1 Introduction

The objective of this report is the illustration and execution of AUTOSAR modeling and the AUTOSAR methodology (see [1]) for selected show cases.

Each show case focuses on a few specific topics and gives an overview of their basic usage and their application in the field. Where appropriate, the show cases are based on real world applications of the AUTOSAR standard.

It contains

- explanatory background on the functional use case for which the specific part of the AUTOSAR modeling is applied.
- illustration of the AUTOSAR model content in form of interlinked tables
- explanation of the processing results of these AUTOSAR models (e.g. C code, A2L files, ...)
- snippets of the full-blown examples. The complete examples are provided in the archive `AUTOSAR_EXP_ModelingShowCases.zip` [2].

2 Overview

The report is organized in chapters according to the main focus of the contained show cases. Each chapter contains a topic specific overview and at least one show case. Each chapter is self contained and understandable without reading any other chapter.

The technical report on the AUTOSAR Methodology [1] deserves a special mentioning as accompanying document for going through the show cases.

In the first version of the technical report, the show cases are targeting the topic of measurement and calibration, involving the creation of A2L files based on AUTOSAR models. For these show cases, also the specification of the `SoftwareComponent-Template` [3] is a good accompanying document.

This updated version is extended by an additional show case targeting the topic of Structured Requirements. For these show cases, also the specification of the `StandardizationTemplate` [4] is a good accompanying document.

3 Measurement and Calibration

Measurements and Calibration (short: MC) is a major step in the development of electronic control units (ECUs). Measurement and Calibration systems (MC systems), involving software tools (MC tools) as well as the hardware to access an ECU (not in focus here), enable the developer to measure variables and to adapt calibration parameters (or "characteristics") during the run-time of the ECU.

For instance, the following tasks are regularly done by "Measurement and Calibration"

- Adaptation to real hardware (e.g. inserting the electrical characteristics of a sensor)
- Calibration of controllers (e.g. adjusting the parameters of a closed loop controller)
- Tuning of ECU internal environment models (e.g. for "virtual sensors")
- Validation of ECU functions
- Tracking of development errors
- Collecting data for automated optimization of parameters

The "Introductory Show Case" (see 3.1), illustrates all basic artifacts on the way from a physical system that is to be controlled by an ECU until measuring and calibrating with a MC system.

As didactic simplification only a few data types were used, e.g. neither `CURVES`¹ nor `MAPs`² were chosen, nor any `ApplicationCompositeDataType`.

However, those advanced topics, their modeling in AUTOSAR as well as their transfer to a MC tool, is of particular interest: they are regularly needed and used the field. Therefore, the "Advanced Show Case" in chapter 3.2 especially highlights these topics. This show case is directly derived from the real world modeling and structuring approach of a major Tier 1 in the powertrain domain. So it also illustrates "good practices" in the field for designing AUTOSAR systems which are to be measured and calibrated later on in their development.

¹`CURVES` are two dimensional functions defined via axis points and the corresponding function values. Interpolation or extrapolation is used to calculate function values that are not directly defined.

²`MAPs` are similar to `CURVES` but three dimensional

3.1 Introductory Show Case

As introduction to measurement and calibration with AUTOSAR a simple, artificial closed-loop control system was chosen. This allows interesting feedback of the system when using a MC tool. At the same time, the model, the source code and generated files are still comprehensible.

A drawback is, that not all typical "real world" data types are featured, for instance. Such topics are covered in the "Advanced Show Case", chapter 3.2.

3.1.1 Physical System

This section contains a description of the physical system setup. It can safely be skipped, if only the AUTOSAR modeling itself is of interest to the reader.

Figure 3.1: Physical Overview

Figure 3.1 shows the major physical values and entities of our system. The control task is the following: The plant is a sensor in an airstream that requires heating. The temperature T_{Plant} is to be controlled by the ECU. However, there is no direct way to measure T_{Plant} .

For the estimation of T_{Plant} the following properties of the system are used:

- T_{Plant} depends on the temperature of the environment T_{Env} , i.e. the temperature of the air stream. T_{Env} can be measured directly.

- T_{Plant} depends on the current $I_{Controller}$ which is output by the ECU and controlled by the controller and therefore known.
- The plant itself acts as a thermal energy storage. So T_{Plant} also depends on the heat quantity that is currently stored within the plant.
- All other influences on T_{Plant} are considered to be insignificant. So they can safely be ignored for this control task.

An estimation of T_{Plant} can be calculated by a plant model, which uses T_{Env} and $I_{Controller}$ as inputs and has the stored heat quantity as internal state.

3.1.1.1 Components Overview

Figure 3.2: Component Overview

For this show case, the interaction with a real physical environment is completely left out, i.e. there is no Heating Power Output component and the profile of T_{Env} is randomly generated inside the component Environment. This cuts off a lot of complexity from the example, and allows to run the software system on a PC without complex environment simulations.

For completeness: The plant model is calculated inside the component Plant and the controller inside the component Controller.

As typical for ECUs the calculations happen in a time-discrete manner, i.e. the calculations in the components are executed periodically at discrete in time steps. In the following, the index $n \in \{1, 2, \dots\}$ denotes the current time step. The previous time step is denoted by the index $n - 1$. The index 0 denotes the initialization value. This also means that time step 1 is the first, that is actually calculated by the ECU.

Furthermore Δt denotes the time in seconds, that elapsed between the calculation of the previous time step and the current time step. In case of time step 1, Δt denotes the time that elapsed between initialization of the system and time step 1. For setting

the actual value of Δt the frequency bandwidth of the physical properties in the system has to be taken into account. Decreasing the value of Δt usually increases the quality of the sampling of physical signals up to a certain point where the costs of further decreasing the value of Δt outweighs the benefit gained in terms of signal quality.

3.1.1.2 The Environment

Figure 3.3: Environment

The modeling and implementation of the environment is not in the focus of this show case. The temperature $T_{env_n} [^{\circ}\text{C}]$ is generated (pseudo) randomly. This is done in order to see the controller and the plant model "in action" during run-time of the system.

The generated profile is a random walk limited by an upper and a lower boundary, with saturation at these boundaries.

The random walk is configurable via $T_{LowLimit} [^{\circ}\text{C}]$ and $T_{HighLimit} [^{\circ}\text{C}]$, for the boundaries, and $T_{StepSize} [\text{K}]$, for the change of the temperature during one time step.

Assuming $rand_n [-] \in \{-1, 0, 1\}$ and $n \in \{1, 2, 3, \dots\}$ then T_{env_n} is characterized by this equation (with $T_{env_0} [^{\circ}\text{C}] = -273.15 [^{\circ}\text{C}]$):

$$T_{env_n} [^{\circ}\text{C}] = T_{env_{n-1}} [^{\circ}\text{C}] + T_{StepSize} [\text{K}] \cdot rand_n [-]$$

if and only if T_{env_n} would be inside the boundaries, i.e.

$$T_{LowLimit} < T_{env_n} < T_{HighLimit}$$

If T_{env_n} would be outside one of the boundaries, it is set to the value of that boundary.

3.1.1.3 The Plant

Figure 3.4: Plant

The plant is an electrically heated mass that is exposed to the air flow in the environment. The heat quantity Q_{plant} that is stored inside the plant is considered to always be directly proportional to the temperature T with constant proportionality factor. Neither the mass of the plant, nor the specific heat capacity changes during the run-time of our system.

For simplicity, this proportionality factor is considered to be $1 \left[\frac{\text{J}}{\text{K}} \right]$. For the calculations inside the `Plant` component, we are always using $[\text{K}]$ as unit for temperatures, so the conversion from and to $[°\text{C}]$ only happens at the interface of the component.

With this, we have the following:

$$Q_{plant_n} [\text{J}] = T_n [\text{K}] \cdot 1 \left[\frac{\text{J}}{\text{K}} \right]$$

$$T_n [\text{K}] = \frac{Q_{plant_n} [\text{J}]}{1 \left[\frac{\text{J}}{\text{K}} \right]}$$

This also means, that $Q_{plant_n} [\text{J}] = 0 [\text{J}]$ corresponds $T_n [\text{K}] = 0 [\text{K}]$, i.e. absolute zero. So $Q_{plant_n} [\text{J}] \geq 0 [\text{J}]$ shall always be true.

In each time step, there are two heat flows: One from the electrical heater to the plant and one from the plant to the environment. A negative heat flow means that heat energy is flowing away from the plant. Respectively, a positive heat flow means that heat energy is stored in the plant.

The heat flow $Q_{heater_n} [\text{J}]$ from the electrical heater to the plant in one time step is considered to be proportional to the current $I_n [\text{mA}]$ through the plant during this time step. The proportionality factor is $h_{\text{Heater}} \left[\frac{\text{J}}{\text{mA s}} \right]$. Of course, the plant can only be heated up by the electrical heater, i.e. a "negative" current I_n would not cool down the plant, but causes the same heat up as $-I_n$. So we have

$$Q_{heater_n} [\text{J}] = |I_n| [\text{mA}] \cdot h_{\text{Heater}} \left[\frac{\text{J}}{\text{mA s}} \right] \cdot \Delta t [\text{s}]$$

The cool down of the plant can only happen via the second heat flow, i.e. the heat flow $Q_{env_n} [\text{J}]$ from the plant to the environment. The flow in one time step is considered

to be proportional to the difference between the temperature of the plant (calculated from the stored heat quantity during the last time step) and the temperature of the environment (received in this time step, but actually "measured" during the last time step). With the proportionality factor $h_{Env} \left[\frac{J}{K} \right]$, we have:

$$Q_{env_n} [J] = (T_{env_n} [K] - T_{n-1} [K]) \cdot h_{Env} \left[\frac{J}{K} \right] \cdot \Delta t [s]$$

The heat quantity that was stored in the plant in last time step $Q_{plant_{n-1}}$ is now modified by these two heat flows. This results in the stored heat quantity in the current time step. With $Q_{plant_0} [J] = 0 [J]$, we have

$$Q_{plant_n} [J] = Q_{plant_{n-1}} [J] + Q_{heater_n} [J] + Q_{env_n} [J]$$

3.1.1.4 The Controller

Figure 3.5: Controller

For the closed loop control an I controller (by and large) was chosen for component `Controller`. This means that the amplification of the input signal is proportional to the integral of the errors, i.e. the deviation between measured variable and setpoint. Because the controller cannot actively cool down the temperature of the plant, the output $I_n \geq 0$ for all n .

Again, all temperatures are converted to and from $[^{\circ}C]$ at the interface of the component. All internal calculation are done in $[K]$.

The error during the current time step is the difference between $T_{SetPoint} [K]$ and the measured variable $T_n [K]$:

$$e_n [K] = T_{SetPoint} [K] - T_n [K]$$

The integral part of the controller is calculated via summing up all errors from the previous steps. With $eSum_n [Ks] = 0 [Ks]$ we have:

$$eSum_n [Ks] = eSum_{n-1} [Ks] + e_n [K] \cdot \Delta t$$

A further design decision for the controller was, to limit the integral and to saturate at the limits. This has the benefit that it limits the current I_n that is output by the controller. Furthermore, it enables the controller to react faster after long deviations.

The lower limit is 0 [Ks] . So if $eSum_n$ would fall below zero in time step n , we set $eSum_n \text{ [Ks]} = 0 \text{ [Ks]}$. The upper limit is $L_{MaxESum} \text{ [Ks]}$. If $eSum_n$ would exceed $L_{MaxESum}$ in time step n we set $eSum_n \text{ [Ks]} = L_{MaxESum} \text{ [Ks]}$.

The integral state $eSum_n$ of the controller is then amplified by $k \left[\frac{\text{mA}}{\text{Ks}} \right]$ to calculate the current $I_n \text{ [mA]}$, i.e. the output of the controller:

$$I_n \text{ [mA]} = eSum_n \text{ [Ks]} \cdot k \left[\frac{\text{mA}}{\text{Ks}} \right]$$

So the limitations of the $eSum_n$ guarantee, that

$$0 \text{ [mA]} \leq I_n \text{ [mA]} \leq L_{MaxESum} \text{ [Ks]} \cdot k \left[\frac{\text{mA}}{\text{Ks}} \right]$$

3.1.2 AUTOSAR Modeling

This section gives a brief overview of the AUTOSAR modeling. More insight can be gained by browsing through the hyper-linked tables in section 3.1.7. These tables are generated from the AUTOSAR model of this show case. If this is still not sufficient, the complete model is available in .arxml format in AUTOSAR_EXP_ModelingShowCases.zip [2].

Figure 3.6: Example Composition

In this show case the components specified in section 3.1.1.1 are modeled as `ApplicationSwComponentTypes`.

- `Environment`
- `Plant`
- `Controller`

To keep the example simple, no `SwcImplementations` were modeled. For some tasks, like generation of a `MemMap` for an embedded controller, this would be needed.

The in- and outputs of the `ApplicationSwComponentTypes` are modeled as `SenderReceiverInterface`. The internal state is realized as `implicitInterRunnableVariables`. Besides the illustrative aspect, the rationale for this design decision was that the internal state is likely to be used by more than one runnable in `ApplicationSwComponentTypes` (at least "outside" of an introductory show case).

For variables that should just be available for measurement in a MC tool, `arTypedPerInstanceMemory`s are used. For this use case, no synchronization of access to the variable needs to be implemented, so the way with the least overhead was chosen.

All parameters in the specification of the components were put in a fourth `SwComponentType`, in the `ParameterSwComponentType` "Parameters".

A distinct `ParameterInterface` was defined for the parameters of each of the three `ApplicationSwComponentTypes`. The respective `PPortPrototypes` of the `ParameterSwComponentType` hold the `initValue` for each `ParameterDataPrototype` in the `PortPrototypes`. Each `value` is specified in a `ValueSpecification` aggregated by a `ParameterProvideComSpec`.

The component types are instantiated in the `CompositionSwComponentType` "Composition".

This `Composition` is the type of the `rootSoftwareComposition` of the `ECU_Extract`. This also implies that all `SwComponentPrototypes` of `Composition` are mapped to one `EcuInstance`.

Some information on the `FlatMap` can be found in section 3.1.3.1.

3.1.3 RTE Generation, Measurement and Calibration

The `McSupport` is an interface between the RTE generator and the A2L generator. A RTE generator provides a `McDataInstance` for each calibrateable or measurable object. From logical view the generation of `McSupport` could be seen in two steps:

1. Provide unique names for all parameters, measurements, component prototypes which are instantiated one or multiple times. This is done by the used AUTOSAR Authoring Tool.
2. Generate the `McSupport` itself. This is usually done by the RTE generator. A2L supports only one global namespace, while AUTOSAR defines own namespaces within each `ARPackage`. This means, that on the one hand unique names are needed for all objects which are to be accessible during measurement and calibration (parameters, measurements, component prototypes). But on the other hand, unique names are needed for all other things that will appear in A2L, e.g. `CompuMethods`, `Units`. For them the RTE generator will create unique names.

AUTOSAR specifies additionally an `AliasNameSet` to override names which is not used here.

See `AUTOSAR_EXP_ModelingShowCases.zip` [2] for the generated `Rte_McSupportData.arxml` file.

3.1.3.1 FlatMap

In this show case, the `FlatMap` gives unique names to the

- `dataElements`
- `implicitInterRunnableVariables`
- `arTypedPerInstanceMemoryS`

The RTE-Generator uses this information for the generation of the `McSupport` file as well as for generation of the `.c` and `.h` files.

The `FlatMap` consists of a `FlatInstanceDescriptor` for each instance of these `VariableDataPrototypes`.

The flat map for this use case can be found in `AUTOSAR_EXP_ModelingShowCases.zip` [2].

3.1.3.2 ECU Documentation, Measurement and Calibration

When developing an ECU one usual requirement is, that objects described in A2L can be easily found in the documentation of the ECU. This is a challenge since documentation is on the level of `SwComponentTypes` while A2L is defined on the level of a `System` of `category` "ECU_EXTRACT".

- The names of `SwComponentPrototypes` are potentially different to the names of `SwComponentTypes`
- The names of `McDataInstances` are potentially different to the names of `DataPrototypes`

The challenge gets bigger, if types are instantiated multiple times. This issue needs to be solved by proper architecture, modeling conventions and clever generation of the `FlatMap`.

In this show case, this topic is only slightly touched by instantiating `TemperatureSRIF` two times, for the interface transporting T_{Env} as well as for the interface transporting T_{Plant} .

It is demonstrated that the `FlatMap` can be used to solve the issue. However, we manually crafted our `FlatMap`, which is usually not possible in the field. `FlatMaps` are usually automatically generated by customizable, "clever", not standardized tools.

3.1.4 A2L File

With the information in the `McSupport` file an A2L file is generated. However, for this generation the memory addresses for the variables and characteristics are needed. They are usually extracted from the map file that is output by the linker of the ECU

executable. The exact process as well as the tool for the A2L file generation is not standardized.

An example A2L file is provided in `AUTOSAR_EXP_ModelingShowCases.zip`.

3.1.5 Implementation in C

The implementation in C is a straight forward realization of the physical specification within the AUTOSAR modeling (see section 3.1.1.1 and 3.1.2). Therefore, the listings are presented without further explanation besides the comments in the source code.

A remark on the (pseudo) random numbers generated in line 22 of `Environment.c` (Listing 3.1): The numbers don't have good "pseudo randomness" properties but are sufficient for this show case, nevertheless. This way of generation was only chosen, because it fits in one line of C code without introducing a dependency to a library.

Listing 3.3: Controller.c

3.1.6 A walk with T_{Plant} through the Show Case

This section revisits the complete show case, but focuses on one physical value: T_{Plant} . It visits all artifacts and highlights all places that relate to T_{Plant} to illustrate the dependencies between all artifacts.

3.1.6.1 Physical System

Our journey begins at the physical system, where the value of the physical system outside of the ECU is identified with a software value inside the ECU.

Figure 3.7: Physical Overview

3.1.6.1.1 Components

It was located at the interface between two architectural components, sent by the `Plant` and received by the `Controller`. Furthermore a sequencing was introduced³, i.e. in one time step the `Plant` is calculated before the `Controller`.

³Please note that this sequencing is a design decision. As there is also a data flow from the `Plant` to the `Controller` one could also argue for another calculation sequence.

Figure 3.8: Component Overview

3.1.6.1.2 Equations

The functional behavior is defined by the equations for the `Plant`

$$Q_{plant_n} [J] = T_n [K] \cdot 1 \left[\frac{J}{K} \right]$$

$$T_n [K] = \frac{Q_{plant_n} [J]}{1 \left[\frac{J}{K} \right]}$$

Figure 3.9: Dependency between Q_{Plant} and T_{Plant}

$$Q_{env_n} [J] = (T_{env_n} [K] - T_{n-1} [K]) \cdot h_{Env} \left[\frac{J}{K} \right] \cdot \Delta t [s]$$

Figure 3.10: Heat flow from the `Plant` to the `Environment`

T_{Plant} is also used by the physical equations in the component `Controller`:

$$e_n [K] = T_{SetPoint} [K] - T_n [K]$$

Figure 3.11: Calculation of the control error in the `Controller`

Furthermore, calculations inside the components are done in Kelvin [K]. The conversion from and to [°C] happens at the interface level.

3.1.6.2 AUTOSAR Modeling

This architecture, i.e. the layout of the physical system, is modeled in AUTOSAR. The functional behavior defined by the equations will be implemented in C Code later on.

3.1.6.2.1 Physical Dimension and Unit

A `PhysicalDimension` is defined: T_{Plant} is a temperature.

Common <code>PhysicalDimension</code> attributes	
<code>shortName</code>	Temperature
<code>currentExp</code>	0
<code>lengthExp</code>	0
<code>luminousIntensityExp</code>	0
<code>massExp</code>	0
<code>molarAmountExp</code>	0
<code>temperatureExp</code>	1
<code>timeExp</code>	0

Table 3.1: PhysicalDimension Temperature

The corresponding ARXML description is:

```

<PHYSICAL-DIMENSION>
  <SHORT-NAME>Temperature</SHORT-NAME>
  <LENGTH-EXP>0</LENGTH-EXP>
  <MASS-EXP>0</MASS-EXP>
  <TIME-EXP>0</TIME-EXP>
  <CURRENT-EXP>0</CURRENT-EXP>
  <TEMPERATURE-EXP>1</TEMPERATURE-EXP>
  <MOLAR-AMOUNT-EXP>0</MOLAR-AMOUNT-EXP>
  <LUMINOUS-INTENSITY-EXP>0</LUMINOUS-INTENSITY-EXP>
</PHYSICAL-DIMENSION>
    
```

Listing 3.4: Physical Dimension of Temperature

T_{Plant} shall have the `Unit` DegreeCelsius:

Common <code>Unit</code> attributes	
<code>shortName</code>	DegreeCelsius
<code>displayName</code>	$\ddot{i}_c \frac{1}{2} C$
<code>offsetSiToUnit</code>	-273.15
<code>factorSiToUnit</code>	1.0
<code>physicalDimension</code>	Temperature

Table 3.2: Unit DegreeCelsius

The corresponding ARXML description is:

```

<UNIT>
  <SHORT-NAME>DegreeCelsius</SHORT-NAME>
  <DISPLAY-NAME>°C</DISPLAY-NAME>
  <FACTOR-SI-TO-UNIT>1.0</FACTOR-SI-TO-UNIT>
  <OFFSET-SI-TO-UNIT>-273.15</OFFSET-SI-TO-UNIT>
  <PHYSICAL-DIMENSION-REF DEST="PHYSICAL-DIMENSION">
    /McInt/PhysicalDimensions/Temperature
  </PHYSICAL-DIMENSION-REF>
    
```

</UNIT>

Listing 3.5: Unit Degree Celsius

The following is presented for completeness, although not directly needed for T_{Plant} . It is possible to link more than one unit to a physical dimension. So in the model, there is also a definition for the unit Kelvin:

Common Unit attributes	
shortName	Kelvin
displayName	K
offsetSiToUnit	0.0
factorSiToUnit	1.0
physicalDimension	Temperature

Table 3.3: Unit Kelvin

The corresponding ARXML Code is:

```

<UNIT>
  <SHORT-NAME>Kelvin</SHORT-NAME>
  <DISPLAY-NAME>K</DISPLAY-NAME>
  <FACTOR-SI-TO-UNIT>1.0</FACTOR-SI-TO-UNIT>
  <OFFSET-SI-TO-UNIT>0.0</OFFSET-SI-TO-UNIT>
  <PHYSICAL-DIMENSION-REF DEST="PHYSICAL-DIMENSION">
    /McInt/PhysicalDimensions/Temperature
  </PHYSICAL-DIMENSION-REF>
</UNIT>
    
```

Listing 3.6: Unit Kelvin

3.1.6.2.2 Application Data Type

A new `ApplicationDataType` is defined for temperatures in degree Celsius:

Common ApplicationDataType attributes	
shortName	Temperature_C
category	VALUE
desc	Type for a temperature in [°C]
swCalibrationAccess	readOnly
unit	DegreeCelsius
Range	
Conversion	
category	LINEAR
direction	compuInternalToPhys

desc	lowerLimit	upperLimit	compuNumerator / compuDenominator
-	-	-	$Phys = \frac{-273.15 + 1 * Internal}{1}$

Table 3.4: ApplicationDataType Temperature_C

The corresponding ARXML Code is split between the definition of the [ApplicationDataType](#):

```

<APPLICATION-PRIMITIVE-DATA-TYPE>
  <SHORT-NAME>Temperature_C</SHORT-NAME>
  <DESC>
  <L-2 L="EN">Type for a temperature in [°C]</L-2>
  </DESC>
  <CATEGORY>VALUE</CATEGORY>
  <SW-DATA-DEF-PROPS>
  <SW-DATA-DEF-PROPS-VARIANTS>
    <SW-DATA-DEF-PROPS-CONDITIONAL>
      <SW-CALIBRATION-ACCESS>READ-ONLY</SW-CALIBRATION-ACCESS>
      <COMPU-METHOD-REF DEST="COMPU-METHOD">
        /McInt/CompuMethods/Temperature_C
      </COMPU-METHOD-REF>
      <UNIT-REF DEST="UNIT">/McInt/Units/DegreeCelsius</UNIT-REF>
    </SW-DATA-DEF-PROPS-CONDITIONAL>
  </SW-DATA-DEF-PROPS-VARIANTS>
  </SW-DATA-DEF-PROPS>
</APPLICATION-PRIMITIVE-DATA-TYPE>
    
```

Listing 3.7: Datatype

and the [CompuMethod](#), which is referenced by the [ApplicationDataType](#):

```

<COMPU-METHOD>
  <SHORT-NAME>Temperature_C</SHORT-NAME>
  <DESC>
  <L-2 L="EN">Conversion from [°C] to [K]</L-2>
  </DESC>
  <CATEGORY>LINEAR</CATEGORY>

Listing 3.10: Implementation Type and Base Type

3.1.6.2.3 Port Interface

The `Temperature_C` is used to define the `SenderReceiverInterface` which is used to type the "transport" of a temperature in degree Celsius between `SwComponentTypes`. Please note that in the show case, this `PortInterface` is not only used to type the "transport" of T_{Plant} , but also to type the "transport" of T_{Env} .

Common <code>SenderReceiverInterface</code> attributes	
<code>shortName</code>	TemperatureSRIF
<code>desc</code>	Interface type for transferring temperatures in [\bar{T} ; $\frac{1}{2}$ C]
properties of the <code>dataElements</code>	
properties of <code>VariableDataPrototype</code>	
<code>shortName</code>	T
<code>type</code>	<code>Temperature_C</code>

Listing 3.17: FlatMap

3.1.6.4 ECU Configuration

There are further things that need to be defined before the RTE and the OS can be generated. For instance, the order in which the `RTEEvents` for the `RunnableEntities` are invoked and the assignment to an `OsTask`. This is done via `EcucModuleConfigurationValues`. The interesting parts of the RTE configuration are:

```
...
<ECUC-CONTAINER-VALUE>
  <SHORT-NAME>controller100ms</SHORT-NAME>
  <DEFINITION-REF ...>.../RteEventToTaskMapping</DEFINITION-REF>
  <PARAMETER-VALUES>
  <ECUC-NUMERICAL-PARAM-VALUE>
    <DEFINITION-REF ...>.../RtePositionInTask</DEFINITION-REF>
    <VALUE>3</VALUE>
  </ECUC-NUMERICAL-PARAM-VALUE>
  ...
  </PARAMETER-VALUES>
  <REFERENCE-VALUES>
  <ECUC-REFERENCE-VALUE>
    <DEFINITION-REF ...>.../RteMappedToTaskRef</DEFINITION-REF>
    <VALUE-REF ...>.../OS/OS_CFG/task_100ms</VALUE-REF>
  </ECUC-REFERENCE-VALUE>
  <ECUC-REFERENCE-VALUE>
    <DEFINITION-REF ...>.../RteEventRef</DEFINITION-REF>
    <VALUE-REF DEST="TIMING-EVENT">.../controller100ms</VALUE-REF>
  </ECUC-REFERENCE-VALUE>
  </REFERENCE-VALUES>
</ECUC-CONTAINER-VALUE>
...
<ECUC-CONTAINER-VALUE>
  <SHORT-NAME>plant100ms</SHORT-NAME>
  <DEFINITION-REF ...>.../RteEventToTaskMapping</DEFINITION-REF>
  <PARAMETER-VALUES>
  <ECUC-NUMERICAL-PARAM-VALUE>
    <DEFINITION-REF ...>.../RtePositionInTask</DEFINITION-REF>
    <VALUE>2</VALUE>
  </ECUC-NUMERICAL-PARAM-VALUE>
  ...
  </PARAMETER-VALUES>
  <REFERENCE-VALUES>
  <ECUC-REFERENCE-VALUE>
    <DEFINITION-REF ...>.../RteMappedToTaskRef</DEFINITION-REF>
    <VALUE-REF ...>.../OS/OS_CFG/task_100ms</VALUE-REF>
  </ECUC-REFERENCE-VALUE>
  <ECUC-REFERENCE-VALUE>
    <DEFINITION-REF ...>.../RteEventRef</DEFINITION-REF>
    <VALUE-REF DEST="TIMING-EVENT">.../plant100ms</VALUE-REF>
  </ECUC-REFERENCE-VALUE>
```

```

</REFERENCE-VALUES>
</ECUC-CONTAINER-VALUE>
...
    
```

Listing 3.18: RTE Config

This part of the OS configuration defines the name of the OSTask, that we see later on in the generated C code:

```

...
<AR-PACKAGE>
  <SHORT-NAME>OS</SHORT-NAME>
  <ELEMENTS>
    <ECUC-MODULE-CONFIGURATION-VALUES>
      <SHORT-NAME>OS_CFG</SHORT-NAME>
      <DEFINITION-REF DEST="ECUC-MODULE-DEF"/>/AUTOSAR/EcucDefs/OS</DEFINITION-REF>
      <CONTAINERS>
        ...
        <ECUC-CONTAINER-VALUE>
          <SHORT-NAME>task_100ms</SHORT-NAME>
          <DEFINITION-REF ...>.../OsTask</DEFINITION-REF>
          <PARAMETER-VALUES>
            ...
          </ECUC-CONTAINER-VALUE>
        ...
      </ECUC-MODULE-CONFIGURATION-VALUES>
    </ELEMENTS>
  </AR-PACKAGE>
...
    
```

Listing 3.19: OsConfig

These configurations are tied to the ECU_Extract by an [EcucValueCollection](#):

```

<ECUC-VALUE-COLLECTION>
  <SHORT-NAME>EcucValueCollection</SHORT-NAME>
  <ECU-EXTRACT-REF DEST="SYSTEM"/>/McInt/System/EcuExtract</ECU-EXTRACT-REF>
  <ECUC-VALUES>
    <ECUC-MODULE-CONFIGURATION-VALUES-REF-CONDITIONAL>
      <ECUC-MODULE-CONFIGURATION-VALUES-REF DEST="ECUC-MODULE-CONFIGURATION-VALUES"/>
        /McInt/RTE/RTE_CFG</ECUC-MODULE-CONFIGURATION-VALUES-REF>
    </ECUC-MODULE-CONFIGURATION-VALUES-REF-CONDITIONAL>
    <ECUC-MODULE-CONFIGURATION-VALUES-REF-CONDITIONAL>
      <ECUC-MODULE-CONFIGURATION-VALUES-REF DEST="ECUC-MODULE-CONFIGURATION-VALUES"/>
        /McInt/OS/OS_CFG</ECUC-MODULE-CONFIGURATION-VALUES-REF>
    </ECUC-MODULE-CONFIGURATION-VALUES-REF-CONDITIONAL>
  </ECUC-VALUES>
</ECUC-VALUE-COLLECTION>
    
```

Listing 3.20: EcuC Value Collection

This completes the presentation of the AUTOSAR modeling in our walk through.

3.1.6.5 RTE Generation

In the following, some snippets of the generated RTE are presented. However, they are examples only and may differ if different RTE generators are used.

Among other things, the `OsTask` is generated as defined in the ECU configuration above:

```

1  ...
2  #define RTE_START_SEC_VAR
3  #include "MemMap.h" /*lint !e537 permit multiple inclusion */
4  ...
5  VAR(float32, RTE_DATA) TPlant;
6  ...
7  #define RTE_STOP_SEC_VAR
8  #include "MemMap.h" /*lint !e537 permit multiple inclusion */
9  ...
10 TASK(task_100ms)
11 {
12     ...
13     Rte_ImplicitBufs.isa_1._task_100ms.sbuf1.value = TPlant;
14     ...
15     plantRE_func();
16     ...
17     controllerRE_func();
18     ...
19     TPlant = Rte_ImplicitBufs.isa_1._task_100ms.sbuf1.value;
20     ...
21 } /* task_100ms */
22 ...
    
```

Listing 3.21: Rte.c

Also a MACRO to write T_{Plant} in the Plant

```

1  ...
2  #define Rte_IRead_plantRE_EnvTemperatureRPP_T() ((CONST(float32,
3  RTE_DATA)) Rte_ImplicitBufs.isa_1._task_100ms.sbuf0.value )
4  ...
    
```

Listing 3.22: Rte_Plant.h

and to read T_{Plant} in the Controller

```

1  ...
2  #define Rte_IRead_ControllerRE_TemperatureRPP_T() ((CONST(float32,
3  RTE_DATA)) Rte_ImplicitBufs.isa_1._task_100ms.sbuf1.value )
4  ...
    
```

Listing 3.23: Rte_Controller.h

was generated. Furthermore, the `McSupport` file is generated as an interface between the "AUTOSAR world" and the "A2L world". As the reader can see, this is a compilation of necessary data from the AUTOSAR model presented before:

```

Listing 3.24: McSupportData

3.1.6.6 Implementation in C

The implementation in C-Code is a direct implementation of the physical equations. The Plant uses the MACRO, generated by the RTE generator, to write T_{Plant} :

```

1  #include "Rte_Plant.h"
2  ...
3  FUNC (void, Plant_CODE) plantRE_func (void)
4  {
5      ...
6      /* heat capacity of 1 assumed */
7      float32 lTPlant = lQPlant;
8      /* calculate heat flows, store in PIM to make them measurable */
9      *Rte_Pim_QEnv() = (lTenv - lTPlant) * lEfactor * lDt;
10     ...
11     /* heat capacity of 1 assumed */
12     lTPlant = lQPlant;
13     ...
14     /* Write output of plant: temerature of plant */
15     Rte_IWrite_plantRE_PlantTemperaturePPP_T(lTPlant);
16 }
    
```

Listing 3.25: Plant

The Controller uses the MACRO, generated by the RTE generator, to read T_{Plant} :

```

1  #include "Rte_Controller.h"
2  ...
3  FUNC (void, Controller_CODE) controllerRE_func (void)
4  {
5      /* read input, define output variable */
6      float32 lT = Rte_IRead_ControllerRE_TemperatureRPP_T();
7      ...
8
9      /* store current error in PIM to make it measurable */
10     *Rte_Pim_E() = lSetPoint - lT;
11     ...
12 }
    
```

Listing 3.26: Controller

3.1.6.7 A2L File

Using the McSupport file and the map file from the linker, an example A2L file was generated for this show case. The snippet below is an example only and could differ if a different A2L file generator is used:

```

1  ...
2  /begin MEASUREMENT TPlant
3      "TPlant"
4      FLOAT32_IEEE
5      McInt_CompuMethods_Temperature_C
6      0
7      0
    
```

```
8      -1E+32
9      1E+32
10     DISPLAY_IDENTIFIER  "TPlant"
11     ECU_ADDRESS 0xe000001c
12     FORMAT "%.1f"
13     PHYS_UNIT "°C"
14 /end MEASUREMENT
15 ...
16 /begin UNIT McInt_PhysicalDimensions_Temperature
17     "McInt_PhysicalDimensions_Temperature"
18     "McInt_PhysicalDimensions_Temperature"
19     EXTENDED_SI
20     SI_EXPONENTS 0 0 0 0 1 0 0
21 /end UNIT
22 /begin UNIT McInt_Units_DegreeCelsius
23     "McInt_Units_DegreeCelsius"
24     "°C"
25     DERIVED
26     REF_UNIT McInt_PhysicalDimensions_Temperature
27     UNIT_CONVERSION 1 -273.15
28 /end UNIT
29 /begin COMPU_METHOD McInt_CompuMethods_Temperature_C
30     "McInt_CompuMethods_Temperature_C"
31     LINEAR
32     "%f"
33     "°C"
34     COEFFS_LINEAR 1 -273.15
35     REF_UNIT McInt_Units_DegreeCelsius
36 /end COMPU_METHOD
37 ...
```

Listing 3.27: A2L File

3.1.6.8 Measurement and Calibration Tool

The A2L file is then used by a MC tool to measure T_{Plant} . Of course, in addition to the A2L file a suitable ECU access⁴ must be available, to actually do measurement and calibration with the AUTOSAR system of this show case. However, the ECU access is not presented because this is not in the focus of this show case.

Below is a typical screen shot from a MC tool during an actual measurement and calibration task. You can see T_{Plant} measured and displayed in degree Celsius.

⁴for instance, a measurement and calibration service like XCP or a hardware access to the memory of the micro controller

Figure 3.12: Screenshot of a MC Tool

3.2 Advanced Show Case

3.2.1 General Objectives of the Model Structure

3.2.1.1 The Ecu Description

Since the show case is focusing on measurement and calibration only a minimal system model is provided. Hereby the file `Pprj_EcuDescr_U_SystemNodeStub.arxml` defines the `System` `SystemU_EcuDescr` of `category` `ECU_SYSTEM_DESCRIPTION` which contains only the `RootSwCompositionPrototype`. The file `Pprj_EcuDescr_U.arxml` contains the according `CompositionSwComponentType` describing the hierarchical top-level-composition of software components shown in table `SystemURootComposition_EcuDescr`.

3.2.1.2 The Ecu Extract

The file `Pprj_EcuExtract_U_SystemNodeStub.arxml` defines the `System` `SystemU_System` of `category` `ECU_EXTRACT` which contains only the `RootSwCompositionPrototype` `SystemU` referencing the ECU Flat Map and the flat top-level-composition `SystemU_Root`. The file `Pprj_EcuExtract_U.arxml` contains the according `CompositionSwComponentType` describing the flat top-level-composition of software components shown in table `SystemU_Root`.

Please note that the flat top-level-composition uses the identical software component types as the hierarchical top-level-composition. Therefore an identification of component and data instances in the hierarchical software component structure or in the flat structure requires the correct iteration from the according `System` nodes.

3.2.1.2.1 The ECU Flat Map

The file `Pprj_EcuExtract_U_FlatMap.arxml` contains the ECU Flat Map.

The ECU Flat Map is utilized to assign unique and comprehensible names to all `DataPrototype`s representing measurements and characteristics. This is important for the calibration engineers⁵

The applied strategy for the creation of a `FlatInstanceDescriptor.shortName` is to shorten it to the `shortName` of the `DataPrototype` when only a single instance of the `DataPrototype` is used.

⁵Calibration engineers in this context means the engineers working with measurement and calibration tooling e.g. to determine the correct calibration parameter values in order to adopt functionality in the software components to the mechanical components in the vehicle.

3.2.1.3 Data Types and Data Objects

The components are designed top down coming from the physical function down to the implementation in the target programming language C. Hereby the interfaces of Software Components are typically typed with `ApplicationDataTypes` in order to describe the physical meaning of the `DataPrototypes`. The only exceptions are the interfaces to AUTOSAR Services which are typed by `ImplementationDataTypes` directly as those are standardized. `ApplicationPrimitiveDataTypes` are mainly of `category`

- BOOLEAN
- VALUE
- CURVE
- MAP
- COM_AXIS

and the most important CompuMethod `categorys` are

- LINEAR
- TEXTTABLE

In case of `LINEAR` conversions it is supported to differentiate the `Unit` used for the implemented calculations and an additional `Unit` used in the MCD system. This relationship of such `Units` are expressed with `UnitGroups`. The `ARElements` are structured in a way to support the common usage of elements relevant for the interface description up to the level of `PortInterfaces` by several Component Descriptions. Those elements are located under `Tier1/ARPlatform1/DataDictionary/<KindPackage>` in the file `Pprj_DataDictionary.arxml`.

The `CompuMethods` and `DataConstrs` are exclusively used by one `ApplicationPrimitiveDataType`. The possible reuse between `ApplicationPrimitiveDataTypes` supported by AUTOSAR is not used in this model structure. When such a `ApplicationDataType` is defined the intended mapping to the reasonable `ImplementationDataType` is already considered in order to get an optimal usage of the possible range of the `ImplementationDataType`. Nevertheless, the several physical meanings are **not** reflected by the definition of individual `ImplementationDataType` but only the standardized Platform Types [5] are used to describe primitives on implementation level. This has the effect that the RTE APIs are typed by the standardized Platform Types in cases of primitives and arrays of primitives. Only structure types are getting observable in the types of RTE APIs. This approach allows the direct usage of data read from RTE in mathematical or interpolation libraries without any type cast.

The memory allocation of the data objects is controlled by the usage of `SwAddrMethods`. Those are defined for `ParameterDataPrototypes` and `VariableDataPrototypes` on level of the `PortInterfaces`. A few examples are shown in

the chapter 3.2.2.17 for the basic uses cases like calibration parameter, normal data and code.

3.2.1.4 Axis, Curves and Maps

The show case contains description for axis, curves and maps which are in AUTOSAR so called compound primitives. In order to understand the structure and the defined attributes in the example it is helpful to understand how such objects are described in AUTOSAR. For this it is necessary to look at the hierarchy of [ApplicationDataTypes](#), [DataPrototypes](#), [PortPrototypes](#), [SwComponentTypes](#) and [FlatMap](#).

3.2.1.5 Axis, Curves and Maps on ApplicationDataType level

Figure 3.13 is based on the example of the [ApplicationPrimitiveDataType](#) `Map_Time_Lnr_s_uint16`. It shows the relationships between the [ApplicationPrimitiveDataTypes](#) describing the

- MAP itself
- its axis being a group axis
- in turn the properties of a matching working point

Figure 3.13: ApplicationPrimitiveDataType of category MAP and its group axes

The [ApplicationPrimitiveDataType](#) `Map_Time_Lnr_s_uint16` defines a data type for a MAP with group axes. The physical meaning and range of the contained values is described with the [ApplicationPrimitiveDataType](#) `s_Lnr_0_8191d875_0_FFFF_uint16`. It is referenced with the [valueAxisDataType](#) attribute. This means it's a value in the range 0 .. 8191.875 [second] with the resolution of 0.125 [second].

The referenced [ApplicationPrimitiveDataType](#) in the role [valueAxisDataType](#) represents the primitive data type of the value axis within a compound primitive (e.g. CURVE, MAP). It supersedes `CompuMethod`, `Unit`, and `BaseType`. In the particular example, the [valueAxisDataType](#) provides the properties of the primitive elements of the CURVE or MAP via a [valueAxisDataType](#) reference to an [ApplicationPrimitiveDataType](#). This in turn defines the attributes:

- [dataConstr](#)
- [compuMethod](#)
- [displayFormat](#)
- [unit](#)
- [swCalibrationAccess](#)

Thereby, despite being set, the value of [swCalibrationAccess](#) of the referenced [ApplicationPrimitiveDataType](#) is meaningless for the using CURVE and MAP. Note: The referenced data type needs to be a real primitive (typically of category VALUE. Category BOOLEAN is also supported).

The [ApplicationPrimitiveDataType](#) of the CURVE and MAP can additionally define [SwDataDefProps](#) which are relevant for the whole compound primitive. Currently the following attributes are used in the example:

- [swCalprmAxisSet](#)
- [swRecordLayout](#)
- [swCalibrationAccess](#) (but will be refined on [DataPrototype](#) level)

Further on, via the [dataTypeMapping](#) of the using software component, the properties of [ImplementationDataType](#) and [SwBaseType](#) are described.

As axes of the MAP two group axes are used. The properties of the group axes are described by two [ApplicationPrimitiveDataTypes](#) of category `COM_AXIS`. The attribute [swAxisIndex](#) indicates for which dimension the group axis applies (1 = X, 2 = Y). With the attribute [sharedAxisType](#) the reference to the [ApplicationPrimitiveDataType](#) describing the axis is defined.

In the example, the group axis `ComAxis_Temp_Lin_K_uint16` defines the applicable minimum and maximum number of axis points. Additionally the [inputVariableType](#) reference to the [ApplicationPrimitiveDataType](#) `K_Celsius_Lnr_0_511d9921875_0_FFFF_uint16` defines the properties of the input

value for the axis. This in turn corresponds to the values stored as axis point. The same principle applies for the group axis `ComAxis_Mass_Lnr_Kg_uint8`.

Please note, the above mentioned properties are defined on the level of `ApplicationDataTypes` and so far not any data instance implementing such properties exists. This requires an instantiation of such `ApplicationDataTypes`.

3.2.1.6 Axis, Curves and Maps on DataPrototype and SwComponentPrototype level

3.2.1.6.1 Instantiation of Axis, Curves and Maps

Figure 3.14: Instantiation of a MAP and its group axes

Figure 3.14 shows the instantiation of the `ApplicationPrimitiveDataType` `ComAxis_Temp_Lin_K_uint16`, `ComAxis_Mass_Lnr_Kg_uint8`, and `Map_Time_Lnr_s_uint16` up to the level of the `CompositionSwComponentType` `Pcpt_CMscB`.

Thereby `ParameterDataPrototypes` are typed by the mentioned `ApplicationPrimitiveDataTypes`. Each `ParameterDataPrototype` is owned by an own `ParameterInterface`. This offers the most flexibility to instantiate the map and axes independently from each other. On the level of the `ParameterDataPrototype` additionally the `swCalibrationAccess` and the `swAddrMethod` is defined.

Further on, the `ParameterSwComponentType CMscB_par` defines three `Port-Prototypes` typed by the `ParameterInterfaces`.

Please note that a group axes of a curve or map are not necessarily provided by the same `ParameterSwComponentType` as the one providing the curve or map. This case is illustrated with the map `ArrldMap_Time_Lnr_s_uint16` using the group axes `ArrldComAxis_Temp_Lin_K_uint16` provided by `CMscD_par` and `ComAxis_Mass_Lnr_Kg_uint8` provided by `CMscB_par`.

3.2.1.6.2 Usage of Axis, Curves and Maps by Software Components

3.2.1.6.3 Linking map and curve instances to its axes instances

Consider a software component that uses curves and maps with group axes. It is then required to denote which instance of curve and map uses which instance of a group axis as axis of abscissae and, in case of a map, as axis of ordinate.

The AUTOSAR meta model provides hereby two possibilities:

- `RunnableEntity.parameterAccess.swDataDefProps`
- or
- `SwcInternalBehavior.instantiationDataDefProps.swDataDef-Props`.

Inside one software component it's very unlikely, that the same curve or map is used with different axes by different `RunnableEntities` (note that this cannot be expressed by ASAM MCD-2MC, also) . Therefore, in this show case the second ability is used. This avoids the risk of inconsistencies when several `RunnableEntities` are defining `parameterAccesses` to the same curve or map instance.

The according `instantiationDataDefProps.parameterInstance` references the map instance in the scope of the `SwComponentType` and the `swDataDefProps.swCalprmAxisSet.swCalprmAxis.swCalprmAxisTypeProps.swCalprmRef` references the applied group axes with the according `SwCalprmAxis.swAxisIndex`

3.2.1.6.4 Linking axes instances to its working point instances

When a software component uses compound primitives containing axes (e.g. curves, maps, or group axes) it's beneficial to indicate which data is used as input for the according axis. This enables the measurement and calibration tool to display the current working point. Like explained in section 3.2.1.6.3, this information can be provided

- at the [ParameterAccess.swDataDefProps](#) of the compound primitives containing the axis **or**
- by means of [instantiationDataDefProps.swDataDefProps](#).

In this show case the second ability is used for the same reasons as discussed in section 3.2.1.6.3.

The according `instantiationDataDefProps.parameterInstance` references the axes instance in the scope of the `SwComponentType CMscB`. The `swDataDef-Props.swCalprmAxisSet.swCalprmAxis.swCalprmAxisTypeProps.swVariableRef` references the applied working point variable (in this case, a `dataElement` in a `RPortPrototype`) with the according `SwCalprmAxis.swAxisIndex`.

Listing 3.30: Example of a `FlatInstanceDescriptor` for map axis and working point variable

3.2.1.7 Arrays of Maps and Axes

The ability of curves, maps and cuboids is usually used to describe the physical dependency of a characteristic on other physical input values. Hereby each input value is described by an orthogonal axis. In contrast to this, arrays are used to group a set of values of the same nature which can be handled by the same algorithm. Typically, in this case the algorithm iterates over the array with an index. Nevertheless, each array element may represent a particular part of the vehicle, e.g. a specific cylinder or a specific sensor. It's possible to combine these design principles. This ends up in the need to describe arrays of curves, maps, cuboids and the according axes.

The show case illustrates the model of those objects by the following elements:

- [Arr1dMap_Time_Lnr_s_uint16](#)
- [Arr1dComAxis_Temp_Lin_K_uint16](#)
- [Arr1dPrimData_Temperature_Lin_K_C_uint16](#)

Hereby, the array of the map [Arr1dMap_Time_Lnr_s_uint16](#) uses for the x-axis an array of group axes [Arr1dComAxis_Temp_Lin_K_uint16](#) which in turn uses an array of primitive values as working points [Arr1dPrimData_Temperature_Lin_K_C_uint16](#). In this case, the n'th map uses the n'th x-axes which uses the n'th value as working point. In contrast, the map uses one group axis [ComAxis_Mass_Lnr_Kg_uint8](#) for the y-axis. In this case all maps in the array are using the same y-axis.

3.2.1.7.1 Arrays of Maps and Axes in the ECU Flat Map

In the ECU Flat Map the ability to reference [ApplicationCompositeElementDataPrototypes](#) is used to express the specific meaning of each array element in the array of map and group axis.

For instance, each element in the array [Arr1dMap_Time_Lnr_s_uint16](#) is named in a way to indicate the specific meaning:

- [Arr1dMap_Time_Lnr_s_uint16_FrontLeft](#)
- [Arr1dMap_Time_Lnr_s_uint16_FrontRight](#)
- [Arr1dMap_Time_Lnr_s_uint16_RearLeft](#)
- [Arr1dMap_Time_Lnr_s_uint16_RearRight](#)

The following listing shows the structure of such an FlatInstanceDescriptor on one example:

```
<FLAT-INSTANCE-DESCRIPTOR>
  <SHORT-NAME>Arr1dMap_Time_Lnr_s_uint16_FrontLeft</SHORT-NAME>
  <ECU-EXTRACT-REFERENCE-IREF>
    <CONTEXT-ELEMENT-REF DEST="ROOT-SW-COMPOSITION-PROTOTYPE"/>/Tier1/

</ECU-EXTRACT-REFERENCE-IREF>
</FLAT-INSTANCE-DESCRIPTOR>
    
```

Listing 3.31: Example of a `FlatInstanceDescriptor` for an `ApplicationCompositeElementDataPrototype`

Please note the usage of the `index` attribute in the `target` reference.

3.2.1.8 Measurement of Modes

3.2.1.8.1 Enabling Measurement of Modes

The measurement of a mode is enabled in the software-component description by setting the `ModeDeclarationGroupPrototype.swCalibrationAccess` to `read-Only`. See `ModeDirection`.

3.2.1.8.2 Modes in the ECU Flat Map

AUTOSAR supports the measurement of the current mode, the previous mode and the next mode. Hereby the last two are useful when the mode is measured during a on-going transition to identify the kind of transition. In this show case only the measurement of the current mode is illustrated. For this, the `FlatMap` contains a `FlatInstanceDescriptor` pointing to the `ModeDeclarationGroupPrototype` which is to be measured. The `role` attribute of the `FlatInstanceDescriptor` is set to `CURRENT_MODE`

```

<FLAT-INSTANCE-DESCRIPTOR>

4 Structured Requirements

Structured Requirements are available at different sections in the meta model. There exists a clear definition of the elements of `StructuredReq`. Based on these elements a variety of possible use cases can be applied. The following show cases shall illustrate this:

- provide additional information for configuration
- provide specification items as requirements
- provide diagnostical requirements
- provide decomposition of requirements

4.1 Introductory Show Case

An OEMs e.g. can specify additional unmapped Ecu Configuration information using Structured Requirements. They are serialized using standardized ARXML. This would ensure a consistent processing of these data by a suitable tooling solution on supplier side. In addition, further validation can be applied to data and lead to a high quality of the exchanged information. No new and additional elements have to be introduced in the meta model because `StructuredReq` still provides all needed entities.

4.1.1 Additional information (M1 parameter)

The `System Template` [6] defines upstream mappings for a variety of M1 parameters. They are transported by the System Extract or Diagnostic Extract and presented in figure 4.1 as importable parameters.

The show case that an OEM needs to specify a value for not importable M1 parameters (no full mapping specified in AUTOSAR templates) to determine a dedicated behavior, e.g. `CanDevErrorDetect` which can be enabled by `true` or disabled by `false` is illustrated in figure 4.1 as processable parameters. A tool based processing of these information can increase efficiency and minimize error-proneness. This show case is targeting to solve this by using the `StructuredReq`.

Figure 4.1: Types of Parameters

The figure 4.1 shows further type of parameters; calculated and adjusted parameters; which exist but are not in the scope of show case.

In listing 4.1 the `StructuredReq` for `CanDevErrorDetect` is illustrated.

The same data can also be rendered in the table 4.1.

ReqID	CAN_00001	CanDevErrorDetect	Setting	FALSE
Use Case	preconfigured/default	4.2.2, 4.3.0, 4.4.0	Range	FALSE, TRUE
Description	Switches the development error detection and notification on or off. true: detection and notification is enabled. false: detection and notification is disabled.	Rational	The feature development error detection shall be disabled for production code else it has to be ensured that there will be no side effects from this code.	

Table 4.1: StructuredReq of CanDevErrorDetect

4.1.2 Specification items as requirements

AUTOSAR uses `StructuredReq` within AUTOSAR RS documents [TPS_STDT_00060]. They are automatically generated based on the specification generation process. These specification items use the attributes of `StructuredReq` including `Traceable`, to realize the up tracing. A dedicated example is illustrated in 4.4 this.

```

Listing 4.4: Example for `StructuredReq` in RS AUTOSAR Specification

The `Traceable` is realized by the tags `<TRACE-REF>`s in inside `<TRACE-REFS>`. In the specification the up traces appear as links below the table.

[RS_SYST_00020] Exclusion of signals from a specific physical line [

Type:	valid
Description:	The System Constraint Description shall be able to describe that signals have not to be mapped to a specific physical line.
Rationale:	Some physical lines can result unsuitable (too slow, unsafe communication protocol, etc.) for the transmission of some specific signals.
Dependencies:	None identified.
Use Case:	Most of power train signals cannot be mapped to a low speed CAN bus, due to their timing requirements.
Supporting Material:	—

]([RS_Main_00150](#), [RS_Main_00030](#))

Figure 4.2: Spec item represented by `StructuredReq`

Using `StructuredReq` a complete requirements description and tracing is available.

4.1.3 Diagnostic requirements

In this context the `StructuredReq` is embedded in `DiagnosticAccessPermission`. Mainly the description of the two conditions are shown here.

```

4.1.4 Decomposition of requirements

The [StructuredReq](#) can also be used for decomposition of requirements.

Figure 4.3: Decomposition of [StructuredReq](#)

In figure 4.3 the [StructuredReqB](#) has an upstream requirement to [StructuredReqA](#) realized by [Traceable](#) using `<TRACE-REF>`. The [StructuredReqB](#) itself is

decomposed by StructuredReqB1 and StructuredReqB2. This is realized by the attribute dependencies of StructuredReq. It contains two <TRACE>s which in turn use <TRACE-REF> again.

A Mentioned Class Tables

For the sake of completeness, this chapter contains a set of class tables representing meta-classes mentioned in the context of this document but which are not contained directly in the scope of describing specific meta-model semantics.

Class	ARElement (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::ARPackage			
Note	An element that can be defined stand-alone, i.e. without being part of another element (except for packages of course).			
Base	<i>ARObject</i> , <i>CollectableElement</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>PackageableElement</i> , <i>Referrable</i>			
Subclasses	AclObjectSet, AclOperation, AclPermission, AclRole, AliasNameSet , ApplicationPartition, <i>AutosarData Type</i> , <i>BaseType</i> , BlueprintMappingSet, BswEntryRelationshipSet, BswModuleDescription, BswModuleEntry, BuildActionManifest, CalibrationParameterValueSet, ClientIdDefinitionSet, ClientServerInterfaceToBswModuleEntryBlueprintMapping, Collection, CompuMethod , ConsistencyNeedsBlueprintSet, ConstantSpecification, ConstantSpecificationMappingSet, CpSoftwareCluster, CpSoftwareClusterBinaryManifestDescriptor, CpSoftwareClusterMappingSet, CpSoftwareClusterResourcePool, CryptoEllipticCurveProps, CryptoServiceCertificate, CryptoServiceKey, CryptoServicePrimitive, CryptoServiceQueue, CryptoSignatureScheme, DataConstr , DataExchangePoint, DataTransformationSet, DataTypeMappingSet , <i>DiagnosticCommonElement</i> , DiagnosticConnection, DiagnosticContributionSet, DltContext, DltEcu, Documentation, E2EProfileCompatibilityProps, EcuDefinitionCollection, EcuDestinationUriDefSet, EcuModuleConfigurationValues , EcuModuleDef, EcuValueCollection , EndToEndProtectionSet, EthIhpProps, EthTcplPcmpProps, EthTcplPProps, EvaluatedVariantSet, FMFeature, FMFeatureMap, FMFeatureModel, FMFeatureSelectionSet, FlatMap , GeneralPurposeConnection, HwCategory, HwElement, HwType, IPsecConfigProps, IPv6ExtHeaderFilterSet, <i>IdsCommonElement</i> , IdsDesign, <i>Implementation</i> , InterpolationRoutineMappingSet, J1939ControllerApplication, KeywordSet, LifecycleInfoSet, LifecycleStateDefinitionGroup, LogAndTraceMessageCollectionSet, MacSecGlobalKayProps, MacSecParticipantSet, McFunction, McGroup, ModeDeclarationGroup , ModeDeclarationMappingSet, OsTaskProxy, PhysicalDimension , PhysicalDimensionMappingSet, PortInterface , PortInterfaceMappingSet, PortPrototypeBlueprint, PostBuildVariantCriterion, PostBuildVariantCriterionValueSet, PredefinedVariant, RapidPrototypingScenario, SdgDef, SignalServiceTranslationPropsSet, SomeipSdClientEventGroupTimingConfig, SomeipSdClientServiceInstanceConfig, SomeipSdServerEventGroupTimingConfig, SomeipSdServerServiceInstanceConfig, SwAddrMethod , SwAxisType, SwComponentMappingConstraints, SwComponentType , SwRecordLayout, SwSystemconst, SwSystemconstantValueSet, SwcBswMapping, System , SystemSignal, SystemSignalGroup, TDCpSoftwareClusterMappingSet, TcpOptionFilterSet, <i>TimingExtension</i> , TlsConnectionGroup, TlvDataIdDefinitionSet, TransformationPropsSet, Unit , UnitGroup , ViewMapSet			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table A.1: ARElement

Class	ARPackage			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::ARPackage			
Note	AUTOSAR package, allowing to create top level packages to structure the contained ARElements. ARPackages are open sets. This means that in a file based description system multiple files can be used to partially describe the contents of a package. This is an extended version of MSR's SW-SYSTEM.			
Base	<i>ARObject</i> , <i>AtpBlueprint</i> , <i>AtpBlueprintable</i> , <i>CollectableElement</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>			
Aggregated by	ARPackage.arPackage , AUTOSAR.arPackage			
Attribute	Type	Mult.	Kind	Note

Class	ARPackage			
arPackage	ARPackage	*	aggr	This represents a sub package within an ARPackage, thus allowing for an unlimited package hierarchy. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=arPackage.shortName, arPackage.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime xml.sequenceOffset=30
element	PackageableElement	*	aggr	Elements that are part of this package Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=element.shortName, element.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=20
referenceBase	ReferenceBase	*	aggr	This denotes the reference bases for the package. This is the basis for all relative references within the package. The base needs to be selected according to the base attribute within the references. Stereotypes: atpSplitable Tags: atp.Splitkey=referenceBase.shortLabel xml.sequenceOffset=10

Table A.2: ARPackage

Class	AliasNameSet			
Package	M2::AUTOSARTemplates::CommonStructure::FlatMap			
Note	This meta-class represents a set of AliasNames. The AliasNameSet can for example be an input to the A2L-Generator. Tags: atp.recommendedPackage=AliasNameSets			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
aliasName	AliasNameAssignment	*	aggr	AliasNames contained in the AliasNameSet. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=aliasName.shortLabel, aliasName.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Table A.3: AliasNameSet

Class	AnyInstanceRef			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::AnyInstanceRef			
Note	Describes a reference to any instance in an AUTOSAR model. This is the most generic form of an instance ref. Refer to the superclass notes for more details.			
Base	ARObject , AtpInstanceRef			

Class		AnyInstanceRef		
Aggregated by	Collection.collectedInstance, Collection.sourceInstance, DocumentationContext.feature, EcuInstanceReferenceValue.value, FlatInstanceDescriptor.ecuExtractReference , FlatInstanceDescriptor.upstreamReference , RptContainer.byPassPoint, RptHook.rptArHook, ViewMap.firstElementInstance, ViewMap.secondElementInstance			
Attribute	Type	Mult.	Kind	Note
base	AtpClassifier	1	ref	This is the base from which navigation path begins. Stereotypes: atpDerived
contextElement (ordered)	AtpFeature	*	ref	This is one step in the navigation path specified by the instance ref.
target	AtpFeature	1	ref	This is the target of the instance ref.

Table A.4: AnyInstanceRef

Class		ApplicationArrayType		
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	An application data type which is an array, each element is of the same application data type. Tags: atp.recommendedPackage=ApplicationDataTypes			
Base	ARElement , ARObject , ApplicationCompositeDataType , ApplicationDataType , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , AutosarDataType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
dynamicArraySizeProfile	String	0..1	attr	Specifies the profile which the array will follow if it is a variable size array.
element	ApplicationArrayElement	0..1	aggr	This association implements the concept of an array element. That is, in some cases it is necessary to be able to identify single array elements, e.g. as input values for an interpolation routine.

Table A.5: ApplicationArrayType

Class		ApplicationArrayElement		
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	Describes the properties of the elements of an application array data type.			
Base	ARObject , ApplicationCompositeElementDataPrototype , AtpFeature , AtpPrototype , DataPrototype , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	ApplicationArrayType.element , AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note
arraySizeHandling	ArraySizeHandlingEnum	0..1	attr	The way how the size of the array is handled.
arraySizeSemantics	ArraySizeSemanticsEnum	0..1	attr	This attribute controls how the information about the array size shall be interpreted.
indexDataType	ApplicationPrimitiveDataType	0..1	ref	This reference can be taken to assign a CompuMethod of category TEXTTABLE to the array. The texttable entries associate a textual value to an index number such that the element with that index number is represented by a symbolic name.

Class	ApplicationArrayElement			
maxNumberOfElements	PositiveInteger	0..1	attr	The maximum number of elements that the array can contain. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime

Table A.6: ApplicationArrayElement

Class	ApplicationCompositeDataType (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	Abstract base class for all application data types composed of other data types.			
Base	ARElement , ARObject , ApplicationDataType , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , AutosarDataType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Subclasses	ApplicationArrayDataType , ApplicationRecordDataType			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table A.7: ApplicationCompositeDataType

Class	ApplicationCompositeElementDataPrototype (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	This class represents a data prototype which is aggregated within a composite application data type (record or array). It is introduced to provide a better distinction between target and context in instance Refs.			
Base	ARObject , AtpFeature , AtpPrototype , DataPrototype , Identifiable , MultilanguageReferrable , Referrable			
Subclasses	ApplicationArrayElement , ApplicationRecordElement			
Aggregated by	AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note
type	ApplicationDataType	0..1	tref	This represents the corresponding data type. Stereotypes: isOfType

Table A.8: ApplicationCompositeElementDataPrototype

Class	ApplicationDataType (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	ApplicationDataType defines a data type from the application point of view. Especially it should be used whenever something "physical" is at stake. An ApplicationDataType represents a set of values as seen in the application model, such as measurement units. It does not consider implementation details such as bit-size, endianness, etc. It should be possible to model the application level aspects of a VFB system by using ApplicationData Types only.			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , AutosarDataType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Subclasses	ApplicationCompositeDataType , ApplicationPrimitiveDataType			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table A.9: ApplicationDataType

Class	ApplicationPrimitiveDataType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	A primitive data type defines a set of allowed values. Tags: atp.recommendedPackage=ApplicationDataTypes			
Base	ARElement , ARObject , ApplicationDataType , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , AutosarDataType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table A.10: ApplicationPrimitiveDataType

Class	ApplicationRecordDataType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	An application data type which can be decomposed into prototypes of other application data types. Tags: atp.recommendedPackage=ApplicationDataTypes			
Base	ARElement , ARObject , ApplicationCompositeDataType , ApplicationDataType , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , AutosarDataType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
element (ordered)	ApplicationRecordElement	*	aggr	Specifies an element of a record. The aggregation of ApplicationRecordElement is subject to variability with the purpose to support the conditional existence of elements inside a ApplicationrecordData Type. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=element.shortName, element.variation Point.shortLabel vh.latestBindingTime=preCompileTime

Table A.11: ApplicationRecordDataType

Class	ApplicationRecordElement			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	Describes the properties of one particular element of an application record data type.			
Base	ARObject , ApplicationCompositeElementDataPrototype , AtpFeature , AtpPrototype , DataPrototype , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	ApplicationRecordDataType.element , AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note
isOptional	Boolean	0..1	attr	This attribute represents the ability to declare the enclosing ApplicationRecordElement as optional. This means the that, at runtime, the ApplicationRecord Element may or may not have a valid value and shall therefore be ignored. The underlying runtime software provides means to set the ApplicationRecordElement as not valid at the sending end of a communication and determine its validity at the receiving end.

Table A.12: ApplicationRecordElement

Class	ApplicationSwComponentType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	The ApplicationSwComponentType is used to represent the application software. Tags: atp.recommendedPackage=SwComponentTypes			
Base	ARElement , ARObject , AtomicSwComponentType , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable , SwComponentType			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table A.13: ApplicationSwComponentType

Enumeration	ArraySizeSemanticsEnum
Package	M2::AUTOSARTemplates::CommonStructure::ImplementationDataTypes
Note	This type controls how the information about the number of elements in an ApplicationArrayType is to be interpreted.
Aggregated by	ApplicationArrayElement.arraySizeSemantics , DiagnosticDataElement.arraySizeSemantics , ImplementationDataTypeElement.arraySizeSemantics , SwTextProps.arraySizeSemantics
Literal	Description
fixedSize	This means that the ApplicationArrayType will always have a fixed number of elements. Tags: atp.EnumerationLiteralIndex=0
variableSize	This implies that the actual number of elements in the ApplicationArrayType might vary at run-time. The value of arraySize represents the maximum number of elements in the array. Tags: atp.EnumerationLiteralIndex=1

Table A.14: ArraySizeSemanticsEnum

Class	AssemblySwConnector			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	AssemblySwConnectors are exclusively used to connect SwComponentPrototypes in the context of a CompositionSwComponentType.			
Base	ARObject , AtpClassifier , AtpFeature , AtpStructureElement , Identifiable , MultilanguageReferrable , Referrable , SwConnector			
Aggregated by	AtpClassifier.atpFeature , CompositionSwComponentType.connector			
Attribute	Type	Mult.	Kind	Note
provider	AbstractProvidedPort Prototype	0..1	iref	Instance of providing port. InstanceRef implemented by: PPortInComposition InstanceRef
requester	AbstractRequiredPort Prototype	0..1	iref	Instance of requiring port. InstanceRef implemented by: RPortInComposition InstanceRef

Table A.15: AssemblySwConnector

Class	AtomicSwComponentType (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	An atomic software component is atomic in the sense that it cannot be further decomposed and distributed across multiple ECUs.			

Class	AtomicSwComponentType (abstract)			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable , SwComponentType

Aggregated by	AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note
type	AutosarDataType	0..1	tref	This represents the corresponding data type. Stereotypes: isOfType

Table A.17: AutosarDataPrototype

Class	CompositionSwComponentType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	A CompositionSwComponentType aggregates SwComponentPrototypes (that in turn are typed by SwComponentTypes) as well as SwConnectors for primarily connecting SwComponentPrototypes among each others and towards the surface of the CompositionSwComponentType. By this means, hierarchical structures of software-components can be created. Tags: atp.recommendedPackage=SwComponentTypes			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable , SwComponentType			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note

Class	CompositionSwComponentType			
component	SwComponent Prototype	*	aggr	<p>The instantiated components that are part of this composition. The aggregation of SwComponentPrototype is subject to variability with the purpose to support the conditional existence of a SwComponentPrototype. Please be aware: if the conditional existence of Sw ComponentPrototypes is resolved post-build the deselected SwComponentPrototypes are still contained in the ECUs build but the instances are inactive in that they are not scheduled by the RTE.</p> <p>The aggregation is marked as atpSplitable in order to allow the addition of service components to the ECU extract during the ECU integration.</p> <p>The use case for having 0 components owned by the CompositionSwComponentType could be to deliver an empty CompositionSwComponentType to e.g. a supplier for filling the internal structure.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=component.shortName, component.variation Point.shortLabel vh.latestBindingTime=postBuild</p>
connector	SwConnector	*	aggr	<p>SwConnectors have the principal ability to establish a connection among PortPrototypes. They can have many roles in the context of a CompositionSwComponentType. Details are refined by subclasses.</p> <p>The aggregation of SwConnectors is subject to variability with the purpose to support variant data flow.</p> <p>The aggregation is marked as atpSplitable in order to allow the extension of the ECU extract with AssemblySw Connectors between ApplicationSwComponentTypes and ServiceSwComponentTypes during the ECU integration.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=connector.shortName, connector.variation Point.shortLabel vh.latestBindingTime=postBuild</p>
constantValue Mapping	ConstantSpecification MappingSet	*	ref	<p>Reference to the ConstantSpecificationMapping to be applied for initValues of PPortComSpecs and RPortCom Spec.</p> <p>Stereotypes: atpSplitable Tags:atp.Splitkey=constantValueMapping</p>

Class	CompositionSwComponentType			
dataTypeMapping	DataTypeMappingSet	*	ref	<p>Reference to the DataTypeMapping to be applied for the used ApplicationDataTypes in PortInterfaces.</p> <p>Background: when developing subsystems it may happen that ApplicationDataTypes are used on the surface of CompositionSwComponentTypes. In this case it would be reasonable to be able to also provide the intended mapping to the ImplementationDataTypes. However, this mapping shall be informal and not technically binding for the implementors mainly because the RTE generator is not concerned about the CompositionSwComponentTypes.</p> <p>Rationale: if the mapping of ApplicationDataTypes on the delegated and inner PortPrototype matches then the mapping to ImplementationDataTypes is not impacting compatibility.</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=dataTypeMapping</p>
instantiationRTEEventProps	InstantiationRTEEventProps	*	aggr	<p>This allows to define instantiation specific properties for RTE Events, in particular for instance specific scheduling.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=instantiationRTEEventProps.shortLabel, instantiationRTEEventProps.variationPoint.shortLabel vh.latestBindingTime=codeGenerationTime</p>

associatedPdurIPduGroup	PdurIPduGroup	*	ref	<p>With this reference it is possible to identify which PdurIPdu Groups are applicable for which Communication Connector/ ECU.</p>
clientIdRange	ClientIdRange	0..1	aggr	<p>Restriction of the Client Identifier for this Ecu to an allowed range of numerical values. The Client Identifier of the transaction handle is generated by the client RTE for inter-Ecu Client/Server communication.</p>
comConfigurationGwTimeBase	TimeValue	0..1	attr	<p>The period between successive calls to Com_Main FunctionRouteSignals of the AUTOSAR COM module in seconds.</p>
comConfigurationRxTimeBase	TimeValue	0..1	attr	<p>The period between successive calls to Com_Main FunctionRx of the AUTOSAR COM module in seconds.</p>
comConfigurationTxTimeBase	TimeValue	0..1	attr	<p>The period between successive calls to Com_Main FunctionTx of the AUTOSAR COM module in seconds.</p>
comEnableMDTForCyclicTransmission	Boolean	0..1	attr	<p>Enables for the Com module of this EcuInstance the minimum delay time monitoring for cyclic and repeated transmissions (TransmissionModeTiming has cyclic Timing assigned or eventControlledTiming with numberOfRepetitions > 0).</p>
commController	CommunicationController	1..*	aggr	<p>CommunicationControllers of the ECU.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=commController.shortName, commController.variationPoint.shortLabel vh.latestBindingTime=postBuild</p>
connector	CommunicationConnector	*	aggr	<p>All channels controlled by a single controller.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=connector.shortName, connector.variationPoint.shortLabel vh.latestBindingTime=postBuild</p>
dltConfig	DltConfig	0..1	aggr	<p>Describes the Dlt configuration on this EcuInstance.</p>
dolpConfig	DolpConfig	0..1	aggr	<p>Dolp configuration on this EcuInstance.</p> <p>Tags:atp.Status=draft</p>

Class	EcuInstance			
ecuTaskProxy	OsTaskProxy	*	ref	Reference to OsTaskProxies assigned to the Ecu Instance. Stereotypes: atpSplittable Tags: atp.Splitkey=ecuTaskProxy
ethSwitchPort Group Derivation	Boolean	0..1	attr	Defines whether the derivation of SwitchPortGroups based on VLAN and/or CouplingPort.pncMapping shall be performed for this EcuInstance. If not defined the derivation shall not be done.
partition	EcuPartition	*	aggr	Optional definition of Partitions within an Ecu.
pncNmRequest	Boolean	0..1	attr	Defines if this EcuInstance shall request Nm on all its PhysicalChannels which have Nm variant set to FULL each time a PNC is requested.
pncPrepare SleepTimer	TimeValue	0..1	attr	Time in seconds the PNC state machine shall wait in PNC_PREPARE_SLEEP.
pnc Synchronous Wakeup	Boolean	0..1	attr	If this parameter is available and set to true then all available PNCs will be woken up as soon as a channel wakeup occurs. This is ensured by adding all PNCs to all channel wakeup sources during upstream mapping.
pnResetTime	TimeValue	0..1	attr	Specifies the runtime of the reset timer in seconds. This reset time is valid for the reset of PN requests in the EIRA and in the ERA.
sleepMode Supported	Boolean	1	attr	Specifies whether the ECU instance may be put to a "low power mode" <ul style="list-style-type: none"> • true: sleep mode is supported • false: sleep mode is not supported Note: This flag may only be set to "true" if the feature is supported by both hardware and basic software.
tcpIcmpProps	EthTcpIcmpProps	0..1	ref	EcuInstance specific ICMP (Internet Control Message Protocol) attributes
tcpIplProps	EthTcpIplProps	0..1	ref	EcuInstance specific TcpIpl Stack attributes.
v2xSupported	V2xSupportEnum	0..1	attr	This attribute is used to control the existence of the V2X stack on the given EcuInstance.
wakeUpOver BusSupported	Boolean	1	attr	Driver support for wakeup over Bus.

Table A.29: EcuInstance

Class	EcucModuleConfigurationValues
Package	M2::AUTOSARTemplates::ECUCDescriptionTemplate
Note	Head of the configuration of one Module. A Module can be a BSW module as well as the RTE and ECU Infrastructure. As part of the BSW module description, the EcucModuleConfigurationValues element has two different roles: The recommendedConfiguration contains parameter values recommended by the BSW module vendor. The preconfiguredConfiguration contains values for those parameters which are fixed by the implementation and cannot be changed. These two EcucModuleConfigurationValues are used when the base EcucModuleConfigurationValues (as part of the base ECU configuration) is created to fill parameters with initial values. Tags: atp.recommendedPackage=EcucModuleConfigurationValues
Base	ARElement , ARObject , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable

Class	EcucModuleConfigurationValues			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
container	EcucContainerValue	*	aggr	Aggregates all containers that belong to this module configuration. atpVariation: [RS_ECUC_00078] Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=container.shortName, container.variation Point.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=10
definition	EcucModuleDef	0..1	ref	Reference to the definition of this EcucModule ConfigurationValues element. Typically, this is a vendor specific module configuration. Tags: xml.sequenceOffset=-10
ecucDefEdition	RevisionLabelString	0..1	attr	This is the version info of the ModuleDef ECUC Parameter definition to which this values conform to / are based on. For the Definition of ModuleDef ECUC Parameters the AdminData shall be used to express the semantic changes. The compatibility rules between the definition and value revision labels is up to the module's vendor.
implementation ConfigVariant	EcucConfiguration VariantEnum	0..1	attr	Specifies the kind of deliverable this EcucModule ConfigurationValues element provides. If this element is not used in a particular role (e.g. preconfigured Configuration or recommendedConfiguration) then the value shall be one of VariantPreCompile, VariantLink Time, VariantPostBuild.
module Description	BswImplementation	0..1	ref	Referencing the BSW module description, which this EcucModuleConfigurationValues element is configuring. This is optional because the EcucModuleConfiguration Values element is also used to configure the ECU infrastructure (memory map) or Application SW-Cs. However in case the EcucModuleConfigurationValues are used to configure the module, the reference is mandatory in order to fetch module specific "common" published information.
postBuildVariant Used	Boolean	0..1	attr	Indicates whether a module implementation has or plans to have (i.e., introduced at link or post-build time) new post-build variation points. TRUE means yes, FALSE means no. If the attribute is not defined, FALSE semantics shall be assumed.

Table A.30: EcucModuleConfigurationValues

Class	EcucValueCollection			
Package	M2::AUTOSARTemplates::ECUCDescriptionTemplate			
Note	This represents the anchor point of the ECU configuration description. Tags: atp.recommendedPackage=EcucValueCollections			
Base	ARElement , ARObject , CollectableElement , Identifiable , MultilanguageReferrable , Packageable Element , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note

Class	EcucValueCollection			
ecucValue	EcucModuleConfigurationValues	*	ref	References to the configuration of individual software modules that are present on this ECU. atpVariation: [RS_ECUC_00079] Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=ecucValue.ecucModuleConfigurationValues, ecucValue.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
ecuExtract	System	0..1	ref	Represents the extract of the System Configuration that is relevant for the ECU configured with that ECU Configuration Description.

Table A.31: EcucValueCollection

Class	FlatInstanceDescriptor			
Package	M2::AUTOSARTemplates::CommonStructure::FlatMap			
Note	Represents exactly one node (e.g. a component instance or data element) of the instance tree of a software system. The purpose of this element is to map the various nested representations of this instance to a flat representation and assign a unique name (shortName) to it. Use cases: <ul style="list-style-type: none"> Specify unique names of measurable data to be used by MCD tools Specify unique names of calibration data to be used by MCD tool Specify a unique name for an instance of a component prototype in the ECU extract of the system description Note that in addition it is possible to assign alias names via AliasNameAssignment.			
Base	<i>ARObject</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>			
Aggregated by	FlatMap.instance			
Attribute	Type	Mult.	Kind	Note
ecuExtract Reference	AtpFeature	0..1	iref	Refers to the instance in the ECU extract. This is valid only, if the FlatMap is used in the context of an ECU extract. The reference shall be such that it uniquely defines the object instance. For example, if a data prototype is declared as a role within an SwcInternalBehavior, it is not enough to state the SwcInternalBehavior as context and the aggregated data prototype as target. In addition, the reference shall also include the complete path identifying instance of the component prototype and the Atomic SoftwareComponentType, which is referred by the particular SwcInternalBehavior. Tags: xml.sequenceOffset=40 InstanceRef implemented by: AnyInstanceRef
role	Identifier	0..1	attr	The role denotes the particular role of the downstream memory location described by this FlatInstanceDescriptor. It applies to use case where one upstream object results in multiple downstream objects, e.g. ModeDeclaration GroupPrototypes which are measurable. In this case the RTE will provide locations for current mode, previous mode and next mode.

Class	FlatInstanceDescriptor			
rtePluginProps	RtePluginProps	0..1	aggr	The properties of a communication graph with respect to the utilization of RTE Implementation Plug-in. Stereotypes: atpSplitable Tags: atp.Splitkey=rtePluginProps
swDataDef Props	SwDataDefProps	0..1	aggr	The properties of this FlatInstanceDescriptor. Stereotypes: atpSplitable Tags: atp.Splitkey=swDataDefProps
upstream Reference	AtpFeature	0..1	iref	Refers to the instance in the context of an "upstream" descriptions, wich could be the system or system extract description, the basic software module description or (if a flat map is used in preliminary context) a description of an atomic component or composition. This reference is optional in case the flat map is used in ECU context. The reference shall be such that it uniquely defines the object instance in the given context. For example, if a data prototype is declared as a role within an SwcInternal Behavior, it is not enough to state the SwcInternal Behavior as context and the aggregated data prototype as target. In addition, the reference shall also include the complete path identifying the instance of the component prototype that contains the particular instance of Swc InternalBehavior. Tags: xml.sequenceOffset=20 InstanceRef implemented by: AnyInstanceRef

Table A.32: FlatInstanceDescriptor

Class	FlatMap			
Package	M2::AUTOSARTemplates::CommonStructure::FlatMap			
Note	Contains a flat list of references to software objects. This list is used to identify instances and to resolve name conflicts. The scope is given by the RootSwCompositionPrototype for which it is used, i.e. it can be applied to a system, system extract or ECU-extract. An instance of FlatMap may also be used in a preliminary context, e.g. in the scope of a software component before integration into a system. In this case it is not referred by a RootSwComposition Prototype. Tags: atp.recommendedPackage=FlatMaps			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , CollectableElement , Identifiable , Multilanguage Referrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note

Class	FlatMap			
instance	FlatInstanceDescriptor	1..*	aggr	<p>A descriptor instance aggregated in the flat map.</p> <p>The variation point accounts for the fact, that the system in scope can be subject to variability, and thus the existence of some instances is variable.</p> <p>The aggregation has been made splittable because the content might be contributed by different stakeholders at different times in the workflow. Plus, the overall size might be so big that eventually it becomes more manageable if it is distributed over several files.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=instance.shortName, instance.variationPoint.shortLabel vh.latestBindingTime=postBuild</p>

Table A.33: FlatMap

Class	Identifiable (abstract)
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable
Note	Instances of this class can be referred to by their identifier (within the namespace borders). In addition to this, Identifiables are objects which contribute significantly to the overall structure of an AUTOSAR description. In particular, Identifiables might contain Identifiables.
Base	ARObject , MultilanguageReferrable , Referrable
Subclasses	<p>ARPackage, AbstractDolpLogicAddressProps, AbstractEvent, AbstractImplementationDataTypeElement, AbstractSecurityEventFilter, AbstractSecurityIdsmInstanceFilter, AbstractServiceInstance, AppOsTaskProxyToEcuTaskProxyMapping, ApplicationEndpoint, ApplicationError, ApplicationPartitionToEcuPartitionMapping, AsynchronousServerCallResultPoint, AtpBlueprint, AtpBlueprintable, AtpClassifier, AtpFeature, AutosarOperationArgumentInstance, AutosarVariableInstance, BinaryManifestAddressableObject, BinaryManifestItemDefinition, BinaryManifestResource, BinaryManifestResourceDefinition, BlockState, BswInternalTriggeringPoint, BswModuleDependency, BuildActionEntity, BuildActionEnvironment, CanTpAddress, CanTpChannel, CanTpNode, Chapter, ClassContentConditional, ClientIdDefinition, ClientServerOperation, Code, CollectableElement, ComManagementMapping, CommConnectorPort, CommunicationConnector, CommunicationController, Compiler, ConsistencyNeeds, ConsumedEventGroup, CouplingPort, CouplingPortStructuralElement, CpSoftwareClusterResource, CpSoftwareClusterResourceToApplicationPartitionMapping, CpSoftwareClusterToEcuInstanceMapping, CpSoftwareClusterToResourceMapping, CryptoServiceMapping, DataPrototypeGroup, DataTransformation, DependencyOnArtifact, DiagEventDebounceAlgorithm, DiagnosticConnectedIndicator, DiagnosticDataElement, DiagnosticDebounceAlgorithmProps, DiagnosticFunctionInhibitSource, DiagnosticParameterElement, DiagnosticRoutineSubfunction, DltApplication, DltArgument, DltLogChannel, DltMessage, DolpInterface, DolpLogicAddress, DolpRoutingActivation, ECUMapping, EOCExecutableEntityRefAbstract, EcuPartition, EcucContainerValue, EcucDefinitionElement, EcucDestinationUriDef, EcucEnumerationLiteralDef, EcucQuery, EcucValidationCondition, EndToEndProtection, EthernetWakeupSleepOnDataLineConfig, EventHandler, ExclusiveArea, ExecutableEntity, ExecutionTime, FMAttributeDef, FMFeatureMapAssertion, FMFeatureMapCondition, FMFeatureMapElement, FMFeatureRelation, FMFeatureRestriction, FMFeatureSelection, FlatInstanceDescriptor, FlexrayArTpNode, FlexrayTpConnectionControl, FlexrayTpNode, FlexrayTpPduPool, FrameTriggering, GeneralParameter, GlobalTimeGateway, GlobalTimeMaster, GlobalTimeSlave, HeapUsage, HwAttributeDef, HwAttributeLiteralDef, HwPin, HwPinGroup, IPsecRule, IPv6ExtHeaderFilterList, ISignalToIPduMapping, ISignalTriggering, IdentCaption, InternalTriggeringPoint, J1939SharedAddressCluster, J1939TpNode, Keyword, LifecycleState, LinScheduleTable, LinTpNode, Linker, MacMulticastGroup, MacSecKayParticipant, McDataInstance, MemorySection, ModeDeclaration, ModeDeclarationMapping, ModeSwitchPoint, NetworkEndpoint, NmCluster, NmEcu, NmNode, NvBlockDescriptor, PackageableElement, ParameterAccess, PduActivationRoutingGroup, PduToFrameMapping, PduTriggering, PerInstanceMemory, PhysicalChannel, PortElementToCommunicationResourceMapping, PortGroup, PortInterfaceMapping, PossibleErrorReaction, ResourceConsumption, RootSwCompositionPrototype, RptComponent, RptContainer, RptExecutableEntity, RptExecutableEvent, RptExecutionContext, RptProfile, RptServicePoint, RteEventInCompositionSeparation, RteEventInCompositionToOsTaskProxyMapping, RteEventInSystemSeparation, RteEventInSystemToOsTaskProxyMapping, RunnableEntityGroup, SdgAttribute, SdgClass, SecureCommunicationAuthenticationProps, Secure</p>

Class	Identifiable (abstract)			
	CommunicationFreshnessProps, SecurityEventContextProps, <i>ServerCallPoint</i> , <i>ServiceNeeds</i> , SignalServiceTranslationElementProps, SignalServiceTranslationEventProps, SignalServiceTranslationProps, SocketAddress, SomeipTpChannel, <i>SpecElementReference</i> , <i>StackUsage</i> , StaticSocketConnection, <i>StructuredReq</i> , SwGenericAxisParamType, SwServiceArg, SwcServiceDependency, SwcToApplicationPartitionMapping, SwcToEcuMapping, SwcToImplMapping, SystemMapping, TDCpSoftwareClusterMapping, TDCpSoftwareClusterResourceMapping, TcpOptionFilterList, <i>TimingClock</i> , TimingClockSyncAccuracy, TimingCondition, <i>TimingConstraint</i> , <i>TimingDescription</i> , TimingExtensionResource, TimingModelInstance, TlsCryptoCipherSuite, TlsCryptoCipherSuiteProps, Topic1, TpAddress, TraceableTable, TraceableText, <i>TracedFailure</i> , <i>TransformationProps</i> , TransformationTechnology, Trigger, VariableAccess, VariationPointProxy, ViewMap, VlanConfig, WaitPoint			
Attribute	Type	Mult.	Kind	Note
adminData	AdminData	0..1	aggr	This represents the administrative data for the identifiable object. Stereotypes: atpSplittable Tags: atp.Splitkey=adminData xml.sequenceOffset=-40
annotation	Annotation	*	aggr	Possibility to provide additional notes while defining a model element (e.g. the ECU Configuration Parameter Values). These are not intended as documentation but are mere design notes. Tags: xml.sequenceOffset=-25
category	CategoryString	0..1	attr	The category is a keyword that specializes the semantics of the Identifiable. It affects the expected existence of attributes and the applicability of constraints. Tags: xml.sequenceOffset=-50
desc	MultiLanguageOverviewParagraph	0..1	aggr	This represents a general but brief (one paragraph) description what the object in question is about. It is only one paragraph! Desc is intended to be collected into overview tables. This property helps a human reader to identify the object in question. More elaborate documentation, (in particular how the object is built or used) should go to "introduction". Tags: xml.sequenceOffset=-60
introduction	DocumentationBlock	0..1	aggr	This represents more information about how the object in question is built or is used. Therefore it is a DocumentationBlock. Tags: xml.sequenceOffset=-30
uuid	String	0..1	attr	The purpose of this attribute is to provide a globally unique identifier for an instance of a meta-class. The values of this attribute should be globally unique strings prefixed by the type of identifier. For example, to include a DCE UUID as defined by The Open Group, the UUID would be preceded by "DCE:". The values of this attribute may be used to support merging of different AUTOSAR models. The form of the UUID (Universally Unique Identifier) is taken from a standard defined by the Open Group (was Open Software Foundation). This standard is widely used, including by Microsoft for COM (GUIDs) and by many companies for DCE, which is based on CORBA. The method for generating these 128-bit IDs is published in the standard and the effectiveness and uniqueness of the IDs is not in practice disputed. If the id namespace is omitted, DCE is assumed. An example is "DCE:2fac1234-31f8-11b4-a222-08002b34c003". The

Class	Identifiable (abstract)			
				uuid attribute has no semantic meaning for an AUTOSAR model and there is no requirement for AUTOSAR tools to manage the timestamp. Tags: xml.attribute=true

Table A.34: Identifiable

Class	ImplementationDataType			
Package	M2::AUTOSARTemplates::CommonStructure::ImplementationDataTypes			
Note	Describes a reusable data type on the implementation level. This will typically correspond to a typedef in C-code. Tags: atp.recommendedPackage=ImplementationDataTypes			
Base	ARElement , ARObject , AbstractImplementationDataType , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , AutosarDataType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
dynamicArray SizeProfile	String	0..1	attr	Specifies the profile which the array will follow in case this data type is a variable size array.
isStructWith Optional Element	Boolean	0..1	attr	This attribute is only valid if the attribute category is set to STRUCTURE. If set to true, this attribute indicates that the ImplementationDataType has been created with the intention to define at least one element of the structure as optional.
subElement (ordered)	ImplementationData TypeElement	*	aggr	Specifies an element of an array, struct, or union data type. The aggregation of ImplementationDataTypeElement is subject to variability with the purpose to support the conditional existence of elements inside a Implementation DataType representing a structure. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=subElement.shortName, subElement.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
symbolProps	SymbolProps	0..1	aggr	This represents the SymbolProps for the Implementation DataType. Stereotypes: atpSplitable Tags: atp.Splitkey=symbolProps.shortName
typeEmitter	NameToken	0..1	attr	This attribute is used to control which part of the AUTOSAR toolchain is supposed to trigger data type definitions.

Table A.35: ImplementationDataType

Class	InstantiationDataDefProps			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::InstantiationDataDefProps			
Note	<p>This is a general class allowing to apply additional SwDataDefProps to particular instantiations of a Data Prototype.</p> <p>Typically the accessibility and further information like alias names for a particular data is modeled on the level of DataPrototypes (especially VariableDataPrototypes, ParameterDataPrototypes). But due to the recursive structure of the meta-model concerning data types (a composite (data) type consists out of data prototypes) a part of the MCD information is described in the data type (in case of Application CompositeDataType).</p> <p>This is a strong restriction in the reuse of data typed because the data type should be re-used for different VariableDataPrototypes and ParameterDataPrototypes to guarantee type compatibility on C-implementation level (e.g. data of a Port is stored in PIM or a ParameterDataPrototype used as ROM Block and shall be typed by the same data type as NVRAM Block).</p> <p>This class overcomes such a restriction if applied properly.</p>			
Base	ARObject			
Aggregated by	NvBlockDescriptor.instantiationDataDefProps, ParameterSwComponentType.instantiationDataDefProps , SwcInternalBehavior.instantiationDataDefProps			
Attribute	Type	Mult.	Kind	Note
parameter Instance	AutosarParameterRef	0..1	aggr	This reference identifies the particular DataPrototype (defined in the context of a composite ParameterData Prototype) on which the swDataDefProps shall be applied.
swDataDef Props	SwDataDefProps	0..1	aggr	These are the particular data definition properties which shall be applied Stereotypes: atpSplittable Tags: atp.Splitkey=swDataDefProps
variableInstance	AutosarVariableRef	0..1	aggr	This reference identifies the particular DataPrototype (defined in the context of a composite VariableData Prototype) on which the swDataDefProps shall be applied.

Table A.36: InstantiationDataDefProps

Class	InternalBehavior (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::InternalBehavior			
Note	Common base class (abstract) for the internal behavior of both software components and basic software modules/clusters.			
Base	ARObject, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable , MultilanguageReferrable , Referrable			
Subclasses	BswInternalBehavior, SwcInternalBehavior			
Aggregated by	AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note

Class	InternalBehavior (abstract)			
constantMemory	ParameterDataPrototype	*	aggr	<p>Describes a read only memory object containing characteristic value(s) implemented by this Internal Behavior.</p> <p>The shortName of ParameterDataPrototype has to be equal to the 'C' identifier of the described constant.</p> <p>The characteristic value(s) might be shared between Sw ComponentPrototypes of the same SwComponentType.</p> <p>The aggregation of constantMemory is subject to variability with the purpose to support variability in the software component or module implementations. Typically different algorithms in the implementation are requiring different number of memory objects.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=constantMemory.shortName, constantMemory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
constantValueMapping	ConstantSpecificationMappingSet	*	ref	<p>Reference to the ConstantSpecificationMapping to be applied for the particular InternalBehavior</p> <p>Stereotypes: atpSplittable Tags:atp.Splitkey=constantValueMapping</p>
dataTypeMapping	DataTypeMappingSet	*	ref	<p>Reference to the DataTypeMapping to be applied for the particular InternalBehavior</p> <p>Stereotypes: atpSplittable Tags:atp.Splitkey=dataTypeMapping</p>
exclusiveArea	ExclusiveArea	*	aggr	<p>This specifies an ExclusiveArea for this InternalBehavior. The exclusiveArea is local to the component resp. module. The aggregation of ExclusiveAreas is subject to variability. Note: the number of ExclusiveAreas might vary due to the conditional existence of RunnableEntities or BswModuleEntities.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=exclusiveArea.shortName, exclusiveArea.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
exclusiveAreaNestingOrder	ExclusiveAreaNestingOrder	*	aggr	<p>This represents the set of ExclusiveAreaNestingOrder owned by the InternalBehavior.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=exclusiveAreaNestingOrder.shortName, exclusiveAreaNestingOrder.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>

Class	InternalBehavior (abstract)			
staticMemory	VariableDataPrototype	*	aggr	<p>Describes a read and writeable static memory object representing measurement variables implemented by this software component. The term "static" is used in the meaning of "non-temporary" and does not necessarily specify a linker encapsulation. This kind of memory is only supported if supportsMultipleInstantiation is FALSE.</p> <p>The shortName of the VariableDataPrototype has to be equal with the "C" identifier of the described variable.</p> <p>The aggregation of staticMemory is subject to variability with the purpose to support variability in the software component's implementations.</p> <p>Typically different algorithms in the implementation are requiring different number of memory objects.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=staticMemory.shortName, staticMemory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>

Table A.37: InternalBehavior

Class	McDataInstance			
Package	M2::AUTOSARTemplates::CommonStructure::MeasurementCalibrationSupport			
Note	<p>Describes the specific properties of one data instance in order to support measurement and/or calibration of this data instance.</p> <p>The most important attributes are:</p> <ul style="list-style-type: none"> • Its shortName is copied from the ECU Flat map (if applicable) and will be used as identifier and for display by the MC system. • The category is copied from the corresponding data type (ApplicationDataType if defined, otherwise ImplementationDataType) as far as applicable. • The symbol is the one used in the programming language. It will be used to find out the actual memory address by the final generation tool with the help of linker generated information. <p>It is assumed that in the M1 model this part and all the aggregated and referred elements (with the exception of the Flat Map and the references from ImplementationElementInParameterInstanceRef and McAccessDetails) are completely generated from "upstream" information. This means, that even if an element like e.g. a CompuMethod is only used via reference here, it will be copied into the M1 artifact which holds the complete McSupportData for a given Implementation.</p>			
Base	ARObject, Identifiable, MultilanguageReferrable, Referrable			
Aggregated by	McDataInstance.subElement, McSupportData.mcParameterInstance, McSupportData.mcVariableInstance			
Attribute	Type	Mult.	Kind	Note
arraySize	PositiveInteger	0..1	attr	The existence of this attribute turns the data instance into an array of data. The attribute determines the size of the array in terms of number of elements.
displayIdentifier	McIdentifier	0..1	attr	An optional attribute to be used to set the ASAM ASAP2 DISPLAY_IDENTIFIER attribute.

Class	McDataInstance			
flatMapEntry	FlatInstanceDescriptor	0..1	ref	Reference to the corresponding entry in the ECU Flat Map. This allows to trace back to the original specification of the generated data instance. This link shall be added by the RTE generator mainly for documentation purposes. The reference is optional because <ul style="list-style-type: none"> • The McDataInstance may represent an array or struct in which only the subElements correspond to FlatMap entries. • The McDataInstance may represent a task local buffer for rapid prototyping access which is different from the "main instance" used for measurement access.
instanceInMemory	ImplementationElementInParameterInstanceRef	0..1	aggr	Reference to the corresponding data instance in the description of calibration data structures published by the RTE generator. This is used to support emulation methods inside the ECU, it is not required for A2L generation.
mcDataAccessDetails	McDataAccessDetails	0..1	aggr	Refers to "upstream" information on how the RTE uses this data instance. Use Case: Rapid Prototyping
mcDataAssignment	RoleBasedMcDataAssignment	*	aggr	An assignment between McDataInstances. This supports the indication of related McDataElement implementing the of "RP global buffer", "RP global measurement buffer", "RP enabler flag".
resultingProperties	SwDataDefProps	0..1	aggr	These are the generated properties resulting from decisions taken by the RTE generator for the actually implemented data instance. Only those properties are relevant here, which are needed for the measurement and calibration system. Stereotypes: atpSplitable Tags: atp.Splitkey=resultingProperties
resultingRptSwPrototypingAccess	RptSwPrototypingAccess	0..1	aggr	Describes the implemented accessibility of data and modes by the rapid prototyping tooling.
role	Identifier	0..1	attr	An optional attribute to be used for additional information on the role of this data instance, for example in the context of rapid prototyping.
rptImplPolicy	RptImplPolicy	0..1	aggr	Describes the implemented code preparation for rapid prototyping at data accesses for a hook based bypassing.
subElement (ordered)	McDataInstance	*	aggr	This relation indicates, that the target element is part of a "struct" which is given by the source element. This information will be used by the final generator to set up the correct addressing scheme. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=subElement.shortName, subElement.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Class	McDataInstance			
symbol	SymbolString	0..1	attr	<p>This String is used to determine the memory address during final generation of the MC configuration data (e.g. "A2L" file) . It shall be the name of the element in the programming language such that it can be identified in linker generated information.</p> <p>In case the McDataInstance is part of composite data in the programming language, the symbol String may include parts denoting the element context, unless the context is given by the symbol attribute of an enclosing McDataInstance. This means in particular for the C language that the "." character shall be used as a separator between the name of a "struct" variable the name of one of its elements.</p> <p>The symbol can differ from the shortName in case of generated C data declarations.</p> <p>It is an optional attribute since it may be missing in case the instance represents an element (e.g. a single array element) which has no name in the linker map.</p> <p>Stereotypes: atpSplitable Tags:atp.Splitkey=symbol</p>

Table A.38: McDataInstance

Enumeration	MemoryAllocationKeywordPolicyType
Package	M2::MSR::DataDictionary::AuxillaryObjects
Note	Enumeration to specify the name pattern of the Memory Allocation Keyword.
Aggregated by	SwAddrMethod.memoryAllocationKeywordPolicy
Literal	Description
addrMethodShort Name	<p>The MemorySection shortNames of referring MemorySections and therefore the belonging Memory Allocation Keywords in the code are build with the shortName of the SwAddrMethod. This is the default value if the attribute does not exist.</p> <p>Tags:atp.EnumerationLiteralIndex=0</p>
addrMethodShort NameAndAlignment	<p>The MemorySection shortNames of referring MemorySections and therefore the belonging Memory Allocation Keywords in the code are build with the shortName of the SwAddrMethod and a variable alignment postfix.</p> <p>Thereby the alignment postfix needs to be consistent with the alignment attribute of the related MemorySection.</p> <p>Tags:atp.EnumerationLiteralIndex=1</p>

Table A.39: MemoryAllocationKeywordPolicyType

Enumeration	MemorySectionType
Package	M2::MSR::DataDictionary::AuxillaryObjects
Note	Enumeration to specify the essential nature of the data which can be allocated in a common memory class by the means of the AUTOSAR Memory Mapping.
Aggregated by	SwAddrMethod.sectionType
Literal	Description
calibrationVariables	<p>This memory section is reserved for "virtual variables" that are computed by an MCD system during a measurement session but do not exist in the ECU memory.</p> <p>Tags:atp.EnumerationLiteralIndex=2</p>

Enumeration	MemorySectionType
calprm	To be used for calibratable constants of ECU-functions. Tags: atp.EnumerationLiteralIndex=3
code	To be used for mapping code to application block, boot block, external flash etc. Tags: atp.EnumerationLiteralIndex=4
configData	Constants with attributes that show that they reside in one segment for module configuration. Tags: atp.EnumerationLiteralIndex=5
const	To be used for global or static constants. Tags: atp.EnumerationLiteralIndex=6
excludeFromFlash	This memory section is reserved for "virtual parameters" that are taken for computing the values of so-called dependent parameter of an MCD system. Dependent Parameters that are not at the same time "virtual parameters" are allocated in the ECU memory. Virtual parameters, on the other hand, are not allocated in the ECU memory. Virtual parameters exist in the ECU Hex file for the purpose of being considered (for computing the values of dependent parameters) during an offline-calibration session. Tags: atp.EnumerationLiteralIndex=7
var	To be used for global or static variables. The expected initialization is specified with the attribute sectionInitializationPolicy. Tags: atp.EnumerationLiteralIndex=9

Table A.40: MemorySectionType

Class	ModeDeclaration			
Package	M2::AUTOSARTemplates::CommonStructure::ModeDeclaration			
Note	Declaration of one Mode. The name and semantics of a specific mode is not defined in the meta-model.			
Base	ARObject , AtpClassifier , AtpFeature , AtpStructureElement , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	AtpClassifier.atpFeature , ModeDeclarationGroup.modeDeclaration			
Attribute	Type	Mult.	Kind	Note
value	PositiveInteger	0..1	attr	The RTE shall take the value of this attribute for generating the source code representation of this Mode Declaration.

Table A.41: ModeDeclaration

Class	ModeDeclarationGroup			
Package	M2::AUTOSARTemplates::CommonStructure::ModeDeclaration			
Note	A collection of Mode Declarations. Also, the initial mode is explicitly identified. Tags: atp.recommendedPackage=ModeDeclarationGroups			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
initialMode	ModeDeclaration	0..1	ref	The initial mode of the ModeDeclarationGroup. This mode is active before any mode switches occurred.

Class	ModeDeclarationGroup			
mode Declaration	ModeDeclaration	*	aggr	The ModeDeclarations collected in this ModeDeclaration Group. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=modeDeclaration.shortName, mode Declaration.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime
modeManager ErrorBehavior	ModeErrorBehavior	0..1	aggr	This represents the ability to define the error behavior expected by the mode manager in case of errors on the mode user side (e.g. terminated mode user).
modeTransition	ModeTransition	*	aggr	This represents the available ModeTransitions of the ModeDeclarationGroup
modeUserError Behavior	ModeErrorBehavior	0..1	aggr	This represents the definition of the error behavior expected by the mode user in case of errors on the mode manager side (e.g. terminated mode manager).
onTransition Value	PositiveInteger	0..1	attr	The value of this attribute shall be taken into account by the RTE generator for programmatically representing a value used for the transition between two statuses.

Table A.42: ModeDeclarationGroup

Class	ModeDeclarationGroupPrototype			
Package	M2::AUTOSARTemplates::CommonStructure::ModeDeclaration			
Note	The ModeDeclarationGroupPrototype specifies a set of Modes (ModeDeclarationGroup) which is provided or required in the given context.			
Base	<i>ARObject, AtpFeature, AtpPrototype, Identifiable, MultilanguageReferrable, Referrable</i>			
Aggregated by	<i>AtpClassifier.atpFeature, BswModuleDescription.providedModeGroup, BswModuleDescription.requiredModeGroup, FirewallStateSwitchInterface.firewallStateMachine, FunctionGroupSet.functionGroup, ModeSwitchInterface.modeGroup, Process.processStateMachine, StateManagementStateNotification.stateMachine</i>			
Attribute	Type	Mult.	Kind	Note
swCalibration Access	SwCalibrationAccess Enum	0..1	attr	This allows for specifying whether or not the enclosing ModeDeclarationGroupPrototype can be measured at run-time.
type	ModeDeclarationGroup	0..1	tref	The "collection of ModeDeclarations" (= ModeDeclaration Group) supported by a component Stereotypes: isOfType

Table A.43: ModeDeclarationGroupPrototype

Aggregated by		DataConstrRule.physConstrs		
Attribute	Type	Mult.	Kind	Note
lowerLimit	Limit	0..1	attr	This specifies the lower limit of the constraint. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime xml.sequenceOffset=20
maxDiff	Numerical	0..1	attr	Maximum difference that is permitted between two consecutive values if the constraint is applied to an axis. Tags: xml.sequenceOffset=60
maxGradient	Numerical	0..1	attr	This element specifies the maximum slope that may be used in curves and maps. Tags: xml.sequenceOffset=50
monotony	MonotonyEnum	0..1	attr	This specifies the monotony constraints on the data object. Note that this applies only to curves and maps. Tags: xml.sequenceOffset=70

Class	PhysConstrs			
scaleConstr (ordered)	ScaleConstr	*	aggr	This is one particular scale which contributes to the data constraints. Tags: xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=40 xml.typeElement=false xml.typeWrapperElement=false
unit	Unit	0..1	ref	This is the unit to which the physical constraints relate to. In particular, it is the physical unit of the specified limits. Tags: xml.sequenceOffset=80
upperLimit	Limit	0..1	attr	This specifies the upper limit of the constraint. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime xml.sequenceOffset=30

Table A.52: PhysConstrs

Class	PhysicalDimension			
Package	M2::MSR::AsamHdo::Units			
Note	This class represents a physical dimension. If the physical dimension of two units is identical, then a conversion between them is possible. The conversion between units is related to the definition of the physical dimension. Note that the equivalence of the exponents does not per se define the convertibility. For example Energy and Torque share the same exponents (Nm). Please note further the value of an exponent does not necessarily have to be an integer number. It is also possible that the value yields a rational number, e.g. to compute the square root of a given physical quantity. In this case the exponent value would be a rational number where the numerator value is 1 and the denominator value is 2. Tags: atp.recommendedPackage=PhysicalDimensions

disabledMode	ModeDeclaration	*	iref	Reference to the Modes that disable the Event. Stereotypes: atpSplitable Tags: atp.Splitkey=disabledMode.contextPort, disabledMode.contextModeDeclarationGroupPrototype, disabledMode.targetModeDeclaration InstanceRef implemented by: RModelInAtomicSwcInstanceRef
startOnEvent	RunnableEntity	0..1	ref	The referenced RunnableEntity starts when the corresponding RTEEvent is raised.

Table A.57: RTEEvent

Primitive	Ref			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes			
Note	This primitive denotes a name based reference. For detailed syntax see the xsd.pattern. <ul style="list-style-type: none"> • first slash (relative or absolute reference) [optional] • Identifier [required] • a sequence of slashes and Identifiers [optional] This primitive is used by the meta-model tools to create the references. Tags: xml.xsd.customType=REF xml.xsd.pattern=/?[a-zA-Z][a-zA-Z0-9_]{0,127}/([a-zA-Z][a-zA-Z0-9_]{0,127})* xml.xsd.type=string			
Attribute	Type	Mult.	Kind	Note
base	Identifier	0..1	attr	This attribute reflects the base to be used for this reference. Tags: xml.attribute=true
blueprintValue	String	0..1	attr	This represents a description that documents how the value shall be defined when deriving objects from the blueprint. Tags: atp.Status=draft xml.attribute=true
index	PositiveInteger	0..1	attr	This attribute supports the use case to point on specific elements in an array. This is in particular required if arrays are used to implement particular data objects. The counting of array indices starts with the value 0, i.e. the index of the first array element is 0. Tags: xml.attribute=true

Table A.58: Ref

Class	Referrable (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable			
Note	Instances of this class can be referred to by their identifier (while adhering to namespace borders).			
Base	<i>ARObject</i>			
Subclasses	<i>AtpDefinition, BswDistinguishedPartition, BswModuleCallPoint, BswModuleClientServerEntry, BswVariableAccess, CouplingPortTrafficClassAssignment, DiagnosticEnvModeElement, EthernetPriorityRegeneration, ExclusiveAreaNestingOrder, HwDescriptionEntity, ImplementationProps, LinSlaveConfigIdent, ModeTransition, MultilanguageReferrable, PncMappingIdent, SingleLanguageReferrable, SoConlPdulIdentifier, SocketConnectionBundle, TimeSyncServerConfiguration, TpConnectionIdent</i>			
Attribute	Type	Mult.	Kind	Note
shortName	Identifier	1	attr	This specifies an identifying shortName for the object. It needs to be unique within its context and is intended for humans but even more for technical reference. Stereotypes: atpIdentityContributor Tags: xml.enforceMinMultiplicity=true xml.sequenceOffset=-100
shortName Fragment	ShortNameFragment	*	aggr	This specifies how the Referrable.shortName is composed of several shortNameFragments. Tags: xml.sequenceOffset=-90

Table A.59: Referrable

Class	RootSwCompositionPrototype			
Package	M2::AUTOSARTemplates::SystemTemplate			
Note	<p>The RootSwCompositionPrototype represents the top-level-composition of software components within a given System.</p> <p>According to the use case of the System, this may for example be a more or less complete VFB description, the software of a System Extract or the software of a flat ECU Extract with only atomic SWCs.</p> <p>Therefore the RootSwComposition will only occasionally contain all atomic software components that are used in a complete VFB System. The OEM is primarily interested in the required functionality and the interfaces defining the integration of the Software Component into the System. The internal structure of such a component contains often substantial intellectual property of a supplier. Therefore a top-level software composition will often contain empty compositions which represent subsystems.</p> <p>The contained SwComponentPrototypes are fully specified by their SwComponentTypes (including Port Prototypes, PortInterfaces, VariableDataPrototypes, SwcInternalBehavior etc.), and their ports are interconnected using SwConnectorPrototypes.</p>

Class	RunnableEntity			
symbol	CIdentifier	0..1	attr	The symbol describing this RunnableEntity's entry point. This is considered the API of the RunnableEntity and is required during the RTE contract phase.
waitPoint	WaitPoint	*	aggr	The WaitPoint associated with the RunnableEntity.
writtenLocal Variable	VariableAccess	*	aggr	<p>The presence of a writtenLocalVariable implies that a RunnableEntity needs write access to a VariableData Prototype in the role of implicitInterRunnableVariable or explicitInterRunnableVariable.</p> <p>The aggregation of writtenLocalVariable is subject to variability with the purpose to support the conditional existence of implicitInterRunnableVariable and explicitInterRunnableVariable or the variant existence of writtenLocalVariable (points) in the implementation.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=writtenLocalVariable.shortName, writtenLocalVariable.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>

Table A.61: RunnableEntity

Class	SenderReceiverInterface			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	A sender/receiver interface declares a number of data elements to be sent and received. Tags: atp.recommendedPackage=PortInterfaces			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , DataInterface , Identifiable , MultilanguageReferrable , PackageableElement , PortInterface , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
dataElement	VariableDataPrototype	*	aggr	The data elements of this SenderReceiverInterface.
invalidation Policy	InvalidationPolicy	*	aggr	InvalidationPolicy for a particular dataElement
metaDataItem Set	MetaDataItemSet	*	aggr	This aggregation defines fixed sets of meta-data items associated with dataElements of the enclosing Sender ReceiverInterface

Table A.62: SenderReceiverInterface

Class	StructuredReq			
Package	M2::MSR::Documentation::BlockElements::RequirementsTracing			
Note	This represents a structured requirement. This is intended for a case where specific requirements for features are collected. Note that this can be rendered as a labeled list.			
Base	ARObject , DocumentViewSelectable , Identifiable , MultilanguageReferrable , Paginateable , Referrable , Traceable			
Aggregated by	DocumentationBlock.structuredReq			
Attribute	Type	Mult.	Kind	Note

Class	StructuredReq			
appliesTo	StandardNameEnum	*	attr	This attribute represents the platform the requirement is assigned to. Tags: xml.namePlural=APPLIES-TO-DEPENDENCIES xml.sequenceOffset=25
conflicts	DocumentationBlock	0..1	aggr	This represents an informal specification of conflicts. Tags: xml.sequenceOffset=40
date	DateTime	1	attr	This represents the date when the requirement was initiated. Tags: xml.sequenceOffset=5
dependencies	DocumentationBlock	0..1	aggr	This represents an informal specification of dependencies. Note that upstream tracing should be formalized in the property trace provided by the superclass Traceable. Tags: xml.sequenceOffset=30
description	DocumentationBlock	0..1	aggr	This represents the general description of the requirement. Tags: xml.sequenceOffset=10
importance	String	1	attr	This allows to represent the importance of the requirement. Tags: xml.sequenceOffset=8
issuedBy	String	1	attr	This represents the person, organization or authority which issued the requirement. Tags: xml.sequenceOffset=6
rationale	DocumentationBlock	0..1	aggr	This represents the rationale of the requirement. Tags: xml.sequenceOffset=20
remark	DocumentationBlock	0..1	aggr	This represents an informal remark. Note that this is not modeled as annotation, since these remark is still essential part of the requirement. Tags: xml.sequenceOffset=60
supportingMaterial	DocumentationBlock	0..1	aggr	This represents an informal specification of the supporting material. Tags: xml.sequenceOffset=50
testedItem	Traceable	*	ref	This association represents the ability to trace on the same specification level. This supports for example the of acceptance tests. Tags: xml.sequenceOffset=70
type	String	1	attr	This attribute allows to denote the type of requirement to denote for example is it an "enhancement", "new feature" etc. Tags: xml.sequenceOffset=7
useCase	DocumentationBlock	0..1	aggr	This describes the relevant use cases. Note that formal references to use cases should be done in the trace relation. Tags: xml.sequenceOffset=35

Table A.63: StructuredReq

Class	SwAddrMethod			
Package	M2::MSR::DataDictionary::AuxiliaryObjects			
Note	Used to assign a common addressing method, e.g. common memory section, to data or code objects. These objects could actually live in different modules or components. Tags: atp.recommendedPackage=SwAddrMethods			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
memory Allocation KeywordPolicy	MemoryAllocationKeywordPolicyType	0..1	attr	Enumeration to specify the name pattern of the Memory Allocation Keyword.
option	Identifier	*	attr	This attribute introduces the ability to specify further intended properties of the MemorySection in with the related objects shall be placed. These properties are handled as to be selected. The intended options are mentioned in the list. In the Memory Mapping configuration, this option list is used to determine an appropriate MemMapAddressing ModeSet.
section Initialization Policy	SectionInitializationPolicyType	0..1	attr	Specifies the expected initialization of the variables (inclusive those which are implementing VariableData Prototypes). Therefore this is an implementation constraint for initialization code of BSW modules (especially RTE) as well as the start-up code which initializes the memory segment to which the AutosarData Prototypes referring to the SwAddrMethod's are later on mapped. If the attribute is not defined it has the identical semantic as the attribute value "INIT"
sectionType	MemorySectionType	0..1	attr	Defines the type of memory sections which can be associated with this addressing method.

Table A.64: SwAddrMethod

Class	SwAxisGrouped			
Package	M2::MSR::DataDictionary::Axis			
Note	An SwAxisGrouped is an axis which is shared between multiple calibration parameters.			
Base	ARObject , SwCalprmAxisTypeProps			
Aggregated by	SwCalprmAxis.swCalprmAxisTypeProps			
Attribute	Type	Mult.	Kind	Note
sharedAxisType	ApplicationPrimitiveDataType	0..1	ref	This is the datatype of the calibration parameter providing the shared axis.

Class	SwAxisGrouped			
swAxisIndex	AxisIndexType	0..1	attr	<p>Describes which axis of the referenced calibration parameter provides the values for the group axis. The index satisfies the following convention:</p> <ul style="list-style-type: none"> • 0 = value axis. in this case, the interpolation result of the referenced parameter is used as a base point index. • The index should only be specified if the parameter under swCalprm contains more than one axis. It is standard practice for the axis index of parameters with more than one axis, to be set to 1, if data has not been assigned to swAxis Index. <p>Tags:xml.sequenceOffset=20</p>
swCalprmRef	SwCalprmRefProxy	1	aggr	<p>This property specifies the calibration parameter which serves as the input axis. In AUTOSAR, the type of the referenced Calibration parameter shall be compatible to the type specified by sharedAxisType.</p> <p>Tags: xml.roleElement=false xml.roleWrapperElement=false xml.sequenceOffset=30 xml.typeElement=false xml.typeWrapperElement=false</p>

Table A.65: SwAxisGrouped

Class	SwAxisIndividual			
Package	M2::MSR::DataDictionary::Axis			
Note	This meta-class describes an axis integrated into a parameter (field etc.). The integration makes this individual to each parameter. The so-called grouped axis represents the counterpart to this. It is conceived as an independent parameter (see class SwAxisGrouped).			
Base	ARObject, SwCalprmAxisTypeProps			
Aggregated by	SwCalprmAxis.swCalprmAxisTypeProps			
Attribute	Type	Mult.	Kind	Note
compuMethod	CompuMethod	0..1	ref	<p>This is the compuMethod which is expected for the axis. It is used in early stages if the particular input-value is not yet available.</p> <p>Tags:xml.sequenceOffset=30</p>
dataConstr	DataConstr	0..1	ref	<p>Refers to constraints, e.g. for plausibility checks.</p> <p>Tags:xml.sequenceOffset=80</p>
inputVariable Type	ApplicationPrimitive DataType	0..1	ref	<p>This is the datatype of the input value for the axis. This allows to define e.g. a type of curve, where the input value is finalized at the access point.</p>
swAxisGeneric	SwAxisGeneric	0..1	aggr	<p>this specifies the properties of a generic axis if applicable.</p> <p>Tags:xml.sequenceOffset=90</p>
swMaxAxis Points	Integer	0..1	attr	<p>Maximum number of base points contained in the axis of a map or curve.</p> <p>Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime xml.sequenceOffset=60</p>

Class	SwAxisIndividual			
swMinAxisPoints	Integer	0..1	attr	Minimum number of base points contained in the axis of a map or curve. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime xml.sequenceOffset=70
swVariableRef (ordered)	SwVariableRefProxy	*	aggr	Refers to input variables of the axis. It is possible to specify more than one variable. Here the following is valid: <ul style="list-style-type: none"> The variable with the highest priority shall be given first. It is used in the generation of the code and is also displayed first in the application system. All variables referenced shall be of the same physical nature. This is usually detected in that the conversion formulae affected refer back to the same SI-units. In AUTOSAR this ensured by the constraint, that the referenced input variables shall use a type compatible to "inputVariableType". <ul style="list-style-type: none"> This multiple referencing allows a base point distribution for more than one input variable to be used. One example of this are the temperature curves which can depend both on the induction air temperature and the engine temperature. These variables can be displayed simultaneously by MCD systems (adjustment systems), enabling operating points to be shown in the curves. Tags: xml.roleElement=false xml.roleWrapperElement=true xml.sequenceOffset=20 xml.typeElement=false xml.typeWrapperElement=false
unit	Unit	0..1	ref	This represents the physical unit of the input value of the axis. It is provided to support the case that the particular input variable is not yet known. Tags: xml.sequenceOffset=40

Table A.66: SwAxisIndividual

consistency Needs	ConsistencyNeeds	*	aggr	This represents the collection of ConsistencyNeeds owned by the enclosing SwComponentType. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=consistencyNeeds.shortName, consistencyNeeds.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
port	PortPrototype	*	aggr	The PortPrototypes through which this SwComponent Type can communicate. The aggregation of PortPrototype is subject to variability with the purpose to support the conditional existence of PortPrototypes. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=port.shortName, port.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Class	SwComponentType (abstract)			
portGroup	PortGroup	*	aggr	A port group being part of this component. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=portGroup.shortName, portGroup.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
swcMapping Constraint	SwComponentMapping Constraints	*	ref	Reference to constraints that are valid for this Sw ComponentType.
swComponent Documentation	SwComponent Documentation	0..1	aggr	This adds a documentation to the SwComponentType. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=swComponentDocumentation, swComponentDocumentation.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=-10
unitGroup	UnitGroup	*	ref	This allows for the specification of which UnitGroups are relevant in the context of referencing SwComponentType.

Table A.72: SwComponentType

Class	<<atpVariation>> SwDataDefProps			
Package	M2::MSR::DataDictionary::DataDefProperties			
Note	<p>This class is a collection of properties relevant for data objects under various aspects. One could consider this class as a "pattern of inheritance by aggregation". The properties can be applied to all objects of all classes in which SwDataDefProps is aggregated.</p> <p>Note that not all of the attributes or associated elements are useful all of the time. Hence, the process definition (e.g. expressed with an OCL or a Document Control Instance MSR-DCI) has the task of implementing limitations.</p> <p>SwDataDefProps covers various aspects:</p> <ul style="list-style-type: none"> • Structure of the data element for calibration use cases: is it a single value, a curve, or a map, but also the recordLayouts which specify how such elements are mapped/converted to the Data Types in the programming language (or in AUTOSAR). This is mainly expressed by properties like swRecordLayout and swCalprmAxisSet • Implementation aspects, mainly expressed by swImplPolicy, swVariableAccessImplPolicy, swAddrMethod, swPointerTargetProps, baseType, implementationDataType and additionalNativeTypeQualifier • Access policy for the MCD system, mainly expressed by swCalibrationAccess • Semantics of the data element, mainly expressed by compuMethod and/or unit, dataConstr, invalidValue • Code generation policy provided by swRecordLayout <p>Tags:vh.latestBindingTime=codeGenerationTime</p>			
Base	ARObject			
Aggregated by	AutosarDataType.swDataDefProps, CompositeNetworkRepresentation.networkRepresentation, DataPrototype.swDataDefProps , DataPrototypeTransformationProps.networkRepresentationProps, DiagnosticDataElement.swDataDefProps, DiagnosticEnvDataElementCondition.swDataDefProps, DltArgument.networkRepresentation, FlatInstanceDescriptor.swDataDefProps , ImplementationDataTypeElement.swDataDefProps, InstantiationDataDefProps.swDataDefProps , ISignal.networkRepresentationProps, McDataInstance.resultingProperties , ParameterAccess.swDataDefProps , PerInstanceMemory.swDataDefProps, ReceiverComSpec.networkRepresentation , SenderComSpec.networkRepresentation , SomeipDataPrototypeTransformationProps.networkRepresentation, SwPointerTargetProps.swDataDefProps, SwServiceArg.swDataDefProps, SwSystemconst.swDataDefProps, SystemSignal.physicalProps			
Attribute	Type	Mult.	Kind	Note

Class	<<atpVariation>> SwDataDefProps			
additionalNativeTypeQualifier	NativeDeclarationString	0..1	attr	This attribute is used to declare native qualifiers of the programming language which can neither be deduced from the baseType (e.g. because the data object describes a pointer) nor from other more abstract attributes. Examples are qualifiers like "volatile", "strict" or "enum" of the C-language. All such declarations have to be put into one string. Tags: xml.sequenceOffset=235
annotation	Annotation	*	aggr	This aggregation allows to add annotations (yellow pads ...) related to the current data object. Tags: xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=20 xml.typeElement=false xml.typeWrapperElement=false
baseType	SwBaseType	0..1	ref	Base type associated with the containing data object. Tags: xml.sequenceOffset=50
compuMethod	CompuMethod	0..1	ref	Computation method associated with the semantics of this data object. Tags: xml.sequenceOffset=180
dataConstr	DataConstr	0..1	ref	Data constraint for this data object. Tags: xml.sequenceOffset=190
displayFormat	DisplayFormatString	0..1	attr	This property describes how a number is to be rendered e.g. in documents or in a measurement and calibration system. Tags: xml.sequenceOffset=210
displayPresentation	DisplayPresentationEnum	0..1	attr	This attribute controls the presentation of the related data for measurement and calibration tools.
implementationDataType	AbstractImplementationDataType	0..1	ref	This association denotes the ImplementationDataType of a data declaration via its aggregated SwDataDefProps. It is used whenever a data declaration is not directly referring to a base type. Especially <ul style="list-style-type: none"> • redefinition of an ImplementationDataType via a "typedef" to another ImplementationDatatype • the target type of a pointer (see SwPointerTarget Props), if it does not refer to a base type directly • the data type of an array or record element within an ImplementationDataType, if it does not refer to a base type directly • the data type of an SwServiceArg, if it does not refer to a base type directly Tags: xml.sequenceOffset=215
invalidValue	ValueSpecification	0..1	aggr	Optional value to express invalidity of the actual data element. Tags: xml.sequenceOffset=255
stepSize	Float	0..1	attr	This attribute can be used to define a value which is added to or subtracted from the value of a DataPrototype when using up/down keys while calibrating.

Class	<<atpVariation>> SwDataDefProps			
swAddrMethod	SwAddrMethod	0..1	ref	<p>Addressing method related to this data object. Via an association to the same SwAddrMethod it can be specified that several DataPrototypes shall be located in the same memory without already specifying the memory section itself.</p> <p>Tags:xml.sequenceOffset=30</p>
swAlignment	AlignmentType	0..1	attr	<p>The attribute describes the intended typical alignment of the DataPrototype. If the attribute is not defined the alignment is determined by the swBaseType size and the memoryAllocationKeywordPolicy of the referenced Sw AddrMethod.</p> <p>Tags:xml.sequenceOffset=33</p>
swBit Representation	SwBitRepresentation	0..1	aggr	<p>Description of the binary representation in case of a bit variable.</p> <p>Tags:xml.sequenceOffset=60</p>
swCalibration Access	SwCalibrationAccess Enum	0..1	attr	<p>Specifies the read or write access by MCD tools for this data object.</p> <p>Tags:xml.sequenceOffset=70</p>
swCalprmAxis Set	SwCalprmAxisSet	0..1	aggr	<p>This specifies the properties of the axes in case of a curve or map etc. This is mainly applicable to calibration parameters.</p> <p>Tags:xml.sequenceOffset=90</p>
swComparison Variable	SwVariableRefProxy	*	aggr	<p>Variables used for comparison in an MCD process.</p> <p>Tags: xml.sequenceOffset=170 xml.typeElement=false</p>
swData Dependency	SwDataDependency	0..1	aggr	<p>Describes how the value of the data object has to be calculated from the value of another data object (by the MCD system).</p> <p>Tags:xml.sequenceOffset=200</p>
swHostVariable	SwVariableRefProxy	0..1	aggr	<p>Contains a reference to a variable which serves as a host-variable for a bit variable. Only applicable to bit objects.</p> <p>Tags: xml.sequenceOffset=220 xml.typeElement=false</p>
swImplPolicy	SwImplPolicyEnum	0..1	attr	<p>Implementation policy for this data object.</p> <p>Tags:xml.sequenceOffset=230</p>
swIntended Resolution	Numerical	0..1	attr	<p>The purpose of this element is to describe the requested quantization of data objects early on in the design process.</p> <p>The resolution ultimately occurs via the conversion formula present (compuMethod), which specifies the transition from the physical world to the standardized world (and vice-versa) (here, "the slope per bit" is present implicitly in the conversion formula).</p> <p>In the case of a development phase without a fixed conversion formula, a pre-specification can occur through swIntendedResolution.</p> <p>The resolution is specified in the physical domain according to the property "unit".</p> <p>Tags:xml.sequenceOffset=240</p>

Class	<<atpVariation>> SwDataDefProps			
swInterpolationMethod	Identifier	0..1	attr	This is a keyword identifying the mathematical method to be applied for interpolation. The keyword needs to be related to the interpolation routine which needs to be invoked. Tags: xml.sequenceOffset=250
swIsVirtual	Boolean	0..1	attr	This element distinguishes virtual objects. Virtual objects do not appear in the memory, their derivation is much more dependent on other objects and hence they shall have a swDataDependency . Tags: xml.sequenceOffset=260
swPointerTargetProps	SwPointerTargetProps	0..1	aggr	Specifies that the containing data object is a pointer to another data object. Tags: xml.sequenceOffset=280
swRecordLayout	SwRecordLayout	0..1	ref	Record layout for this data object. Tags: xml.sequenceOffset=290
swRefreshTiming	MultidimensionalTime	0..1	aggr	This element specifies the frequency in which the object involved shall be or is called or calculated. This timing can be collected from the task in which write access processes to the variable run. But this cannot be done by the MCD system. So this attribute can be used in an early phase to express the desired refresh timing and later on to specify the real refresh timing. Tags: xml.sequenceOffset=300
swTextProps	SwTextProps	0..1	aggr	the specific properties if the data object is a text object. Tags: xml.sequenceOffset=120
swValueBlockSize	Numerical	0..1	attr	This represents the size of a Value Block Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime xml.sequenceOffset=80
swValueBlockSizeMult (ordered)	Numerical	*	attr	This attribute is used to specify the dimensions of a value block (VAL_BLK) for the case that that value block has more than one dimension. The dimensions given in this attribute are ordered such that the first entry represents the first dimension, the second entry represents the second dimension, and so on. For one-dimensional value blocks the attribute swValueBlockSize shall be used and this attribute shall not exist. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime
unit	Unit	0..1	ref	Physical unit associated with the semantics of this data object. This attribute applies if no compuMethod is specified. If both units (this as well as via compuMethod) are specified the units shall be compatible. Tags: xml.sequenceOffset=350
valueAxisDataType	ApplicationPrimitiveDataType	0..1	ref	The referenced ApplicationPrimitiveDataType represents the primitive data type of the value axis within a compound primitive (e.g. curve, map). It supersedes CompuMethod, Unit, and BaseType. Tags: xml.sequenceOffset=355

Table A.73: SwDataDefProps

Enumeration	SwImplPolicyEnum
Package	M2::MSR::DataDictionary::DataDefProperties
Note	Specifies the implementation strategy with respect to consistency mechanisms of variables.
Aggregated by	BswInternalTriggeringPoint.swImplPolicy, InternalTriggeringPoint.swImplPolicy, SwDataDefProps.swImplPolicy , Trigger.swImplPolicy
Literal	Description
const	forced implementation such that the running software within the ECU shall not modify it. For example implemented with the "const" modifier in C. This can be applied for parameters (not for those in NVRAM) as well as argument data prototypes. Tags: atp.EnumerationLiteralIndex=0
fixed	This data element is fixed. In particular this indicates, that it might also be implemented e.g. as in place data, (#DEFINE). Tags: atp.EnumerationLiteralIndex=1
measurementPoint	The data element is created for measurement purposes only. The data element is never read directly within the ECU software. In contrast to a "standard" data element in an unconnected provide port is, this unconnection is guaranteed for measurementPoint data elements. Tags: atp.EnumerationLiteralIndex=2
queued	The content of the data element is queued and the data element has 'event' semantics, i.e. data elements are stored in a queue and all data elements are processed in 'first in first out' order. The queuing is intended to be implemented by RTE Generator. This value is not applicable for parameters. Tags: atp.EnumerationLiteralIndex=3
standard	This is applicable for all kinds of data elements. For variable data prototypes the 'last is best' semantics applies. For parameter there is no specific implementation directive. Tags: atp.EnumerationLiteralIndex=4

Table A.74: SwImplPolicyEnum

Class	SwcImplementation			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcImplementation			
Note	This meta-class represents a specialization of the general Implementation meta-class with respect to the usage in application software. Tags: atp.recommendedPackage=SwcImplementations			
Base	ARElement , ARObject , CollectableElement , Identifiable , Implementation , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackageElement			
Attribute	Type	Mult.	Kind	Note
behavior	SwcInternalBehavior	0..1	ref	The internal behavior implemented by this Implementation.
perInstanceMemorySize	PerInstanceMemorySize	*	aggr	Allows a definition of the size of the per-instance memory for this implementation. The aggregation of PerInstanceMemorySize is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects, in this case PerInstanceMemory. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=perInstanceMemorySize, perInstanceMemorySize.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Class	SwcImplementation			
required RTEVendor	String	0..1	attr	Identify a specific RTE vendor. This information is potentially important at the time of integrating (in particular: linking) the application code with the RTE. The semantics is that (if the association exists) the corresponding code has been created to fit to the vendor-mode RTE provided by this specific vendor. Attempting to integrate the code with another RTE generated in vendor mode is in general not possible.

Table A.75: SwcImplementation

Class	SwcInternalBehavior			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior			
Note	The SwcInternalBehavior of an AtomicSwComponentType describes the relevant aspects of the software-component with respect to the RTE, i.e. the RunnableEntities and the RTEEvents they respond to.			
Base	ARObject, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable , InternalBehavior , Multilanguage Referrable , Referrable			
Aggregated by	AtomicSwComponentType.internalBehavior , AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note
arTypedPer Instance Memory	VariableDataPrototype	*	aggr	<p>Defines an AUTOSAR typed memory-block that needs to be available for each instance of the SW-component.</p> <p>This is typically only useful if supportsMultipleInstantiation is set to "true" or if the component defines NVRAM access via permanent blocks.</p> <p>The aggregation of arTypedPerInstanceMemory is subject to variability with the purpose to support variability in the software component's implementations. Typically different algorithms in the implementation are requiring different number of memory objects.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=arTypedPerInstanceMemory.shortName, arTypedPerInstanceMemory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
event	RTEEvent	*	aggr	<p>This is a RTEEvent specified for the particular Swc InternalBehavior.</p> <p>The aggregation of RTEEvent is subject to variability with the purpose to support the conditional existence of RTE events. Note: the number of RTE events might vary due to the conditional existence of PortPrototypes using Data ReceivedEvents or due to different scheduling needs of algorithms.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=event.shortName, event.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>

Class	SwcInternalBehavior			
exclusiveAreaPolicy	SwcExclusiveAreaPolicy	*	aggr	Options how to generate the ExclusiveArea related APIs. When no SwcExclusiveAreaPolicy is specified for an ExclusiveArea the default values apply. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=exclusiveAreaPolicy, exclusiveAreaPolicy.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
explicitInterRunnableVariable	VariableDataPrototype	*	aggr	Implement state message semantics for establishing communication among runnables of the same component. The aggregation of explicitInterRunnableVariable is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=explicitInterRunnableVariable.shortName, explicitInterRunnableVariable.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
handleTerminationAndRestart	HandleTerminationAndRestartEnum	0..1	attr	This attribute controls the behavior with respect to stopping and restarting. The corresponding AtomicSwComponentType may either not support stop and restart, or support only stop, or support both stop and restart.
implicitInterRunnableVariable	VariableDataPrototype	*	aggr	Implement state message semantics for establishing communication among runnables of the same component. The aggregation of implicitInterRunnableVariable is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=implicitInterRunnableVariable.shortName, implicitInterRunnableVariable.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
includedDataTypeSet	IncludedDataTypeSet	*	aggr	The includedDataTypeSet is used by a software component for its implementation. Stereotypes: atpSplitable Tags: atp.Splitkey=includedDataTypeSet
includedModeDeclarationGroupSet	IncludedModeDeclarationGroupSet	*	aggr	This aggregation represents the included ModeDeclarationGroups Stereotypes: atpSplitable Tags: atp.Splitkey=includedModeDeclarationGroupSet
instantiationDataDefProps	InstantiationDataDefProps	*	aggr	The purpose of this is that within the context of a given SwComponentType some data def properties of individual instantiations can be modified. The aggregation of InstantiationDataDefProps is subject to variability with the purpose to support the conditional existence of Port Prototypes and component local memories like "per InstanceParameter" or "arTypedPerInstanceMemory". Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=instantiationDataDefProps, instantiationDataDefProps.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Class	SwcInternalBehavior			
perInstanceMemory	PerInstanceMemory	*	aggr	<p>Defines a per-instance memory object needed by this software component. The aggregation of PerInstanceMemory is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=perInstanceMemory.shortName, perInstanceMemory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
perInstanceParameter	ParameterData Prototype	*	aggr	<p>Defines parameter(s) or characteristic value(s) that needs to be available for each instance of the software-component. This is typically only useful if supportsMultipleInstantiation is set to "true". The aggregation of perInstanceParameter is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=perInstanceParameter.shortName, perInstanceParameter.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
portAPIOption	PortAPIOption	*	aggr	<p>Options for generating the signature of port-related calls from a runnable to the RTE and vice versa. The aggregation of PortPrototypes is subject to variability with the purpose to support the conditional existence of ports.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=portAPIOption, portAPIOption.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
runnable	RunnableEntity	*	aggr	<p>This is a RunnableEntity specified for the particular Swc InternalBehavior.</p> <p>The aggregation of RunnableEntity is subject to variability with the purpose to support the conditional existence of RunnableEntities. Note: the number of RunnableEntities might vary due to the conditional existence of Port Prototypes using DataReceivedEvents or due to different scheduling needs of algorithms.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=runnable.shortName, runnable.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>

Class	SwcInternalBehavior			
service Dependency	SwcService Dependency	*	aggr	<p>Defines the requirements on AUTOSAR Services for a particular item.</p> <p>The aggregation of SwcServiceDependency is subject to variability with the purpose to support the conditional existence of ports as well as the conditional existence of ServiceNeeds.</p> <p>The SwcServiceDependency owned by an SwcInternal Behavior can be located in a different physical file in order to support that SwcServiceDependency might be provided in later development steps or even by different expert domain (e.g OBD expert for Obd related Service Needs) tools. Therefore the aggregation is <<atp Splitable>>.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=serviceDependency.shortName, service Dependency.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
shared Parameter	ParameterData Prototype	*	aggr	<p>Defines parameter(s) or characteristic value(s) shared between SwComponentPrototypes of the same Sw ComponentType The aggregation of sharedParameter is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=sharedParameter.shortName, shared Parameter.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
supports Multiple Instantiation	Boolean	0..1	attr	<p>Indicate whether the corresponding software-component can be multiply instantiated on one ECU. In this case the attribute will result in an appropriate component API on programming language level (with or without instance handle).</p>
variationPoint Proxy	VariationPointProxy	*	aggr	<p>Proxy of a variation points in the C/C++ implementation.</p> <p>Stereotypes: atpSplitable Tags:atp.Splitkey=variationPointProxy.shortName</p>

Table A.76: SwcInternalBehavior

Class	System			
Package	M2::AUTOSARTemplates::SystemTemplate			
Note	<p>The top level element of the System Description. The System description defines five major elements: Topology, Software, Communication, Mapping and Mapping Constraints.</p> <p>The System element directly aggregates the elements describing the Software, Mapping and Mapping Constraints; it contains a reference to an ASAM FIBEX description specifying Communication and Topology.</p> <p>Tags:atp.recommendedPackage=Systems</p>			
Base	ARElement , ARObject , AtpClassifier , AtpFeature , AtpStructureElement , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element , AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note
clientId DefinitionSet	ClientIdDefinitionSet	*	ref	Set of Client Identifiers that are used for inter-ECU client-server communication in the System.

Class	System			
containerIPduHeaderByteOrder	ByteOrderEnum	0..1	attr	Defines the byteOrder of the header in ContainerIPdus.
ecuExtractVersion	RevisionLabelString	0..1	attr	Version number of the Ecu Extract.
fibexElement	FibexElement	*	ref	<p>Reference to ASAM FIBEX elements specifying Communication and Topology.</p> <p>All Fibex Elements used within a System Description shall be referenced from the System Element.</p> <p>atpVariation: In order to describe a product-line, all Fibex Elements can be optional.</p> <p>Stereotypes: atpSplitable; atpVariation</p> <p>Tags: atp.Splitkey=fibexElement.fibexElement, fibexElement.variationPoint.shortLabel vh.latestBindingTime=postBuild</p>
interpolationRoutineMappingSet	InterpolationRoutineMappingSet	*	ref	This reference identifies the InterpolationRoutineMapping Sets that are relevant in the context of the enclosing System.
j1939SharedAddressCluster	J1939SharedAddressCluster	*	aggr	<p>Collection of J1939Clusters that share a common address space for the routing of messages.</p> <p>Stereotypes: atpSplitable; atpVariation</p> <p>Tags: atp.Splitkey=j1939SharedAddressCluster.shortName, j1939SharedAddressCluster.variationPoint.shortLabel vh.latestBindingTime=postBuild</p>
mapping	SystemMapping	*	aggr	<p>Aggregation of all mapping aspects (mapping of SW components to ECUs, mapping of data elements to signals, and mapping constraints).</p> <p>In order to support OEM / Tier 1 interaction and shared development for one common System this aggregation is atpSplitable and atpVariation. The content of System Mapping can be provided by several parties using different names for the SystemMapping.</p> <p>This element is not required when the System description is used for a network-only use-case.</p> <p>Stereotypes: atpSplitable; atpVariation</p> <p>Tags: atp.Splitkey=mapping.shortName, mapping.variationPoint.shortLabel vh.latestBindingTime=postBuild</p>
pncVectorLength	PositiveInteger	0..1	attr	Length of the partial networking request release information vector (in bytes).
pncVectorOffset	PositiveInteger	0..1	attr	Absolute offset (with respect to the NM-PDU) of the partial networking request release information vector that is defined in bytes as an index starting with 0.

Class	System			
rootSoftware Composition	RootSwComposition Prototype	0..1	aggr	Aggregation of the root software composition, containing all software components in the System in a hierarchical structure. This element is not required when the System description is used for a network-only use-case. atpVariation: The RootSwCompositionPrototype can vary. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=rootSoftwareComposition.shortName, rootSoftwareComposition.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime
swCluster	CpSoftwareCluster	*	ref	CP Software Clusters of this System Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=swCluster.cpSoftwareCluster, swCluster.variationPoint.shortLabel atp.Status=draft vh.latestBindingTime=systemDesignTime
system Documentation	Chapter	*	aggr	Possibility to provide additional documentation while defining the System. The System documentation can be composed of several chapters. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=systemDocumentation.shortName, systemDocumentation.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=-10
systemVersion	RevisionLabelString	1	attr	Version number of the System Description.

Table A.77: System

Class	TimingEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This event is used to start RunnableEntities that shall be executed periodically.			
Base	<i>ARObject, AbstractEvent, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable, Multilanguage Referrable, RTEEvent, Referrable</i>			
Aggregated by	<i>AtpClassifier.atpFeature, SwcInternalBehavior.event</i>			
Attribute	Type	Mult.	Kind	Note
offset	TimeValue	0..1	attr	The value makes an assumption about the time offset of the first activation of the RunnableEntity triggered by the mapped TimingEvent relative to the periodic activation of the time base of this TimingEvent. Unit: second.
period	TimeValue	0..1	attr	Period of timing event in seconds. The value of this attribute shall be greater than zero.

Table A.78: TimingEvent

Class	Traceable (abstract)			
Package	M2::MSR::Documentation::BlockElements::RequirementsTracing			
Note	This meta class represents the ability to be subject to tracing within an AUTOSAR model. Note that it is expected that its subclasses inherit either from MultilanguageReferrable or from Identifiable. Nevertheless it also inherits from MultilanguageReferrable in order to provide a common reference target for all Traceables.			
Base	ARObject, MultilanguageReferrable, Referrable			
Subclasses	StructuredReq, TimingConstraint, TraceableTable, TraceableText			
Attribute	Type	Mult.	Kind	Note
trace	Traceable	*	ref	This association represents the ability to trace to upstream requirements / constraints. This supports for example the bottom up tracing ProjectObjectives <- MainRequirements <- Features <- RequirementSpecs <- BSW/AI Tags: xml.sequenceOffset=20

Table A.79: Traceable

Class	Unit			
Package	M2::MSR::AsamHdo::Units			
Note	This is a physical measurement unit. All units that might be defined should stem from SI units. In order to convert one unit into another factor and offset are defined. For the calculation from SI-unit to the defined unit the factor (factorSiToUnit) and the offset (offsetSiToUnit) are applied as follows: $x \{unit\} := y * \{siUnit\} * factorSiToUnit \{unit\} / \{siUnit\} + offsetSiToUnit \{unit\}$ For the calculation from a unit to SI-unit the reciprocal of the factor (factorSiToUnit) and the negation of the offset (offsetSiToUnit) are applied. $y \{siUnit\} := (x * \{unit\} - offsetSiToUnit \{unit\}) / (factorSiToUnit \{unit\} / \{siUnit\})$ Tags: atp.recommendedPackage=Units			
Base	ARElement, ARObject, CollectableElement, Identifiable, MultilanguageReferrable, PackageableElement, Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
displayName	SingleLanguageUnit Names	0..1	aggr	This specifies how the unit shall be displayed in documents or in user interfaces of tools. The displayName corresponds to the Unit.Display in an ASAM MCD-2MC file. Tags: xml.sequenceOffset=20
factorSiToUnit	Float	0..1	attr	This is the factor for the conversion from SI Units to units. The inverse is used for conversion from units to SI Units. Tags: xml.sequenceOffset=30
offsetSiToUnit	Float	0..1	attr	This is the offset for the conversion from and to siUnits. Tags: xml.sequenceOffset=40
physical Dimension	PhysicalDimension	0..1	ref	This association represents the physical dimension to which the unit belongs to. Note that only values with units of the same physical dimensions might be converted. Tags: xml.sequenceOffset=50

Table A.80: Unit

Class	UnitGroup			
Package	M2::MSR::AsamHdo::Units			
Note	<p>This meta-class represents the ability to specify a logical grouping of units. The category denotes the unit system that the referenced units are associated to.</p> <p>In this way, e.g. country-specific unit systems (CATEGORY="COUNTRY") can be defined as well as specific unit systems for certain application domains.</p> <p>In the same way a group of equivalent units, can be defined which are used in different countries, by setting CATEGORY="EQUIV_UNITS". KmPerHour and MilesPerHour could such be combined to one group named "vehicle_speed". The unit MeterPerSec would not belong to this group because it is normally not used for vehicle speed. But all of the mentioned units could be combined to one group named "speed".</p> <p>Note that the UnitGroup does not ensure the physical compliance of the units. This is maintained by the physical dimension.</p> <p>Tags:atp.recommendedPackage=UnitGroups</p>

Class	ValueSpecification (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	Base class for expressions leading to a value which can be used to initialize a data object.			
Base	ARObject			
Subclasses	AbstractRuleBasedValueSpecification , ApplicationValueSpecification , CompositeValueSpecification , ConstantReference , NotAvailableValueSpecification , NumericalValueSpecification , ReferenceValueSpecification , TextValueSpecification			
Aggregated by	ApplicationAssocMapElementValueSpecification.key , ApplicationAssocMapElementValueSpecification.value , ArrayValueSpecification.element , CalibrationParameterValue.applInitValue , CalibrationParameterValue.implInitValue , ConstantSpecification.valueSpec , CryptoServiceKey.developmentValue , DiagnosticEnvDataCondition.compareValue , DiagnosticEnvDataElementCondition.compareValue , FieldSenderComSpec.initValue , ISignal.initValue , ISignal.timeoutSubstitutionValue , NonqueuedReceiverComSpec.initValue , NonqueuedReceiverComSpec.timeoutSubstitutionValue , NonqueuedSenderComSpec.initValue , NvProvideComSpec.ramBlockInitValue , NvProvideComSpec.romBlockInitValue , NvRequireComSpec.initValue , ParameterDataPrototype.initValue , ParameterProvideComSpec.initValue , ParameterRequireComSpec.initValue , PersistencyDataRequiredComSpec.initValue , PersistencyKeyValuePair.initValue , PortDefinedArgumentValue.value , PortPrototypeBlueprintInitValue.value , RecordValueSpecification.field , StateManagementCompareCondition.compareValue , SwDataDefProps.invalidValue , VariableDataPrototype.initValue			
Attribute	Type	Mult.	Kind	Note
shortLabel	Identifier	0..1	attr	This can be used to identify particular value specifications for human readers, for example elements of a record type.

Class	VariableDataPrototype			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	A VariableDataPrototype represents a formalized generic piece of information that is typically mutable by the application software layer. VariableDataPrototype is used in various contexts and the specific context gives the otherwise generic VariableDataPrototype a dedicated semantics.			

Class	VariableDataPrototype			
Base	<i>ARObject, AtpFeature, AtpPrototype, AutosarDataPrototype, DataPrototype, Identifiable, Multilanguage Referrable, Referrable</i>			
Aggregated by	ApplicationInterface.indication, <i>AtpClassifier.atpFeature</i> , BswInternalBehavior.arTypedPerInstanceMemory, BswModuleDescription.providedData, BswModuleDescription.requiredData, BulkNvDataDescriptor.bulkNvBlock, <i>InternalBehavior.staticMemory</i> , NvBlockDescriptor.ramBlock, NvDataInterface.nvData, <i>SenderReceiverInterface.dataElement</i> , ServiceInterface.event, <i>SwcInternalBehavior.arTypedPerInstanceMemory</i> , <i>SwcInternalBehavior.explicitInterRunnableVariable</i> , <i>SwcInternalBehavior.implicitInterRunnableVariable</i>			
Attribute	Type	Mult.	Kind	Note
initValue	ValueSpecification	0..1	aggr	Specifies initial value(s) of the VariableDataPrototype
