RS\\_AP\\_00128](#))

**[SWS\_CORE\_00003] Handling of Violations** [If a `Violation` is detected, then the operation shall be terminated by either:

- throwing an exception that is not a subclass of `ara::core::Exception`
- explicitly terminating the process abnormally via a call to `ara::core::Abort`

] ([RS\\_AP\\_00142](#))

**[SWS\_CORE\_00004] Handling of Corruptions** [If a `Corruption` is detected, it shall result in unsuccessful process termination, in an implementation-defined way.] ([RS\\_AP\\_00142](#))

*Note: It can either be abnormal or normal unsuccessful termination, depending on the implementation's ability to detect the `Corruption` and to react to it by cleaning up resources.*

**[SWS\_CORE\_00005] Handling of failed default allocations** [A "failed default allocation" shall be treated the same as a `Violation`.] ([RS\\_AP\\_00142](#))

*Note: An error of a custom allocator is not subject to this definition.*

#### 7.2.1.4 Facilities for Error Handling

For handling `Errors`, there are a number of data types defined that help in dealing with them. These are described in the following subsections.

##### 7.2.1.4.1 ErrorCode

As its name implies, `ara::core::ErrorCode` is a form of error code; however, it is a class type, loosely modeled on `std::error_code`, and thus allows much more sophisticated handling of errors than the simple error codes as used in typical C APIs. It always contains a low-level `error code value` and a reference to an `error domain`.

The `error code value` is an enumeration, typically a scoped one. When stored into a `ara::core::ErrorCode`, it is type-erased into an integral type and thus handled similarly to a C-style error code. The `error domain` reference defines the context for which the `error code value` is applicable and thus provides some measure of type safety.

An `ara::core::ErrorCode` also contains a `support data value`, which *can* be defined by an implementation of the Adaptive Platform to give a vendor-specific additional piece of data about the error.

**[SWS\_CORE\_10302]{DRAFT} Semantics of ErrorCode** [The type `ara::core::ErrorCode` provides a class interface for storing an error condition. It shall contain these properties:

- error code value: an integral representation of a low-level error code
- error domain: reference to the context for which the *error code value* is applicable
- support data value: an optional vendor-specific additional piece of data about the error

](RS\_AP\_00119)

`ara::core::ErrorCode` instances are usually not created directly, but only via the forwarding form of the function `ara::core::Result::FromError`.

An `ara::core::ErrorCode` is not restricted to any known set of error domains. Its internal type erasure of the enumeration makes sure that it is a simple (i.e., non-templated) type which can contain arbitrary errors from arbitrary domains.

However, comparison of two `ara::core::ErrorCode` instances only considers the error code value and the error domain reference; the support data value member is not considered for checking equality. This is due to the way `ara::core::ErrorCode` instances are usually compared against a known set of errors for which to check:

```
1 ErrorCode ec = ...
2 if (ec == MyEnum::some_error)
3     // ...
4 else if (ec == AnotherEnum::another_error)
5     // ...
```

Each of these comparisons will create a temporary `ara::core::ErrorCode` object for the right-hand side of the comparison, and then compare `ec` against that. Such automatically created instances naturally do not contain any meaningful support data value.

**[SWS\_CORE\_10301]{DRAFT} Comparison of ara::core::ErrorCode instances** [Any comparison of two `ara::core::ErrorCode` instances shall consider only the following members:

- error code value
- error domain

](RS\_AP\_00119)

This frequent creation of temporary `ara::core::ErrorCode` instances is expected to be so fast as to induce no noticeable runtime cost. This is usually ensured by `ara::core::ErrorCode` being a *literal type*.

**[SWS\_CORE\_10300] ErrorCode type properties** [Class `ara::core::ErrorCode` shall be a *literal type*, as defined in section 3.9-10 [basic.types] of [4, the C++14 standard].](RS\_AP\_00130)

#### 7.2.1.4.2 ErrorDomain

`ara::core::ErrorDomain` is the abstract base class for concrete error domains that are defined within Functional Clusters or even Adaptive Applications. This class is loosely based on `std::error_category`, but differs significantly from it.

An error domain has an associated error code enumeration and an associated base exception type. Both these are usually defined in the same namespace as the `ara::core::ErrorDomain` subclass. For normalized access to these associated types, type aliases with standardized names are defined within the `ara::core::ErrorDomain` subclass. This makes the `ErrorDomain` subclass the root of all data about errors.

**[SWS\_CORE\_10303]{DRAFT} Semantics of ErrorDomain** [The type `ara::core::ErrorDomain` defines a context for a set of error conditions.] ([RS\\_AP\\_00119](#))

Identity of error domains is defined in terms of unique identifiers. AUTOSAR-defined error domains are given standardized identifiers; user-defined error domains are also required to define unique identifiers.

The `ara::core::ErrorDomain` class definition requires this unique identifier to be of unsigned 64 bit integer type (`std::uint64_t`). The range of possible values is large enough to apply UUID-like generation patterns (for `UID-64`) even if typical UUIDs have 128 bits and are thus larger than that. When a new error domain is created (either an AUTOSAR defined or an user defined one) an according `Id` shall be randomly generated, which represents this error domain. The uniqueness and standardization of such an `Id` per error domain is mandatory, since the exchange of information on occurred errors between callee and caller (potentially located at different ECUs) is based on this `Id`.

**[SWS\_CORE\_10401]{DRAFT} Identity of ErrorDomains** [Two instances of `ara::core::ErrorDomain` shall compare equal if and only if their unique identifiers are the same.] ([RS\\_AP\\_00119](#))

Given this definition of identity of error domains, it usually makes sense to have only one single instance of each `ara::core::ErrorDomain` subclass. While new instances of these subclasses can be created by calling their constructors, the recommended way to gain access to these subclasses is to call their non-member accessor functions. For instance, the error domain class `ara::core::FutureErrorDomain` is referenced by calling `ara::core::GetFutureErrorDomain`; within any process space, this will always return a reference to the same global instance of this class.

For error domains that are modeled in ARXML (as `ApApplicationErrorDomain`), the C++ language binding will create a C++ class for each such `ApApplicationErrorDomain`. This C++ class will be a subclass of `ara::core::ErrorDomain`, and its name will follow a standard scheme.

`ara::core` has two pre-defined error domains, called `ara::core::CoreErrorDomain` (containing the set of errors returned by non-`Future/Promise` facilities from the

`ara::core` Functional Cluster) and `ara::core::FutureErrorDomain` (containing errors equivalent to those defined by `std::future_errc`).

Application programmers usually do not interact with class `ara::core::ErrorDomain` or its subclasses directly; most access is done via `ara::core::ErrorCode`.

As `ara::core::ErrorDomain` subclasses are expected to be implicitly referred to from within constant (i.e. compile-time) expressions (typically involving `ara::core::ErrorCode`), they are expected to be *literal types*.

**[SWS\_CORE\_10400] ErrorDomain type properties** [Class `ara::core::ErrorDomain` and all its subclasses shall be *literal types*, as defined in section 3.9-10 [basic.types] of [4, the C++14 standard].] ([RS\\_AP\\_00130](#))

### 7.2.1.4.3 Result

The `ara::core::Result` type follows the `ValueOrError` concept from the C++ proposal p0786 [5]. It either contains a value (of type `ValueType`), or an error (of type `ErrorType`). Both `ValueType` and `ErrorType` are template parameters of `ara::core::Result`, and due to their templated nature, both value and error can be of any type. However, `ErrorType` is defaulted to `ara::core::ErrorCode`, and it is expected that this assignment is kept throughout the Adaptive Platform.

`ara::core::Result` acts as a “wrapper type” that connects the exception-less API approach using `ara::core::ErrorCode` with C++ exceptions. As there is a direct mapping between `ara::core::ErrorCode` and a domain-specific exception type, `ara::core::Result` allows to “transform” its embedded `ara::core::ErrorCode` into the appropriate exception type, by calling `ara::core::Result::ValueOrThrow`.

**[SWS\_CORE\_10600]{DRAFT} Semantics of `ara::core::Result`** [The type `ara::core::Result` shall provide a means to handle both return values and errors from synchronous function calls in an exception-less way, by providing an encapsulated return type which may be either:

- a value  $V$ , where  $V$  may be any C++ type; or
- an error  $E$ , where  $E$  may be any C++ type; default is `ara::core::ErrorCode`.

] ([RS\\_AP\\_00119](#), [RS\\_AP\\_00142](#), [RS\\_AP\\_00128](#))

### 7.2.1.4.4 Future and Promise

`ara::core::Future` and its companion class `ara::core::Promise` are closely modeled on `std::future` and `std::promise`, but have been adapted to interoperate with `ara::core::Result`. Similar to `ara::core::Result` described in section 7.2.1.4.3, the class `ara::core::Future` either contains a value, or an error (the `Fu-`

ture first has to be in “ready” state, though). Class `ara::core::Promise` has been adapted in two aspects: `std::promise::set_exception` has been removed, and `ara::core::Promise::SetError` has been introduced in its stead. For `ara::core::Future`, there is a new member function `ara::core::Future::GetResult` that is similar to `ara::core::Future::get`, but never throws an exception and returns a `ara::core::Result` instead.

Thus, `ara::core::Future` as return type allows the same dual approach to error handling as `ara::core::Result`, in that it either works exception-based (with `ara::core::Future::get`), or exception-free (with `ara::core::Future::GetResult`).

`ara::core::Result` is a type used for returning values or errors from a *synchronous* function call, whereas `ara::core::Future` is a type used for returning values or errors from an *asynchronous* function call.

**[SWS\_CORE\_10800]{DRAFT} Semantics of `ara::core::Future` and `ara::core::Promise`** [The types `ara::core::Future` and `ara::core::Promise` shall provide a means to handle both return values and errors from asynchronous function calls in an exception-less way. Together, they provide a means to store a value type *T* or an error type *E* which may be asynchronously retrieved in a thread-safe manner at a later point in time.] ([RS\\_AP\\_00138](#), [RS\\_AP\\_00128](#))

### 7.2.1.5 Duality of `ErrorCode` and exceptions

By using the classes listed above, all APIs of the Adaptive Platform can be used with either an exception-based or an exception-less error handling workflow. However, no API function will ever treat an `Error` by throwing an exception directly; it will always return an error code in the form of a `ara::core::Result` or `ara::core::Future` return value instead. It is then possible for the caller to “transform” the `Error` into an exception, typically via the member function `ara::core::Result::ValueOrThrow`.

When working with a C++ compiler that does not support exceptions at all (or one that has been configured to disable them with an option such as g++’s `-fno-exceptions`), all API functions still show the same behavior. What *does* differ then is that `ara::core::Result::ValueOrThrow` is not defined – this member function is only defined when the compiler does support exceptions.

### 7.2.1.6 Exception hierarchy

The Adaptive Platform defines a base exception type `ara::core::Exception` for all exceptions defined in the standard. This exception takes a `ara::core::ErrorCode` object as mandatory constructor argument, similar to the way `std::system_error` takes a `std::error_code` argument for construction.

Below this exception base type, there is an additional layer of exception base types, one for each error domain.

For error domains that are modeled in ARXML, the C++ language binding will generate an exception class in addition to the `ErrorDomain` subclass (which is described in section 7.2.1.4.2). This exception class also conforms to a standard naming scheme: `<shortname>` of `ApApplicationErrorDomain` plus “Exception” suffix (this makes it distinguishable from the `ErrorDomain` subclass itself). It is located in the same namespace as the corresponding `ErrorDomain` subclass.

### 7.2.1.7 Creating new error domains

Any new software module with significant logical separation from all existing modules of the Adaptive Platform should define one or more own error domains.

An error domain consists of:

- an error condition enumeration
- an exception base class
- an `ara::core::ErrorDomain` subclass
- a non-member `ErrorDomain` subclass accessor function
- a non-member `MakeErrorCode` function overload

All these are to reside not in the `ara::core` namespace, but in the “target” one.

**[SWS\_CORE\_10999] Custom error domain scope** [The `ara::core::ErrorDomain` subclass and the corresponding enumeration, exception base class, non-member accessor function, and the `MakeErrorCode` overload shall be defined in the same namespace as the software module for which they are being specified.] ([RS-AP\\_00130](#))

*Note: This is to help making sure that the C++ ADL mechanism works as expected by other parts of this standard.*

An error domain defined in the way specified in this section is suitable to be used for the `ApApplicationErrorDomain` model element.

Throughout this section, the character sequence `<SN>` is a placeholder for the *short-name* of the `ApApplicationErrorDomain`.

#### 7.2.1.7.1 Error condition enumeration

The error condition enumeration describes all known error conditions of the new software module. It should be reasonably fine-grained to allow users to differentiate error conditions that they might want to handle in different ways.

**[SWS\_CORE\_10900] Error condition enumeration type** [Each error domain shall define an error condition enum class with the base type `ara::core::ErrorDomain::CodeType` that holds all error conditions of that error domain.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10901] Error condition enumeration naming** [Error domain error condition enumerations shall follow the naming scheme `<SN>Errc`, where `<SN>` is the shortname of the `ApApplicationErrorDomain`.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10902] Error condition enumeration contents** [Error domain error condition enumerations shall not contain any values that indicate success.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10903] Error condition enumeration numbers** [Error domain error condition enumerations shall keep the number 0 unassigned.] ([RS\\_AP\\_00130](#))

#### 7.2.1.7.2 Exception base class

As a complement to the error condition enumeration, an exception base class for this error domain also needs to be defined. This exception base class is used for the “transformation” of an `ara::core::ErrorCode` object into an exception.

Additional exception types can be defined by the software module, but all these then derive from this base type.

**[SWS\_CORE\_10910] ErrorDomain exception base type** [Each error domain shall define an exception base type that is a subclass of `ara::core::Exception`.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10911] ErrorDomain exception base type naming** [All error domain exception base types specified by [\[SWS\\_CORE\\_10910\]](#) shall follow the naming scheme `<SN>Exception`, where `<SN>` is the shortname of the `ApApplicationErrorDomain`.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10912]{DRAFT} ErrorDomain exception type hierarchy** [All additional exception types defined by a software module shall have the exception base type specified by [\[SWS\\_CORE\\_10910\]](#) as a base class.] ([RS\\_AP\\_00130](#))

#### 7.2.1.7.3 ErrorDomain subclass

Then, a new class is created that derives from `ara::core::ErrorDomain` and overrides all the pure virtual member functions. In addition to that, it also needs to define in its scope a type alias called `Errc` for the error condition enumeration, as well as another type alias called `Exception` for the exception base class for this new error domain.

**[SWS\_CORE\_10930] ErrorDomain subclass type** [Each error domain shall define a class type that derives publicly from `ara::core::ErrorDomain`.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10931] ErrorDomain subclass naming** [All subclasses of `ara::core::ErrorDomain` shall follow the naming scheme `<SN>ErrorDomain`, where `<SN>` is the shortname of the `ApApplicationErrorDomain`.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10932] ErrorDomain subclass non-extensibility** [All subclasses of `ara::core::ErrorDomain` shall be `final`.] ([RS\\_AP\\_00130](#), [RS\\_AP\\_00140](#))

**[SWS\_CORE\_10933] ErrorDomain subclass Errc symbol** [All subclasses of `ara::core::ErrorDomain` shall contain in their scope a type alias called `Errc` that refers to the error condition enumeration defined by [\[SWS\\_CORE\\_10900\]](#).] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10934] ErrorDomain subclass Exception symbol** [All subclasses of `ara::core::ErrorDomain` shall contain in their scope a type alias called `Exception` that refers to the exception base type defined by [\[SWS\\_CORE\\_10910\]](#).] ([RS\\_AP\\_00130](#))

All `ErrorDomain` subclasses are usable from within constant expressions, see [\[SWS\\_CORE\\_10400\]](#). In particular, this includes that `ErrorDomain` subclasses can be defined as `constexpr` global variables.

In order to further ease working with error domains, all member functions of the `ErrorDomain` subclass are required to be `noexcept`, with the obvious exception of `ara::core::ErrorDomain::ThrowAsException`.

**[SWS\_CORE\_10950] ErrorDomain subclass member function property** [With the exception of `ara::core::ErrorDomain::ThrowAsException`, all public member functions of all `ErrorDomain` subclasses shall be `noexcept`.] ([RS\\_AP\\_00130](#))

The virtual member function `ara::core::ErrorDomain::Name` returns the shortname of the `ApApplicationErrorDomain`, mostly for logging purposes.

**[SWS\_CORE\_10951] ErrorDomain subclass shortname retrieval** [The return value of an error domain's `ara::core::ErrorDomain::Name` member function shall be equal to the shortname of the `ApApplicationErrorDomain`.] ([RS\\_AP\\_00130](#))

Each error domain has an identifier that is used to determine equality of error domains. The error domains that are pre-defined by the Adaptive Platform have standardized identifiers. Application-specific error domains should make sure their identifiers are system-wide unique.

**[SWS\_CORE\_10952] ErrorDomain subclass unique identifier retrieval** [The return value of an error domain's `ara::core::ErrorDomain::Id` member function shall be a unique identifier that follows the rules defined by [\[SWS\\_CORE\\_00010\]](#).] ([RS\\_AP\\_00130](#))

An `ErrorDomain` can “transform” an `ErrorCode` into an exception.

**[SWS\_CORE\_10953] Throwing ErrorCodes as exceptions** [The type of an exception thrown by the `ErrorDomain` subclass's implementation of `ara::core::ErrorDomain::ThrowAsException` shall derive from that `ErrorDomain` subclass's `Exception` type alias defined by [\[SWS\\_CORE\\_10934\]](#).] ([RS\\_AP\\_00130](#))

#### 7.2.1.7.4 Non-member ErrorDomain subclass accessor function

A non-member accessor function for the new error domain class is to be defined. For an error domain class `MyErrorDomain`, the accessor function is named `GetMyErrorDomain`. This accessor function returns a reference to a single global instance of that class. This accessor function shall be fully `constexpr`-capable; this in turn implies that the `ErrorDomain` subclass also shall be `constexpr`-constructible (see [SWS\_CORE\_10400]).

**[SWS\_CORE\_10980] ErrorDomain subclass accessor function** [For all subclasses of `ara::core::ErrorDomain`, there shall be a non-member `constexpr` function that returns a reference-to-const to a singleton instance of it.] (RS\_AP\_00130)

**[SWS\_CORE\_10981] ErrorDomain subclass accessor function naming** [All `ara::core::ErrorDomain` subclass accessor functions shall follow the naming scheme `Get<SN>ErrorDomain`, where `<SN>` is the shortname of the `ApApplicationErrorDomain`.] (RS\_AP\_00130)

**[SWS\_CORE\_10982] ErrorDomain subclass accessor function** [All `ara::core::ErrorDomain` subclass accessor functions shall have a return type of `const ErrorDomain&`.] (RS\_AP\_00130)

#### 7.2.1.7.5 Non-member MakeErrorCode overload

And finally, a non-member factory function `MakeErrorCode` needs to be defined, which is implicitly used by the convenience constructors of class `ara::core::ErrorCode`. This factory function will make use of the non-member accessor function for the error domain subclass, and call the type-erased constructor of class `ara::core::ErrorCode`.

**[SWS\_CORE\_10990] MakeErrorCode overload for new error domains** [For all subclasses of `ara::core::ErrorDomain`, there shall be a `constexpr` overload of the non-member function `MakeErrorCode` that creates an `ara::core::ErrorCode` instance for a given error condition value within the `ara::core::ErrorDomain` subclass's error condition range.] (RS\_AP\_00130)

**[SWS\_CORE\_10991] MakeErrorCode overload signature** [All overloads of the non-member function `MakeErrorCode` shall have the following signature:

```
constexpr ErrorCode MakeErrorCode(<SN>Errc code, ErrorDomain::
    SupportDataType data) noexcept;
```

where `<SN>` is the shortname of the `ApApplicationErrorDomain`.] (RS\_AP\_00130)

### 7.2.1.7.6 C++ pseudo code example

The following C++ pseudo code illustrates how these definitions come together:

```
1 namespace my
2 {
3
4 enum class <SN>Errc : ara::core::ErrorDomain::CodeType
5 {
6     // ...
7 };
8
9 class <SN>Exception : public ara::core::Exception
10 {
11 public:
12     <SN>Exception(ara::core::ErrorCode err) noexcept;
13 };
14
15 class <SN>ErrorDomain final : public ara::core::ErrorDomain
16 {
17 public:

34
35 }
```

### 7.2.1.8 AUTOSAR error domains

The full range of unique error domain identifiers is partitioned into a range of AUTOSAR-specified IDs, another range of vendor-defined IDs, and another range of user-defined IDs.

User-defined IDs have their top-bit set to 0 and can use the remaining 63 bits to provide uniqueness. IDs with their top-bit set to 1 are reserved for AUTOSAR and stack vendor use.

**[SWS\_CORE\_00010] Error domain identifier** [All error domains shall have a system-wide unique identifier that is represented as a 64-bit unsigned integer value.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_00011] AUTOSAR error domain range** [Error domain identifiers where bit #63 is set to 1 and bit #62 is set to 0 are reserved for AUTOSAR-defined error domains.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_00016]{DRAFT} Vendor-defined error domain range** [Error domain identifiers where the top 32 bits (i.e. bit #63..#32) are equal to 0xc000'0000 are reserved for vendor-specific error domains. Bits #31..#16 hold the vendor's numerical identifier, and bits #15..#0 can be used by each vendor for error domain identifiers.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_00013] The Future error domain** [There shall be an error domain `ara::core::FutureErrorDomain` for all errors originating from the interaction of the classes `ara::core::Future` and `ara::core::Promise`. It shall have the shortname `Future` and the identifier 0x8000'0000'0000'0013.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_00014] The Core error domain** [There shall be an error domain `ara::core::CoreErrorDomain` for errors originating from non-Future/Promise facilities of `ara::core`. It shall have the shortname `Core` and the identifier 0x8000'0000'0000'0014.] ([RS\\_AP\\_00130](#))

## 7.2.2 Async signal safety

An *async-signal-safe* function is one that can be safely called from within a POSIX signal handler.

[6, The POSIX standard] defines a set of functions that are guaranteed to be async-signal-safe; all functions not on that list need to be assumed unsuitable to be called within a signal handler. This includes all ARA APIs, as it is not specified (and in general not possible to determine) which other functions (whether from POSIX or from other standards or implementations) are called within them.

Usage of any ARA API within a signal handler will result in undefined behavior of the application, unless otherwise specified.

## 7.2.3 Explicit Operation Abortion

If a `Violation` has been detected by the implementation of an API function, [\[SWS\\_CORE\\_00003\]](#) mandates to abort this operation immediately. It allows two ways to do this; either by throwing certain kinds of exceptions (if the implementation supports C++ exceptions), or by calling `ara::core::Abort`.

Calling `ara::core::Abort` will result in an [Explicit Operation Abortion](#), which usually leads to an [Unexpected Termination](#) as defined by [7]. This section defines the behavior of this mechanism.

Like `std::abort`, calling `ara::core::Abort` is meant to terminate the current process abnormally and immediately, without performing stack unwinding and without calling destructors of static objects.

**[SWS\_CORE\_12402]{DRAFT} “Noreturn” property for Abort** [The function `ara::core::Abort` shall not return to its caller.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_12403]{DRAFT} Logging of Explicit Operation Abortion** [Calling `ara::core::Abort` shall result in a log message, which shall contain the string that has been passed to the function as argument, being output to the process’s standard error stream.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_12407]{DRAFT} Thread-safety of Explicit Operation Abortion** [While a call to `ara::core::Abort` is in progress, other calls to this function shall block the calling threads.] ([RS\\_AP\\_00130](#))

`ara::core::Abort` provides a means to add a “hook” into the system, by calling `ara::core::SetAbortHandler`, similar to the way `std::atexit` allows to install a callback for the `std::exit` mechanism.

**[SWS\_CORE\_12404]{DRAFT} AbortHandler invocation** [Calling `ara::core::Abort` shall invoke the `AbortHandlers` after the log message as per [\[SWS\\_CORE\\_12403\]](#) has been output, in the reverse order of installation.] ([RS\\_AP\\_00130](#))

### 7.2.3.1 AbortHandler

This handler can be installed with `ara::core::SetAbortHandler` or `ara::core::AddAbortHandler`. It is invoked in turn when `ara::core::Abort` is called, and it may perform arbitrary operations and then has these four principal choices for its final statements: it can either

- terminate the process, or
- return from the function call, or
- defer function return by entering an infinite loop, or
- perform a non-local goto operation such as `std::longjmp`.

The use of non-local goto operations, including `std::longjmp`, is strongly discouraged and also expressively prohibited by MISRA, the AUTOSAR C++14 Coding Guidelines, and most other coding guidelines as well.

Similarly, deferring function return by entering an infinite loop is discouraged as well; while this still leads to the desired outcome that the *operation* which caused a [Violation](#) has been aborted, it will do so at the cost of “defunct’ing” the calling thread and risking the destabilization of the software, which already has encountered a [Violation](#).

An `AbortHandler` that terminates the process is strongly advised to do so by calling `std::abort`. This will make sure that the `Unexpected Termination` is properly seen by Execution Management as an `Abnormal Termination` as well.

If all `AbortHandlers` return, or if no `AbortHandler` is defined at all, then the final action of `ara::core::Abort` is to call `std::abort`.

**[SWS\_CORE\_12405]{DRAFT} Final action without AbortHandler** [If there is no custom `ara::core::AbortHandler` that has been installed with `ara::core::SetAbortHandler` or `ara::core::AddAbortHandler`, then the implementation of `ara::core::Abort` shall call `std::abort()`.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_12406]{DRAFT} Final action with returning AbortHandlers** [If there are custom `ara::core::AbortHandlers` that have been installed with `ara::core::SetAbortHandler` or `ara::core::AddAbortHandler` and all of them return, then the implementation of `ara::core::Abort` shall call `std::abort()`.] ([RS\\_AP\\_00130](#))

### 7.2.3.2 SIGABRT handler

In addition to the `ara::core::AbortHandler`, or alternatively to it, the application can also influence this mechanism by installing a signal handler for SIGABRT.

The signal handler for SIGABRT has the same choices of actions as the `ara::core::AbortHandler`: it can terminate the process, return from the function call, defer function return by entering an infinite loop, or perform a non-local goto operation. The same caveats as for the `ara::core::AbortHandler` apply here: non-local goto operations and infinite loops should be avoided.

If the SIGABRT handler does not return, it should in general terminate abnormally with SIGABRT. To do this without entering an infinite loop, it should restore the default disposition of SIGABRT with `std::signal(SIGABRT, SIG_DFL)` and then re-raise SIGABRT with e.g. `std::raise(SIGABORT)`.

This “second step” of influence that the SIGABRT handler provides allows applications that are already handling other synchronous signals such as SIGSEGV or SIGFPE to treat SIGABRT the same way.

## 7.2.4 Advanced data types

### 7.2.4.1 AUTOSAR types

#### 7.2.4.1.1 InstanceSpecifier

Instances of `ara::core::InstanceSpecifier` are used to identify service port prototype instances within the AUTOSAR meta-model and are therefore used in the `ara::com` API and elsewhere. A detailed description and background can be found in [8] sections 6.1 (“Instance Identifiers”) and 9.4.4 (“Usage of meta-model identifiers within `ara::com` based application code”).

`ara::core::InstanceSpecifier` can conceptually be understood to be a wrapper for a string representation of a valid meta-model path. It is designed to be either constructed from a string representation via a factory method `ara::core::InstanceSpecifier::Create`, which provides an exception-free solution, or directly by using the constructor, which might throw an exception if the string representation is invalid.

**[SWS\_CORE\_10200] Valid InstanceSpecifier representations - application interaction** [In case of application interaction and thus in the presence of `PortPrototypes` the string representation of a valid `ara::core::InstanceSpecifier` consists of a "/"-separated list of model element `shortNames` starting from an `Executable` via the `RootSwComponentPrototype` and several `SwComponentPrototypes` to the respective `PortPrototype` to which the `ara::core::InstanceSpecifier` shall apply.]([RS\\_AP\\_00130](#))

Thus, in case of application interaction the content of a valid `ara::core::InstanceSpecifier` adheres to the following pattern:

```
Executable.shortName/RootSwComponentPrototype.shortName  
/SwComponentPrototype.shortName/.../PortPrototype.shortName
```

**[SWS\_CORE\_10203] Valid InstanceSpecifier representations - functional cluster interaction** [In case of functional cluster interaction and thus in the absence of `PortPrototypes` the string representation of a valid `ara::core::InstanceSpecifier` consists of a "/"-separated list of model element `shortNames` starting from a top-level `ARPackage` via contained sub-packages to the respective mapping element that is derived from `FunctionalClusterInteractsWithFunctionalClusterMapping` (see [TPS\\_MANI\\_03268](#) for further details).]([RS\\_AP\\_00130](#))

Thus, in case of functional cluster interaction the content of a valid `ara::core::InstanceSpecifier` adheres to the following pattern:

```
ARPackage.shortName/.../ARPackage.shortName  
/FunctionalClusterInteractsWithFunctionalClusterMapping.shortName
```

**[SWS\_CORE\_10201] Validation of meta-model paths** [The construction mechanisms of class `ara::core::InstanceSpecifier` shall reject meta-model paths that are syntactically invalid according to the syntax rules defined in [\[SWS\\_CORE\\_10200\]](#).]([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10202] Construction of InstanceSpecifier objects** [APIs for construction of `ara::core::InstanceSpecifier` objects shall be available in both potentially-throwing and non-throwing form.] (*RS\_AP\_00130*)

#### 7.2.4.1.2 ScaleLinearAndTexttable

A `ara::core::ScaleLinearAndTexttable` type is a struct type that emulates an enumeration type with extended capabilities, such as those given in [9, the C++17 standard]

In particular, it can hold the values of the enumeration, but also any value of the underlying type of the Enumeration Data Type with which it was defined.

#### 7.2.4.2 Types derived from the base C++ standard

In addition to AUTOSAR-devised data types, which are mentioned in the previous sections, the Adaptive Platform also contains a number of generic data types and helper functions.

Some types are already contained in [4, the C++14 standard]; however, types with almost identical behavior are re-defined within the `ara::core` namespace. The reason for this is that the memory allocation behavior of the `std::` types is often unsuitable for automotive purposes. Thus, the `ara::core` ones define their own memory allocation behavior, and perform some other necessary adaptations as well, including about the throwing of exceptions.

**[SWS\_CORE\_00040]{DRAFT} Errors originating from C++ standard classes** [For the classes in `ara::core` specified below in terms of the corresponding classes of the C++ standard, all functions that are specified by [4, the C++14 standard], [9, the C++17 standard], or [10, the draft C++20 standard] to throw any exceptions, are instead specified to be the cause of a `Violation` when they do so.] (*RS\_AP\_00130*)

Examples for such data types are: Array, Vector, Map, and String.

##### 7.2.4.2.1 Array

This section describes the `ara::core::Array` type that represents a container which encapsulates fixed size arrays.

`ara::core::Array` is an almost-equivalent of `std::array`, and most type properties of `std::array` apply to `ara::core::Array` as well.

These differences to `std::array` are intended:

- `std::array::at` has been omitted (in order to avoid mandatory exception handling)

**[SWS\_CORE\_11200] Array base behavior** [`ara::core::Array` and all its member functions and supporting constructs shall behave identical to those of `std::array` in header `<array>` from [4, the C++14 standard], except for the differences specified in this document.] ([RS\\_AP\\_00130](#))

#### 7.2.4.2.2 Vector

This section describes the `ara::core::Vector` type that represents a container of variable size.

**[SWS\_CORE\_11300]{DRAFT} Vector base behavior** [`ara::core::Vector` and all its member functions and supporting constructs shall behave identical to those of `std::vector` in header `<vector>` from [4, the C++14 standard], except for the differences specified in this document.] ([RS\\_AP\\_00130](#))

#### 7.2.4.2.3 Map

This section describes the `ara::core::Map` type that represents an associative container of variable size.

**[SWS\_CORE\_11400]{DRAFT} Map base behavior** [`ara::core::Map` and all its member functions and supporting constructs shall behave identical to those of `std::map` in header `<map>` from [4, the C++14 standard], except for the differences specified in this document.] ([RS\\_AP\\_00130](#))

#### 7.2.4.2.4 String and BasicString

This section describes the `ara::core::String` and `ara::core::BasicString` types.

**[SWS\_CORE\_12000]{DRAFT} String base behavior** [`ara::core::String`, `ara::core::BasicString` and all their member functions and supporting constructs shall behave identical to those of `std::string` and `std::basic_string` in header `<string>` from [4, the C++14 standard], except for the differences specified in this document.] ([RS\\_AP\\_00130](#))

#### 7.2.4.2.5 SteadyClock

##### 7.2.4.2.5.1 Definitions of terms

The C++ `std::chrono` library defines a number of concepts and types for handling time and durations. One of these concepts is that of a “clock” which is able to create snapshots of specific “time points”. When talking about clocks and time points, the

three qualities *resolution*, *precision*, and *accuracy* are distinguished within this document as follows:

- The *resolution* relates to the smallest increment that can be expressed with the clock's measurement data type.

For clocks of the POSIX `clock_gettime` API, the *resolution* is implicitly defined as nanoseconds by the API's usage of `struct timespec` with its `time-spec::tv_nsec` field.

For C++ clocks of the `std::chrono` APIs, the *resolution* is variable.

- The *precision* of a clock is the smallest time interval that its timer is able to measure. The *precision* is implementation-defined and depends on the properties and capabilities of the physical machine as well as the operating system.
- The *accuracy* of a clock is the relation between the reported value and the truth.

In addition to that, the *epoch* is an important property of a clock as well, as it defines the base of the time range that can originate from a clock. Clocks that measure calendar time often use “Unix time”, which is given as number of seconds (without leap seconds) since the “Unix Epoch”, which is 1970-01-01, 00:00:00 UTC.

Clocks that place more emphasis on high *precision* often do not relate to calendar time at all, but generate timestamps as offsets from something like the power-up time of the system.

#### 7.2.4.2.5.2 Clocks in the Adaptive Platform

The C++ `std::chrono` library defines a number of standard clocks. Amongst these is `std::chrono::steady_clock`, which represents a monotonic clock whose time points are strictly increasing with a fixed interval.

However, the C++ standard does not place any requirements on the *resolution*, *precision*, and *accuracy* of this clock. The undefinedness of its *resolution* can pose some difficulties for application programmers, but these can usually be solved by agreeing on a common – or minimum – *resolution*. The *precision* and *accuracy* are always dependent on the physical properties of the machine and of the operating system.

The Adaptive Platform defines `ara::core::SteadyClock` as a `std::chrono`-compatible clock with nanosecond *resolution* and a `std::int64_t` datatype. Its *precision* and *accuracy* are still implementation-defined and can be given as characteristic values of a concrete platform. Its *epoch* is the power-up time of the ECU. With these properties, timestamps generated by `ara::core::SteadyClock` will not overflow until 292 years after its *epoch*.

It is the standard clock of the Adaptive Platform and should be used for most timekeeping purposes.

The properties of `ara::core::SteadyClock` imply that a type alias to `std::chrono::steady_clock` is a conforming implementation of `ara::core::SteadyClock`, if `std::chrono::steady_clock::period` is equivalent to `std::nano`, and `std::chrono::steady_clock::rep` is a 64-bit signed integer type such as `std::int64_t`.

**[SWS\_CORE\_11800] SteadyClock type requirements** [Class `ara::core::SteadyClock` shall meet the requirements of *TrivialClock* from [4, the C++14 standard].] (*RS\_AP\_00130*)

**[SWS\_CORE\_11801] Epoch of SteadyClock** [The *epoch* of `ara::core::SteadyClock` shall be the system start-up.] (*RS\_AP\_00130*)

### 7.2.4.3 Types derived from newer C++ standards

These types have been defined in or proposed for a newer C++ standard, and the Adaptive Platform includes them into the `ara::core` namespace, usually because they are necessary for certain constructs of the Manifest.

Examples for such data types are: `Optional`, `StringView`, `Span`, and `Variant`.

#### 7.2.4.3.1 Optional

This section describes the `ara::core::Optional` type.

**[SWS\_CORE\_11000]{DRAFT} Optional base behavior** [`ara::core::Optional` and all its member functions and supporting constructs shall behave identical to those of `std::optional` in header `<optional>` from [9, the C++17 standard], except for the differences specified in this document.] (*RS\_AP\_00130*)

Note: The `value()` function and the `bad_optional_access` exception defined in the C++ standard library are left out of this specification to provide an API that does not make use of exceptions. Use either `has_value` or `operator bool()` to check if the `ara::core::Optional` contains a value before accessing the value with e.g., `operator*`. Alternatively, use the `value_or` functions to access the value and provide a default value in case the `ara::core::Optional` contains no value.

**[SWS\_CORE\_01030]{DRAFT} value member function overloads** [Contrary to the description in [9], no member functions with this name exist in `ara::core::Optional`.] (*RS\_AP\_00130*)

**[SWS\_CORE\_01031]{DRAFT} class bad\_optional\_access** [No class named `bad_optional_access` is defined in the `ara::core` namespace.] (*RS\_AP\_00130*)

#### 7.2.4.3.2 Variant

This section describes the `ara::core::Variant` type that represents a type-safe union.

**[SWS\_CORE\_11600]{DRAFT} Variant base behavior** [`ara::core::Variant` and all its member functions and supporting constructs shall behave identical to those of `std::variant` in header `<variant>` from [9, the C++17 standard], except for the differences specified in this document.] ([RS\\_AP\\_00130](#))

#### 7.2.4.3.3 StringView

This section describes the `ara::core::StringView` type that represents a read-only view over a contiguous sequence of characters whose storage is owned by another object.

**[SWS\_CORE\_12200]{DRAFT} StringView base behavior** [`ara::core::StringView` and all its member functions and supporting constructs shall behave identical to those of `std::string_view` in header `<string_view>` from [9, the C++17 standard], except for the differences specified in this document.] ([RS\\_AP\\_00130](#))

#### 7.2.4.3.4 Span

`ara::core::Span` is a type that represents an abstraction over a linear sequence of values of a certain type. It is closely modeled on `std::span` from C++20, with deviations mostly coming from the lack of C++20's “ranges” feature.

**[SWS\_CORE\_11900]{DRAFT} Span base behavior** [`ara::core::Span` and all its member functions and supporting constructs shall behave identical to those of `std::span` in header `<span>` from [10, the draft C++20 standard], except for the differences specified in this document.] ([RS\\_AP\\_00130](#))

#### 7.2.4.3.5 ara::core::Byte

`ara::core::Byte` is a type that is able to hold a “byte” of the machine. It is an own type distinct from any other type.

The definitions of this section have been carefully set up in a way to make `std::byte` from [9, the C++17 standard] a conforming implementation, but also allow a class-based implementation with only C++14 means.

Unlike `std::byte` from [9, the C++17 standard], it is implementation-defined whether `ara::core::Byte` can be used for type aliasing without triggering Undefined Behavior.

**[SWS\_CORE\_10100] Type property of `ara::core::Byte`** [The type `ara::core::Byte` shall not be an integral type. In particular, the value `std::is_integral<ara::core::Byte>::value` shall be 0.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10101] Size of type `ara::core::Byte`** [The size (in bytes) of an instance of type `ara::core::Byte` (determined with `sizeof(ara::core::Byte)`) shall be 1.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10102] Value range of type `ara::core::Byte`** [The value of an instance of type `ara::core::Byte` shall be constrained to the range `[0..std::numeric_limits<unsigned char>::max()]`.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10103] Creation of `ara::core::Byte` instances** [An instance of type `ara::core::Byte` shall be creatable from an integral type with brace-initialization syntax. This initialization shall also be possible when called in a constant expression. If the initializer value is outside the value range of type `ara::core::Byte` (see [\[SWS\\_CORE\\_10102\]](#)), the behavior is undefined.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10104] Default-constructed `ara::core::Byte` instances** [An instance of type `ara::core::Byte` shall be constructible without giving an initializer value. Such a variable definition shall incur no runtime cost, and the value of the instance shall have indeterminate content.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10105] Destructor of type `ara::core::Byte`** [The destructor of type `ara::core::Byte` shall be trivial.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10106] Implicit conversion from other types** [The type `ara::core::Byte` shall not be implicitly convertible from any other type.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10107] Implicit conversion to other types** [The type `ara::core::Byte` shall allow no implicit conversion to any other type, including `bool`.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10108] Conversion to `unsigned char`** [The type `ara::core::Byte` shall allow conversion to `unsigned char` with a `static_cast<>` expression. This conversion shall also be possible when called in a constant expression.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10109] Equality comparison for `ara::core::Byte`** [The type `ara::core::Byte` shall be comparable for equality with other instances of type `ara::core::Byte`. This comparison shall also be possible when called in a constant expression.] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_10110] Non-equality comparison for `ara::core::Byte`** [The type `ara::core::Byte` shall be comparable for non-equality with other instances of type `ara::core::Byte`. This comparison shall also be possible when called in a constant expression.] ([RS\\_AP\\_00130](#))

## 7.2.5 Initialization and Shutdown

This section describes the global initialization and shutdown of the ARA framework. Before the framework is initialized, and after the it is deinitialized, not all ARA functionality may be available.

While it is usually possible for a framework implementation to initialize all parts of the framework in an “initialize on first use” fashion, this might not always be desirable, as it introduces potentially noticeable delays during runtime.

For this reason, there exist initialization and shutdown functions that may be used by the framework vendor to initialize/shutdown the framework to an extent that no lazy initialization during runtime is necessary.

On the other hand, another framework implementation might well have empty implementations of these functions, e.g. if this framework chooses to fully adopt the “initialize on first use” idiom.

**[SWS\_CORE\_15003]{DRAFT} Startup and initialization of ARA** [The `ara::core::Initialize` function shall initiate the start-up of the ARA framework, which might include (but is not limited to):

- initialization of ARA framework specific data structures
- initialization of system resources
- spawning of background threads

]([RS\\_Main\\_00011](#))

**[SWS\_CORE\_15004]{DRAFT} Shutdown and de-initialization of ARA** [The `ara::core::Deinitialize` function shall initiate the shutdown of the ARA framework, which might include (but is not limited to):

- orderly shutdown of spawned background threads
- deallocation of dynamically allocated memory
- deallocation of other system resources

]([RS\\_Main\\_00011](#))

An error returned by `ara::core::Deinitialize` is the only way for the ARA to report an error that is guaranteed to be available, e.g. in case `ara::log` has already been deinitialized. The user is not expected to be able to recover from such an error. However, the user may have a project-specific way of recording errors during deinitialization without `ara::log`. A typical error case to be reported here is that the user is still holding some resource from the ARA.

Calling `ara::core::Deinitialize` while ARA APIs are still being called concurrently results in undefined behavior of the application and the framework.

For a proper shutdown, it is also expected that `ara::core::Deinitialize` is called before the statically initialized data is destructed.

**[SWS\_CORE\_15001]{DRAFT} Handling of interaction with the ARA of an un/deinitialized runtime** [A call to any ARA API (other than the ones mentioned in [SWS\_CORE\_15002]) without prior call to `ara::core::Initialize` shall be treated by the Functional Cluster implementation as a `Violation`.] (*RS\_AP\_00142*)

The rationale to treat this as a `Violation` is that such occurrences cannot be handled by the caller of the API at the point in time where the error is detected. Aborting execution is the only way to signal this kind of systematic error and prevent later failures.

**[SWS\_CORE\_15002]{DRAFT} Special `ara::core` types to be used without initialization** [A small subset of `ara::core` types and functions shall be usable independently of initialization with `ara::core::Initialize`. These are:

- `ara::core::ErrorCode` and all its member functions and supporting constructs (including non-member operators)
- `ara::core::StringView` and all its member functions and supporting constructs (including non-member operators)
- `ara::core::Result` and all its member functions and supporting constructs, except for `ara::core::Result::ValueOrThrow`
- `ara::core::ErrorDomain` and all its member functions and its subclasses, as long as they adhere to [SWS\_CORE\_10400], but excluding `<Prefix>ErrorDomain::ThrowAsException`.

] (*RS\_AP\_00142*)

The rationale for the exception for this subset is the intended use before initialization and that these types are used as part of the initialization (`ara::core::Result`, `ara::core::ErrorCode`, `ara::core::ErrorDomain`).

## 8 API specification

### 8.1 C++ language binding

All symbols described in this chapter reside within the namespace `ara::core`. All symbols have `public` visibility unless otherwise noted.

#### 8.1.1 ErrorDomain data type

This section describes the `ara::core::ErrorDomain` type that constitutes a base class for error domain implementations.

[SWS\_CORE\_00110]{DRAFT} [

<b>Kind:</b>	class
<b>Symbol:</b>	ErrorDomain
<b>Scope:</b>	namespace <code>ara::core</code>
<b>Syntax:</b>	<code>class ara::core::ErrorDomain {...};</code>
<b>Header file:</b>	<code>#include "ara/core/error_domain.h"</code>
<b>Description:</b>	Encapsulation of an error domain. An error domain is the controlling entity for <code>ErrorCode</code> 's error code values, and defines the mapping of such error code values to textual representations. This class is a literal type, and subclasses are strongly advised to be literal types as well.

](RS\_AP\_00130)

[SWS\_CORE\_00121]{DRAFT} [

<b>Kind:</b>	type alias
<b>Symbol:</b>	<code>IdType</code>
<b>Scope:</b>	<code>class ara::core::ErrorDomain</code>
<b>Derived from:</b>	<code>std::uint64_t</code>
<b>Syntax:</b>	<code>using ara::core::ErrorDomain::IdType = std::uint64_t;</code>
<b>Header file:</b>	<code>#include "ara/core/error_domain.h"</code>

<b>Syntax:</b>	<code>void ara::core::ErrorCode::ThrowAsException () const;</code>
<b>Return value:</b>	None

<b>Header file:</b>	#include "ara/core/error_code.h"
<b>Description:</b>	Throw this error as exception.  This function will determine the appropriate exception type for this ErrorCode and throw it. The thrown exception will contain this ErrorCode.

](RS\_AP\_00130)

### 8.1.2.1 ErrorCode non-member operators

[SWS\_CORE\_00571]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	operator==(const ErrorCode &lhs, const ErrorCode &rhs)	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	constexpr bool ara::core::operator==(const ErrorCode &lhs, const ErrorCode &rhs) noexcept;	
<b>Parameters (in):</b>	lhs	the left hand side of the comparison
	rhs	the right hand side of the comparison
<b>Return value:</b>	bool	true if the two instances compare equal, false otherwise
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/error_code.h"	
<b>Description:</b>	Non-member operator== for ErrorCode.  Two ErrorCode instances compare equal if the results of their Value() and Domain() functions are equal. The result of SupportData() is not considered for equality.	

](RS\_AP\_00130)

[SWS\_CORE\_00572]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	operator!=(const ErrorCode &lhs, const ErrorCode &rhs)	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	constexpr bool ara::core::operator!=(const ErrorCode &lhs, const ErrorCode &rhs) noexcept;	
<b>Parameters (in):</b>	lhs	the left hand side of the comparison
	rhs	the right hand side of the comparison
<b>Return value:</b>	bool	true if the two instances compare not equal, false otherwise
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/error_code.h"	
<b>Description:</b>	Non-member operator!= for ErrorCode.  Two ErrorCode instances compare equal if the results of their Value() and Domain() functions are equal. The result of SupportData() is not considered for equality.	

](RS\_AP\_00130)

### 8.1.3 Exception data type

This section describes the `ara::core::Exception` type that constitutes the base type for all exception types defined by the Adaptive Platform.

[SWS\_CORE\_00601] [

<b>Kind:</b>	class
<b>Symbol:</b>	Exception
<b>Scope:</b>	namespace ara::core
<b>Base class:</b>	std::exception
<b>Syntax:</b>	<code>class ara::core::Exception : public exception {...};</code>
<b>Header file:</b>	<code>#include "ara/core/exception.h"</code>
<b>Description:</b>	Base type for all AUTOSAR exception types.

](RS\_AP\_00130)

[SWS\_CORE\_00611] [

<b>Kind:</b>	function
<b>Symbol:</b>	Exception(ErrorCode err)
<b>Scope:</b>	<a href="#">class ara::core::Exception</a>
<b>Syntax:</b>	<code>explicit ara::core::Exception::Exception (ErrorCode err) noexcept;</code>
<b>Parameters (in):</b>	err                      the ErrorCode
<b>Exception Safety:</b>	noexcept
<b>Header file:</b>	<code>#include "ara/core/exception.h"</code>
<b>Description:</b>	Construct a new Exception object with a specific ErrorCode.

](RS\_AP\_00130)

[SWS\_CORE\_00615]{DRAFT} [

<b>Kind:</b>	function
<b>Symbol:</b>	Exception(Exception &&other)
<b>Scope:</b>	<a href="#">class ara::core::Exception</a>
<b>Syntax:</b>	<code>ara::core::Exception::Exception (Exception &amp;&amp;other)=default;</code>
<b>Parameters (in):</b>	other                      the other instance
<b>Header file:</b>	<code>#include "ara/core/exception.h"</code>
<b>Description:</b>	Move constructor from another instance.

](RS\_AP\_00130)

[SWS\_CORE\_00616]{DRAFT} [

<b>Kind:</b>	function
<b>Symbol:</b>	operator=(Exception &&other)
<b>Scope:</b>	<a href="#">class ara::core::Exception</a>
<b>Syntax:</b>	<code>Exception&amp; ara::core::Exception::operator= (Exception &amp;&amp;other) &amp;=default;</code>

△

<b>Parameters (in):</b>	other	the other instance
<b>Return value:</b>	Exception &	–
<b>Header file:</b>	#include "ara/core/exception.h"	
<b>Description:</b>	Move assignment operator from another instance.	

](RS\_AP\_00130)

[SWS\_CORE\_00617]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	~Exception()	
<b>Scope:</b>	class ara::core::Exception	
<b>Syntax:</b>	virtual ara::core::Exception::~~Exception ()=default;	
<b>Header file:</b>	#include "ara/core/exception.h"	
<b>Description:</b>	Destructs the Exception object.	

](RS\_AP\_00130, RS\_AP\_00145)

[SWS\_CORE\_00612] [

<b>Kind:</b>	function	
<b>Symbol:</b>	what()	
<b>Scope:</b>	class ara::core::Exception	
<b>Syntax:</b>	const char* ara::core::Exception::what () const noexcept override;	
<b>Return value:</b>	const char *	a null-terminated string
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/exception.h"	
<b>Description:</b>	Return the explanatory string. This function overrides the virtual function std::exception::what. All guarantees about the lifetime of the returned pointer that are given for std::exception::what are preserved.	

](RS\_AP\_00130)

[SWS\_CORE\_00613] [

<b>Kind:</b>	function	
<b>Symbol:</b>	Error()	
<b>Scope:</b>	class ara::core::Exception

### 8.1.4.1 Result<void, E> template specialization

This section defines the interface of the `ara::core::Result` template specialization where the type `T` is "void".

This specialization omits these member functions that are defined in the generic template:

- `operator->`
- `Bind`

In addition, a number of function overloads collapse to a single, no-argument one.

[SWS\_CORE\_00801] [

<b>Kind:</b>	class	
<b>Symbol:</b>	Result< void, E >	
<b>Scope:</b>	namespace <code>ara::core</code>	
<b>Syntax:</b>	<pre>template &lt;typename E&gt; class ara::core::Result&lt; void, E &gt; final {...};</pre>	
<b>Template param:</b>	typename <code>E</code>	the type of error
<b>Header file:</b>	#include "ara/core/result.h"	
<b>Description:</b>	Specialization of class <code>Result</code> for "void" values.

<b>Kind:</b>	function	
<b>Symbol:</b>	Bind(F &&f)	
<b>Scope:</b>	class ara::core::Result<void, E >	
<b>Syntax:</b>	template <typename F> auto ara::core::Result< void, E >::Bind (F &&f) const -> <see below>;	
<b>Template param:</b>	F	the type of the Callable f
<b>Parameters (in):</b>	f	the Callable
<b>Return value:</b>	<see below>	a new Result instance of the possibly transformed type
<b>Header file:</b>	#include "ara/core/result.h"	
<b>Description:</b>	Call the given Callable, and return a new Result with the result of the call. The Callable is expected to be compatible to one of these two interfaces: Result<XXX, E> f(); XXX f(); meaning that the Callable either returns a Result<XXX, E> or a XXX directly, where XXX can be any type that is suitable for use by class Result. The return type of this function is decltype(f()) for a template argument F that returns a Result type, and it is Result<decltype(f()), E> for a template argument F that does not return a Result type. If this instance does not contain a value, a new Result<XXX, E> is still created and returned, with the original error contents of this instance being copied into the new instance.

<b>Parameters (in):</b>	errorCode the ErrorCode instance
<b>Return value:</b>	None

<b>Exception Safety:</b>	noexcept(false)
<b>Header file:</b>	#include "ara/core/core_error_domain.h"
<b>Description:</b>	Throw the exception type corresponding to the given ErrorCode.

](RS\_AP\_00130)

#### 8.1.5.4 GetCoreErrorDomain accessor function

[SWS\_CORE\_05280] [

<b>Kind:</b>	function
<b>Symbol:</b>	GetCoreErrorDomain()
<b>Scope:</b>	namespace ara::core
<b>Syntax:</b>	constexpr const <a href="#">ErrorDomain</a> & ara::core::GetCoreErrorDomain () noexcept;
<b>Return value:</b>	const ErrorDomain & the CoreErrorDomain
<b>Exception Safety:</b>	noexcept
<b>Header file:</b>	#include "ara/core/core_error_domain.h"
<b>Description:</b>	Return a reference to the global CoreErrorDomain.

](RS\_AP\_00130)

#### 8.1.5.5 MakeErrorCode overload for CoreErrorDomain

[SWS\_CORE\_05290] [

<b>Kind:</b>	function
<b>Symbol:</b>	MakeErrorCode(CoreErrc code, ErrorDomain::SupportDataType data)
<b>Scope:</b>	namespace ara::core
<b>Syntax:</b>	constexpr <a href="#">ErrorCode</a> ara::core::MakeErrorCode ( <a href="#">CoreErrc</a> code, <a href="#">Error Domain::SupportDataType</a> data) noexcept;
<b>Parameters (in):</b>	code the CoreErrorDomain-specific error code value data optional vendor-specific error data
<b>Return value:</b>	ErrorCode a new ErrorCode instance
<b>Exception Safety:</b>	noexcept
<b>Header file:</b>	#include "ara/core/core_error_domain.h"
<b>Description:</b>	Create a new ErrorCode within CoreErrorDomain. This function is used internally by constructors of ErrorCode. It is usually not used directly by users.

](RS\_AP\_00130)

### 8.1.6 Future and Promise data types

This section describes the `Future` and `Promise` class templates used in `ara::core` to provide and retrieve the results of asynchronous method calls.

Whenever there is a mention of a standard C++14 item (class, class template, enum or function) such as `std::future` or `std::promise`, the implied source material is [4]. Whenever there is a mention of an experimental C++ item such as `std::experimental::future::is_ready`, the implied source material is [11].

Futures are technically referred to as “asynchronous return objects”, and Promises are referred to as “asynchronous providers”. Their interaction is made possible by a “shared state”. The “shared state” concept is described in [4], section 30.6.4. The description also applies to the shared state behind `ara::core::Future` and `ara::core::Promise`, with the following changes:

- The text “, as used by `async` when policy is `launch::deferred`” is removed from paragraph 2.
- Paragraph 10, referring to “`promise::set_value_at_thread_exit`”, is removed.

Class `ara::core::Future` and `ara::core::Promise` are closely modeled on `std::future` and `std::promise`. Consequently, the behavior of `ara::core::Future` and `ara::core::Promise` is expected to be same as that of `std::future` and `std::promise` from [4, the C++14 standard] and the corresponding `std::experimental::` classes from [11], except for the deviations from the `std::` classes that result from the integration with `ara::core::Result`.

#### 8.1.6.1 future\_errc enumeration

[SWS\_CORE\_00400] [

<b>Kind:</b>	enumeration	
<b>Symbol:</b>	future_errc	
<b>Scope:</b>	namespace ara::core	
<b>Underlying type:</b>	std::int32_t	
<b>Syntax:</b>	enum class future_errc : std::int32_t {...};	
<b>Values:</b>	broken_promise= 101	the asynchronous task abandoned its shared state
	future_already_retrieved= 102	the contents of the shared state were already accessed
	promise_already_satisfied= 103	attempt to store a value into the shared state twice
	no_state= 104	attempt to access Promise or Future without an associated state
<b>Header file:</b>	#include "ara/core/future_error_domain.h"	

<b>Description:</b>	Specifies the types of internal errors that can occur upon calling Future::get or Future::Get Result. These definitions are equivalent to the ones from std::future_errc.
---------------------	--

](RS\_AP\_00130)

### 8.1.6.2 FutureException type

[SWS\_CORE\_00411] [

<b>Kind:</b>	class
<b>Symbol:</b>	FutureException
<b>Scope:</b>	namespace ara::core
<b>Base class:</b>	Exception
<b>Syntax:</b>	<code>class ara::core::FutureException : public Exception {...};</code>
<b>Header file:</b>	<code>#include "ara/core/future_error_domain.h"</code>
<b>Description:</b>	Exception type thrown by Future and Promise classes.

](RS\_AP\_00130)

[SWS\_CORE\_00412] [

<b>Kind:</b>	function
<b>Symbol:</b>	FutureException(ErrorCode err)
<b>Scope:</b>	<a href="#">class ara::core::FutureException</a>
<b>Syntax:</b>	<code>explicit ara::core::FutureException::FutureException (ErrorCode err) noexcept;</code>
<b>Parameters (in):</b>	err      the ErrorCode
<b>Exception Safety:</b>	noexcept
<b>Header file:</b>	<code>#include "ara/core/future_error_domain.h"</code>
<b>Description:</b>	Construct a new FutureException from an ErrorCode.

](RS\_AP\_00130)

### 8.1.6.3 FutureErrorDomain type

[SWS\_CORE\_00421] [

<b>Kind:</b>	class
<b>Symbol:</b>	FutureErrorDomain
<b>Scope:</b>	namespace ara::core
<b>Base class:</b>	ErrorDomain
<b>Syntax:</b>	<code>class ara::core::FutureErrorDomain final : public ErrorDomain {...};</code>
<b>Unique ID:</b>	0x8000'0000'0000'0013

<b>Header file:</b>	#include "ara/core/future_error_domain.h"
<b>Description:</b>	Error domain for errors originating from classes Future and Promise.

](RS\_AP\_00130)

[SWS\_CORE\_00431] [

<b>Kind:</b>	type alias
<b>Symbol:</b>	Errc
<b>Scope:</b>	<a href="#">class ara::core::FutureErrorDomain</a>
<b>Derived from:</b>	future_errc
<b>Syntax:</b>	using ara::core::FutureErrorDomain::Errc = future_errc;
<b>Header file:</b>	#include "ara/core/future_error_domain.h"
<b>Description:</b>	Alias for the error code value enumeration.

](RS\_AP\_00130)

[SWS\_CORE\_00432] [

<b>Kind:</b>	type alias
<b>Symbol:</b>	Exception
<b>Scope:</b>	<a href="#">class ara::core::FutureErrorDomain</a>
<b>Derived from:</b>	FutureException
<b>Syntax:</b>	using ara::core::FutureErrorDomain::Exception = FutureException;
<b>Header file:</b>	#include "ara/core/future_error_domain.h"
<b>Description:</b>	Alias for the exception base class.

](RS\_AP\_00130)

[SWS\_CORE\_00441] [

<b>Kind:</b>	function

<b>Syntax:</b>	constexpr ara::core::FutureErrorDomain::FutureErrorDomain () noexcept;
<b>Exception Safety:</b>	noexcept
<b>Header file:</b>	#include "ara/core/future_error_domain.h"
<b>Description:</b>	Default constructor.

](RS\_AP\_00130)

[SWS\_CORE\_00442] [

<b>Kind:</b>	function
<b>Symbol:</b>	Name()
<b>Scope:</b>	<a href="#">class ara::core::FutureErrorDomain</a>
<b>Syntax:</b>	const char* ara::core::FutureErrorDomain::Name () const noexcept override;

<b>Return value:</b>	const char *	"Future"
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future_error_domain.h"	
<b>Description:</b>	Return the "shortname" ApApplicationErrorDomain.SN of this error domain.	

](RS\_AP\_00130)

[SWS\_CORE\_00443] [

<b>Kind:</b>	function	
<b>Symbol:</b>	Message(ErrorDomain::CodeType errorCode)	
<b>Scope:</b>	class ara::core::FutureErrorDomain	
<b>Syntax:</b>	const char* ara::core::FutureErrorDomain::Message (ErrorDomain::CodeType errorCode) const noexcept override;	
<b>Parameters (in):</b>	errorCode	the error code value
<b>Return value:</b>	const char *	the text message, never nullptr
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future_error_domain.h"	
<b>Description:</b>	Translate an error code value into a text message.	

](RS\_AP\_00130)

[SWS\_CORE\_00444] [

<b>Kind:</b>	function	
<b>Symbol:</b>	ThrowAsException(const ErrorCode &errorCode)	
<b>Scope:</b>	class ara::core::FutureErrorDomain	
<b>Syntax:</b>	void ara::core::FutureErrorDomain::ThrowAsException (const ErrorCode &errorCode) const noexcept(false) override;	
<b>Parameters (in):</b>	errorCode	the ErrorCode instance
<b>Return value:</b>	None	
<b>Exception Safety:</b>	noexcept(false)	
<b>Header file:</b>	#include "ara/core/future_error_domain.h"	
<b>Description:</b>	Throw the exception type corresponding to the given ErrorCode.	

](RS\_AP\_00130)

#### 8.1.6.4 FutureErrorDomain accessor function

[SWS\_CORE\_00480] [

<b>Kind:</b>	function	
<b>Symbol:</b>	GetFutureErrorDomain()	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	constexpr const ErrorDomain& ara::core::GetFutureErrorDomain () noexcept;	
<b>Return value:</b>	const ErrorDomain &	reference to the FutureErrorDomain instance

<b>Exception Safety:</b>	noexcept
<b>Header file:</b>	#include "ara/core/future_error_domain.h"
<b>Description:</b>	Obtain the reference to the single global FutureErrorDomain instance.

](RS\_AP\_00130)

### 8.1.6.5 MakeErrorCode overload for FutureErrorDomain

[SWS\_CORE\_00490] [

<b>Kind:</b>	function	
<b>Symbol:</b>	MakeErrorCode(future_errc code, ErrorDomain::SupportDataType data)	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	constexpr ErrorCode ara::core::MakeErrorCode (future_errc code, Error Domain::SupportDataType data) noexcept;	
<b>Parameters (in):</b>	code	an enumeration value from future_errc
	data	a vendor-defined supplementary value
<b>Return value:</b>	ErrorCode	the new ErrorCode instance
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future_error_domain.h"	
<b>Description:</b>	Create a new ErrorCode for FutureErrorDomain with the given support data type.	

](RS\_AP\_00130)

### 8.1.6.6 future\_status enumeration

[SWS\_CORE\_00361]{DRAFT} [

<b>Kind:</b>	enumeration	
<b>Symbol:</b>	future_status	
<b>Scope:</b>	namespace ara::core	
<b>Underlying type:</b>	std::uint8_t	
<b>Syntax:</b>	enum class future_status : std::uint8_t {...};	
<b>Values:</b>	ready	the shared state is ready
	timeout	the shared state did not become ready before the specified timeout has passed
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	<p>Specifies the state of a Future as returned by wait_for() and wait_until().</p> <p>These definitions are equivalent to the ones from std::future_status. However, no item equivalent to std::future_status::deferred is available here.</p> <p>The numerical values of the enum items are implementation-defined.</p>	

](RS\_AP\_00130)

### 8.1.6.7 Future data type

[SWS\_CORE\_00321]{DRAFT} [

<b>Kind:</b>	class	
<b>Symbol:</b>	Future	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<pre>template &lt;typename T, typename E = ErrorCode&gt; class ara::core::Future final {...};</pre>	
<b>Template param:</b>	typename T	the type of values
	typename E = ErrorCode	the type of errors
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Provides ara::core specific Future operations to collect the results of an asynchronous call.	

]([RS\\_AP\\_00130](#))

[SWS\_CORE\_00322]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	Future()	
<b>Scope:</b>	<a href="#">class ara::core::Future</a>	
<b>Syntax:</b>	<pre>ara::core::Future&lt; T, E &gt;::Future () noexcept=default;</pre>	
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Default constructor. This function shall behave the same as the corresponding std::future function.	

]([RS\\_AP\\_00130](#))

[SWS\_CORE\_00334]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	Future(const Future &)	
<b>Scope:</b>	<a href="#">class ara::core::Future</a>	
<b>Syntax:</b>	<pre>ara::core::Future&lt; T, E &gt;::Future (const Future &amp;)=delete;</pre>	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Copy constructor shall be disabled.

<b>Scope:</b>	<a href="#">class ara::core::Future</a>	
<b>Syntax:</b>	<pre>ara::core::Future&lt; T, E &gt;::Future (Future &amp;&amp;other) noexcept;</pre>	
<b>Parameters (in):</b>	other	the other instance
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Move construct from another instance. This function shall behave the same as the corresponding std::future function.	

](RS\_AP\_00130)

[SWS\_CORE\_00333]{DRAFT} [

<b>Kind:</b>	function
<b>Symbol:</b>	~Future()
<b>Scope:</b>	class ara::core::Future
<b>Syntax:</b>	ara::core::Future< T, E >::~~Future () noexcept;
<b>Exception Safety:</b>	noexcept
<b>Header file:</b>	#include "ara/core/future.h"
<b>Description:</b>	Destructor for Future objects. This function shall behave the same as the corresponding std::future function.

](RS\_AP\_00130)

[SWS\_CORE\_00335]{DRAFT} [

<b>Kind:</b>	function
<b>Symbol:</b>	operator=(const Future &)
<b>Scope:</b>	class ara::core::Future
<b>Syntax:</b>	Future& ara::core::Future< T, E >::~operator= (const Future &)=delete;
<b>Header file:</b>	#include "ara/core/future.h"
<b>Description:</b>	Copy assignment operator shall be disabled.

](RS\_AP\_00130)

[SWS\_CORE\_00325]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	operator=(Future &&other)	
<b>Scope:</b>	class ara::core::Future	
<b>Syntax:</b>	Future& ara::core::Future< T, E >::~operator= (Future &&other) noexcept;	
<b>Parameters (in):</b>	other	the other instance
<b>Return value:</b>	Future &	*this
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Move assign from another instance. This function shall behave the same as the corresponding std::future function.	

](RS\_AP\_00130)

[SWS\_CORE\_00326]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	get()	
<b>Scope:</b>	class ara::core::Future	
<b>Syntax:</b>	T ara::core::Future< T, E >::~get ();	
<b>Return value:</b>	T	value of type T

△

<b>Errors:</b>	Domain:error	the error that has been put into the corresponding Promise via Promise::SetError
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Get the value. This function shall behave the same as the corresponding std::future function. This function does not participate in overload resolution when the compiler toolchain does not support C++ exceptions.	

](RS\_AP\_00130)

[SWS\_CORE\_00336]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	GetResult()	
<b>Scope:</b>	class ara::core::Future	
<b>Syntax:</b>	Result<T, E> ara::core::Future< T, E >::GetResult () noexcept;	
<b>Return value:</b>	Result< T, E >	a Result with either a value or an error
<b>Exception Safety:</b>	noexcept	
<b>Errors:</b>	Domain:error	the error that has been put into the corresponding Promise via Promise::SetError
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Get the result. Similar to get(), this call blocks until the value or an error is available. However, this call will never throw an exception.	

](RS\_AP\_00130)

[SWS\_CORE\_00327]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	valid()	
<b>Scope:</b>	class ara::core::Future	
<b>Syntax:</b>	bool ara::core::Future< T, E >::valid () const noexcept;	
<b>Return value:</b>	bool	true if the Future is usable, false otherwise
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Checks if the Future is valid, i.e. if it has a shared state. This function shall behave the same as the corresponding std::future function.	

](RS\_AP\_00130)

[SWS\_CORE\_00328]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	wait()	
<b>Scope:</b>	class ara::core::Future	
<b>Syntax:</b>	void ara::core::Future< T, E >::wait () const;	
<b>Return value:</b>	None	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Wait for a value or an error to be available. This function shall behave the same as the corresponding std::future function.	

|(RS\_AP\_00130)

[SWS\_CORE\_00329]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	wait_for(const std::chrono::duration< Rep, Period > &timeoutDuration)	
<b>Scope:</b>	class ara::core::Future	
<b>Syntax:</b>	<pre>template &lt;typename Rep, typename Period&gt; future_status ara::core::Future&lt; T, E &gt;::wait_for (const std::chrono::duration&lt; Rep, Period &gt; &amp;timeoutDuration) const;</pre>	
<b>Parameters (in):</b>	timeoutDuration	maximal duration to wait for
<b>Return value:</b>	future_status	status that indicates whether the timeout hit or if a value is available
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Wait for the given period, or until a value or an error is available. This function shall behave the same as the corresponding std::future function.	

|(RS\_AP\_00130)

[SWS\_CORE\_00330]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	wait_until(const std::chrono::time_point< Clock, Duration > &deadline)	
<b>Scope:</b>	class ara::core::Future	
<b>Syntax:</b>	<pre>template &lt;typename Clock, typename Duration&gt; future_status ara::core::Future&lt; T, E &gt;::wait_until (const std::chrono::time_point&lt; Clock, Duration &gt; &amp;deadline) const;</pre>	
<b>Parameters (in):</b>	deadline	latest point in time to wait
<b>Return value:</b>	future_status	status that indicates whether the time was reached or if a value is available
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Wait until the given time, or until a value or an error is available. This function shall behave the same as the corresponding std::future function.	

|(RS\_AP\_00130)

[SWS\_CORE\_00331]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	then(F &&func)	
<b>Scope:</b>	class ara::core::Future	
<b>Syntax:</b>	<pre>template &lt;typename F&gt; auto ara::core::Future&lt; T, E &gt;::then (F &amp;&amp;func) -&gt; Future&lt; &lt;see below&gt; &gt;;</pre>	
<b>Parameters (in):</b>	func	a callable to register
<b>Return value:</b>	Future< <see below> >	a new Future instance for the result of the continuation
<b>Header file:</b>	#include "ara/core/future.h"	

<b>Description:</b>	<p>Register a callable that gets called when the Future becomes ready.</p> <p>When func is called, it is guaranteed that get() and GetResult() will not block.</p> <p>func may be called in the context of this call or in the context of Promise::set_value() or Promise::SetError() or somewhere else.</p> <p>The return type of then depends on the return type of func (aka continuation).</p> <p>Let U be the return type of the continuation (i.e. a type equivalent to std::result_of_t&lt;std::decay_t&lt;F&gt;(Future&lt;T,E&gt;)&gt;). If U is Future&lt;T2,E2&gt; for some types T2, E2, then the return type of then() is Future&lt;T2,E2&gt;. This is known as implicit Future unwrapping. If U is Result&lt;T2,E2&gt; for some types T2, E2, then the return type of then() is Future&lt;T2,E2&gt;. This is known as implicit Result unwrapping. Otherwise it is Future&lt;U,E&gt;.</p>
---------------------	---

### 8.1.6.7.1 Future<void, E> template specialization

This section defines the interface of the `ara::core::Future<T, E>` template specialization where the type `T` is `void`.

[SWS\_CORE\_06221] [

<b>Kind:</b>	class	
<b>Symbol:</b>	Future< void, E >	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<pre>template &lt;typename E&gt; class ara::core::Future&lt; void, E &gt; final {...};</pre>	
<b>Template param:</b>	typename E	the type of error
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Specialization of class Future for "void" values.	

](RS\_AP\_00130)

[SWS\_CORE\_06222] [

<b>Kind:</b>	function	
<b>Symbol:</b>	Future()	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	<pre>ara::core::Future&lt; void, E &gt;::Future () noexcept;</pre>	
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Default constructor. This function shall behave the same as the corresponding <code>std::future</code> function.	

](RS\_AP\_00130)

[SWS\_CORE\_06234] [

<b>Kind:</b>	function	
<b>Symbol:</b>	Future(const Future &other)	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	<pre>ara::core::Future&lt; void, E &gt;::Future (const Future &amp;other)=delete;</pre>	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Copy constructor shall be disabled.	

](RS\_AP\_00130)

[SWS\_CORE\_06223] [

<b>Kind:</b>	function	
<b>Symbol:</b>	Future(Future &&other)	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	ara::core::Future< void, E >::Future (Future &&other) noexcept;	
<b>Parameters (in):</b>	other	the other instance
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Move construct from another instance. This function shall behave the same as the corresponding std::future function.	

](RS\_AP\_00130)

[SWS\_CORE\_06233]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	~Future()	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	ara::core::Future< void, E >::~~Future () noexcept;	
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Destructor for Future objects. This function shall behave the same as the corresponding std::future function.	

](RS\_AP\_00130)

[SWS\_CORE\_06235] [

<b>Kind:</b>	function	
<b>Symbol:</b>	operator=(const Future &other)	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	Future& ara::core::Future< void, E >::operator= (const Future &other)=delete;	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Copy assignment operator shall be disabled.	

](RS\_AP\_00130)

[SWS\_CORE\_06225] [

<b>Kind:</b>	function	
<b>Symbol:</b>	operator=(Future &&other)	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	Future& ara::core::Future< void, E >::operator= (Future &&other) noexcept;	
<b>Parameters (in):</b>	other	the other instance
<b>Return value:</b>	Future &	*this
<b>Exception Safety:</b>	noexcept	

△

<b>Header file:</b>	#include "ara/core/future.h"
<b>Description:</b>	Move assign from another instance. This function shall behave the same as the corresponding std::future function.

] (RS\_AP\_00130)

[SWS\_CORE\_06226] [

<b>Kind:</b>	function	
<b>Symbol:</b>	get()	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	void ara::core::Future< void, E >::get ();	
<b>Return value:</b>	None	
<b>Errors:</b>	Domain:error	the error that has been put into the corresponding Promise via Promise::SetError
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Get the value. This function shall behave the same as the corresponding std::future function. This function does not participate in overload resolution when the compiler toolchain does not support C++ exceptions.	

] (RS\_AP\_00130)

[SWS\_CORE\_06236] [

<b>Kind:</b>	function	
<b>Symbol:</b>	GetResult()	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	Result<void, E> ara::core::Future< void, E >::GetResult () noexcept;	
<b>Return value:</b>	Result< void, E >	a Result with either a value or an error
<b>Exception Safety:</b>	noexcept	
<b>Errors:</b>	Domain:error	the error that has been put into the corresponding Promise via Promise::SetError
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Get the result. Similar to get(), this call blocks until the value or an error is available. However, this call will never throw an exception.	

] (RS\_AP\_00130)

[SWS\_CORE\_06227] [

<b>Kind:</b>	function	
<b>Symbol:</b>	valid()	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	bool ara::core::Future< void, E >::valid () const noexcept;	
<b>Return value:</b>	bool	true if the Future is usable, false otherwise
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Checks if the Future is valid, i.e. if it has a shared state. This function shall behave the same as the corresponding std::future function.	

](RS\_AP\_00130)

[SWS\_CORE\_06228] [

<b>Kind:</b>	function
<b>Symbol:</b>	wait()
<b>Scope:</b>	class ara::core::Future<void, E >
<b>Syntax:</b>	void ara::core::Future< void, E >::wait () const;
<b>Return value:</b>	None
<b>Header file:</b>	#include "ara/core/future.h"
<b>Description:</b>	Wait for a value or an error to be available. This function shall behave the same as the corresponding std::future function.

](RS\_AP\_00130)

[SWS\_CORE\_06229] [

<b>Kind:</b>	function	
<b>Symbol:</b>	wait_for(const std::chrono::duration< Rep, Period > &timeoutDuration)	
<b>Scope:</b>	class ara::core::Future<void, E >	
<b>Syntax:</b>	template <typename Rep, typename Period> future_status ara::core::Future< void, E >::wait_for (const std::chrono::duration< Rep, Period > &timeoutDuration) const;	
<b>Parameters (in):</b>	timeoutDuration	maximal duration to wait for
<b>Return value:</b>	future_status	status that indicates whether the timeout hit or if a value is available
<b>Header file:</b>	#include "ara/core/future.h"	
<b>Description:</b>	Wait for the given period, or until a value or an error is available. This function shall behave the same as the corresponding std::future function.	

](RS\_AP\_00130)

[SWS\_CORE\_06230] [

<b>Kind:</b>	function	
<b>Symbol:</b>	wait_until(const std::chrono::time_point< Clock, Duration > &deadline)

## 8.1.7 Array data type

This section describes the `ara::core::Array` type that represents a container which encapsulates fixed size arrays.

### 8.1.7.1 Class Array

**[SWS\_CORE\_01201]** [

<b>Kind:</b>	class	
<b>Symbol:</b>	Array	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	template <typename T, std::size_t N> class ara::core::Array final {...};	
<b>Template param:</b>	typename T	the type of element in the array
	std::size_t N	the number of elements in the array
<b>Header file:</b>	#include "ara/core/array.h"	
<b>Description:</b>	Encapsulation of fixed size arrays.	

 ] ([RS\\_AP\\_00130](#))

[SWS\_CORE\_01210] [

<b>Kind:</b>	type alias
<b>Symbol:</b>	reference
<b>Scope:</b>	<a href="#">class ara::core::Array</a>
<b>Derived from:</b>	T&
<b>Syntax:</b>	<code>using ara::core::Array&lt; T, N &gt;::reference = T&amp;;</code>
<b>Header file:</b>	<code>#include "ara/core/array.h"</code>
<b>Description:</b>	Alias type for a reference to an element.

]([RS\\_AP\\_00130](#))

[SWS\_CORE\_01211] [

<b>Kind:</b>	type alias
<b>Symbol:</b>	const_reference
<b>Scope:</b>	<a href="#">class ara::core::Array</a>
<b>Derived from:</b>	const T&
<b>Syntax:</b>	<code>using ara::core::Array&lt; T, N &gt;::const_reference = const T&amp;;</code>
<b>Header file:</b>	<code>#include "ara/core/array.h"</code>
<b>Description:</b>	Alias type for a const_reference to an element.

]([RS\\_AP\\_00130](#))

[SWS\_CORE\_01212] [

<b>Kind:</b>	type alias
<b>Symbol:</b>	iterator
<b>Scope:</b>	<a href="#">class ara::core::Array</a>
<b>Derived from:</b>	T*
<b>Syntax:</b>	<code>using ara::core::Array&lt; T, N &gt;::iterator = T*;</code>
<b>Header file:</b>	<code>#include "ara/core/array.h"</code>
<b>Description:</b>	The type of an iterator to elements.

]([RS\\_AP\\_00130](#))

[SWS\_CORE\_01213] [

<b>Kind:</b>	type alias
<b>Symbol:</b>	const_iterator
<b>Scope:</b>	<a href="#">class ara::core::Array</a>

### 8.1.7.3 Tuple interface

These definitions implement the standard interface of tuple-like types for class `Array`.

The specializations of the `std::tuple_size` and `std::tuple_element` traits are put into the `std` namespace:

[SWS\_CORE\_01280] [

<b>Kind:</b>	struct	
<b>Symbol:</b>	tuple_size< ara::core::Array< T, N > >	
<b>Scope:</b>	namespace std	
<b>Syntax:</b>	<pre>template &lt;typename T, size_t N&gt; struct std::tuple_size&lt; ara::core::Array&lt; T, N &gt; &gt; : public integral_ constant&lt; size_t, N &gt; {...};</pre>	
<b>Template param:</b>	typename T	the type of element in the Array
	size_t N	the number of elements in the Array
<b>Header file:</b>	#include "ara/core/array.h"	
<b>Description:</b>	Specialization of <code>std::tuple_size</code> for <code>ara::core::Array</code> . This specialization shall meet the C++14 <code>UnaryTypeTrait</code> requirements with a Base Characteristic of <code>std::integral_constant&lt;std::size_t, N&gt;</code> .	

](RS\_AP\_00130)

[SWS\_CORE\_01281] [

<b>Kind:</b>	struct	
<b>Symbol:</b>	tuple_element< I, ara::core::Array< T, N > >	
<b>Scope:</b>	namespace std	
<b>Syntax:</b>	<pre>template &lt;size_t I, typename T, size_t N&gt; struct std::tuple_element&lt; I, ara::core::Array&lt; T, N &gt; &gt; {...};</pre>	
<b>Template param:</b>	size_t I	the index into the Array whose type is desired
	typename T	the type of element in the Array

△

	size_t N	the number of elements in the Array
<b>Header file:</b>	#include "ara/core/array.h"	
<b>Description:</b>	Specialization of std::tuple_element for ara::core::Array. The implementation shall flag the condition I >= N as a compile error.	

](RS\_AP\_00130)

[SWS\_CORE\_01285] [

<b>Kind:</b>	type alias
<b>Symbol:</b>	type
<b>Scope:</b>	struct std::tuple_element<I, ara::core::Array<T, N > >
<b>Derived from:</b>	T
<b>Syntax:</b>	using std::tuple_element< I, ara::core::Array< T, N > >::type = T;
<b>Header file:</b>	#include "ara/core/array.h"
<b>Description:</b>	Alias for the type of the Array element with the given index.

](RS\_AP\_00130)

The overloads of `std::get` are contained in the `ara::core` namespace; they can either be called explicitly (i.e. namespace-qualified), or be invoked via ADL.

For ADL lookup to work in C++14, `get` needs to be called without namespace qualification, similar to the way that `swap` is recommended to be called, e.g.:

```

1 using std::get;
2
3 ara::core::Array<int, 4> array = {1, 2, 3, 4};
4 int& e = get<0>(array);
    
```

[SWS\_CORE\_01282] [

<b>Kind:</b>	function
<b>Symbol:</b>	get(Array< T, N > &a)
<b>Scope:</b>	namespace ara::core
<b>Syntax:</b>	template <std::size_t I, typename T, std::size_t N> constexpr T& ara::core::get (Array< T, N > &a) noexcept;
<b>Template param:</b>	I T N
	the index into the Array whose element is desired
	the type of element in the Array
	the number of elements in the Array
<b>Parameters (in):</b>	a
	the Array
<b>Return value:</b>	T &
	a reference to the Ith element of the Array
<b>Exception Safety:</b>	noexcept
<b>Header file:</b>	#include "ara/core/array.h"
<b>Description:</b>	Overload of std::get for an lvalue mutable ara::core::Array. The implementation shall flag the condition I >= N as a compile error.

<b>Parameters (in):</b>	lhs	the first Map
	rhs	the second Map
<b>Return value:</b>	None	
<b>Header file:</b>	#include "ara/core/map.h"	
<b>Description:</b>	Exchange the state of lhs with that of rhs.	

](RS\_AP\_00130)

### 8.1.10 Optional data type

This section describes the class template `ara::core::Optional` that provides access to optional record elements of a Structure Implementation data type. Whenever there is a mention of the standard C++17 item `std::optional`, the implied source material is [9, the C++17 standard].

The class template `ara::core::Optional` manages optional values, i.e. values that may or may not be present. The existence can be evaluated during both compile-time and runtime.

**Note:** Mandatory record elements are declared directly with the corresponding `ImplementationDataType` without using `ara::core::Optional`.

[SWS\_CORE\_01033]{DRAFT} [

<b>Kind:</b>	class	
<b>Symbol:</b>	Optional	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<pre>template &lt;typename T&gt; class ara::core::Optional final {...};</pre>	
<b>Template param:</b>	typename T	the type of element in the container
<b>Header file:</b>	#include "ara/core/optional.h"	
<b>Description:</b>	A container with at most one element.	

]([RS\\_AP\\_00130](#))

[SWS\_CORE\_01096]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	swap(Optional< T > &lhs, Optional< T > &rhs)	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<pre>template &lt;typename T&gt; void ara::core::swap (Optional&lt; T &gt; &amp;lhs, Optional&lt; T &gt; &amp;rhs);</pre>	
<b>Parameters (in):</b>	lhs	the first Optional
	rhs	the second Optional
<b>Return value:</b>	None	
<b>Header file:</b>	#include "ara/core/optional.h"	
<b>Description:</b>	Exchange the state of lhs with that of rhs.	

]([RS\\_AP\\_00130](#))

### 8.1.11 Variant data type

This section describes the `ara::core::Variant` type that represents a type-safe union.

[SWS\_CORE\_01601]{DRAFT} [

<b>Kind:</b>	class	
<b>Symbol:</b>	Variant	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<pre>template &lt;typename... Types&gt; class ara::core::Variant final {...};</pre>	
<b>Template param:</b>	typename... Types	the types that the Variant is able to hold
<b>Header file:</b>	#include "ara/core/variant.h"	
<b>Description:</b>	A type-safe union.	

]([RS\\_AP\\_00130](#))

[SWS\_CORE\_01696]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	swap(Variant< Types... > &lhs, Variant< Types... > &rhs)	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<pre>template &lt;typename... Types&gt; void ara::core::swap (Variant&lt; Types... &gt; &amp;lhs, Variant&lt; Types... &gt; &amp;rhs);</pre>	
<b>Parameters (in):</b>	lhs	the first Variant
	rhs	the second Variant
<b>Return value:</b>	None	
<b>Header file:</b>	#include "ara/core/variant.h"	
<b>Description:</b>	Exchange the state of lhs with that of rhs.	

](RS\_AP\_00130)

### 8.1.12 StringView data type

This section describes the `ara::core::StringView` type that constitutes a read-only view over a contiguous sequence of characters, the storage of which is owned by another object.

[SWS\_CORE\_02001]{DRAFT} [

<b>Kind:</b>	class
<b>Symbol:</b>	StringView
<b>Scope:</b>	namespace ara::core
<b>Syntax:</b>	<pre>class ara::core::StringView final {...};</pre>
<b>Header file:</b>	#include "ara/core/string_view.h"
<b>Description:</b>	A read-only view over a contiguous sequence of characters whose storage is owned by another object.

](RS\_AP\_00130)

### 8.1.13 String data types

This section describes the `ara::core::String` type and its complement `ara::core::BasicString` which both represent sequences of characters.

These types are closely modeled on `std::string` and `std::basic_string` respectively from [4, the C++14 standard], with a number of additions coming from [9, the C++17 standard].

As the UTF-8 encoding is used throughout the Adaptive Platform, only the `char` type is supported for `ara::core::BasicString`.

**[SWS\_CORE\_03000]{DRAFT} [**

<b>Kind:</b>	class	
<b>Symbol:</b>	BasicString	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<pre>template &lt;typename Allocator = &lt;implementation-defined&gt;&gt; class ara::core::BasicString final {...};</pre>	
<b>Template param:</b>	typename Allocator = <implementation-defined>	the allocator to use for any memory allocations
<b>Header file:</b>	#include "ara/core/string.h"	
<b>Description:</b>	BasicString type.	

 ] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_03012]{DRAFT} [**

<b>Kind:</b>	type alias	
<b>Symbol:</b>	size_type	
<b>Scope:</b>	<a href="#">class ara::core::BasicString</a>	
<b>Derived from:</b>	std::size_t	
<b>Syntax:</b>	<pre>using ara::core::BasicString&lt; Allocator &gt;::size_type = std::size_t;</pre>	
<b>Header file:</b>	#include "ara/core/string.h"	
<b>Description:</b>	Alias for the type of parameters that indicate a size of a number of values.	

 ] ([RS\\_AP\\_00130](#))

**[SWS\_CORE\_03302]{DRAFT} [**

### 8.1.14 Span data type

This section describes the `ara::core::Span` type that constitutes a view over a contiguous sequence of objects, the storage of which is owned by another object.

This specification is based on the draft standard of `std::span` in revision N4835 (section 22.7), but has been adapted in several ways:

- The type alias `Span::index_type` has been renamed into `Span::size_type`, following the P1872R0 proposal.
- Some compile-time checks are now being imposed on implementations, following the proposed resolution of LWG issue 3103.
- All symbols from section 22.7.3.8 (`span.tuple`) have been omitted, following the proposed resolution of LWG issue 3212.
- The `std::array`-based constructors have been made more flexible, following the proposed resolution of LWG issue 3255.
- Constructors have been added that take a `ara::core::Array`, with semantics that are the same as those of the constructors that take a `std::array`.

- A number of non-member `MakeSpan` factory function overloads have been added.

**[SWS\_CORE\_01901]{DRAFT} [**

<b>Kind:</b>	variable
<b>Symbol:</b>	<code>dynamic_extent</code>
<b>Scope:</b>	namespace <code>ara::core</code>
<b>Type:</b>	<code>std::size_t</code>
<b>Syntax:</b>	<code>constexpr std::size_t ara::core::dynamic_extent = std::numeric_limits&lt;std::size_t&gt;::max();</code>
<b>Header file:</b>	<code>#include "ara/core/span.h"</code>
<b>Description:</b>	A constant for creating Spans with dynamic sizes. The constant is always set to <code>std::numeric_limits&lt;std::size_t&gt;::max()</code> .

<b>Template param:</b>	Container	the type of container
<b>Parameters (in):</b>	cont	the container
<b>Return value:</b>	Span< typename Container::value_         type const >	the new Span
<b>Header file:</b>	#include "ara/core/span.h"	
<b>Description:</b>	Create a new Span from the given const container.	

 ] ([RS\\_AP\\_00130](#))

These non-member functions allow to “convert” a `Span<T>` into a `Span<Byte>`, thereby gaining access to the in-memory representation of the object referenced by a `Span` instance.

Unlike `std::byte` from [9, the C++17 standard], it is implementation-defined whether `ara::core::Byte` can be used for type aliasing without triggering Undefined Behavior. This may also affect `ara::core::as_bytes` and `ara::core::as_writable_bytes` in particular. Implementations usually provide a way to make this safe by loosening the aliasing restrictions of the C++ compiler.

**[SWS\_CORE\_01980]{DRAFT} [**

<b>Kind:</b>	function	
<b>Symbol:</b>	as_bytes(Span< ElementType, Extent > s)	
<b>Scope:</b>	namespace ara::core	

△

<b>Syntax:</b>	<pre>template &lt;typename ElementType, std::size_t Extent&gt; Span&lt;const Byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent&gt; ara::core::as_bytes (Span&lt; ElementType, Extent &gt; s) noexcept;</pre>	
<b>Parameters (in):</b>	s	the input Span<T>
<b>Return value:</b>	Span< const Byte, Extent==dynamic_ extent ? dynamic_extent :sizeof(ElementType) *Extent >	a Span<const Byte>
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/span.h"	
<b>Description:</b>	Return a read-only Span<Byte> over the object representation of the input Span<T>

<b>Header file:</b>	#include "ara/core/utility.h"	
<b>Description:</b>	A non-integral binary type.	

]([RS\\_AP\\_00130](#))

### 8.1.18.2 In-place disambiguation tags

The data types `ara::core::in_place_t`, `ara::core::in_place_type_t`, and `ara::core::in_place_index_t` are disambiguation tags that can be passed to certain constructors of `ara::core::Optional` and `ara::core::Variant` to indicate that the contained type shall be constructed in-place, i.e. without any copy operation taking place.

They are equivalent to `std::in_place_t`, `std::in_place_type_t`, and `std::in_place_index_t` from [9]. All these symbols are provided here in order to give the necessary support for implementing `ara::core::Optional` and `ara::core::Variant` in a way that is highly compatible with the corresponding classes from [9, the C++17 standard].

#### 8.1.18.2.1 `in_place_t` tag

[SWS\_CORE\_04011] [

<b>Kind:</b>	struct
<b>Symbol:</b>	<code>in_place_t</code>
<b>Scope:</b>	namespace <code>ara::core</code>
<b>Syntax:</b>	<code>struct ara::core::in_place_t {...};</code>
<b>Header file:</b>	<code>#include "ara/core/utility.h"</code>
<b>Description:</b>	Denote an operation to be performed in-place.  An instance of this type can be passed to certain constructors of <code>ara::core::Optional</code> to denote the intention that construction of the contained type shall be done in-place, i.e. without any copying taking place.

### 8.1.19 Initialization and Shutdown

This section describes the non-member initialization and shutdown functions that initialize resp. deinitialize data structures and threads of the AUTOSAR Runtime for Adaptive Applications.

[SWS\_CORE\_10001]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	Initialize()	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<code>Result&lt;void&gt; ara::core::Initialize () noexcept;</code>	
<b>Return value:</b>	Result< void >	a Result with an error code, in case an error occurred
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/initialization.h"	
<b>Description:</b>	<p>(Pre-)Initialization of the ARA Framework.</p> <p>Prior to this call, interaction with the ARA is not allowed with the exception of types intended to be used independently of initialization: ara::core::ErrorCode, ara::core::StringView, ara::core::Result but not the function ValueOrThrow, ara::core::ErrorDomain and subclasses, but not the function ThrowAsException. It is strongly recommended to make this call in a place where it is guaranteed that static initialization has completed.</p>	

]([RS\\_Main\\_00011](#))

[SWS\_CORE\_10002]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	Deinitialize()	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<code>Result&lt;void&gt; ara::core::Deinitialize () noexcept;</code>	
<b>Return value:</b>	Result< void >	a Result with an error code, in case an error occurred
<b>Exception Safety:</b>	noexcept	
<b>Header file:</b>	#include "ara/core/initialization.h"	
<b>Description:</b>	<p>Shutdown of the ARA Framework.</p> <p>After this call, no interaction with the ARA is allowed with the exception of types intended to be used independently of initialization: ara::core::ErrorCode, ara::core::StringView, ara::core::Result but not the function ValueOrThrow, ara::core::ErrorDomain and subclasses, but not the function ThrowAsException. As a prerequisite to calling this API it is expected that the use of ARA interfaces is completed (with the given exceptions). It is strongly recommended to make this call in a place where it is guaranteed that the static initialization has completed and destruction of statically initialized data has not yet started.</p>	

]([RS\\_Main\\_00011](#))

### 8.1.20 Abnormal process termination

This section describes the APIs that constitute the explicit abnormal termination facility.

**[SWS\_CORE\_00053]{DRAFT} [**

<b>Kind:</b>	function
<b>Symbol:</b>	AbortHandlerPrototype()
<b>Scope:</b>	namespace ara::core
<b>Syntax:</b>	<code>void ara::core::AbortHandlerPrototype () noexcept;</code>
<b>Return value:</b>	None
<b>Exception Safety:</b>	noexcept
<b>Header file:</b>	<code>#include "ara/core/abort.h"</code>
<b>Description:</b>	<p>A function declaration with the correct prototype for SetAbortHandler().</p> <p>This declaration exists only for providing a function type that includes "noexcept" and that acts as base type for a type alias, which is defined in SWS_CORE_00050.</p> <p>This compensates for the fact that the C++ standard (up to and including C++14) prohibits that "noexcept" appears in an alias-declaration.</p> <p>There is no implementation of this function.</p>

 ] ([RS\\_AP\\_00132](#))

**[SWS\_CORE\_00050] [**

<b>Kind:</b>	type alias
<b>Symbol:</b>	AbortHandler
<b>Scope:</b>	namespace ara::core
<b>Derived from:</b>	<code>decltype(&amp;AbortHandlerPrototype)</code>
<b>Syntax:</b>	<code>using ara::core::AbortHandler = decltype(&amp;AbortHandlerPrototype);</code>
<b>Header file:</b>	<code>#include "ara/core/abort.h"</code>
<b>Description:</b>	The type of a handler for SetAbortHandler().

 ] ([RS\\_AP\\_00132](#))

**[SWS\_CORE\_00051] [**

<b>Kind:</b>	function		
<b>Symbol:</b>	SetAbortHandler(AbortHandler handler)		
<b>Scope:</b>	namespace ara::core		
<b>Syntax:</b>	<code>AbortHandler ara::core::SetAbortHandler (AbortHandler handler) noexcept;</code>		
<b>Parameters (in):</b>	<table border="1" style="width: 100%;"> <tr> <td style="width: 50%;">handler</td> <td>a custom Abort handler (or nullptr)</td> </tr> </table>	handler	a custom Abort handler (or nullptr)
handler	a custom Abort handler (or nullptr)		
<b>Return value:</b>	<table border="1" style="width: 100%;"> <tr> <td style="width: 50%;">AbortHandler</td> <td>the most recently installed Abort handler (or nullptr if none was installed)</td> </tr> </table>	AbortHandler	the most recently installed Abort handler (or nullptr if none was installed)
AbortHandler	the most recently installed Abort handler (or nullptr if none was installed)		
<b>Exception Safety:</b>	noexcept		
<b>Thread Safety:</b>	thread-safe		
<b>Header file:</b>	<code>#include "ara/core/abort.h"</code>		
<b>Description:</b>	<p>Add a custom Abort handler function and return the most recently added one.</p> <p>By setting nullptr, the implementation may restore the default handler instead; this will remove all previously installed handlers.</p> <p>This function can be called from multiple threads simultaneously; these calls are performed in an implementation-defined sequence.</p>		

 ] ([RS\\_AP\\_00132](#))

[SWS\_CORE\_00054]{DRAFT} [

<b>Kind:</b>	function	
<b>Symbol:</b>	AddAbortHandler(AbortHandler handler)	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	bool ara::core::AddAbortHandler (AbortHandler handler) noexcept;	
<b>Parameters (in):</b>	handler	a custom Abort handler
<b>Return value:</b>	bool	true if the given handler was successfully installed; false otherwise
<b>Exception Safety:</b>	noexcept	
<b>Thread Safety:</b>	thread-safe	
<b>Header file:</b>	#include "ara/core/abort.h"	
<b>Description:</b>	<p>Add a custom Abort handler function.</p> <p>false is returned when either the implementation-defined limit for number of abort handlers would be exceeded, or if nullptr is passed to this function</p> <p>Implementations support at least 8 AbortHandlers.</p>

[SWS\_CORE\_00052] [

<b>Kind:</b>	function	
<b>Symbol:</b>	Abort(const Args &... args)	
<b>Scope:</b>	namespace ara::core	
<b>Syntax:</b>	<pre>template &lt;typename... Args&gt; void ara::core::Abort (const Args &amp;... args) noexcept;</pre>	
<b>Template param:</b>	Args...	the types of arguments given to this function
<b>Parameters (in):</b>	args	custom texts to be added in the log message being output
<b>Return value:</b>	None	
<b>Exception Safety:</b>	noexcept	
<b>Thread Safety:</b>	thread-safe	
<b>Header file:</b>	#include "ara/core/abort.h"	
<b>Description:</b>	<p>Abort the current operation.</p> <p>This function will never return to its caller. The stack is not unwound: destructors of variables with automatic storage duration are not called.</p> <p>Calling this function is ill-formed if any of the arguments is not convertible to ara::core::String View.</p>	

]([RS\\_AP\\_00127](#), [RS\\_AP\\_00132](#), [RS\\_AP\\_00136](#))

## A Mentioned Manifest Elements

For the sake of completeness, this chapter contains a set of class tables representing meta-classes mentioned in the context of this document but which are not contained directly in the scope of describing specific meta-model semantics.

Chapter is generated.

<b>Class</b>	<b>ApApplicationErrorDomain</b>			
<b>Package</b>	M2::AUTOSARTemplates::AdaptivePlatform::ApplicationDesign::PortInterface			
<b>Note</b>	This meta-class represents the ability to define a global error domain for an ApApplicationError. <b>Tags:</b> atp.recommendedPackage=ApplicationErrorDomains			
<b>Base</b>	<i>ARElement, ARObject, CollectableElement, Identifiable, MultilanguageReferrable, PackageableElement, Referrable</i>			
<b>Aggregated by</b>	ARPackage.element			
<b>Attribute</b>	<b>Type</b>	<b>Mult.</b>	<b>Kind</b>	<b>Note</b>
namespace (ordered)	SymbolProps	*	aggr	This aggregation defines the namespace of the Ap ApplicationErrorDomain
value	PositiveUnlimitedInteger	0..1	attr	This attribute identifies the error category.

**Table A.1: ApApplicationErrorDomain**

<b>Class</b>	<b>ImplementationDataType</b>			
<b>Package</b>	M2::AUTOSARTemplates::CommonStructure::ImplementationDataTypes			
<b>Note</b>	Describes a reusable data type on the implementation level. This will typically correspond to a typedef in C-code. <b>Tags:</b> atp.recommendedPackage=ImplementationDataTypes			
<b>Base</b>	<i>ARElement, ARObject, AbstractImplementationDataType, AtpBlueprint, AtpBlueprintable, AtpClassifier, AtpType, AutosarDataType, CollectableElement, Identifiable, MultilanguageReferrable, PackageableElement, Referrable</i>			
<b>Aggregated by</b>	ARPackage.element			
<b>Attribute</b>	<b>Type</b>	<b>Mult.</b>	<b>Kind</b>	<b>Note</b>
dynamicArray SizeProfile	String	0..1	attr	Specifies the profile which the array will follow in case this data type is a variable size array.
isStructWith Optional Element	Boolean	0..1	attr	This attribute is only valid if the attribute category is set to STRUCTURE. If set to true, this attribute indicates that the ImplementationDataType has been created with the intention to define at least one element of the structure as optional.
subElement (ordered)	ImplementationData TypeElement	*	aggr	Specifies an element of an array, struct, or union data type. The aggregation of ImplementationDataTypeElement is subject to variability with the purpose to support the conditional existence of elements inside a ImplementationDataType representing a structure. <b>Stereotypes:</b> atpSplitable; atpVariation <b>Tags:</b> atp.Splitkey=subElement.shortName, subElement.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

<i>Class</i>	<b>ImplementationDataType</b>			
symbolProps	SymbolProps	0..1	aggr	This represents the SymbolProps for the Implementation DataType. <b>Stereotypes:</b> atpSplitable <b>Tags:</b> atp.Splitkey=symbolProps.shortName
typeEmitter	NameToken	0..1	attr	This attribute is used to control which part of the AUTOSAR toolchain is supposed to trigger data type definitions.

**Table A.2: ImplementationDataType**

## B Interfaces to other Functional Clusters (informative)

### B.1 Overview

AUTOSAR decided not to standardize interfaces which are exclusively used between Functional Clusters (on platform-level only), to allow efficient implementations, which might depend e.g. on the used Operating System.

This chapter provides informative guidelines how the interaction between Functional Clusters looks like, by clustering the relevant requirements of this document to describe Inter-Functional Cluster (IFC) interfaces. In addition, the standardized public interfaces which are accessible by user space applications (see chapter 8 (“[API specification](#)”)) can also be used for interaction between Functional Clusters.

The goal is to provide a clear understanding of Functional Cluster boundaries and interaction, without specifying syntactical details. This ensures compatibility between documents specifying different Functional Clusters and supports parallel implementation of different Functional Clusters. Details of the interfaces are up to the platform provider. Additional interfaces, parameters and return values can be added.

### B.2 Interface Tables

#### B.2.1 Functional Cluster initialization

`ara::core::Initialize` and `ara::core::Deinitialize` initialize and deinitialize other Functional Clusters as necessary for the particular implementation. All Functional Clusters where this is necessary thus need to provide internal interfaces for their initialization and deinitialization.

## C History of Specification Items

Please note that the lists in this chapter also include specification items that have been removed from the specification in a later version. These specification items do not appear as hyperlinks in the document.

### C.1 Specification Item History of this document compared to AUTOSAR R20-11.
