

Document Title	Specification of SW-C End-to-End Communication Protection Library
Document Owner	AUTOSAR
Document Responsibility	AUTOSAR
Document Identification No	428

Document Status	published
Part of AUTOSAR Standard	Classic Platform
Part of Standard Release	R23-11

Document Change History			
Date	Release	Changed by	Description
2023-11-23	R23-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • Corrections of Length type in P44m
2022-11-24	R22-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • Corrections of MinDataLength in P04m and P07m • Correction of syntax errors in profiles P11 and P22 • Chapters 8 and Annex B: Make Service IDs of functions unique
2021-11-25	R21-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • New profiles 8m, 44m
2020-11-30	R20-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • New profiles 4m, 7m, 08,44 • E2E for methods • Extension of E2E State Machine

2019-11-28	R19-11	AUTOSAR Release Management	<ul style="list-style-type: none"> ● Incorporated E2E_PxxForward methods to replicate detected E2E-Errors on outgoing messages ● E2E P0xSTATUS_ERROR values are now the same for all profiles ● Fixed minor inconsistencies and typos ● Updated Tracing from SRS_E2E to RS_E2E ● Changed Document Status from Final to published
2018-10-31	4.4.0	AUTOSAR Release Management	<ul style="list-style-type: none"> ● Added clarification regarding assumptions on failure modes and detection capabilities in annex A. ● Fixed inconsistent definition of length in E2E header for P04, P05, and P06 ● Clarification of parameters CounterOffset and CRCOffset in E2E_P01ConfigType
2017-12-08	4.3.1	AUTOSAR Release Management	<ul style="list-style-type: none"> ● Updated traceability to SRS E2E. ● Fixed enumeration literals for E2E_PxxCheckStatusType for profiles 1 and 2. ● Corrected name of step E2E_SMClearProfileStatus to E2E_SMClearStatus in Routine E2E_SM_checkinit ● Various clarifications in configuration and routine parameters, mainly of profile 2 and 7.

2016-11-30	4.3.0	AUTOSAR Release Management	<ul style="list-style-type: none"> • Added new Profiles 7, 11 and 22. • Fixed initialization of profile 1 and 2 in the init function. Now properly sets WaitForFirstData to TRUE. • Corrected/unified initialization of Counter state variable and bit/byte conversion in configuration data in profiles 4, 5, and 6. • Removed chapter 8.3.7 elementary protocol functions that were marked obsolete since several releases.
2015-07-31	4.2.2	AUTOSAR Release Management	<ul style="list-style-type: none"> • Introduced new E2E state machine profile status E2E_P_NONEWDATA. Adapted figures, API tables and mapping functions. This solves an issue with deterministic startup of the state machine. • Updated Figure 7 7, added behavior in case ReceivedCounter is out of range. • Assigned new specification ID SWS_E2E_00478 to duplicate specification SWS_E2E_00324 (specification of profile 4). • Fixed "Calculate CRC over Data ID and Data", which was already fixed in R4.1.2 but falsely included as of R4.1.1.
2014-10-31	4.2.1	AUTOSAR Release Management	<ul style="list-style-type: none"> • Introduction of E2E profiles 4, 5, 6 • Introduction of E2E state machine • Introduction of init functions and status mapping functions for profiles 1, 2 • Overview of wrapper, by means of several new diagrams.
2014-03-31	4.1.3	AUTOSAR Release Management	<ul style="list-style-type: none"> • Editorial changes
2013-10-31	4.1.2	AUTOSAR Release Management	<ul style="list-style-type: none"> • Correction in E2E variant 1C • Various minor corrections • Editorial changes

2013-03-15	4.1.1	AUTOSAR Release Management	<ul style="list-style-type: none"> • Full support for E2E protection at signal group level • Removed dependency to Rte_IsUpdated • Changed recommendations about the maximum data lengths • Addition of initialization functions to the redundant wrapper • Corrections in code examples • Reworked according to the new SWS_BSWGeneral • New indexing scheme for requirements • Extension of E2E Profile 1 to support 12-bit Data IDs (variant 1C) • Alignment with ISO 26262 (terms, communication faults) • Quality ameliorations (due to document review) • Clarification in the configuration of E2E parameters
2011-12-22	4.0.3	AUTOSAR Release Management	<ul style="list-style-type: none"> • E2E Profile 3 removed (not backward compatible) • Several bugfixes in of E2E Protection Wrapper API (not backward compatible) • Modified return values of E2E Protection Wrapper API (not backward compatible) • Addition of init API for the E2E Protection Wrapper • Several bugfixes and modifications in code examples of E2E Protection Wrapper • Extensions in configuration, making sender and receiver more independent • Bugfix in the profile 1 alternating mode CRC calculation

△

			<p>△</p> <ul style="list-style-type: none"> • Clarifications with in E2E Profile 1 with respect to the CRC • Several minor bug fixes • Several optimizations in the text descriptions • New template with requirements traceability
2010-09-30	3.1.5	AUTOSAR Release Management	<ul style="list-style-type: none"> • Corrected the wrapper configuration. • Corrected the code example for the usage of the wrapper.
2010-02-02	3.1.4	AUTOSAR Release Management	<ul style="list-style-type: none"> • Initial release

1 Introduction and functional overview

This document contains the platform specific implementation requirements of the PRS E2E Protocol. This includes interfaces and datatypes used.

The main part of the functional specification is given in the AUTOSAR Foundation document 849 "E2E Protocol Specification".

Platform dependent functional specifications extending the protocol specifications are collected in the following sub section(s).

The concept of E2E protection assumes that safety-related data exchange shall be protected at runtime against the effects of faults within the communication link (see Figure 1.1). Examples for such faults are random HW faults (e.g. corrupt registers of a CAN transceiver), interference (e.g. due to EMC), and systematic faults within the software implementing the VFB communication (e.g. RTE, IOC, COM and network stacks).

Figure 1.1: Example of faults mitigated by E2E protection

By using E2E communication protection mechanisms, the faults in the communication link can be detected and handled at runtime. The E2E Library provides mechanisms for E2E protection, adequate for safety-related communication having requirements up to ASIL D.

The algorithms of protection mechanisms are implemented in the E2E Library. The callers of the E2E Library are responsible for the correct usage of the library, in particular for providing correct parameters the E2E Library routines.

The E2E protection allows the following:

- It protects the safety-related data elements to be sent over the RTE by attaching control data,
- It verifies the safety-related data elements received from the RTE using this control data, and
- It indicates that received safety-related data elements faulty, which then has to be handled by the receiver SW-C.

To provide the appropriate solution addressing flexibility and standardization, AUTOSAR specifies a set of flexible E2E profiles that implement an appropriate combination of E2E protection mechanisms. Each specified E2E profile has a fixed behavior, but it has some configuration options by function parameters (e.g. the location of CRC in relation to the data, which are to be protected).

The E2E library is invoked from:

1. E2E Transformer (a new, standardized way to invoke E2E, introduced in R4.2.1)
2. E2E Protection Wrapper
3. COM E2E Callout.

Regardless where E2E is executed, the E2E Protection is for data elements. The E2E Protection is performed on the serialized representation of data elements, on the same bit layout as the one transmitted on the bus. This means:

- In case E2E Transformer is used, the serialization is performed by a transformer above E2E Transformer (COM-based transformer or Some/IP transformer).
- In case E2E Protection Wrapper is used, the wrapper needs to serialize the data element into the serialized form of the corresponding signal group (in other words, the wrapper creates a part of I-PDU that represents the signal group and at the same time the data element).
- In case the COM callout is used, the serialization is done by the communication stack (RTE, COM), so the callout operates directly on the serialized signal groups in the I-PDU.

A data element (and the corresponding signal group) is either completely E2E-protected, or it is not protected. It is not possible to protect a part of it.

An I-PDU may carry several data elements (and corresponding signal groups). It is possible to independently E2E-protect a subset of these data elements.

An appropriate usage of the E2E Library alone is not sufficient to achieve a safe E2E communication according to ASIL D requirements. Solely the user is responsible to demonstrate that the selected profile provides sufficient error detection capabilities for the considered network (e.g. by evaluation hardware failure rates, bit error rates, number of nodes in the network, repetition rate of messages and the usage of a gateway).

2 Acronyms and Abbreviations

All technical terms used in this document, except the ones listed in the table below, can be found in the official AUTOSAR glossary [1, AUTOSAR_TR_Glossary].

Acronyms and abbreviations that have a local scope and therefore are not contained in the AUTOSAR glossary appear in the glossary below.

Abbreviation / Acronym:	Description:
E2E Library	Short name for the End-to-End Communication Protection Library.
Data ID	An identifier that uniquely identifies the message / data element / data.
Source ID	An identifier that uniquely identified the source (origin) of the message / data element / data.
Repetition	Repetition of information.
Loss	Loss of information.
Delay	Delay of information.
Insertion	Insertion of information.
Masquerade	Masquerade.
Incorrect addressing	Incorrect addressing of information.
Incorrect sequence	Incorrect sequence of information.
Corruption	Corruption of information.
Asymmetric information	Asymmetric information sent from a sender to multiple receivers.
Subset	Information from a sender received by only a subset of the receivers.
Blocking	Blocking access to a communication channel.

Table 2.1: Acronyms and abbreviations used in the scope of this Document

In the whole document, there are many requirements that apply to all E2E Profiles at the same time. Such requirements are defined as one requirement that applies to all profiles at the same time. In case some names are profile dependent, then XX notation is used: if in a requirement appears the string containing XX, then it is developed to strings with 01, 02, 04, 4m, 05, 06, 07, 7m, 11, 12, 22, and 44 respectively instead of XX. For example, E2E_PXXCheck() develops to the following two E2E_P01Check(), E2E_P02Check() a.s.o.

3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [2, SWS BSW General], which is also valid for E2ELibrary.

Thus, the specification SWS BSW General shall be considered as additional and required specification for E2ELibrary.

4 Constraints and assumptions

4.1 Limitations

General limitations regarding E2E protection and the detectable failure modes are described in [3, AUTOSAR PRS E2EProtocol]. E2E Profile 2 has in R4.2.1 a new setting offset. This offset can be configured in the system template. However, the E2E Profile 2 specification does not support the case when offset is different than 0. The specification of E2E Profile 2 will be fixed in a future AUTOSAR release, to support a configurable offset.

E2E Profile 1 in the "Double Data ID configuration" uses an implicit 2-byte Data ID, over which CRC8 is calculated. As a CRC over two different 2-byte numbers may result with the same CRC, some precautions must be taken by the user. See PRS_E2E_UC_00072 and PRS_E2E_UC_00073.

E2E Profile 2 uses an implicit 1-byte Data ID, selected from a List of Data IDs depending on each value of the counter, for calculation of the CRC. See [3, AUTOSAR PRS E2EProtocol] for details on the usage and generation of DataIDList for E2E profile 2.

4.2 Implementation of the E2E Library

[SWS_E2E_00050] [The implementation of the E2E Library shall comply with the requirements for the development of safety-related software for the automotive domain.] ([RS_E2E_08527](#))

The ASIL assigned to the requirements implemented by the E2E library depends on the safety concept of a particular system. Depending on that application, the E2E Library at least may need to comply with an ASIL A, B, C or D development process. Therefore, it may be most efficient to develop the library according to the highest ASIL, which enables to use the same library for lower ASILs as well.

[SWS_E2E_00311] [The configuration of the E2E Library and of the code invoking it (e.g. E2E wrapper , E2E callouts , E2E transformer) shall be implemented and configured (including configuration options used from other subsystems, e.g. COM signal to I-PDU mapping) according to the requirements for the development of safety-related software for the automotive domain.] ([RS_E2E_08528](#))

5 Dependencies to other modules

5.1 Required file structure

[SWS_E2E_00048] [E2E library shall be built of the following files: E2E.h (common header), E2E.c (implementation of common parts), E2E_PXX.c (where XX: e.g. 01, 02, ... representing the profile) and E2E_SM.c (for E2E state machine).] ([RS_E2E_08528](#))

[SWS_E2E_00215] [Files E2E_PXX.c and E2E.h shall contain implementation parts specific of each profile.] ([RS_E2E_08528](#))

The below requirement is redundant with above ones, but important to be stated explicitly:

[SWS_E2E_00115] [E2E library files (i.e. E2E_*.*) shall not include any RTE files.] ([RS_E2E_08528](#))

5.2 Dependency on CRC library

It is important to note that the function `Crc_CalculateCRC8` of CRC library / CRC routines have changed its functionality since R4.0, i.e. it is different in R3.2 and \geq R4.0:

- There is an additional parameter `Crc_IsFirstCall`
- The function has different start value and different XOR values (changed from 0x00 to 0xFF).

This results with a different value of computed CRC of a given buffer.

To have the same results of the functions `E2E_P01Protect()` and `E2E_P01Check()` in \geq R4.0 and R3.2, while using differently functioning CRC library, E2E "compensates" different behavior of the CRC library. This results with different invocation of the CRC library by E2E library in \geq R4.0 and R3.2.

6 Requirements Tracing

The following tables reference the requirements specified in [4, Requirements on E2E], [5, Requirements on Libraries], [6, General Requirements on Basic Software Modules] and links to the fulfillment of these. Please note that if column “Satisfied by” is empty for a specific requirement this means that this requirement is not fulfilled by this document.

Requirement	Description	Satisfied by

[SRS_BSW_00345]	BSW Modules shall support pre-compile configuration	[SWS_E2E_00037]
[SRS_BSW_00369]	All AUTOSAR Basic Software Modules shall not return specific development error codes via the API	[SWS_E2E_00049]

Table 6.1: Requirements Tracing

7 Functional specification

7.1 Error classification

Libraries have no configuration and therefore a tracing of development errors cannot be disabled or enabled. Thus, there is no possibility to classify errors detected by library-internal mechanisms as development or production errors. Moreover, Libraries cannot call BSW modules (e.g. DEM or DET). Therefore, the errors detected by library-internal mechanisms are reported to callers synchronously. Note that both CRC Library and E2E Library are not BSW Modules; Libraries are allowed to call each other.

[SWS_E2E_00049] [The E2E library shall not contain library-internal mechanisms for error detection to be traced as development errors.] ([SRS_BSW_00369](#))

[SWS_E2E_00011] [The E2E Library shall report errors detected by library-internal mechanisms to callers of E2E functions through return value.] ([RS_E2E_08528](#))

[SWS_E2E_00216] [The E2E Library shall not call BSW modules for error reporting (in particular DEM and DET), nor for any other purpose. The E2E Library shall not call RTE.] ([SRS_BSW_00339](#))

7.1.1 Development Errors

The following error flags for errors shall be used by all E2E Library functions:

[SWS_E2E_00047] Definiton of development errors in module E2E [

Type of error	Related error code	Error value
At least one pointer parameter is a NULL pointer	E2E_E_INPUTERR_NULL	0x13
At least one input parameter is erroneous, e.g. out of range	E2E_E_INPUTERR_WRONG	0x17
An internal library error has occurred (e.g. error detected by program flow monitoring, violated invariant or postcondition)	E2E_E_INTERR	0x19
Function executed in wrong state	E2E_E_WRONGSTATE	0x1A

] ([SRS_BSW_00337](#), [SRS_BSW_00323](#), [RS_E2E_08534](#)) The range 0x80..0xFE is foreseen only for extending the AUTOSAR profiles with vendor specific return values.

[UC_E2E_00313] [The caller of the E2E functions E2E_PXXProtect() / E2E_PXXCheck() shall handle the errors/stati defined in SWS_E2E_00047 according to the column "How do caller of E2E shall handle it".] ([RS_E2E_08528](#))

In other words, the E2E library does not define any integration errors for itself. However, the caller of E2E library uses the return values of E2E functions and does the corresponding error handling.

7.1.2 Runtime Errors

There are no runtime errors.

7.1.3 Transient Faults

There are no transient faults.

7.1.4 Production Errors

There are no production errors.

7.1.5 Extended Production Errors

8 API specification

This chapter specifies the API of E2E Library.

Members of the configuration structures (e.g. in [Figure 8.1](#)) are in alphabetical order. However, for implementation, the sequence of members of this data structure is provided by table specification items (e.g. [[SWS_E2E_00386](#)]).

8.1 Imported types

In this chapter, all types and #defines included from the following files are listed:

[SWS_E2E_00017] Definition of imported datatypes of module E2E [

Module	Header File	Imported Type
Std	Std_Types.h	Std_MessageResultType
	Std_Types.h	Std_MessageTypeType
	Std_Types.h	Std_ReturnType
	Std_Types.h	Std_VersionInfoType

] ([RS_E2E_08528](#))

8.2 Type definitions

This chapter defines the data types defined by E2E Library that are visible to the callers.

Some attributes shown below define data offset. The offset is defined according to the following rules:

- The offset is in bits,
- Within a byte, bits are numbered from 0 upwards, with bit 0 being the least significant bit (regardless of the microcontroller or bus endianness).

Example 1 - Counter with bit offset = 8 on MSB microcontroller:

	MSB							LSB
Data[0]	7	6	5	4	3	2	1	0
	CRC with bit offset 0							
Data[1]	15	14	13	12	11	10	9	8
	User data with bit offset 12				Counter with offset 8			
Data[2]	23	22	21	20	19	18	17	16
	User data with bit offset 20				User data with bit offset 16			

8.2.1 E2E Profile 1 types

Note: Since AUTOSAR 4.1.1, type names were renamed. If an existing application using E2E Library requires compatibility of interfaces to previous release versions, then the header file E2E.h shall contain following type definitions:

```
typedef E2E_P01ProtectStateType E2E_P01SenderStateType;
```

```
typedef E2E_P01CheckStateType E2E_P01ReceiverStateType;
```

```
typedef E2E_P01CheckStatusType E2E_P01ReceiverStatusType;
```

Figure 8.1: E2E Profile 1 configuration

8.2.1.1 E2E_P01ConfigType

[SWS_E2E_00018] Definition of datatype E2E_P01ConfigType [

Name	E2E_P01ConfigType	
Kind	Structure	
Elements	CounterOffset	
	Type	uint16
	Comment	Bit offset of Counter in MSB first order. CounterOffset shall be a multiple of 4. In variants 1A, 1B, and 1C, CounterOffset is 8.
	CRCOffset	
	Type	uint16
	Comment	Bit offset of CRC (i.e. since *Data) in MSB first order. The offset shall be a multiple of 8. In variants 1A, 1B, and 1C, CRCOffset is 0.
	DataID	
	Type	uint16
	Comment	A unique identifier, for protection against masquerading. There are some constraints on the selection of ID values, described in section "Configuration constraints on Data IDs".
	DataIDNibbleOffset	
Type	uint16	

	Comment	Bit offset of the low nibble of the high byte of Data ID. This parameter is used by E2E Library only if DataIDMode = E2E_P01_DATAID_NIBBLE (otherwise it is ignored by E2E Library). For DataIDMode different than E2E_P01_DATAID_NIBBLE, DataIDNibbleOffset shall be initialized to 0 (even if it is ignored by E2E Library).	
	DataIDMode		
	Type	E2E_P01DataIDMode	
	Comment	Inclusion mode of ID in CRC computation (both bytes, alternating, or low byte only of ID included).	
	DataLength		
	Type	uint16	
	Comment	Length of data, in bits. The value shall be a multiple of 8.	
	MaxDeltaCounterInit		
	Type	uint8	
	Comment	Initial maximum allowed gap between two counter values of two consecutively received valid Data. For example, if the receiver gets Data with counter 1 and MaxDeltaCounterInit is 1, then at the next reception the receiver can accept Counters with values 2 and 3, but not 4. Note that if the receiver does not receive new Data at a consecutive read, then the receiver increments the tolerance by 1.	
	MaxNoNewOrRepeatedData		
	Type	uint8	
	Comment	The maximum amount of missing or repeated Data which the receiver does not expect to exceed under normal communication conditions.	
	SyncCounterInit		
	Type	uint8	
	Comment	Number of Data required for validating the consistency of the counter that must be received with a valid counter (i.e. counter within the allowed lock-in range) after the detection of an unexpected behavior of a received counter.	
Description	Configuration of transmitted Data (Data Element or I-PDU), for E2E Profile 1. For each transmitted Data, there is an instance of this typedef.		
Available via	E2E.h		

]([RS_E2E_08528](#))

8.2.1.2 E2E_P01DataIDMode

Note: The values for the enumeration constants are specified on the associated UML diagram.

[SWS_E2E_00200] Definition of datatype E2E_P01DataIDMode [

Name	E2E_P01DataIDMode		
Kind	Enumeration		
Range	E2E_P01_DATAID_BOTH	0	Two bytes are included in the CRC (double ID configuration) This is used in E2E variant 1A.

	E2E_P01_DATAID_ALT	1	One of the two bytes byte is included, alternating high and low byte, depending on parity of the counter (alternating ID configuration). For an even counter, the low byte is included. For an odd counter, the high byte is included. This is used in E2E variant 1B.
	E2E_P01_DATAID_LOW	2	Only the low byte is included, the high byte is never used. This is applicable if the IDs in a particular system are 8 bits.
	E2E_P01_DATAID_NIBBLE	3	The low byte is included in the implicit CRC calculation, the low nibble of the high byte is transmitted along with the data (i.e. it is explicitly included), the high nibble of the high byte is not used. This is applicable for the IDs up to 12 bits. This is used in E2E variant 1C.
Description	The Data ID is two bytes long in E2E Profile 1. There are four inclusion modes how the implicit two-byte Data ID is included in the one-byte CRC.		
Available via	E2E.h		

](RS_E2E_08528)

8.2.1.3 E2E_P01ProtectStateType

[SWS_E2E_00020] Definition of datatype E2E_P01ProtectStateType [

Name	E2E_P01ProtectStateType		
Kind	Structure		
Elements	Counter		
	Type	uint8	
	Comment	Counter to be used for protecting the next Data. The initial value is 0, which means that the first Data will have the counter 0. After the protection by the Counter, the Counter is incremented modulo 0xF. The value 0xF is skipped (after 0xE the next is 0x0), as 0xF value represents the error value. The four high bits are always 0.	
Description	State of the sender for a Data protected with E2E Profile 1.		
Available via	E2E.h		

](RS_E2E_08528)

8.2.1.4 E2E_P01CheckStateType

Note: The values for the enumeration constants are specified on the associated UML diagram. Note that in previous SWS E2E versions, E2E_P01STATUS_OK was equal to 0x10.

Figure 8.2: E2E Profile 1 check state type

[SWS_E2E_00021] Definition of datatype E2E_P01CheckStateType [

Name	E2E_P01CheckStateType	
Kind	Structure	
Elements	LastValidCounter	
	Type	uint8
	Comment	Counter value most recently received. If no data has been yet received, then the value is 0x0. After each reception, the counter is updated with the value received.
	MaxDeltaCounter	
	Type	uint8
	Comment	MaxDeltaCounter specifies the maximum allowed difference between two counter values of consecutively received valid messages.
	WaitForFirstData	
	Type	boolean
	Comment	If true means that no correct data (with correct Data ID and CRC) has been yet received after the receiver initialization or reinitialization.
	NewDataAvailable	
	Type	boolean
	Comment	Indicates to E2E Library that a new data is available for Library to be checked. This attribute is set by the E2E Library caller, and not by the E2E Library.
	LostData	
	Type	uint8
	Comment	Number of data (messages) lost since reception of last valid one. This attribute is set only if Status equals E2E_P01STATUS_OK or E2E_P01STATUS_OKSOMELOST. For other values of Status, the value of LostData is undefined. E2E_P01CheckStatusType Status Result of the verification of the Data, determined by the Check function.
	Status	
Type	E2E_P01CheckStatusType	
Comment	Result of the verification of the Data, determined by the Check function.	
SyncCounter		
Type	uint8	
Comment	Number of Data required for validating the consistency of the counter that must be received with a valid counter (i.e. counter within the allowed lock-in range) after the detection of an unexpected behavior of a received counter.	
NoNewOrRepeatedDataCounter		
Type	uint8	

	Comment	Amount of consecutive reception cycles in which either (1) there was no new data, or (2) when the data was repeated.
Description	State of the receiver for a Data protected with E2E Profile 1.	
Available via	E2E.h	

](RS_E2E_08528, RS_E2E_08534)

8.2.1.5 E2E_P01CheckStatusType

[SWS_E2E_00022] Definition of datatype E2E_P01CheckStatusType [

Name	E2E_P01CheckStatusType		
Kind	Enumeration		
Range	E2E_P01STATUS_OK	0x00	OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by 1 with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that no Data has been lost since the last correct data reception.
	E2E_P01STATUS_NONEWDATA	0x01	Error: the Check function has been invoked but no new Data is not available since the last call, according to communication medium (e.g. RTE, COM). As a result, no E2E checks of Data have been consequently executed.
	E2E_P01STATUS_WRONGCRC	0x02	Error: The data has been received according to communication medium, but 1. the CRC is incorrect (applicable for all E2E Profile 1 configurations) or 2. the low nibble of the high byte of Data ID is incorrect (applicable only for E2E Profile 1 with E2E_P01DataIDMode = E2E_P01_DATAID_NIBBLE). The two above errors can be a result of corruption, incorrect addressing or masquerade.
	E2E_P01STATUS_SYNC	0x03	NOT VALID: The new data has been received after detection of an unexpected behavior of counter. The data has a correct CRC and a counter within the expected range with respect to the most recent Data received, but the determined continuity check for the counter is not finalized yet.
	E2E_P01STATUS_INITIAL	0x04	Initial: The new data has been received according to communication medium, the CRC is correct, but this is the first Data since the receiver's initialization or reinitialization, so the Counter cannot be verified yet.
	E2E_P01STATUS_REPEATED	0x08	Error: The new data has been received according to communication medium, the CRC is correct, but the Counter is identical to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST.

	E2E_P01STATUS_OKSOMELOST	0x20	OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by DeltaCounter (1 < DeltaCounter = Max DeltaCounter) with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that some Data in the sequence have been probably lost since the last correct/initial reception, but this is within the configured tolerance range.
	E2E_P01STATUS_WRONGSEQUENCE	0x40	Error: The new data has been received according to communication medium, the CRC is correct, but the Counter Delta is too big (DeltaCounter > MaxDeltaCounter) with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that too many Data in the sequence have been probably lost since the last correct/initial reception.
Description	Result of the verification of the Data in E2E Profile 1, determined by the Check function.		
Available via	E2E.h		

|(RS_E2E_08534)

8.2.2 E2E Profile 2 types

Since AUTOSAR 4.1.1, type names were renamed. If an existing application using E2E Library requires compatibility of interfaces to previous release versions, then the header file E2E.h shall contain following type definitions:

```
typedef E2E_P02ProtectStateType E2E_P02SenderStateType;
typedef E2E_P02CheckStateType E2E_P02ReceiverStateType;
typedef E2E_P02CheckStatusType E2E_P02ReceiverStatusType;
```

8.2.2.1 E2E_P02ConfigType

[SWS_E2E_00152] Definition of datatype E2E_P02ConfigType [

Name	E2E_P02ConfigType	
Kind	Structure	
Elements	DataLength	
	Type	uint16
	Comment	Length of Data, in bits. The value shall be a multiple of 8.
	DataIDList	
	Type	Array of uint8
	Size	16

	Comment	An array of appropriately chosen Data IDs for protection against masquerading.
	MaxDeltaCounterInit	
	Type	uint8
	Comment	Initial maximum allowed gap between two counter values of two consecutively received valid Data. For example, if the receiver gets Data with counter 1 and MaxDeltaCounterInit is 1, then at the next reception the receiver can accept Counters with values 2 and 3, but not 4. Note that if the receiver does not receive new Data at a consecutive read, then the receiver increments the tolerance by 1.
	MaxNoNewOrRepeatedData	
	Type	uint8
	Comment	The maximum amount of missing or repeated Data which the receiver does not expect to exceed under normal communication conditions.
	SyncCounterInit	
	Type	uint8
	Comment	Number of Data required for validating the consistency of the counter that must be received with a valid counter (i.e. counter within the allowed lock-in range) after the detection of an unexpected behavior of a received counter.
	Offset	
	Type	uint16
	Comment	Offset of the E2E header in the Data[] array in bits. It shall be: $0 \leq \text{Offset} \leq \text{DataLength} - (2 \cdot 8)$.
Description	Non-modifiable configuration of the data element sent over an RTE port, for E2E profile 2. The position of the counter and CRC is not configurable in profile 2.	
Available via	E2E.h	

](RS_E2E_08528)

8.2.2.2 E2E_P02ProtectStateType

[SWS_E2E_00153] Definition of datatype E2E_P02ProtectStateType [

Name	E2E_P02ProtectStateType	
Kind	Structure	
Elements	Counter	
	Type	uint8
	Comment	Counter to be used for protecting the Data. The initial value is 0. As the counter is incremented before sending, the first Data will have the counter value 1
Description	State of the sender for a Data protected with E2E Profile 2.	
Available via	E2E.h	

](RS_E2E_08528)

8.2.2.3 E2E_P02CheckStateType

Note that in previous SWS E2E versions, E2E_P02STATUS_OK was equal to 0x10.

Figure 8.3: E2E Profile 2 check state

[SWS_E2E_00154] Definition of datatype E2E_P02CheckStateType [

Name	E2E_P02CheckStateType	
Kind	Structure	
Elements	LastValidCounter	
	Type	uint8
	Comment	Counter of last valid received message.
	MaxDeltaCounter	
	Type	uint8
	Comment	MaxDeltaCounter specifies the maximum allowed difference between two counter values of consecutively received valid messages.
	WaitForFirstData	
	Type	boolean
	Comment	If true means that no correct data (with correct Data ID and CRC) has been yet received after the receiver initialization or reinitialization.
	NewDataAvailable	
	Type	boolean
	Comment	Indicates to E2E Library that a new data is available for Library to be checked. This attribute is set by the E2E Library caller, and not by the E2E Library.
	LostData	
	Type	uint8
	Comment	Number of data (messages) lost since reception of last valid one.
	Status	
	Type	E2E_P02CheckStatusType
Comment	Result of the verification of the Data, determined by the Check function.	
SyncCounter		
Type	uint8	
Comment	Number of Data required for validating the consistency of the counter that must be received with a valid counter (i.e. counter within the allowed lock-in range) after the detection of an unexpected behavior of a received counter.	
NoNewOrRepeatedDataCounter		
Type	uint8	

	Comment	Amount of consecutive reception cycles in which either (1) there was no new data, or (2) when the data was repeated.
Description	State of the sender for a Data protected with E2E Profile 2.	
Available via	E2E.h	

](RS_E2E_08528, RS_E2E_08534)

8.2.2.4 E2E_P02CheckStatusType

Note: The values for the enumeration constants are specified on the associated UML diagram.

[SWS_E2E_00214] Definition of datatype E2E_P02CheckStatusType [

Name	E2E_P02CheckStatusType		
Kind	Enumeration		
Range	E2E_P02STATUS_OK	0x00	OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by 1 with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that no Data has been lost since the last correct data reception.
	E2E_P02STATUS_NONEWDATA	0x01	Error: the Check function has been invoked but no new Data is not available since the last call, according to communication medium (e.g. RTE, COM). As a result, no E2E checks of Data have been consequently executed.
	E2E_P02STATUS_WRONGCRC	0x02	Error: The data has been received according to communication medium, but the CRC is incorrect.
	E2E_P02STATUS_SYNC	0x03	NOT VALID: The new data has been received after detection of an unexpected behavior of counter. The data has a correct CRC and a counter within the expected range with respect to the most recent Data received, but the determined continuity check for the counter is not finalized yet.
	E2E_P02STATUS_INITIAL	0x04	Initial: The new data has been received according to communication medium, the CRC is correct, but this is the first Data since the receiver's initialization or reinitialization, so the Counter cannot be verified yet.
	E2E_P02STATUS_REPEATED	0x08	Error: The new data has been received according to communication medium, the CRC is correct, but the Counter is identical to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST.

	E2E_P02STATUS_OKSOMELOST	0x20	OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by DeltaCounter (1 < DeltaCounter =Max DeltaCounter) with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that some Data in the sequence have been probably lost since the last correct/initial reception, but this is within the configured tolerance range.
	E2E_P02STATUS_WRONGSEQUENCE	0x40	Error: The new data has been received according to communication medium, the CRC is correct, but the Counter Delta is too big (DeltaCounter > MaxDeltaCounter) with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that too many Data in the sequence have been probably lost since the last correct/initial reception.
Description	Result of the verification of the Data in E2E Profile 2, determined by the Check function.		
Available via	E2E.h

8.2.3 E2E Profile 4 types

Figure 8.4: E2E Profile 4 configuration

8.2.3.1 E2E_P04ConfigType

[SWS_E2E_00334] Definition of datatype E2E_P04ConfigType [

Name	E2E_P04ConfigType	
Kind	Structure	
Elements	DataID	
	Type	uint32
	Comment	A system-unique identifier of the Data.
	Offset	
	Type	uint16

	Comment	Bit offset of the first bit of the E2E header from the beginning of the Data (bit numbering: bit 0 is the least important). The offset shall be a multiple of 8 and $0 \leq \text{Offset} \leq \text{MaxDataLength} - (12 \cdot 8)$. Example: If Offset equals 8, then the high byte of the E2E Length (16 bit) is written to Byte 1, the low Byte is written to Byte 2.
	MinDataLength	
	Type	uint16
	Comment	Minimal length of Data, in bits. E2E checks that DataLength is \geq MinDataLength (see [PRS_E2E_00651]).
	MaxDataLength	
	Type	uint16
	Comment	Maximal length of Data, in bits. E2E checks that DataLength is \leq MaxDataLength (see [PRS_E2E_00651]).
	MaxDeltaCounter	
	Type	uint16
	Comment	Maximum allowed gap between two counter values of two consecutively received valid Data. For example, if the receiver gets Data with counter 1 and MaxDeltaCounter is 3, then at the next reception the receiver can accept Counters with values 2, 3 or 4.
Description	Configuration of transmitted Data (Data Element or I-PDU), for E2E Profile 4. For each transmitted Data, there is an instance of this typedef.	
Available via	E2E.h

Name	E2E_P07mConfigType	
Kind	Structure	
Elements	DataID	
	Type	uint32
	Comment	A system-unique identifier of the Data.
	Offset	
	Type	uint32
	Comment	Bit offset of the first bit of the E2E header from the beginning of the Data (bit numbering: bit 0 is the least important). The offset shall be a multiple of 8 and $0 \leq \text{Offset} \leq \text{MaxDataLength} - (24 \cdot 8)$. Example: If Offset equals 8, then the high byte of the E2E Length (16 bit) is written to Byte 1, the low Byte is written to Byte 2.
	MinDataLength	
	Type	uint32
	Comment	Minimal length of Data, in bits. E2E checks that DataLength is \geq MinDataLength (see [PRS_E2E_00851]).
	MaxDataLength	
	Type	uint32
	Comment	Maximal length of Data, in bits. E2E checks that DataLength is \leq MaxDataLength (see [PRS_E2E_00851]).
MaxDeltaCounter		
Type	uint32	
Comment	Maximum allowed gap between two counter values of two consecutively received valid Data. For example, if the receiver gets Data with counter 1 and MaxDeltaCounter is 3, then at the next reception the receiver can accept Counters with values 2, 3 or 4.	
Description	Configuration of transmitted Data (Data Element or I-PDU), for E2E Profile 7m. For each transmitted Data, there is an instance of this typedef.

Figure 8.27: E2E Profile 11 configuration

[SWS_E2E_00565] Definition of datatype E2E_P11ConfigType [

Name	E2E_P11ConfigType	
Kind	Structure	
Elements	DataLength	
	Type	uint16
	Comment	Length of data, in bits. The value shall be a multiple of 8.
	DataID	
	Type	uint16
	Comment	A unique identifier, for protection against masquerading. There are some constraints on the selection of ID values, described in section "Configuration constraints on Data IDs".
	MaxDeltaCounter	
	Type	uint8
	Comment	Maximum allowed gap between two counter values of two consecutively received valid Data. For example, if the receiver gets Data with counter 1 and MaxDeltaCounter is 3, then at the next reception the receiver can accept Counters with values 2, 3 or 4.
	DataIDMode	
	Type	E2E_P11DataIDMode
	Comment	–
	CRCOffset	
	Type	uint16
	Comment	Bit offset of CRC (i.e. since *Data) in MSB first order. In variants 1A and 1B, CRCOffset is 0. The offset shall be a multiple of 8.
	CounterOffset	
Type	uint16	
Comment	Bit offset of Counter in MSB first order. In variants 1A and 1B, Counter Offset is 8. The offset shall be a multiple of 4.	
DataIDNibbleOffset		
Type	uint16	
Comment	Bit offset of the low nibble of the high byte of Data ID. This parameter is used by E2E Library only if DataIDMode = E2E_P11_DATAID_NIBBLE (otherwise it is ignored by E2E Library). For DataIDMode different than E2E_P11_DATAID_NIBBLE, Data IDNibbleOffset shall be initialized to 0 (even if it is ignored by E2E Library).	
Description	Configuration of transmitted Data (Data Element or I-PDU), for E2E Profile 11. For each transmitted Data, there is an instance of this typedef.

Description	State of the sender for a Data protected with E2E Profile 22.	
Available via	E2E.h	

]([RS_E2E_08528](#), [RS_E2E_08534](#))

8.2.12.4 E2E_P22CheckStatusType

[SWS_E2E_00569] Definition of datatype E2E_P22CheckStatusType [

Name	E2E_P22CheckStatusType		
Kind	Enumeration		
Range	E2E_P22STATUS_OK	0x00	OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by 1 with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that no Data has been lost since the last correct data reception.
	E2E_P22STATUS_NONEWDATA	0x01	Error: the Check function has been invoked but no new Data is not available since the last call, according to communication medium (e.g. RTE, COM). As a result, no E2E checks of Data have been consequently executed.
	E2E_P22STATUS_ERROR	0x07	Error: The data has been received according to communication medium, but the CRC is incorrect.
	E2E_P22STATUS_REPEATED	0x08	Error: The new data has been received according to communication medium, the CRC is correct, but the Counter is identical to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST.
	E2E_P22STATUS_OKSOMELOST	0x20	OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by DeltaCounter (1 < DeltaCounter =Max DeltaCounter) with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that some Data in the sequence have been probably lost since the last correct/initial reception, but this is within the configured tolerance range.

	E2E_P22STATUS_WRONGSEQUENCE	0x40	Error: The new data has been received according to communication medium, the CRC is correct, but the Counter Delta is too big (DeltaCounter > MaxDeltaCounter) with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that too many Data in the sequence have been probably lost since the last correct/initial reception.
Description	Result of the verification of the Data in E2E Profile 22, determined by the Check function.		
Available via	E2E.h

8.2.13 E2E Profile 44 types

8.2.13.1 E2E_P44ConfigType

«structure» E2E::E2E_P44Types: E2E_P44ConfigType
+ DataID: uint32
+ MaxDataLength: uint32
+ MaxDeltaCounter: uint16
+ MinDataLength: uint32
+ Offset: uint32

Figure 8.33: E2E Profile 44 configuration

[SWS_E2E_91023] Definition of datatype E2E_P44ConfigType [

Name	E2E_P44ConfigType	
Kind	Structure	
Elements	DataID	
	Type	uint32
	Comment	A system-unique identifier of the Data.
	Offset	
	Type	uint32
	Comment	Bit offset of the first bit of the E2E header from the beginning of the Data (bit numbering: bit 0 is the least important). The offset shall be a multiple of 8 and 0 <= Offset <= MaxDataLength-(12*8). Example: If Offset equals 8, then the high byte of the E2E Length (16 bit) is written to Byte 1, the low Byte is written to Byte 2.
	MinDataLength	
	Type	uint32
	Comment	Minimal length of Data, in bits. E2E checks that DataLength is >= Min DataLength (see [PRS_E2E_00735]).
	MaxDataLength	
Type	uint32	

	Comment	Maximal length of Data, in bits. E2E checks that DataLength is <= Max DataLength (see [PRS_E2E_00735]).
	MaxDeltaCounter	
	Type	uint16
	Comment	Maximum allowed gap between two counter values of two consecutively received valid Data. For example, if the receiver gets Data with counter 1 and MaxDeltaCounter is 3, then at the next reception the receiver can accept Counters with values 2, 3 or 4
Description	Configuration of transmitted Data (Data Element or I-PDU), for E2E Profile 44. For each transmitted Data, there is an instance of this typedef.	
Available via	E2E.h	

]([RS_E2E_08528](#))

8.2.13.2 E2E_P44ProtectStateType

[SWS_E2E_91024] Definition of datatype E2E_P44ProtectStateType [

Name	E2E_P44ProtectStateType	
Kind	Structure	
Elements	Counter	
	Type	uint16
	Comment	Counter to be used for protecting the next Data. The initial value is 0, which means that in the first cycle, Counter is 0. Each time E2E_P44Protect() is called, it increments the counter up to 0xFF'FF. After the maximum value is reached, the next value is 0x0. The overflow is not reported to the caller.
Description	State of the sender for a Data protected with E2E Profile 44.	
Available via	E2E.h	

]([RS_E2E_08528](#))

8.2.13.3 E2E_P44CheckStateType

Note: The values for the enumeration constants are specified only on the associated UML diagram (not in the table).

Figure 8.34: E2E Profile 44 Check state type

[SWS_E2E_91025] Definition of datatype E2E_P44CheckStateType [

Name	E2E_P44CheckStateType	
Kind	Structure	
Elements	Status	
	Type	E2E_P44CheckStatusType
	Comment	Result of the verification of the Data in this cycle, determined by the Check function.
	Counter	
	Type	uint16
	Comment	Counter of the data in previous cycle.
Description	State of the reception on one single Data protected with E2E Profile 44.	
Available via	E2E.h	

]([RS_E2E_08528](#), [RS_E2E_08534](#))

8.2.15.2 E2E_SMConfigType

[SWS_E2E_00342] Definition of datatype E2E_SMConfigType [

Name	E2E_SMConfigType	
Kind	Structure	
Elements	WindowSizeValid	
	Type	uint8
	Comment	Size of the monitoring window for the state machine during state VALID.
	MinOkStateInit	
	Type	uint8
	Comment	Minimal number of checks in which ProfileStatus equal to E2E_P_OK was determined within the last WindowSize checks (for the state E2E_SM_INIT) required to change to state E2E_SM_VALID.
	MaxErrorStateInit	
	Type	uint8
	Comment	Maximal number of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last WindowSize checks (for the state E2E_SM_INIT).

	MinOkStateValid	
	Type	uint8
	Comment	Minimal number of checks in which ProfileStatus equal to E2E_P_OK was determined within the last WindowSize checks (for the state E2E_SM_VALID) required to keep in state E2E_SM_VALID.
	MaxErrorStateValid	
	Type	uint8
	Comment	Maximal number of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last WindowSize checks (for the state E2E_SM_VALID).
	MinOkStateInvalid	
	Type	uint8
	Comment	Minimum number of checks in which ProfileStatus equal to E2E_P_OK was determined within the last WindowSize checks (for the state E2E_SM_INVALID) required to change to state E2E_SM_VALID.
	MaxErrorStateInvalid	
	Type	uint8
	Comment	Maximal number of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last WindowSize checks (for the state E2E_SM_INVALID).
	WindowSizeInit	
	Type	uint8
	Comment	Size of the monitoring windows for the state machine during state INIT.
	WindowSizeInvalid	
	Type	uint8
	Comment	Size of the monitoring window for the state machine during state INVALID.
	ClearToInvalid	
	Type	boolean
	Comment	Clear monitoring window data on transition to state INVALID.
	transitToInvalidExtended	
	Type	boolean
	Comment	Restrict/allow transition from states INIT/NODATA to INVALID state.
Description	Configuration of a communication channel for exchanging Data.	
Available via	E2E.h	

|(RS_E2E_08548)

8.2.15.3 E2E_SMCkCheckStateType

Note: The values for the enumeration constants are specified only on the associated UML diagram (not in the table).

Figure 8.38: E2E SM check state

[SWS_E2E_00343] Definition of datatype E2E_SMCheckStateType [

Name	E2E_SMCheckStateType	
Kind	Structure	
Elements	ProfileStatusWindow	
	Type	uint8*
	Comment	Pointer to an array, in which the ProfileStatus-es of the last E2E-checks are stored. The array size shall be WindowSize
	WindowTopIndex	
	Type	uint8
	Comment	index in the array, at which the next ProfileStatus is to be written.
	OkCount	
	Type	uint8
	Comment	Count of checks in which ProfileStatus equal to E2E_P_OK was determined, within the last WindowSize checks.
	ErrorCount	
	Type	uint8
	Comment	Count of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last WindowSize checks.
	SMState	
Type	E2E_SMStateType	
Comment	The current state in the state machine. The value is not explicitly used in the pseudocode of the state machine, because it is expressed in UML as UML states.	
Description	State of the protection of a communication channel.	
Available via	E2E.h	

]([RS_E2E_08548](#))

8.2.15.4 E2E_SMStateType

[SWS_E2E_00344] Definition of datatype E2E_SMStateType [

Name	E2E_SMStateType		
Kind	Enumeration		
Range	E2E_SM_VALID	0x00	Communication functioning properly according to E2E, data can be used.
	E2E_SM_DEINIT	0x01	State before E2E_SMCheckInit() is invoked, data cannot be used.
	E2E_SM_NODATA	0x02	No data from the sender is available since the initialization, data cannot be used.
	E2E_SM_INIT	0x03	There has been some data received since startup, but it is not yet possible use it, data cannot be used.
	E2E_SM_INVALID	0x04	Communication not functioning properly, data cannot be used.
	reserved	0x07, 0x0F	reserved for runtime errors (shall not be used for any state in future)
Description	Status of the communication channel exchanging the data. If the status is OK, then the data may be used.		
Available via	E2E.h

8.3 Routine definitions

This chapter defines the routines provided by E2E Library. The provided routines can be implemented as:

- Functions
- Inline functions
- Macros

8.3.1 E2E Profile 1 routines

8.3.1.1 E2E_P01Protect

[SWS_E2E_00166] Definition of API function E2E_P01Protect [

Service Name	E2E_P01Protect
Syntax	<pre>Std_ReturnType E2E_P01Protect (const E2E_P01ConfigType* ConfigPtr, E2E_P01ProtectStateType* StatePtr, uint8* DataPtr)</pre>
Service ID [hex]	0x01

Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
Parameters (inout)	StatePtr	Pointer to port/data communication state.
	DataPtr	Pointer to Data to be transmitted.
Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.
Description	Protects the array/buffer to be transmitted using the E2E profile 1. This includes checksum calculation, handling of counter and Data ID.	
Available via	E2E.h	

]([RS_E2E_08528](#), [RS_E2E_08527](#))

8.3.1.2 E2E_P01ProtectInit

[SWS_E2E_00385] Definition of API function E2E_P01ProtectInit [

Service Name	E2E_P01ProtectInit	
Syntax	Std_ReturnType E2E_P01ProtectInit (E2E_P01ProtectStateType* StatePtr)	
Service ID [hex]	0x1b	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	StatePtr	Pointer to port/data communication state.
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL - null pointer passed E2E_E_OK
Description	Initializes the protection state.	
Available via	E2E.h	

]([RS_E2E_08539](#), [RS_E2E_08527](#))

[SWS_E2E_00386] [In case State is NULL, E2E_P01ProtectInit shall return immediately with E2E_E_INPUTERR_NULL. Otherwise, it shall initialize the state structure, setting Counter to 0.]([RS_E2E_08528](#))

8.3.1.3 E2E_P01Forward

[SWS_E2E_00588]{DRAFT} Definition of API function E2E_P01Forward [

Service Name	E2E_P01Forward (draft)	
Syntax	<pre>Std_ReturnType E2E_P01Forward (const E2E_P01ConfigType* ConfigPtr, E2E_PCheckStatusType Checkstatus, E2E_P01ProtectStateType* StatePtr, uint8* DataPtr)</pre>	
Service ID [hex]	0x38	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
	Checkstatus	E2E Status of the received message
Parameters (inout)	StatePtr	Pointer to port/data communication state.
	DataPtr	Pointer to Data to be transmitted.
Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.
Description	Protects data which is forwarded by using the E2E profile 01. This includes checksum calculation, handling of counter and Data ID. Detected Errors of received message will be reconstruct on output data. Tags: atp.Status=draft	
Available via	E2E.h	

]([RS_E2E_08527](#), [RS_E2E_08528](#))

8.3.1.4 E2E_P01Check

[SWS_E2E_00158] Definition of API function E2E_P01Check [

Service Name	E2E_P01Check	
Syntax	<pre>Std_ReturnType E2E_P01Check (const E2E_P01ConfigType* Config, E2E_P01CheckStateType* State, const uint8* Data)</pre>	
Service ID [hex]	0x02	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	Config	Pointer to static configuration.
	Data	Pointer to received data.
Parameters (inout)	State	Pointer to port/data communication state.
Parameters (out)	None	

Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.
Description	Checks the Data received using the E2E profile 1. This includes CRC calculation, handling of Counter and Data ID.	
Available via	E2E.h	

]([RS_E2E_08528](#), [RS_E2E_08527](#))

8.3.1.5 E2E_P01CheckInit

[SWS_E2E_00390] Definition of API function E2E_P01CheckInit [

Service Name	E2E_P01CheckInit	
Syntax	Std_ReturnType E2E_P01CheckInit (E2E_P01CheckStateType* StatePtr)	
Service ID [hex]	0x1c	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	StatePtr	Pointer to port/data communication state.
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL - null pointer passed E2E_E_OK
Description	Initializes the check state	
Available via	E2E.h	

]([RS_E2E_08528](#), [RS_E2E_08527](#))

[SWS_E2E_00389] [In case State is NULL, E2E_P01CheckInit shall return immediately with E2E_E_INPUTERR_NULL. Otherwise, it shall initialize the state structure, setting:

- LastValidCounter = 0
- MaxDeltaCounter = 0
- WaitForFirstData = TRUE
- NewDataAvailable = TRUE
- LostData = 0
- Status = E2E_P01STATUS_NONEWDATA
- NoNewOrRepeatedDataCounter = 0
- SyncCounter = 0.

]([RS_E2E_08528](#))

The LastValidCounter is ignored in the first cycle(s) because WaitForFirstData is set to TRUE, therefore the value does not need to be set to 0xE.

8.3.1.6 E2E_P01MapStatusToSM

[SWS_E2E_00382] Definition of API function E2E_P01MapStatusToSM [

Service Name	E2E_P01MapStatusToSM	
Syntax	<pre>E2E_PCheckStatusType E2E_P01MapStatusToSM (Std_ReturnType CheckReturn, E2E_P01CheckStatusType Status, boolean profileBehavior)</pre>	
Service ID [hex]	0x1d	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	CheckReturn	Return value of the E2E_P01Check function
	Status	Status determined by E2E_P01Check function
	profileBehavior	FALSE: check has the legacy behavior, before R4.2 TRUE: check behaves like new P4/P5/P6 profiles introduced in R4.2
Parameters (inout)	None	
Parameters (out)	None	
Return value	E2E_PCheckStatusType	Profile-independent status of the reception on one single Data in one cycle.
Description	The function maps the check status of Profile 1 to a generic check status, which can be used by E2E state machine check function. The E2E Profile 1 delivers a more fine-granular status, but this is not relevant for the E2E state machine.	
Available via	E2E.h	

]([RS_E2E_08528](#), [RS_E2E_08527](#)) This represents the R4.2 behavior:

[SWS_E2E_00383] [If CheckReturn == E2E_E_OK and ProfileBehavior == TRUE, then the function E2E_P01MapStatusToSM shall return the values depending on the value of Status: See [[SWS_E2E_00602](#)]]([RS_E2E_08528](#), [RS_E2E_08548](#))

[SWS_E2E_00602] [

Status	Return value
E2E_P01STATUS_OK E2E_P01STATUS_OKSOMELOST E2E_P01STATUS_SYNC	E2E_P_OK
E2E_P01STATUS_WRONGCRC	E2E_P_ERROR
E2E_P01STATUS_REPEATED	E2E_P_REPEATED

8.3.2 E2E Profile 2 routines

8.3.2.1 E2E_P02Protect

[SWS_E2E_00160] Definition of API function E2E_P02Protect [

Service Name	E2E_P02Protect	
Syntax	<pre>Std_ReturnType E2E_P02Protect (const E2E_P02ConfigType* ConfigPtr, E2E_P02ProtectStateType* StatePtr, uint8* DataPtr)</pre>	
Service ID [hex]	0x03	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
Parameters (inout)	StatePtr	Pointer to port/data communication state.
	DataPtr	Pointer to the data to be protected.
Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.

Description	Protects the array/buffer to be transmitted using the E2E profile 2. This includes checksum calculation, handling of sequence counter and Data ID.
Available via	E2E.h

|(RS_E2E_08528, RS_E2E_08527)

8.3.2.2 E2E_P02ProtectInit

[SWS_E2E_00387] Definition of API function E2E_P02ProtectInit [

Service Name	E2E_P02ProtectInit	
Syntax	Std_ReturnType E2E_P02ProtectInit (E2E_P02ProtectStateType* StatePtr)	
Service ID [hex]	0x1e	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	StatePtr	Pointer to port/data communication state.
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL - null pointer passed E2E_E_OK
Description	Initializes the protection state.	
Available via	E2E.h	

|(RS_E2E_08528, RS_E2E_08527)

[SWS_E2E_00388] [In case State is NULL, E2E_P02ProtectInit shall return immediately with E2E_E_INPUTERR_NULL. Otherwise, it shall initialize the state structure, setting Counter to 0.] (RS_E2E_08528)

8.3.2.3 E2E_P02Forward

[SWS_E2E_00583]{DRAFT} Definition of API function E2E_P02Forward [

Service Name	E2E_P02Forward (draft)	
Syntax	Std_ReturnType E2E_P02Forward (const E2E_P02ConfigType* ConfigPtr, E2E_PCheckStatusType Checkstatus, E2E_P02ProtectStateType* StatePtr, uint8* DataPtr)	
Service ID [hex]	0x32	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.

	Checkstatus	E2E Status of the received message
Parameters (inout)	StatePtr	Pointer to port/data communication state.
	DataPtr	Pointer to Data to be transmitted.
Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.
Description	Protects data which is forwarded by using the E2E profile 02. This includes checksum calculation, handling of counter and Data ID. Detected Errors of received message will be reconstruct on output data. Tags: atp.Status=draft	
Available via	E2E.h	

]([RS_E2E_08527](#), [RS_E2E_08528](#))

8.3.2.4 E2E_P02Check

[SWS_E2E_00161] Definition of API function E2E_P02Check [

Service Name	E2E_P02Check	
Syntax	Std_ReturnType E2E_P02Check (const E2E_P02ConfigType* ConfigPtr, E2E_P02CheckStateType* StatePtr, const uint8* DataPtr)	
Service ID [hex]	0x04	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
	DataPtr	–
Parameters (inout)	StatePtr	Pointer to port/data communication state.
Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.
Description	Check the array/buffer using the E2E profile 2. This includes checksum calculation, handling of sequence counter and Data ID.	
Available via	E2E.h	

]([RS_E2E_08528](#), [RS_E2E_08527](#))

8.3.2.5 E2E_P02CheckInit

[SWS_E2E_00391] Definition of API function E2E_P02CheckInit [

Service Name	E2E_P02CheckInit	
Syntax	Std_ReturnType E2E_P02CheckInit (E2E_P02CheckStateType* StatePtr)	
Service ID [hex]	0x1f	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	StatePtr	Pointer to port/data communication state.
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL - null pointer passed E2E_E_OK
Description	Initializes the check state	
Available via	E2E.h	

]([RS_E2E_08528](#), [RS_E2E_08527](#))

[SWS_E2E_00392] [In case State is NULL, E2E_P02CheckInit shall return immediately with E2E_E_INPUTERR_NULL. Otherwise, it shall initialize the state structure, setting:

- LastValidCounter = 0
- MaxDeltaCounter = 0
- WaitForFirstData = TRUE
- NewDataAvailable = TRUE
- LostData = 0
- Status = E2E_P02STATUS_NONEWDATA
- NoNewOrRepeatedDataCounter = 0
- SyncCounter = 0.

]([RS_E2E_08528](#))

The LastValidCounter is ignored in the first cycle(s) because WaitForFirstData is set to TRUE, therefore the value does not need to be set to 0xF.

8.3.2.6 E2E_P02MapStatusToSM

[SWS_E2E_00379] Definition of API function E2E_P02MapStatusToSM [

Service Name	E2E_P02MapStatusToSM	
Syntax	<pre>E2E_PCheckStatusType E2E_P02MapStatusToSM (Std_ReturnType CheckReturn, E2E_P02CheckStatusType Status, boolean profileBehavior)</pre>	
Service ID [hex]	0x20	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	CheckReturn	Return value of the E2E_P02Check function
	Status	Status determined by E2E_P02Check function
	profileBehavior	FALSE: check has the legacy behavior, before R4.2 TRUE: check behaves like new P4/P5/P6 profiles introduced in R4.2
Parameters (inout)	None	
Parameters (out)	None	
Return value	E2E_PCheckStatusType	Profile-independent status of the reception on one single Data in one cycle.
Description	The function maps the check status of Profile 2 to a generic check status, which can be used by E2E state machine check function. The E2E Profile 2 delivers a more fine-granular status, but this is not relevant for the E2E state machine.	
Available via	E2E.h	

]([RS_E2E_08528](#), [RS_E2E_08527](#)) This represents the R4.2 behavior:

[SWS_E2E_00549] Definition of API function E2E_P07CheckInit [

Service Name	E2E_P07CheckInit	
Syntax	<pre>Std_ReturnType E2E_P07CheckInit (E2E_P07CheckStateType* StatePtr)</pre>	
Service ID [hex]	0x79	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	StatePtr	Pointer to port/data communication state.
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.

Description	Initializes the check state
Available via	E2E.h

|(RS_E2E_08528, RS_E2E_08539, RS_E2E_08527)

[SWS_E2E_00552] [In case State is NULL, E2E_P07CheckInit shall return immediately with E2E_E_INPUTERR_NULL. Otherwise, it shall initialize the state structure, setting:

1. Counter to 0xFF'FF'FF'FF
2. Status to E2E_P07STATUS_ERROR.

|(RS_E2E_08528, RS_E2E_08539)

8.3.7.6 E2E_P07MapStatusToSM

[SWS_E2E_00550] Definition of API function E2E_P07MapStatusToSM [

Service Name	E2E_P07MapStatusToSM	
Syntax	<pre>E2E_PCheckStatusType E2E_P07MapStatusToSM (E2E_PCheckStatusType return, E2E_P07CheckStatusType Status)</pre>	
Service ID [hex]	0x80	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	return	Profile-independent status of the reception on one single Data in one cycle.
	Status	Status determined by E2E_P07Check function
Parameters (inout)	None	
Parameters (out)	None	
Return value	E2E_PCheckStatusType	Profile-independent status of the reception on one single Data in one cycle.
Description	The function maps the check status of Profile 7 to a generic check status, which can be used by E2E state machine check function. The E2E Profile 7 delivers a more fine-granular status, but this is not relevant for the E2E state machine.	
Available via	E2E.h	

|(RS_E2E_08528, RS_E2E_08539, RS_E2E_08527)

[SWS_E2E_00553] [If CheckReturn = E2E_E_OK, then the function E2E_P07MapStatusToSM shall return the values depending on the value of Status: See [SWS_E2E_00607] |(RS_E2E_08548)

[SWS_E2E_00607] [

Status	Return value
E2E_P07STATUS_OK or E2E_P07STATUS_OKSOMELOST	E2E_P_OK
E2E_P07STATUS_ERROR	E2E_P_ERROR
E2E_P07STATUS_REPEATED	E2E_P_REPEATED
E2E_P07STATUS_NONEWDATA	E2E_P_NONEWDATA
E2E_P07STATUS_WRONGSEQUENCE	E2E_P_WRONGSEQUENCE

Mapping of profile 07

] ([RS_E2E_08548](#))

[SWS_E2E_00554] [If CheckReturn != E2E_E_OK, then the function E2E_P07MapStatusToSM() shall return E2E_P_ERROR (regardless of value of Status).] ([RS_E2E_08548](#))

8.3.8 E2E Profile 7m routines

8.3.8.1 E2E_P07mProtect

[SWS_E2E_91014] Definition of API function E2E_P07mProtect [

Service Name	E2E_P07mProtect	
Syntax	<pre>Std_ReturnType E2E_P07mProtect (const E2E_P07mConfigType* ConfigPtr, E2E_P07mProtectStateType* StatePtr, uint32 SourceID, Std_MessageTypeType MessageType, Std_MessageResultType MessageResult, uint8* DataPtr, uint32 Length)</pre>	
Service ID [hex]	0x4b	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
	SourceID	A system-unique identifier of the Data Source.
	MessageType	Type of the message (request/response)
	MessageResult	Result of the message (OK/ERROR)
	Length	Length of the data in bytes.
Parameters (inout)	StatePtr	Pointer to port/data communication state.
	DataPtr	Pointer to Data to be transmitted.
Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.

Description	Protects the array/buffer to be transmitted using the E2E profile 7m. This includes CRC calculation, handling of Counter, Data ID, Message Type, Message Result, and Source ID.
Available via	E2E.h

|(RS_E2E_08539, RS_E2E_08527)

8.3.8.2 E2E_P07mProtectInit

[SWS_E2E_91015] Definition of API function E2E_P07mProtectInit [

Service Name	E2E_P07mProtectInit	
Syntax	Std_ReturnType E2E_P07mProtectInit (E2E_P07mProtectStateType* StatePtr)	
Service ID [hex]	0x4c	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	StatePtr	Pointer to port/data communication state.
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL - null pointer passed E2E_E_OK
Description	Initializes the protection state.	
Available via	E2E.h	

|(RS_E2E_08539, RS_E2E_08527)

[SWS_E2E_00596] [In case State is NULL, E2E_P07mProtectInit shall return immediately with E2E_E_INPUTERR_NULL. Otherwise, it shall initialize the state structure, setting Counter to 0.] (RS_E2E_08539)

8.3.8.3 E2E_P07mForward

[SWS_E2E_91016]{DRAFT} Definition of API function E2E_P07mForward [

Service Name	E2E_P07mForward (draft)	
Syntax	Std_ReturnType E2E_P07mForward (const E2E_P07mConfigType* ConfigPtr, uint32 Length, E2E_PCheckStatusType Checkstatus, E2E_P07mProtectStateType* StatePtr, uint32 SourceID, Std_MessageTypeType MessageType, Std_MessageResultType MessageResult, uint8* DataPtr)	
Service ID [hex]	0x4d	

Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
	Length	Length of the data in bytes.
	Checkstatus	E2E Status of the received message
	SourceID	A system-unique identifier of the Data Source.
	MessageType	Type of the message (request/response)
	MessageResult	Result of the message (OK/ERROR)
Parameters (inout)	StatePtr	Pointer to port/data communication state.
	DataPtr	Pointer to Data to be transmitted.
Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.
Description	Protects data which is forwarded by using the E2E profile 7m. This includes CRC calculation, handling of Counter, Data ID, Message Type, Message Result, and Source ID. Detected Errors of received message will be reconstruct on output data. Tags: atp.Status=draft	
Available via	E2E.h	

](RS_E2E_08527, RS_E2E_08539)

8.3.8.4 E2E_P07mSourceCheck

[SWS_E2E_91018] Definition of API function E2E_P07mSourceCheck [

Service Name	E2E_P07mSourceCheck	
Syntax	<pre>Std_ReturnType E2E_P07mSourceCheck (const E2E_P07mConfigType* ConfigPtr, E2E_P07mCheckStateType* StatePtr, uint32 SourceID, Std_MessageTypeType MessageType, Std_MessageResultType MessageResult, const uint8* DataPtr, uint32 Length)</pre>	
Service ID [hex]	0x4f	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
	SourceID	A system-unique identifier of the Data Source.
	MessageType	Type of the message (request/response)
	MessageResult	Result of the message (OK/ERROR)
	DataPtr	Pointer to received data.
	Length	Length of the data in bytes.
Parameters (inout)	StatePtr	Pointer to received data.

Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.
Description	<p>Checks the Data received using the E2E profile 7m. This includes CRC calculation, handling of Counter, Data ID, Message Type, Message Result, and Source ID.</p> <p>The function checks only one single data in one cycle, it does not determine/compute the accumulated state of the communication link.</p> <p>This function is intended for usage at the data source (i.e., in case of C/S communication at the client).</p>	
Available via	E2E.h	

](RS_E2E_08539, RS_E2E_08527)

8.3.8.5 E2E_P07mSinkCheck

[SWS_E2E_91017] Definition of API function E2E_P07mSinkCheck [

Service Name	E2E_P07mSinkCheck	
Syntax	<pre>Std_ReturnType E2E_P07mSinkCheck (const E2E_P07mConfigType* ConfigPtr, E2E_P07mCheckStateType* StatePtr, uint32* SourceID, Std_MessageTypeType MessageType, Std_MessageResultType MessageResult, const uint8* DataPtr, uint32 Length)</pre>	
Service ID [hex]	0x4e	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
	MessageType	Type of the message (request/response)
	MessageResult	Result of the message (OK/ERROR)
	DataPtr	Pointer to received data.
	Length	Length of the data in bytes.
Parameters (inout)	StatePtr	Pointer to received data.
Parameters (out)	SourceID	A system-unique identifier of the Data Source.
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.

Description	<p>Checks the Data received using the E2E profile 7m. 8.3.10.4 E2E_P08mSourceCheck

[SWS_E2E_91084] Definition of API function E2E_P08mSourceCheck [

Service Name	E2E_P08mSourceCheck	
Syntax	Std_ReturnType E2E_P08mSourceCheck (const E2E_P08mConfigType* ConfigPtr, E2E_P08mCheckStateType* StatePtr, uint32 SourceID, Std_MessageTypeType MessageType, Std_MessageResultType Messageresult, const uint8* DataPtr, uint32 Length)	
Service ID [hex]	0x63	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
	SourceID	A system-unique identifier of the Data Source.
	MessageType	Type of the message (request/response)
	Messageresult	Result of the message (OK/Error)
	DataPtr	Pointer to received data.
	Length	Length of the data in bytes.
Parameters (inout)	StatePtr	Pointer to received data.
Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.

Description	Checks the Data received using the E2E profile 8m. This includes CRC calculation, handling of Counter, Data ID, Message Type, Message Result, and Source ID. The function checks only one single data in one cycle, it does not determine/compute the accumulated state of the communication link. This function is intended for usage at the data source (i.e., in case of C/S communication at the client).
Available via	E2E.h

[SWS_E2E_91029]{DRAFT} Definition of API function E2E_P44Forward [

Service Name	E2E_P44Forward (draft)	
Syntax	<pre>Std_ReturnType E2E_P44Forward (const E2E_P44ConfigType* ConfigPtr, uint16 Length, E2E_P44CheckStatusType Checkstatus, E2E_P44ProtectStateType StatePtr, uint8* DataPtr)</pre>	
Service ID [hex]	0x52	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
	Length	Length of the data in bytes.
	Checkstatus	E2E Status of the received message
Parameters (inout)	StatePtr	Pointer to port/data communication state.
	DataPtr	Pointer to Data to be transmitted.
Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.
Description	Protects data which is forwarded by using the E2E profile 44. This includes checksum calculation, handling of counter and Data ID. Detected Errors of received message will be reconstruct on output data. Tags: atp.Status=draft	
Available via	E2E.h	

]([RS_E2E_08527](#))

8.3.13.4 E2E_P44Check

[SWS_E2E_91030] Definition of API function E2E_P44Check [

Service Name	E2E_P44Check	
Syntax	<pre>Std_ReturnType E2E_P44Check (const E2E_P44ConfigType* ConfigPtr, E2E_P44CheckStateType* StatePtr, const uint8* DataPtr, uint16 Length)</pre>	
Service ID [hex]	0x53	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	ConfigPtr	Pointer to static configuration.
	DataPtr	Pointer to received data.
	Length	Length of the data in bytes.
Parameters (inout)	StatePtr	Pointer to received data.

Parameters (out)	None	
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL E2E_E_INPUTERR_WRONG E2E_E_INTERR E2E_E_OK For definitions for return values, see SWS_E2E_00047.
Description	Checks the Data received using the E2E profile 44. This includes CRC calculation, handling of Counter and Data ID. The function checks only one single data in one cycle, it does not determine/compute the accumulated state of the communication link.	
Available via	E2E.h	

|(RS_E2E_08527)

8.3.13.5 E2E_P44CheckInit

[SWS_E2E_91031] Definition of API function E2E_P44CheckInit [

Service Name	E2E_P44CheckInit	
Syntax	Std_ReturnType E2E_P44CheckInit (E2E_P44CheckStateType* StatePtr)	
Service ID [hex]	0x55	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	StatePtr	Pointer to port/data communication state.
Return value	Std_ReturnType	E2E_E_INPUTERR_NULL - null pointer passed E2E_E_OK
Description	Initializes the check state.	
Available via	E2E.h	

|(RS_E2E_08527)

[SWS_E2E_10002] [In case State is NULL, E2E_P44CheckInit shall return immediately with E2E_E_INPUTERR_NULL. Otherwise, it shall initialize the state structure, setting:

1. Counter to 0xFF'FF.
2. Status to E2E_P44STATUS_ERROR.

|(RS_E2E_08528, RS_E2E_08539)

8.3.13.6 E2E_P44MapStatusToSM

[SWS_E2E_91032] Definition of API function E2E_P44MapStatusToSM [

Service Name	E2E_P44MapStatusToSM	
Syntax	<pre>E2E_PCheckStatusType E2E_P44MapStatusToSM (Std_ReturnType CheckReturn, E2E_P44CheckStatusType Status)</pre>	
Service ID [hex]	0x56	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	CheckReturn	Return value of the E2E_P44Check function
	Status	Status determined by E2E_P44Check function
Parameters (inout)	None	
Parameters (out)	None	
Return value	E2E_PCheckStatusType	Profile-independent status of the reception on one single Data in one cycle.
Description	The function maps the check status of Profile 44 to a generic check status, which can be used by E2E state machine check function. The E2E Profile 44 delivers a more fine-granular status, but this is not relevant for the E2E state machine.	
Available via	E2E.h	

](RS_E2E_08527)

[SWS_E2E_10003] [If CheckReturn = E2E_E_OK, then the function E2E_P44MapStatusToSM shall return the values depending on the value of Status: See [SWS_E2E_00612] If CheckReturn != E2E_E_OK, then the function E2E_P44MapStatusToSM() shall return E2E_P_ERROR (regardless of value of Status).](RS_E2E_08548)

]([RS_E2E_08528](#))

8.4 Callback notifications

None. The E2E library does not have call-back notifications.

8.5 Scheduled functions

None. The E2E library does not have scheduled functions.

8.6 Expected interfaces

In this chapter, all interfaces required from other modules are listed. The functions of the E2E Library are not allowed to call any other external functions than the listed below. In particular, E2E library does not call RTE.

[SWS_E2E_00110] [The E2E library shall not call any functions from external modules apart from explicitly listed expected interfaces of E2E Library.] ([RS_E2E_08528](#))

8.6.1 Mandatory Interfaces

This chapter defines the interfaces, which are required to fulfill the core functionality of the module.

Figure 8.39: Expected mandatory interfaces by E2E library

9 Sequence diagrams

This chapter describes how the E2E library is supposed to be invoked by the callers. It shows how the E2E Library is used to protect data elements and I-PDUs.

9.1 Sender

[UC_E2E_00202] [During its initialization, the Sender shall instantiate the structures PXXConfigType and PXXProtectStateType, separately for each Data to be protected.] ([RS_E2E_08528](#))

[UC_E2E_00203] [During its initialization, the Sender shall initialize the PXXConfigType with the required configured settings, for each Data to be protected.] ([RS_E2E_08528](#))

Settings for each instance of PXXConfigType are different for each Data; they are defined in Software Component template in the class EndToEndDescription.

[UC_E2E_00204] [During its initialization, the Sender shall initialize the E2E_PXXProtectStateType for each Data, with the configured following values: Counter = 0.] ([RS_E2E_08528](#))

[UC_E2E_00205] [In every send cycle, the Sender shall invoke once the function E2E_PXXProtect() and then once the function to transmit the data (e.g. Rte_Send_<p>_<o>() or PduR_ComTransmit()).

This means that is not allowed e.g. to call E2E_PXXProtect() twice without having Rte_Send_<p>_<o>() in between. It is also not allowed e.g. to call PduR_ComTransmit() twice without having E2E_PXXProtect() in between.] ([RS_E2E_08528](#))

9.1.1 Sender of data elements

The diagram below specifies the overall sequence involving the E2E Library called by the Sender of data elements. The Sender itself can be realized by one or more modules/files. After the diagram, there are requirements specific to Sender of data elements.

Figure 9.1: Sender of data elements

After the new data element is available, before calling E2E_PXXProtect(), the Sender of data elements, shall:

[UC_E2E_00230] [In case the data element communication is inter-ECU and the data element is not an opaque uint8 array, then the user of the E2E Library shall serialize the data element into the array Data. The content of the array Data shall be the equal to the content of the serialized representation of corresponding signal group in an I-PDU.]
(RS_E2E_08528)

Note that there can be several protected signal groups in an I-PDU.

To fulfill the above requirement, the user of E2E library needs to know how safety-related data elements are mapped by RTE to signals and then by COM to areas in I-PDUs so that it can replay this step. This is quite a complex activity because this means that the Sender needs to do a "user-level" COM.

[UC_E2E_00232] [For sending of data elements different from opaque arrays, the caller of E2E Library shall serialize the data element to Data, then it shall call the E2E_PXXProtect() routine and then it shall copy back the control fields from Data to data element.] ([RS_E2E_08528](#))

By its nature, the serialization involves data copying. If a data element is an opaque array, then there is no need for data serialization to array and the caller can cast a data element to `uint8*`. However, to avoid a special treatment of opaque arrays with respect to other data types, an implementer may decide to apply serialization of data element to Data also for opaque arrays.

The offsets of control fields in Data are defined in Software Component Template meta-class EndToEndDescription.

9.1.2 Sender at signal group level

The diagram below species the overall sequence involving the E2E Library by the Sender at the signal group level. The Sender itself can be realized by one or more modules/files (e.g. COM plus callouts, or COM plus complex device driver).

The diagram shows the example when there is only one E2E-protected signal group in the I-PDU, but in general it is possible to have several of them (0 or 1 E2E-protections per signal group). In such case, the sender of I-PDUs invokes E2E_PXXProtect on each E2E-protected signal group.

Figure 9.2: Sender of I-PDUs

9.2 Receiver

[UC_E2E_00206] [During its initialization, the Receiver shall instantiate the structures PXXConfigType and PXXReceiverType.] ([RS_E2E_08528](#))

Note: When selecting the following initialization and configuration parameters the functional behaviour of the enhanced E2E_PXXCheck()-functions (introduced in AUTOSAR R4.0.4 and R3.2.2) is application-wise backward compatible to the E2E_PxxCheck()-function of the earlier AUTOSAR releases:

State -> SyncCounter := 0;

Config -> MaxNoNewOrRepeatedData := 14 (when using Profile 1);

Config -> MaxNoNewOrRepeatedData := 15 (when using Profile 2);

Config -> SyncCounterInit := 0;

Exemplary configuration parameters and resulting behaviour of the E2E_PxxCheck function:

E2E_PxxConfigType:
 Config → MaxDeltaCounterInit = 2 (i.e. tolerance interval for initial counter differences)
 Config → MaxNoNewOrRepeatedData = 3 (i.e. tolerance interval for maximum counter differences)
 Config → SyncCounterInit = 2 (i.e. duration of counter continuity check)
 Timeout interval checked by SWC = 8 transmission cycles

Figure 9.3: Configuration parameters of the E2E_PxxCheck() function and their effects

Clarification regarding SYNC states in Figure 9.3: In cycle 9, the counter value is not trustable anymore since the NoNewOrRepeatedData exceeds MaxNoNewOrRepeatedData. The resulting behavior is similar to as if an "unexpected behavior of the counter" is detected in cycle 9. Thus, the "counter continuity check" spans from cycle 10-11.

[UC_E2E_00207] [During its initialization, the Receiver shall initialize the PXXConfig Type with the required configured settings, for each Data.] ([RS_E2E_08528](#))

Settings for each instance of PXXConfigType are different for each Data; they are defined in Software Component template in the class EndToEndDescription.

[UC_E2E_00209] [In every receive cycle, the Receiver shall:

- Invoke once the reception function Rte_Read_<p>_<o>().
1. Set the attribute State->NewDataAvailable to TRUE if new data has been received without any errors:
 - In case of single channel or channel 1: State->NewDataAvailable = (retRteRead == RTE_E_OK) ? TRUE : FALSE;
 - In case of channel 2: State->NewDataAvailable = TRUE; (note: the second channel has no access to Rte_Read return value).
 2. Update Data, using received data element or I-PDU.
 3. Call once the function E2E_PXXCheck().
 4. Handle results (return value and State parameter) returned by E2E_PXXCheck().

](RS_E2E_08528)

Note: In case of single channel only, the NewDataAvailable flag may additionally incorporate the return value of the Rte_IsUpdated() API (if available) in the following way:

1. Invoke once the function Rte_IsUpdated_<p>_<o>().
2. Distinguish
 - If Rte_IsUpdated_<p>_<o>() returned FALSE : Set the attribute State->NewDataAvailable to FALSE and retRteRead to RTE_E_OK
 - If Rte_IsUpdated_<p>_<o>() returned TRUE :
 - Invoke once the reception function Rte_Read_<p>_<o>()
 - Set the attribute State->NewDataAvailable to TRUE if Rte_Read_<p>_<o>() returned RTE_E_OK, otherwise set it to FALSE
3. Steps 3.-5. as stated in [UC_E2E_00209].

This resembles the optional functionality of E2EPW_Read_<p>_<o>() as specified in AR 3.2.1 - 3.2.2 / AR 4.0.1 - AR 4.1.1. It was changed as the functionality of RTE_IsUpdated_<p>_<o>() strongly depends on the underlying Com stack to provide a reliable reception indication (callback). Otherwise, corrupted data might be masked.

Note: In case of single channel only AND if AliveTimeout is configured, the NewDataAvailable flag may additionally incorporate the return value of the Rte_IsUpdated() API (if available) in the following way:

1. Invoke Rte_IsUpdated_<p>_<o>
2. Invoke Rte_Read_<p>_<o>
3. Distinguish:
 - Set State->NewDataAvailable to TRUE if Rte_Read_<p>_<o> returned TRUE AND Rte_IsUpdated_<p>_<o> returned TRUE
 - Set State->NewDataAvailable to FALSE otherwise

This way the AliveTimeout "RTE_E_MAX_AGE_EXCEEDED" is returned via Rte_Read_<p>_<o> to the SWC.

The Functions E2E_PXXCheck() return the results of verification, by means of parameter State. Within the State (structure E2E_PXXCheckStateType), there is the attribute LostData, which is has a defined value and makes sense only for the following states: E2E_PXXSTATUS_OK and E2E_PXXSTATUS_OKSOMELOST.

[UC_E2E_00233] [If the return from the function E2E_PXXCheck() is different than E2E_PXXSTATUS_OK and E2E_PXXSTATUS_OKSOMELOST, then the caller shall not evaluate the attribute State->LostData.] (RS_E2E_08528)

9.2.1 Receiver at data element level

The diagram below specifies the overall sequence involving the E2E Library called by the Receiver at data element level. The Sender itself can be realized by one or more modules/files. After the diagram, there are requirements specific to Sender of data elements.

Figure 9.4: Receiver of data elements

[UC_E2E_00277] [In case the data element communication is inter-ECU and the data element is not an opaque uint8 array, then the Receiver shall serialize the data element into the array Data. The layout (content) of Data shall be the same as the layout of the corresponding I-PDU over which the data element is sent. Moreover, the Receiver shall also verify that all bits that are not transmitted in I-PDU (i.e. which are not present in Data) are equal to 0.] ([RS_E2E_08528](#))

To fulfill the above requirement, the Receiver needs to know how safety-related data elements are mapped by RTE to signals and then by COM to I-PDUs so that it can replay this step. This is quite a complex activity because this means that the Sender needs to do a "user-level" COM.

An example of bit verification: Assuming that 10 bits in I-PDU are expanded by COM into 16-bit signal and then by RTE into a 16-bit data element. In this case, the 6 most significant bits of the data element shall be 0. This shall be verified by the Receiver.

[UC_E2E_00278] [For reception of data elements different from opaque arrays, the caller of E2E Library shall serialize the data element to Data, then it shall call the check routine.] ([RS_E2E_08528](#))

9.2.2 Receiver at signal group level

The diagram below summarizes the sequence involving the E2E Library by the Receiver at signal group level.

The diagram shows the example when there is only one E2E-protected signal group in the I-PDU, but in general, it is possible to have several of them (0 or 1 E2E-protections per signal group). In such case, the receiver of I-PDUs invokes E2E_PXXCheck on each E2E-protected signal group.

Diagram below shows the step "State".

This applies only for channel 2. For channel 1 and single channel, the step is "State.NewDataAvailable = (ret0 == RTE_E_OK) ? TRUE : FALSE".

Figure 9.5: Receiver of I-PDUs

10 Configuration specification

E2E Library, like all AUTOSAR libraries, has no configuration options. All the information needed for execution of Library functions is passed at runtime by function parameters. For the functions E2E_PXXProtect() and E2E_PXXCheck(), one of the parameters is Config, which contains the options for the protection of Data.

[SWS_E2E_00037] [The E2E library shall not have any configuration options.] ([SRS_BSW_00344](#), [SRS_BSW_00345](#), [SRS_BSW_00159](#), [SRS_BSW_00167](#), [SRS_BSW_00171](#), [SRS_BSW_00170](#), [SRS_BSW_00101](#))

10.1 Published Information

[SWS_E2E_00038] [The standardized common published parameters as required by SRS_BSW_00402 in [6, General Requirements on Basic Software Modules] shall be published within the header file of this module and need to be provided in the BSW Module Description. The according module abbreviation can be found in [7, List of Basic Software Modules].] ([SRS_BSW_00004](#))

Additional module-specific published parameters are listed below if applicable.

A Annex A: Safety Manual for usage of E2E Library

This chapter contains requirements on usage of E2E Library when designing and implementing safety-related systems, which are depending on E2E Protection of communication.

The description how to invoke/call of E2E Library API is defined in [chapter 9](#).

A.1 E2E profiles and their standard variants

E2E Library provides two E2E Profiles. They can be used for inter and intra ECU communication.

Because E2E Profile 1 has several configuration options, the recommended/default values for the options are defined as standard E2E profile 1 variants.

[UC_E2E_00053] [Any user of E2E Profile 1 shall use whenever possible the defined E2E variants.] ([RS_E2E_08528](#))

A.2 E2E error handling

The E2E library itself does not handle detected communication errors. It only detects such errors for single received data elements and returns this information to the callers (e.g. SW-Cs), which have to react appropriately.

A general standardization of the error handling of an application is usually not possible.

[UC_E2E_00235] [The user (caller) of E2E Library, in particular the receiver, shall provide the error handling mechanisms for the faults detected by the E2E Library .] ([RS_E2E_08528](#))

A.3 Methodology of usage of E2E Library

This section summarizes the steps needed to use the E2E Library. In AUTOSAR R4.0 the usage of E2E Library is not defined by AUTOSAR methodology. There are four main steps, as described below.

In the first step the user selects the architectural approach how E2E Library is used in a given system (through COM callouts, through E2E Protection wrapper etc). There are several architectural solutions of usage of E2E Library described in Chapter [section A.5](#).

In the second step, the user selects which data elements or signal groups need to be protected and with which E2E Profile. In principle, all transmitted data identified as safety-related are those that need to be protected.

In the third step, the user determines the settings for each selected data element or signal group to be protected. The settings are stored in Software Component Template metaclass `EndToEndDescription`. The settings include e.g. Data ID, CRC offset.

1. For each signal group to be protected, there is a separate instance of `EndToEndDescription`, associated in System Template to `ISignalIPdu` metaclass.
2. For each data element to be protected, there is a separate instance of `EndToEndDescription`, associated indirectly to `VariableDataPrototype`, `SenderComSpec` and `ReceiverComSpec` metaclasses.

In the fourth and last step, the user generates (or otherwise develops) the necessary glue code (e.g. E2E Protection Wrapper, COM callouts), responsible for invocation of E2E Library functions. The glue code serves as an adapter between the communication modules (e.g. COM, RTE) and E2E Library.

A.4 RTE configuration constraints for SW-C level protection

In case the E2E Library is used to protect data elements, there are a few constraints how RTE needs to be configured.

If the protection takes place at the level of I-PDUs, then there are no constraints from the side of E2E on RTE configuration.

A.4.1 Communication model for SW-C level protection

AUTOSAR RTE supports different communication models, like client-server, sender-receiver, mode switch etc.

A.4.2 Multiplicities for SW-C level protection

The E2E Library is not intended to be used for N:1 sender-receiver multiplicities.

[UC_E2E_00258] [In case the E2E Library is used to protect data elements, then the selected multiplicity shall be 1:N or 1:1.] ([RS_E2E_08528](#))

A.4.3 Explicit access

Sender-receiver SW-C communication is asynchronous in the sense that the sender does not wait for the receiver. It means that the sender passes the data element to RTE and continues the execution - it does not wait for the receiver to receive the data - this is not configurable. RTE transmits the data to the receiver concurrently to the execution of the sender.

Now, the question is how the receiver gets the data. There are two ways to do it in AUTOSAR, which is configurable in RTE:

- The receiver waits for new data: it is blocked/waiting until new data element from the sender arrives (RTE communication modes "wake up of wait point" and "activation of Runnable entity")
- The receiver gets the currently available data element from RTE, i.e. the most recent data element (RTE communication modes "Implicit data read access" and "Explicit data read access")

E2E Profile 1 and 2 together with the proposed E2E protection wrapper provide timeout detection (which is one of the failure modes to handle - e.g. message loss). This is achieved by having the receiver executing independently from the reception of the data, and by the usage of a counter within E2E Profiles. By this means, if e.g. a data element is lost, it is seen by the receiver that every time the read data element has the same counter. This however requires that the receiver is not solely executed upon the arrival of data.

In case the receiver is event-driven, then a timeout mechanism at the receiver needs to be used. The timeout mechanism is not a part of E2E Library.

[UC_E2E_00089] [In case the E2E Library is used to protect data elements, data elements accessed with E2E Protection Wrapper shall use the activation "Explicit data read access" (i.e. it shall not use the activations "Implicit data read access").] ([RS_E2E_08528](#))

A.5 Restrictions on the use of COM features

The following table lists COM features with a brief description and provides a classification of restriction of use in combination with End-to-End communication protection as described in this document.

Note: This list only covers features of the BSW module COM in combination with E2E Library and E2E Protection Wrapper. It does not address features of above layers (e.g. RTE) or use-cases where the E2E Transformer is used. The latter usually is used above the BSW module LdCom.

The restriction classes are as follows:

- "supported" means that both (E2E COM Callout and E2EPW) do support this feature.
- "use case dependent" means that the feature might be used/usable depending on the actual use case and configuration on sender and receiver side. However, suitability for an actual system and its influence on the safety requirements has to be analysed.

- "not supported" means that at least one variant (either E2E COM Callout or E2EPW) does not support this feature or a failure mode can be masked.

COM Feature / brief description	Classification
[SRS_Com_02078] Support of endianness conversion	supported
[SRS_Com_02086] Support of Sign-Extension for received signals	supported
[SRS_Com_02042] Initialization of unused areas/ bits of an I-PDU	supported
[SRS_Com_02083] Transmission Modes	use case dependent
[SRS_Com_02082] Two different Transmission Modes	use case dependent
[SRS_Com_02084] Signal data based selection of Transmission Mode	use case dependent
[SRS_Com_02113] Signal data based transmission modes for configured serialized data	use case dependent
[SRS_Com_02046] Configuration of signal notification	supported
[SRS_Com_02080] Cancellation outstanding repetitions in case of a new send request	use case dependent
[SRS_Com_02089] Two configurable options to handle signal timeouts on receiver side	use case dependent
[SRS_Com_02077] Signal invalidation mechanism on sender-side	use case dependent
[SRS_Com_02079] Signal invalidation mechanism on receiver-side	use case dependent
[SRS_Com_02087] Substitution of invalid value by configurable data value	use case dependent
[SRS_Com_02088] Substitution of the last received value by the init value in case of signal timeout	use case dependent
[SRS_Com_00218] Starting/ Stopping communication of I-PDU groups	supported
[SRS_Com_00192] Enabling/ disabling reception deadline monitoring of I-PDU groups	use case dependent
[SRS_Com_02041] Consistent transfer of complex data types	supported
[SRS_Com_02091] Placement of large or dynamical length signals	not supported
[SRS_Com_02092] Support only one dynamic length signal per I-PDU	not supported
[SRS_Com_02093] Dynamic length signal must be placed last in I PDU	not supported
[SRS_Com_02094] Dynamic length signals must be of type UINT8[n]	not supported
[SRS_Com_02095] TP shall be used to fragment and reassemble large signals and dynamical signals	not supported
[SRS_Com_02030] Identify if a signal/signal group is updated by the sender	use case dependent
[SRS_Com_02058] Deadline monitoring of receiving updated signals/signal groups	use case dependent
[SRS_Com_02099] I-PDU Counter mechanism	use case dependent
[SRS_Com_02100] I-PDU Counter configuration	use case dependent
[SRS_Com_02101] Transmission and reception using I-PDU Counter	use case dependent
[SRS_Com_02102] I-PDU Counter error handling	use case dependent
[SRS_Com_02103] I-PDU Replication mechanism	use case dependent

COM Feature / brief description	Classification
[SRS_Com_02104] I-PDU replication configuration	use case dependent
[SRS_Com_02105] Transmission and reception using I-PDU Replication	use case dependent
[SRS_Com_02106] I-PDU Replication error handling	use case dependent
Minimum Delay Time	use case dependent
Filtering at receiver side (e.g. COM273)	use case dependent
Filtering at sender side	use case dependent
Multiple Signal groups within an I-PDU	use case dependent

Table A.1: Classification of COM features

B Annex B: Application hints on usage of E2E Library

To enable the proper usage of the E2E Library different solutions are possible. They may depend e.g. on the integrity of RTE, COM or other basic software modules as well as the usage of other SW/HW mechanisms.

The user is responsible for selecting the solution for usage of E2E Library that is fulfilling safety requirements of his particular safety-related system.

Each particular implementation based on solutions described in this chapter needs to be evaluated with regard to functional safety prior to their use.

The E2E Library can be used in different ways (each explained in a separate section of this chapter):

- E2E Protection Wrapper - non-standard integrator software to protect data, above RTE ([section B.1](#))
- COM callouts - non-standard integrator code to protect I-PDUs ([section B.2](#)).
- hybrid / unused ([section B.3](#))
- Out-of-box protection at RTE level (E2E Transformer)([section B.4](#))

It is also possible to have mixed scenarios, e.g.:

- For a particular data element, a sender using E2E Protection Wrapper and receiver using COM E2E callouts (or reverse)
- In a given ECU network or one ECU: some data elements protected with E2E protection Wrapper and some with COM E2E callouts.

The first scenario is useful for network diagnostic (e.g. when a monitoring device without RTE checks messages), or when one of the communication partners does not have RTE.

The best situation is when the integrity of operation of RTE and COM for transmitting/ converting safety-related data can be guaranteed. In short, we call this safe RTE and safe COM.

This annex describes two exemplary, basic solutions how E2E Library can be invoked. First, this is by means of a dedicated sub-layer for a SW-C or several SW-Cs (which is called E2E Protection Wrapper, see [section B.1](#)). Secondly, this can be done by means of dedicated COM Callouts invoking E2E Library to protect signal groups representing data elements (which is called COM E2E Callouts, see [section B.2](#)).

[section B.3](#) shows how a component which requires the Protection Wrapper interfaces ([section B.1](#)) can be integrated on a ECU providing the COM Callout solution ([section B.2](#)).

All necessary options, enabling to generate the code for the described solutions are available in AUTOSAR configuration, defined in [8, System Template] and [9, Software Component Template]. This contains e.g. association of I-PDUs with Data IDs.

To generate the wrapper, the user defines EndToEnd* metaclasses and associates them to VariableDataPrototypes (representing complex data elements). To generate the COM E2E callouts for an I-PDU, the user defines EndToEnd* metaclasses and associates them to ISignalIPdu metaclass (representing the I-PDU).

There are a few E2E mechanisms in which an I-PDU can be protected. There is a new standard mechanism: E2E Transformer, and there are two de-facto-standard mechanisms COM E2E callouts and E2E Protection Wrapper. Finally, some integrators use their own mechanisms like safe COM module. It makes only sense to use one of the mechanism for a given I-PDU.

[UC_E2E_00271] [A given I-PDU, if protected by E2E, shall be protected by only one E2E mechanism.] ([RS_E2E_08528](#))

B.1 E2E Protection Wrapper

Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach.

In this approach, every safety-related SW-C has its own additional sub-layer (which is a .h/.c file pair) called E2E Protection Wrapper, which is responsible for marshalling of complex data elements into the layout identical to the corresponding I-PDUs (for inter-ECU communication), and for correct invocation of E2E Library and of RTE.

The usage of E2E Protection Wrapper allows the use of VFB communication between SW-Cs¹, without the need of further measures to ensure VFB's integrity.

The communication between such SW-Cs can be within an ECU (which means on the same or different cores or within the same or different memory partitions of a micro-controller) or across ECUs (SW-Cs connected by a VFB also using a network).

The end-to-end protection is a systematic solution for protecting SW-C communication, regardless of the communication resources used (e.g. COM and network, OS/IOC or internal communication within the RTE). Relocation of SW-Cs may only require selection of other protection parameters, but no changes on SW-C application code.

The usage of E2E Protection Wrapper can be optimized by appropriate software/memory partitioning.

The E2E Protection Wrapper does not support multiple instantiation of the SW-Cs. This means, if an SW-C is supposed to use E2E Protection Wrapper, then this SW-C must be single-instantiated.

¹The term SW-C includes any software module that has an RTE interface, i.e. a sensor/actuator/application SW-C, an AUTOSAR service, or a Complex Driver.

[UC_E2E_00292] [If the E2E Library is invoked from E2E Protection Wrapper (at the level of data elements), then multiple instantiation is not allowed. For an AUTOSAR software component which uses the E2E Protection Wrapper the value of the attribute `supportsMultipleInstantiation` of the `SwcInternalBehavior` shall be set to `FALSE` in the AUTOSAR software component description.

The E2E Protection Wrapper itself is not a part of E2E Library. However, its options are standardized. Most of the options for E2E Protection Wrapper are defined in [8, System Template] and some of them are in [9, Software Component Template].] ([RS_E2E_08528](#))

[UC_E2E_00249] [The integrity of the operation of E2E Protection Wrapper (for transmitting/converting safety-related data) shall be guaranteed.] ([RS_E2E_08528](#))

The functions of the E2E Protection Wrapper are not reentrant, therefore they are not to be called concurrently.

[UC_E2E_00288] [Each E2E Protection Wrapper function shall not be called concurrently.] ([RS_E2E_08528](#))

To implement the above requirement, it is recommended to design the SW-Cs and the E2E ports in the way that one particular E2E Protection Wrapper function is called from one Runnable only, i.e. one E2E Protection Wrapper should "belong" to a particular Runnable.

Note: The caller of E2EPW API functions shall make sure that internal status data structures of E2EPW are initialized correctly. Initialization can be done by ECU start-up code or explicitly via E2EPW init functions.

B.1.1 Functional overview

The E2E Protection Wrapper functions as a wrapper over the `Rte_Write` and `Rte_Read` functions, offered to SW-Cs. The E2E Protection Wrapper encapsulates the `Rte_Read/Write` invocations and protection of data exchange using E2E Library.

For a data element to transmit, there is a set of wrapper functions (`Read/Write/Init`) generated for Sender and for the Receiver.

The E2E Protection Wrapper functions are responsible for instantiation and initialization of data structures required for calling the E2E Library, for invocation of E2E Library and invocation of `Rte_Read/Rte_Write` functions and for serialization of data elements. The initialization of data structures depend on specific data element, e.g. the Data ID, or E2E Profile to be used.

The functions `E2EPW_Write_<p>_<o>()` and `E2EPW_Read_<p>_<o>()` return 32-bit integers that represent the status.

[Figure B.1](#) shows the overall flow of usage of E2E Library and E2E Protection Wrapper from SW-Cs (the 1st number on the labels defines the order of execution):

Figure B.1: Example E2E Protection Wrapper - overall flow

B.1.2 Application scenario with Transmission Manager

It is possible to have one central SW-C to collect safety-related data of several SW-Cs on a given ECU to transmit them combined through a network.

On the sender ECU, there is a dedicated SW-C called Transmission Manager, containing E2E Protection Wrapper. The Transmission Manager collects safety-related data from related SW-Cs, combines them and protects them using E2E Protection Wrapper. Finally, it provides the combined and protected Data as data element to RTE.

On the receiver ECU there may also be a Transmission Manager, which does the reverse steps for the reception of such data.

The Transmission Manager SW-C modules are not part of E2E Library nor part of AUTOSAR.

Figure B.2: Example Transmission Manager - sender ECU

Figure B.3: Example Transmission Manager - receiver ECU

Figure B.4: Example Transmission Manager - sender ECU sequence

In this example, for SW-C1 and SW-C2 it is not visible that the communication is going through such a Transmission Manager, which can support the portability and optimize resource usage of communication network. It is only through AUTOSAR configuration where it is visible that the receiver of SW-C1 and of SW-C2 is SW-C3.

[UC_E2E_00213] [The implementation of the Transmission Manager (as a safety-related Software Component), shall comply with the requirements for the development of safety-related software for automotive domain.] ([RS_E2E_08528](#))

B.1.3 Application scenario with E2E Manager and Conversion Manager

This application scenario is similar to the previous one, where the Transmission Manager is split into two separate SW-Cs (E2E Manager and Conversion Manager). The advantage of the scenario is that the E2E Manager can be automatically generated and that Conversion Manager is independent completely from E2E protection.

The Conversion Manager is an SW-C responsible for data conversion, e.g. float-to-integer conversion. On sender ECU, the E2E Manager is responsible for assembling all data elements to be transmitted and protecting them through E2E Protection Wrapper. On receiver ECU, the Conversion Manager is responsible for checking the data through E2E Protection Wrapper and then by filtering out the data that is not needed by receiver Conversion Manager.

The E2E Manager and Conversion Manager SW-C modules are not part of E2E Library nor part of AUTOSAR.

Figure B.5: E2E Manager and Conversion Manager - sender ECU

Figure B.6: E2E Manager and Conversion Manager - receiver ECU

In the above example, the SW-Cs of sender ECU generate three data elements (data E1, dataE2 and dataE3) but the SW-Cs of receiver ECU use only two data elements (dataE1 and dataE2). The unused DataE3c is not delivered to Conversion Manager.

Thanks to this, if due to e.g. system evolution, the definition of DataE13 changes, then the receiver SW-Cs (SW-C 5, SW-C 6 and SW-C 7 Conversion Manager) do not need to be changed.

The corresponding system configuration description looks as shown by Figure Figure B.7. Note that the SW-C 7 has as input only the required data elements. The unused data elements (CRC, counter, dataE13c) are not provided:

Figure B.7: E2E Manager and Conversion Manager - system configuration

The E2E protection wrapper of E2E manager can be automatically generated.

The application code of E2E manager is responsible only for "routing" of the input data elements into output data elements, which is also straightforward and can be generated. For the example above, the application code of E2E Manager may look as follows:

```

/* the input complex data element contains primitive data elements
   unused by other SW-Cs of the ECU */
typedef struct {
    uint8 crc;
    uint8 counter;
    uint16 dataE11c;
    uint16 dataE12c;
    uint16 dataE13c;
} Inputswc8Type;
/* the output complex data element is a subset of input, with the
   data used by other SW-Cs of the ECU */
typedef struct {
    uint16 dataE11c;
    uint16 dataE12c;
} Outputswc8DataType;
Inputswc8Type Inputswc8;
Outputswc8Type Outputswc8;
...
/* copy from Inputswc8 the primitive data elements that are also in
   outputswc8 */
Outputswc8Type.dataE11c = Inputswc8Type.dataE11c;
Outputswc8Type.dataE12c = Inputswc8Type.dataE12c;

```

[UC_E2E_00274] [E2E Manager shall have complex data elements with prefix Input or with prefix Output. There is one-to-one relationship between the data element with input prefix and data element with output prefix] ([RS_E2E_08528](#))

In the example above, there is Inputswc8 and the corresponding Outputswc8.

[UC_E2E_00275] [The output data element shall contain the subset of primitive data elements of those of the corresponding input data element (in particular, they may be equal).] ([RS_E2E_08528](#))

In the example above, Outputswc8 contains the subset of attributes of Inputswc8. It does not contain dataEl3c, crc, nor counter.

For each primitive data element of output complex data element, the (generated) application code of E2E manager shall write it with the value read from the corresponding primitive data element of the input complex data element.

In the example above, the application code of E2E manager copies dataEl1c and dataEl2c from Inputswc8 to Outputswc8.

[UC_E2E_00272] [The implementation of the Conversion Manager and E2E Manager (as a safety-related Software Component), shall comply with the requirements for the development of safety-related software for automotive domain.] ([RS_E2E_08528](#))

[UC_E2E_00273] [The E2E Manager SW-C at receiver ECU shall filter out the data elements that are not used by the SW-Cs of the ECU. The E2E Manager SW-C at receiver ECU shall forward to Conversion Manager SW-C only the data elements that are used by Conversion Manager SW-C.] ([RS_E2E_08528](#))

B.1.4 File structure

[UC_E2E_00239] [The E2E Protection Wrapper, for the given SW-C identified with <SWC-Type-short name>, shall be made of two files: E2EPW_<SWC-Type-short name>.c and E2EPW_<SWC-Type-short name>.h.] ([RS_E2E_08528](#))

[UC_E2E_00242] [The SW-C implementation files that invoke E2E Protection Wrapper functions shall include E2EPW_<SWC-Type-short name>.h.] ([RS_E2E_08528](#))

[UC_E2E_00256] [The E2E Protection Wrapper shall ensure the integrity of the safety-related data elements.] ([RS_E2E_08528](#))

[UC_E2E_00257] [The implementation of the E2E Protection Wrapper (as a safety-related Software Component) shall comply with the requirements for the development of safety-related software for the automotive domain.] ([RS_E2E_08528](#))

B.1.5 Methodology

Note: Different releases of AUTOSAR have different names for COM classes. The text description below is generalized to fit to different releases, but the diagrams are slightly different (main differences are different names of classes and objects).

During the RTE contract phase (i.e. when SW-C interface files are generated), the standard AUTOSAR RTE generator generates, for an SW-C, the SW-C interface file `Rte_<SWC-Type-short name>.h`. This file contains the RTE's generated functions like `Rte_Write_<p>_<o>()`. For each function in this file used to transmit safety-related data, there is the corresponding function in `Rte_<SWC-Type-short name>.h`.

The E2E protection wrapper can be implemented manually, or can be generated/configured from its description. All necessary information required to generate the E2E Protection Wrapper can be configured using AUTOSAR templates (system template, SW-C template, ECU configuration).

The generation of the E2E protection wrapper can be done along the execution the step "Generate Component API", which step generates "Component API".

[UC_E2E_00248] [The E2E Protection Wrapper shall be generated for the complex data elements (represented by `VariableDataPrototype` metaclass) for which the corresponding `EndToEnd*` metaclasses are defined.] ([RS_E2E_08528](#))

[UC_E2E_00289] [If the E2EProtection is done in the E2E Wrapper then both `EndToEndProtectionSignalIPdu` and `EndToEndProtectionVariablePrototype` shall be defined.] ([RS_E2E_08528](#))

Most of the settings are defined under [9, Software Component Template].

Figure B.8: Release R4.0.1 and newer: E2E Protection Wrapper configuration (hardcopy from DOC_EndtoEndProtection)

The metaclass `EndToEndProtectionVariablePrototype` defines that a particular (complex) data element shall be protected. This data element has at most one specific sender and any quantity of receivers (`VariableDataPrototype`). The specific settings how the data element shall be protected are defined in the class `EndToEndDescription` (these settings can be reused by different data prototypes).

Apart from configuring `EndToEndProtectionVariablePrototype`, further settings involve the mapping signal groups to I-PDUs, which is done according to [8, System Template]:

Figure B.9: Release R4.0.1 and newer: E2E Protection Wrapper configuration (hardcopy from DOC_PduEndToEndProtection)

The important settings are:

- ISignalIPdu (represents an I-PDU)
 - ISignalIPdu.unusedBitPattern: bits that are not used in an I-PDU,
- ISignalToIPduMapping: describes the mapping of signals to I-PDUs,
 - ISignalToIPduMapping.startPosition: offset in bits of a signal in the I-PDU,
- EndToEndProtectionISignalPdu: association of one E2E protection to a one I-PDU and to one signal group,
 - EndToEndProtectionISignalPdu.dataOffset: offset in bits of the signal group in the I-PDU.

It is possible to add several signal groups into one I-PDU using several EndToEndProtectionISignalPdu elements.

The ISignalIPdu.unusedBitPattern is used by COM to create the final I-PDU and by E2E Protection Wrapper, to create a correct I-PDU representation of the protected data (on which a correct CRC can be computed).

It is also necessary to configure SenderComSpec and ReceiverComSpec. ReceiverComSpec may override maxDeltaCounterInit provided by EndToEndDescription (by means of attribute ReceiverComSpec. maxDeltaCounterInit). This may be useful if different receivers of one data element (for the same sender) require different settings.

Figure B.10: Release R4.0.1 and newer: SenderComSpec (hardcopy from DOC_SenderComSpec)

Figure B.11: Release R4.0.1 and newer: ReceiverComSpec (hardcopy from DOC_ReceiverComSpec)

B.1.6 Error classification

The wrapper uses the standard E2E error codes of E2E library functions, which are extended with additional error codes.

[UC_E2E_00302] [Where applicable, the following error status shall be used by E2E Wrapper functions within byte 3 of the return value.] ([RS_E2E_08528](#)) The other error codes are already defined by SWS_E2E_00047, [section 7.1](#).

Type or error or status	How should the caller of E2E Wrapper handle it	Related code	Value [hex]
OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by 1 with respect to the most recent Data received with Status <code>_INITIAL</code> , <code>_OK</code> , or <code>_OKSOMELOST</code> . This means that no Data has been lost since the last correct data reception.	Production	<code>E2EPW_STATUS_OK</code>	0x0
Error: the Check function has been invoked but no new Data is not available since the last call, according to communication medium (e.g. RTE, COM). As a result, no E2E checks of Data have been consequently executed.	Production	<code>E2EPW_STATUS_NONEWDATA</code>	0x1
Error: The data has been received according to communication medium, but the CRC or Data or part of Data is incorrect/corrupted. This may be caused by corruption, insertion or by addressing faults.	Production	<code>E2EPW_STATUS_WRONGCRC</code>	0x2
NOT VALID: The new data has been received after detection of an unexpected behaviour of counter. The data has a correct CRC and a counter within the expected range with respect to the most recent Data received, but the determined continuity check for the counter is not finalized yet	Production	<code>E2EPW_STATUS_SYNC</code>	0x3
Error: The new data has been received according to communication medium, the CRC is correct, but this is the first Data since the receiver's initialization or reinitialization, so the Counter cannot be verified yet.	Production	<code>E2EPW_STATUS_INITIAL</code>	0x4
Error: The new data has been received according to communication medium, the CRC is correct, but the Counter is identical to the most recent Data received with Status <code>_INITIAL</code> , <code>_OK</code> , or <code>_OKSOMELOST</code> .	Production	<code>E2EPW_STATUS_REPEATED</code>	0x8
OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by DeltaCounter ($1 < \text{DeltaCounter} \leq \text{MaxDeltaCounter}$) with respect to the most recent Data received with Status <code>_INITIAL</code> , <code>_OK</code> , or <code>_OKSOMELOST</code> . This means that some Data in the sequence have been probably lost since the last correct/initial reception, but this is within the configured tolerance range.	Production	<code>E2EPW_STATUS_OKSOMELOST</code>	0x20
Error: The new data has been received according to communication medium, the CRC is correct, but the Counter Delta is too big ($\text{DeltaCounter} > \text{MaxDeltaCounter}$) with respect to the most recent Data received with Status <code>_INITIAL</code> , <code>_OK</code> , or <code>_OKSOMELOST</code> . This means that too many Data in the sequence have been probably lost since the last correct/initial reception.	Production	<code>E2EPW_STATUS_WRONGSEQUENCE</code>	0x40

Table B.1: Error codes of E2E Wrapper functions (in addition to E2E Library error codes)

Note that the previous versions of E2E Library (R3.2.1, R4.0.1, R4.0.2) returned the value 0x10 as `E2EPW_STATUS_OK`, so in case of upgrade of E2E libraries from those versions, the SW-Cs need an update.

[UC_E2E_00303] [Where applicable, the following error flags shall be used by E2E Wrapper functions on byte 1 of the return value] ([RS_E2E_08528](#)) The other error codes are already defined by [\[SWS_E2E_00047\] section 7.1](#)):

Type or error or status	How should the caller of E2E Wrapper handle it	Related code	Value [hex]
Extension/expansion error(s) occurred. It is the status if bit extension (conversion of shortened I-PDU representation into data elements) is correct. For example, if 12 bits from I-PDU are expanded into 16-bit uint, then the top most 4 bits shall be 0.	Integration or production	E2EPW_E_DESERIALIZATION	0x3
The control fields computed by Write1 and Write2 are not equal, i.e. status of voting between Write1 and Write2 failed	Integration or production	E2EPW_E_REDUNDANCY	0x5

Table B.2: Error codes of E2E Wrapper functions (in addition to E2E Library error codes)

[SWS_E2E_00314] [The caller of the E2E Wrapper functions should handle the errors/stati defined in UC_E2E_0302 and UC_E2E_0303 according to the column "How do caller of E2E shall handle it".] ([RS_E2E_08528](#))

In other words, the E2E library does not define any integration errors for itself, it does not call DEM nor DET. However, the caller of E2E library uses the return values of E2E functions and does the corresponding error handling.

B.1.7 E2E Protection Wrapper routines

There are two ways how the wrapper is generated. The first way is to have single channel functions Read and Write. The second way is to have redundant functions Write1, Write2, Read1 and Read2. Typically, the user should use either single channel or redundant function sets.

[UC_E2E_00293] [The parameter <instance> of the E2E Protection Wrapper routines shall be present if and only if the calling software component is multiply instantiated. Because in the current release multiple instantiation of software components is not supported by E2E Protection wrapper, this means that the optional parameter <instance> shall never be present.] ([RS_E2E_08528](#))

Because the above may change in future (the support for multiple instances may be introduced), and because of the goal to have the same API as the corresponding API of RTE, the optional parameter <instance> is kept.

To support future protocol and wrapper extensions on one side and the proprietary extensions on the other side, the set of return values are divided (for each byte) into AUTOSAR use and proprietary use.

[UC_E2E_00304] [The return values returned by the E2E Wrapper read/write functions shall be used as follows:

- For byte 1, 2 and 3 the set of return values ranging from 0x00 to 0x7F (i.e. decimal 0 to 127) is restricted for usage within AUTOSAR specifications only and shall not be used for proprietary return values that are not part of AUTOSAR specifications.
- For byte 1, 2 and 3 the set of return values ranging from 0x80 to 0xFE (i.e. decimal 128 to 254) is not restricted and shall be used for proprietary implementation specific return values that are not part of AUTOSAR specifications.

- For byte 1, 2 and 3 the value 0xFF (i.e. decimal 255) represents the invalid value..

]([RS_E2E_08527](#))

Only a subset of return values out of the set of restricted return values (i.e. 0x00 to 0x7F) is used within AUTOSAR specifications today, the remaining ones are reserved for future use by AUTOSAR.

[UC_E2E_00328] [Redundant wrapper routines shall use separate configuration and state data structures for each of the redundant channels.]([RS_E2E_08527](#))

E.g. use `config1_<p>_<o>/state1_<p>_<o>` for channel 1 and `config2_<p>_<o>/state2_<p>_<o>` for channel 2, as indicated in the code example in [subsection B.1.9.2](#).

B.1.7.1 Single channel wrapper routines and init routines

B.1.7.1.1 E2EPW_Write_<p>_<o>

[UC_E2E_00279] Definition of API function E2EPW_Write_<p>_<o> [

Service Name	E2EPW_Write_<p>_<o>	
Syntax	<pre>uint32 E2EPW_Write_<p>_<o> (Rte_Instance <instance>, - <data>)</pre>	
Service ID [hex]	0x71	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	<instance>	SW-C instance. This parameter is passed to the corresponding Rte_Write function, and apart from that the parameter is unused by E2E Protection Wrapper. This means that the wrapper ignores the instance of SW-C. The name and data type are the same as in the corresponding Rte_Write function.
Parameters (inout)	<data>	Data element to be protected and sent. The parameter is inout, because this function invokes E2E_PXXProtect function, which updates the values of control fields. The name and data type are the same as in the corresponding Rte_Write function.
Parameters (out)	None	

Return value	uint32	<p>The byte 0 (lowest byte) is the status of Rte_Write function: RTE_E_COM_STOPPED - the RTE could not perform the operation because the COM service is currently not available (inter ECU communication only) RTE_E_SEG_FAULT - a segmentation violation is detected in the handed over parameters to the RTE API. No transmission is executed RTE_E_OK - data passed to communication service successfully</p> <p>The byte 1 is the status of runtime checks done within E2E Protection Wrapper function: E2E_E_INPUTERR_NULL - At least one pointer parameter of E2EPW_Write is a NULL pointer E2E_E_INPUTERR_WRONG - At least one input parameter of E2EPW_Write is erroneous, e.g. out of range E2E_E_INTERR - An internal error has occurred in E2EPW_Write (e.g. error detected by program flow monitoring, violated invariant or postcondition) E2E_E_OK - Function E2EPW_Write completed successfully</p> <p>The byte 2 is the return value of E2E_PXXProtect function: E2E_E_INPUTERR_NULL - At least one pointer parameter of E2E_PXXProtect is a NULL pointer E2E_E_INPUTERR_WRONG - At least one input parameter of E2E_PXXProtect is erroneous, e.g. out of range E2E_E_INTERR - An internal error has occurred in E2E_PXXProtect (e.g. error detected by program flow monitoring, violated invariant or postcondition) E2E_E_OK - Function E2E_PXXProtect completed successfully</p> <p>The byte 3 is a placeholder for future use and takes the following values E2E_E_OK - default case</p>
Description	Initiates a safe explicit sender-receiver transmission of a safety-related data element with data semantic. It protects data with E2E Library function E2E_PXXProtect and then it calls the corresponding RTE_Write function.	
Available via	E2EPW_<SWC-Type-short name>.h	

](RS_E2E_08528)

[UC_E2E_00280] [The function E2EPW_Write_<p>_<o>() shall:

1. If this communication is inter-ECU and the Data element is not an opaque uint8 byte array, then serialize the data element into the layout identical to the one of the corresponding area in I-PDU
2. Invoke E2E Library function E2E_PXXProtect()
3. If this communication is inter-ECU and the Data element is not an opaque uint8 byte array , store the computed CRC/Counter in the data element
 - Invoke Rte_Write_<p>_<o>()

](RS_E2E_08528)

B.1.7.1.2 E2EPW_WriteInit_<p>_<o>

[UC_E2E_00300] Definition of API function E2EPW_WriteInit_<p>_<o> [

Service Name	E2EPW_WriteInit_<p>_<o>	
Syntax	Std_ReturnType E2EPW_WriteInit_<p>_<o> (Rte_Instance <instance>)	
Service ID [hex]	0x15	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	<instance>	SW-C instance. This parameter is not used (it is ignored).
Parameters (inout)	None	
Parameters (out)	None	
Return value	Std_ReturnType	Status of runtime checks: E2E_E_INTERR - An internal error has occurred in the function (e.g. error detected by program flow monitoring, violated invariant or postcondition) E2E_E_OK - Function completed successfully
Description	The function reinitializes the corresponding data structure after a detected error or at startup.	
Available via	E2EPW_<SWC-Type-short name>.h	

]([RS_E2E_08528](#))

[UC_E2E_00301] [The function E2EPW_WriteInit_<p>_<o> shall initialize the E2E_PXXProtectStateType_<p>_<o> with the following values:

Counter = 0]([RS_E2E_08528](#))

B.1.7.1.3 E2EPW_Read_<p>_<o>

[UC_E2E_00165] Definition of API function E2EPW_Read_<p>_<o> [

Service Name	E2EPW_Read_<p>_<o>	
Syntax	uint32 E2EPW_Read_<p>_<o> (Rte_Instance <instance>, - <data>)	
Service ID [hex]	0x72	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	<instance>	SW-C instance. This parameter is passed to the corresponding Rte_Read function, and apart from that the parameter is unused by E2E Protection Wrapper. This means that the wrapper ignores the instance of SW-C. The name and data type are the same as in the corresponding Rte_Read function.
Parameters (inout)	None	
Parameters (out)	<data>	Parameter to pass back the received data. The pointer to the OUT. parameter <data> must remain valid until the function call returns.

<p>Return value</p>	<p>uint32</p>	<p>The byte 0 (lowest byte) is the status of Rte_Read function: RTE_E_INVALID - data element invalid RTE_E_MAX_AGE_EXCEEDED - data element outdated RTE_E_NEVER_RECEIVED - No data received since system start or partition restart RTE_E_UNCONNECTED - Indicates that the receiver port is not connected. RTE_E_OK - data read successfully</p> <p>The byte 1 is the status of runtime checks done within E2E Protection Wrapper function, plus including bit extension checks: E2E_E_INPUTERR_NULL - At least one pointer parameter of E2EPW_Read is a NULL pointer E2E_E_INPUTERR_WRONG - At least one input parameter of E2EPW_Read is erroneous, e.g. out of range E2E_E_INTERR - An internal error has occurred in E2EPW_Read (e.g. error detected by program flow monitoring, violated invariant or postcondition) E2EPW_E_DESERIALIZATION - extension/expansion error(s) occurred. It is the status if bit extension (conversion of shortened I-PDU representation into data elements) is correct. For example, if 12 bits from I-PDU are expanded into 16-bit uint, then the top most 4 bits shall be 0. E2E_E_OK - Function E2EPW_Read completed successfully</p> <p>The byte 2 is the return value of E2E_PXXCheck function: E2E_E_INPUTERR_NULL - At least one pointer parameter of E2E_PXXCheck is a NULL pointer E2E_E_INPUTERR_WRONG - At least one input parameter of E2E_PXXCheck is erroneous, e.g. out of range E2E_E_INTERR - An internal error has occurred in E2E_PXXCheck (e.g. error detected by program flow monitoring, violated invariant or postcondition) E2E_E_OK - Function E2E_PXXCheck completed successfully</p> <p>The byte 3 is the value of E2E_PXXCheckStatusType Enumeration, representing the result of the verification of the Data in E2E Profile XX, determined by the Check function. E2EPW_STATUS_NONEWDATA - Error: the Check function has been invoked but no new Data is not available since the last call, according to communication medium (e.g. RTE, COM). As a result, no E2E checks of Data have been consequently executed. E2EPW_STATUS_WRONGCRC - Error: The data has been received according to communication medium, but the CRC or Data or part of Data is incorrect/corrupted. This may be caused by corruption, insertion or by addressing faults. E2EPW_STATUS_INITIAL - Error: The new data has been received according to communication medium, the CRC is correct, but this is the first Data since the receiver's initialization or reinitialization, so the Counter cannot be verified yet. E2EPW_STATUS_REPEATED - Error: The new data has been received according to communication medium, the CRC is correct, but the Counter is identical to the most recent Data received with Status_INITIAL, _OK, or _OKSOMELOST. E2EPW_STATUS_OK - OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by 1 with respect to the most recent Data received with Status_INITIAL, _OK, or _OKSOMELOST. This means that no Data has been lost since the last correct data reception. E2EPW_STATUS_OKSOMELOST - OK: The new data has been received according to communication medium, the CRC is correct, the Counter is incremented by DeltaCounter (1 < DeltaCounter = MaxDeltaCounter) with respect to the most recent Data received with Status_INITIAL, _OK, or _OKSOMELOST. This means that some Data in the sequence have been probably</p>
----------------------------	---------------	---

		<p>lost since the last correct/initial reception, but this is within the configured tolerance range</p> <p>E2EPW_STATUS_WRONGSEQUENCE - Error: The new data has been received according to communication medium, the CRC is correct, but the Counter Delta is too big (DeltaCounter > Max DeltaCounter) with respect to the most recent Data received with Status _INITIAL, _OK, or _OKSOMELOST. This means that too many Data in the sequence have been probably lost since the last correct/initial reception.</p> <p>E2EPW_STATUS_SYNC - NOT VALID: The new data has been received after detection of an unexpected behaviour of counter. The data has a correct CRC and a counter within the expected range with respect to the most recent Data received, but the determined continuity check for the counter is not finalized yet.</p>
Description	Performs a safe explicit read on a sender-receiver safety-related communication data element with data semantics. The function calls the corresponding function RTE_Read, and then checks received data with E2E_PXXCheck.	
Available via	E2EPW_<SWC-Type-short name>.h	

|(RS_E2E_08528)

[UC_E2E_00192] [The function E2EPW_Read_<p>_<o>() shall:

- Invoke Rte_Read_<p>_<o>()
- If this communication is inter-ECU and the Data element is not an opaque uint8 byte array, then serialize the data element into the layout identical to the one of the corresponding area in I-PDU
- Invoke E2E Library function E2E_PXXCheck()
- Do the deserialization check.

SyncCounter = 0](RS_E2E_08528)

B.1.7.2 Redundant wrapper routines

B.1.7.2.1 E2EPW_Write1_<p>_<o>

[UC_E2E_00261] Definition of API function E2EPW_Write1_<p>_<o> [

Service Name	E2EPW_Write1_<p>_<o>	
Syntax	uint32 E2EPW_Write1_<p>_<o> (Rte_Instance <instance>, - <data>)	
Service ID [hex]	0x73	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	<instance>	SW-C instance. This parameter is passed to the corresponding Rte_Write function, and apart from that the parameter is unused by E2E Protection Wrapper. This means that the wrapper ignores the instance of SW-C. The name and data type are the same as in the corresponding Rte_Write function.

Parameters (inout)	<data>	Data element to be protected and sent. The parameter is inout, because this function invokes E2E_PXXProtect function, which updates the values of control fields. The name and data type are the same as in the corresponding Rte_Write function.
Parameters (out)	None	
Return value	uint32	<p>The byte 0 (lowest byte) is equal to E2E_E_OK (because Rte_Write is not invoked)</p> <p>The byte 1 is the status of runtime checks done within E2E Protection Wrapper function: E2E_E_INPUTERR_NULL - At least one pointer parameter of E2EPW_Write is a NULL pointer E2E_E_INPUTERR_WRONG - At least one input parameter of E2EPW_Write is erroneous, e.g. out of range E2E_E_INTERR - An internal error has occurred in E2EPW_Write (e.g. error detected by program flow monitoring, violated invariant or postcondition) E2E_E_OK - Function E2EPW_Write completed successfully</p> <p>The byte 2 is the return value of E2E_PXXProtect function: E2E_E_INPUTERR_NULL - At least one pointer parameter of E2E_PXXProtect is a NULL pointer E2E_E_INPUTERR_WRONG - At least one input parameter of E2E_PXXProtect is erroneous, e.g. out of range E2E_E_INTERR - An internal error has occurred in E2E_PXXProtect (e.g. error detected by program flow monitoring, violated invariant or postcondition) E2E_E_OK - Function E2E_PXXProtect completed successfully</p> <p>The byte 3 is a placeholder for future use and takes the following values: E2E_E_OK - default case</p>
Description	It protects data with E2E Library function E2E_PXXProtect. it does not call the corresponding RTE_Write function.	
Available via	E2EPW_<SWC-Type-short name>.h	

](RS_E2E_08528)

[UC_E2E_00262] [The function E2EPW_Write1_<p>_<o>() shall:

- If this communication is inter-ECU and the Data element is not an opaque uint8 byte array, then serialize the data element into the layout identical to the one of the corresponding area in I-PDU.
- Invoke E2E Library function E2E_PXXProtect()
- If this communication is inter-ECU and the Data element is not an opaque uint8 byte array, store the computed CRC/Counter in the data element.

](RS_E2E_08528)

See also [Figure B.18](#).

B.1.7.2.2 E2EPW_Write2_<p>_<o>

[UC_E2E_00263] Definition of API function E2EPW_Write2_<p>_<o> [

Service Name	E2EPW_Write2_<p>_<o>	
Syntax	<pre>uint32 E2EPW_Write2_<p>_<o> (Rte_Instance <instance>, - <data>)</pre>	
Service ID [hex]	0x74	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	<instance>	SW-C instance. This parameter is passed to the corresponding Rte_Write function, and apart from that the parameter is unused by E2E Protection Wrapper. This means that the wrapper ignores the instance of SW-C. The name and data type are the same as in the corresponding Rte_Write function.
	<data>	Data element to be protected and sent. The parameter is IN, because this function compares the calculated protection fields from E2EPW_Write1 with independently calculated fields from invoking E2E_PXXProtect. Nothing is changed in <data> in case of success. The name and data type are the same as in the corresponding Rte_Write function.
Parameters (inout)	None	
Parameters (out)	None	

Return value	uint32	<p>The byte 0 (lowest byte) is the status of Rte_Write function: RTE_E_COM_STOPPED - the RTE could not perform the operation because the COM service is currently not available (inter ECU communication only) RTE_E_SEG_FAULT - a segmentation violation is detected in the handed over parameters to the RTE API. No transmission is executed RTE_E_OK - data passed to communication service successfully</p> <p>The byte 1 is the status of runtime Protects done within E2E Protection Wrapper function: E2E_E_INPUTERR_NULL - At least one pointer parameter of E2EPW_Write is a NULL pointer E2E_E_INPUTERR_WRONG - At least one input parameter of E2EPW_Write is erroneous, e.g. out of range E2E_E_INTERR - An internal error has occurred in E2EPW_Write (e.g. error detected by program flow monitoring, violated invariant or postcondition) E2EPW_E_REDUNDANCY - The control fields computed by Write1 and Write2 are not equal, i.e. status of voting between Write1 and Write2 failed E2E_E_OK - Function E2EPW_Write completed successfully</p> <p>The byte 2 is the return value of E2E_PXXProtect function: E2E_E_INPUTERR_NULL - At least one pointer parameter of E2E_PXXProtect is a NULL pointer E2E_E_INPUTERR_WRONG - At least one input parameter of E2E_PXXProtect is erroneous, e.g. out of range E2E_E_INTERR - An internal error has occurred in E2E_PXXProtect (e.g. error detected by program flow monitoring, violated invariant or postcondition) E2E_E_OK - Function E2E_PXXProtect completed successfully</p> <p>The byte 3 is a placeholder for future use and takes the following values: E2E_E_OK - default case</p>
Description	Initiates a safe explicit sender-receiver transmission of a safety-related data element with data semantic. It protects data with E2E Library function E2E_PXXProtect, compares the computed control fields with the ones computed by Write1, and then it calls the corresponding RTE_Write function.	
Available via	E2EPW_<SWC-Type-short name>.h	

|(RS_E2E_08528)

[UC_E2E_00264] [The function E2EPW_Write2_<p>_<o>() shall:

- If this communication is inter-ECU and the Data element is not an opaque uint8 byte array, then serialize the data element into the layout identical to the one of the corresponding area in I-PDU
- Invoke E2E Library function E2E_PXXProtect()
- Execute voting on control fields between Write1 and Write2
- Invoke Rte_Write_<p>_<o>() .

B.1.9 Code Example

Important:

To enable proper memory mapping by the AUTOSAR memmap methodology and to enable the use of init functions, function-static and function-constant variables cannot be used and must be defined on module level. To avoid name clashes, they shall be suffixed.

The suffixes used shall be:

- For functions E2EPW_Write_<p>_<o> and E2EPW_Read_<p>_<o>: with suffix "_<p>_<o>" (e.g. variable_<p>_<o> instead of variable)
- For functions E2EPW_Write1_<p>_<o> and E2EPW_Read1_<p>_<o>: with suffix "1_<p>_<o>" (e.g. variable_<p>_<o> instead of variable)
- For functions E2EPW_Write2_<p>_<o> and E2EPW_Read2_<p>_<o>: with suffix "2_<p>_<o>" (e.g. variable_<p>_<o> instead of variable)

In the code example, the suffix is formatted like this: _<p>_<o>

This is to emphasize that <p> and <o> are placeholders.

The below code example illustrates the possible implementation of E2E Protection wrapper. The example shows Profile 1, but this is applicable also for Profile 2.

Note: The below code is only pseudocode to provide a better understanding of the intention of the functionality and does not claim to be correct or to be a reference implementation.

The code example shows the single channel and redundant wrapper. The single channel wrapper is the simplest way to keep the application logic of SW-C independent from data protection, where the wrapper to protect the data on behalf of the application.

The redundant wrapper requires that it is invoked twice by application, but it has the following additional features:

- Code redundancy:
 - For each Rte_Write* function, there are corresponding E2EPW_Write1* and E2EPW_Write2* functions
 - For each Rte_Read* function, there are corresponding E2EPW_Read1* and E2EPW_Read2* functions
- Time diversity:
 - The functions E2EPW_Write1* and E2EPW_Write2* on the sender side and E2EPW_Read1* and E2EPW_Read2* are executed one after each other.
- Data redundancy:
 - All data used by the redundant wrapper, apart from application data element, is redundant
 - The application data element is instantiated by Rte one time only. To mitigate faults, is written/read by application at each call of E2EPW_Write1, E2EPW_Write2, E2EPW_Read1, E2EPW_Read2.

There are no configuration options in AUTOSAR templates to select which wrapper shall be generated. Either redundant or single channel functions should be generated (generating both single channel and redundant wrapper calls for the same SW-Cs would signify generation of dead code). The choice which wrapper is generated may be a global option in the wrapper generator. Alternatively, a wrapper may be able to generate either single-channel or redundant wrapper only.

B.1.9.1 Write/Read symmetry

On the sender side, the two functions Write1 and Write2 compute (create) the values for the control fields (which are CRC and counter for Profiles 1 and 2). Because two different outputs (one from Write1 and one from Write2) are generated, they are compared by Write2 before sending them through RTE.

On the receiver side however, there is no creation of control fields. Instead, they are double-checked (once by Read1 and once by Read2). Therefore, it is checked if both Read1 and Read2 functions agree on the check results (e.g. if both Read1 and Read2 report that the CRC is correct). This voting is done by comparing byte 2 of return values of Read1 and Read2 (and is executed by application (no by the wrapper)).

B.1.9.2 Code Example - Sender SW-C

B.1.9.2.1 Sender- E2EPW_WriteInit, E2EPW_WriteInit1 and E2EPW_WriteInit2

This chapter presents an example implementation of functions

E2EPW_WriteInit_<p>_<o>(), E2EPW_WriteInit1_<p>_<o>() and E2EPW_WriteInit2_<p>_<o>() as well as definition of the module-static configuration and state data structures. <DataLength / 8> is the dataLength configuration value divided by 8 (to represent the length in bytes). The example configuration values are random, but valid values.

```
static const E2E_P01ConfigType Config_<p>_<o> =
{ 8, /* CounterOffset */
  0, /* CRCOffset */
  0x12, /* DataID */
  12, /* DataIDNibbleOffset */
  E2E_P01_DATAID_BOTH, /* DataIDMode */
  64, /* DataLength */
  1, /* MaxDeltaCounterInit */
  3, /* MaxNoNewOrRepeatedData */
  2, /* SyncCounterInit */
};
static E2E_P01ProtectStateType State_<p>_<o> =
{ 0 /* Counter */
};

/* byte array for call of E2Elib */
```

```
static uint8 Data_<p>_<o>[<DataLength / 8>];

Std_ReturnType E2EPW_WriteInit_<p>_<o>(Rte_Instance Instance) {
    State_<p>_<o>.Counter = 0;
    return E2E_E_OK;
}
```

For redundant wrapper:

```
static const E2E_P01ConfigType Config1_<p>_<o> =
{ 8, /* CounterOffset */
  0, /* CRCOffset */
  0x12, /* DataID */
  12, /* DataIDNibbleOffset */
  E2E_P01_DATAID_BOTH, /* DataIDMode */
  64, /* DataLength */
  1, /* MaxDeltaCounterInit */
  3, /* MaxNoNewOrRepeatedData */
  2, /* SyncCounterInit */
};

static E2E_P01ProtectStateType State1_<p>_<o> =
{ 0 /* Counter */
};

static const E2E_P01ConfigType Config2_<p>_<o> =
{ 8, /* CounterOffset */
  0, /* CRCOffset */
  0x12, /* DataID */
  12, /* DataIDNibbleOffset */
  E2E_P01_DATAID_BOTH, /* DataIDMode */
  64, /* DataLength */
  1, /* MaxDeltaCounterInit */
  3, /* MaxNoNewOrRepeatedData */
  2, /* SyncCounterInit */
};

static E2E_P01ProtectStateType State2_<p>_<o> =
{ 0 /* Counter */
};
/* byte array for call of E2Elib - only one is needed for redundant
wrapper */
static uint8 Data_<p>_<o>[<DataLength * 8>];

Std_ReturnType E2EPW_WriteInit1_<p>_<o>(Rte_Instance Instance) {
    State1_<p>_<o>.Counter = 0;
    return E2E_E_OK;
}

Std_ReturnType E2EPW_WriteInit2_<p>_<o>(Rte_Instance Instance) {
    State2_<p>_<o>.Counter = 0;
    return E2E_E_OK;
}
```

B.1.9.2.2 Sender -E2EPW_Write and E2EPW_Write1

This chapter presents an example implementation of functions `E2EPW_Write` and `E2EPW_Write1`.

B.1.9.2.2.1 Generation / Initialization

Generation/Initialization: RTE generates a complex data element (case A) or an opaque `uint8` array (Case B).

Case A (complex data type):

The RTE Generator generates the complex data element. The complex data element has additional two data elements `crc` and `counter`, which are unused by SW-C application part, but only by the E2E Protection Wrapper.

```
typedef struct {
    uint8 crc; /* additional data el, unused by SW-C */
    uint8 counter; /* additional data el, unused by SW-C */
    uint8 dataIDHighByteNibble; /* for nibble configuration of
                                E2E profile 1 only */
    uint16 speed; /* 16-bit, but 12 bits used in I-PDU*/
    uint8 accel; /* 8-bit number, 4 bits used */
} DataType;
...
static DataType AppDataElVal;
static DataType *AppDataEl = &AppDataElVal;
```

Case B (array):

The RTE Generator generates an opaque `uint8` array.

```
static uint8 AppDataEl[8];
```

B.1.9.2.2.2 Step S0

Step S0: Application writes the values in a complex data type:

Case A (complex data type)

```
AppDataEl->speed = U16_V_MAX; /*16-bit number, 12 bits used */
AppDataEl->accel = U8_G_EARTH; /* 8-bit number, 4 bits used */
```

Case B (array):

```
AppDataEl [1] = (U8_G_EARTH & 0x0F) << 4;
AppDataEl [2] = (uint8) (U16_V_MAX& 0x00FF);
AppDataEl [3] = (uint8) (U16_V_MAX) >> 8;
AppDataEl [3] |= 0xF0;
AppDataEl [4] = 0xFF;
```

B.1.9.2.2.3 Step S1

Step S1: Application calls E2E Protection Wrapper.

```

/* single channel - Write */
uint32 wrapperRet = E2EPW_Write_<p>_<o>(Instance, AppDataEl);

```

The redundant step is identical, apart from "1" suffix:

```

/* redundant - Write1 */
uint32 wrapperRet1 = E2EPW_Write1_<p>_<o>(Instance, AppDataEl);

```

B.1.9.2.2.4 Step S2

Step S2: The E2E Wrapper (E2EPW_Write_<p>_<o>, E2EPW_Write1_<p>_<o>()) checks for wrong parameters from SW-C and it creates a data copy:

Case A (complex data type):

The E2E Protection Wrapper (E2EPW_Write_<p>_<o>, E2EPW_Write1_<p>_<o>()) serializes the data to the layout identical with the layout of the corresponding signal group in the I-PDU. It fills in unused bits with a predefined pattern, e.g. '1'-s (as defined in unusedBitPattern of ISignalIPdu; To get '1'-s, unusedBitPattern is 0xFF).

Note that there can be several signal groups in an I-PDU, each protected or not with E2E by means of the wrapper. This means that the Data_<p>_<o> array contains the representation of only one signal group mapped to the I-PDU.

```

Std_ReturnType plausibilityChecks = E2E_E_OK;
...
/* example of possible plausibility checks */
if (AppDataEl == NULL) {
    return (E2E_E_INPUTERR_NULL << 8);
}

/* Data has the same layout as serialized signal group in I-PDU.
   Initialize all bytes of Data[] with the unused bit pattern (called
   unusedBitPattern in system template. */

Data_<p>_<o>[0] = 0;

/* in accel, only 4 bits are used, they go
   To high nibble of Data[1], next to Counter. */
Data_<p>_<o>[1] = (AppDataEl->accel & 0x0F) << 4;

/* in speed, only 8+4 bits are used.
   low byte of speed goes to Data[2].*/
Data_<p>_<o>[2] = (AppDataEl->speed & 0x00FF);

/* low nibble of high byte goes to Data[3] */
Data_<p>_<o>[3] = (AppDataEl->speed & 0x0F00) >> 8;

```

```

/* high nibble of high byte of Data[3] is unused, so it is set with 1s
on each unused bit */
Data_<p>_<o>[3] |= 0xF0;

/* Data[4] is unused but transmitted, so it is explicitly set
to 0xFF*/
Data_<p>_<o>[4] = 0xFF;

```

The above example is illustrated by the figure below:

```

typedef struct {
    Uint8 crc; /* additional data el, unused by SW-C */
    Uint8 counter; /* additional data el, unused by SW-C */
    Uint16 speed; /* 16-bit, but 12 bits used in I-PDU*/
    Uint8 accel; /* 16-bit, but 12 bits used in I-PDU*/
} DataEl;

```

Figure B.20: Mapping of Data elements into I-PDU

Case B (array):

The E2E Protection Wrapper (E2EPW_Write_<p>_<o>, E2EPW_Write1_<p>_<o>()) simply casts the data element to the array and copies it:

```

Std_ReturnType plausibilityChecks = E2E_E_OK;
...
/* example of possible plausibility checks */
if (AppDataEl == NULL) {
    return (E2E_E_INPUTERR_NULL<< 8);
}

memcpy (Data_<p>_<o>, AppDataEl, 8);

```

B.1.9.2.2.5 Step S3

Step S3: E2E Protection Wrapper (E2EPW_Write_<p>_<o>, E2EPW_Write1_<p>_<o>()) calls the E2E library to protect the data element.

```

/* single channel - Write */
Std_ReturnType retE2EProtect = E2E_P01Protect (&Config_<p>_<o>, &State_<p>_<o>, Data_<p>_<o>);

```

The redundant step is identical, apart from "1" suffix:

```

/* redundant - Writel */

```

```
Std_ReturnType retE2EProtect = E2E_P01Protect (&Config1_<p>_<o>, &
State1_<p>_<o>, Data_<p>_<o>);
```

B.1.9.2.2.6 Step S4

Step S5: E2E executes protection, updates State and AppDataEl.

Figure B.21: Step 4

B.1.9.2.2.7 Step S5

Step S5: The E2E Protection Wrapper (E2EPW_Write_<p>_<o>, E2EPW_Write1_<p>_<o>()) copies back the control fields to AppDataEl.

Case A (complex data type):

```
AppDataEl->crc = Data_<p>_<o>[0]; /* Copy CRC from byte 0 */
AppDataEl->counter = Data_<p>_<o>[1]&0x0F; /* Copy counter from byte 1
*/
```

This is illustrated by [Figure B.22](#) he Figure 12-22:

Figure B.22: Copy back of CRC and alive from I-PDU copy to data element

Case B (array):

```
AppDataEl[0] = Data_<p>_<o>[0]; /* Copy CRC from byte 0 */  
AppDataEl[1] = (AppDataEl[1]&0xF0) | (Data_<p>_<o>[1]&0x0F); /* Copy  
CRC */
```

B.1.9.2.2.8 Step S6

Step S6: Single channel Wrapper (E2EPW_Write_<p>_<o>) calls RTE function to send the data element and returns the extended status to SW-C.

```
/* Single channel - Write*/  
Std_ReturnType retRteWrite = Rte_Write_<p>_<o>(Instance, AppDataEl);
```

Redundant wrapper (E2EPW_Write_<p>_<o>) in step S7 does not call Rte_Write_<p>_<o>() function.

```
/* Redundant - Write1 */  
Std_ReturnType retRteWrite = E2E_E_OK;
```

B.1.9.2.2.9 Step S7

Step S7: The E2E Wrapper creates the return value and returns.

```
return ((retRteWrite) | (retE2EProtect<<16) | (plausibilityChecks<<8));
```

B.1.9.2.2.10 Step S8

Step S8: Caller SW-C checks the return value of the wrapper and handles errors, if any. This behavior is specific to the application.

```
/* single channel - Write */  
if(wrapperRet != 0) swc_error_handler(wrapperRet);  
  
/* redundant - Write1 */  
if(wrapperRet1 != 0) swc_error_handler(wrapperRet1);
```

B.1.9.2.3 Sender - E2EPW_Write2

This chapter presents an example implementation of function E2EPW_Write2_<p>_<o>().

B.1.9.2.3.1 Step S10

Step S10: Application writes the values in a complex data type.

Step S10-S19 are only for the redundant scenario. The step S10 is just the repetition of S0 on the same values. The application rewrites the data in AppDataEl. The values must be identical to the values written in step S0, otherwise the voting in step S17 will fail. This redundant write is to prevent some faults related to AppDataEl (e.g. corruption from outside, random memory fault on that area)

B.1.9.2.3.2 Step S11

Steps S11-S18 represent the steps of the function E2EPW_Write2_<p>_<o>().

Step S11: Application calls E2E Protection Wrapper for the second time, this time E2EPW_Write2_<p>_<o>() function.

```
uint32 wrapperRet2 = E2EPW_Write2_<p>_<o>(Instance, AppDataEl);
```

B.1.9.2.3.3 Step S12

The step S13 (of function E2EPW_Write2_<p>_<o>()) is 100% identical to Step S2 (of function E2EPW_Write1_<p>_<o>()).

B.1.9.2.3.4 Step S13

Step S3: E2E Protection Wrapper (E2EPW_Write2_<p>_<o>()) calls the E2E library to protect the data element.

```
/* redundant - Write2 */  
Std_ReturnType retE2EProtect = E2E_P01Protect(Config2_<p>_<o>, State2_<p>_<o>, Data_<p>_<o>);
```

B.1.9.2.3.5 Step S14

The step S14 (of function E2EPW_Write2_<p>_<o>()) is 100% identical to Step S4 (of function E2EPW_Write1_<p>_<o>()).

B.1.9.2.3.6 Step S15-skipped

Contrary to Step S5, there is no copying back of control fields back to AppDataEl in E2EPW_Write2_<p>_<o>().

B.1.9.2.3.7 Steps S16

At this stage, the Wrapper (E2EPW_Write2_<p>_<o>()) has to its disposition the following:

- AppDataEl containing data partly from Step S0 and Step S10:
 - application data filled in by the SW-C in Step S10
 - crc and counter filled in by E2EPW_Write1_<p>_<o>() based on AppDataEl filled in in step S0.
- Data containing:
 - crc and counter filled in by E2EPW_Write2_<p>_<o>(), based on AppDataEl from Step S10.

There are two safety mechanisms provided:

- The control fields (crc and counter from AppDataEl and from Data) are binary compared by the voter. By this means, the results Write1 and Write2 are voted by the sender
- The AppDataEl at this stage contains the application data filled in step S10, but the control fields are computed on data filled in Step S0. In case of error (difference) that has not been detected by the sender voter, the receiver serves as the second voter.

Only in case of successful voting, the data (application data from second round and control fields from first round) is transmitted through RTE.

Case A (structure):

```
if( (AppDataEl->counter != (Data_port1_del[1] & 0x0F)) || (AppDataEl->
    crc != (Data_port1_del[0] )) )
    plausibilityChecks = E2EPW_E_REDUNDANCY; /* 0x05 */
```

```
Std_ReturnType retRteWrite = E2E_E_OK;
```

```
/* Write data regardless if redundancy error detected ... */
retRteWrite = Rte_Write_<p>_<o>(Instance, AppDataEl);
```

Case B (array):

```
if( ((AppDataEl[1] & 0x0F) != (Data_port1_del[1] & 0x0F)) || (AppDataEl
    [0] != (Data_port1_del[0] )) )
    plausibilityChecks= E2EPW_E_REDUNDANCY; /* 0x05 */
```

```
Std_ReturnType retRteWrite = E2E_E_OK;
```

```
/* Write data regardless if redundancy error detected ... */
retRteWrite = Rte_Write_<p>_<o>(Instance, AppDataEl);
```

B.1.9.2.3.8 Step S17

Step S17: The E2E Wrapper creates the return value and returns.

```
return ((retRteWrite) | (retE2EProtect<< 16) | (plausibilityChecks<< 8)
);
```

B.1.9.2.3.9 Step S18

Step S18: Caller SW-C checks the return value (of function E2EPW_Write2_<p>_<o>()) and handles errors, if any. It also compares the return values of E2EPW_Write2_<p>_<o>() against return value of E2EPW_Write1_<p>_<o>() .

```
if(wrapperRet2 != 0) swc_error_handler(wrapperRet2);
```

B.1.9.3 Code Example - Receiver SW-C

B.1.9.3.1 Receiver - E2EPW_ReadInit, E2EPW_ReadInit1 and E2EPW_ReadInit2

This chapter presents an example implementation of functions

```
static const E2E_P01ConfigType Config_<p>_<o> =
{ 8, /* CounterOffset */
  0, /* CRCOffset */
  0x12, /* DataID */
  12, /* DataIDNibbleOffset */
  E2E_P01_DATAID_BOTH, /* DataIDMode */
  64, /* DataLength */
  1, /* MaxDeltaCounterInit */
  3, /* MaxNoNewOrRepeatedData */
  2, /* SyncCounterInit */
};

static E2E_P01CheckStateType State_<p>_<o> =
{ 0, /* LastValidCounter */
  0, /* MaxDeltaCounter */
  TRUE, /* WaitForFirstData */
  FALSE, /* NewDataAvailable */
  0, /* LostData */
  E2E_P01STATUS_NONEWDATA, /* Status */
  0, /* SyncCounter */
  0 /* NoNewOrRepeatedDataCounter */
};

/* byte array for call of E2Elib */
static uint8 Data_<p>_<o>[<DataLength / 8>];

Std_ReturnType E2EPW_ReadInit_<p>_<o>(Rte_Instance Instance) {
  State_<p>_<o>.LastValidCounter = 0;
  State_<p>_<o>.MaxDeltaCounter = 0;
  State_<p>_<o>.WaitForFirstData = TRUE;
```

```
    State_<p>_<o>.NewDataAvailable = FALSE;
    State_<p>_<o>.LostData = 0;
    State_<p>_<o>.Status = E2E_P01STATUS_NONEWDATA;
    State_<p>_<o>.SyncCounter = 0;
    State_<p>_<o>.NoNewOrRepeatedDataCounter = 0;
    return E2E_E_OK;
}
```

For redundant wrapper:

```
static const E2E_P01ConfigType Config1_<p>_<o> =
{ 8, /* CounterOffset */
  0, /* CRCOffset */
  0x12, /* DataID */
  12, /* DataIDNibbleOffset */
  E2E_P01_DATAID_BOTH, /* DataIDMode */
  64, /* DataLength */
  1, /* MaxDeltaCounterInit */
  3, /* MaxNoNewOrRepeatedData */
  2, /* SyncCounterInit */
};

static const E2E_P01ConfigType Config2_<p>_<o> =
{ 8, /* CounterOffset */
  0, /* CRCOffset */
  0x12, /* DataID */
  12, /* DataIDNibbleOffset */
  E2E_P01_DATAID_BOTH, /* DataIDMode */
  64, /* DataLength */
  1, /* MaxDeltaCounterInit */
  3, /* MaxNoNewOrRepeatedData */
  2, /* SyncCounterInit */
};

static E2E_P01CheckStateType State1_<p>_<o> =
{ 0, /* LastValidCounter */
  0, /* MaxDeltaCounter */
  TRUE, /* WaitForFirstData */
  FALSE, /* NewDataAvailable */
  0, /* LostData */
  E2E_P01STATUS_NONEWDATA, /* Status */
  0, /* SyncCounter */
  0 /* NoNewOrRepeatedDataCounter */
};

static E2E_P01CheckStateType State2_<p>_<o> =
{ 0, /* LastValidCounter */
  0, /* MaxDeltaCounter */
  TRUE, /* WaitForFirstData */
  FALSE, /* NewDataAvailable */
  0, /* LostData */
  E2E_P01STATUS_NONEWDATA, /* Status */
  0, /* SyncCounter */
  0 /* NoNewOrRepeatedDataCounter */
};

/* byte array for call of E2Elib */
```

```

static uint8 Data_<p>_<o>[<DataLength * 8>];
Std_ReturnType E2EPW_ReadInit1_<p>_<o>(Rte_Instance Instance) {
    State1_<p>_<o>.LastValidCounter = 0;
    State1_<p>_<o>.MaxDeltaCounter = 0;
    State1_<p>_<o>.WaitForFirstData = TRUE;
    State1_<p>_<o>.NewDataAvailable = FALSE;
    State1_<p>_<o>.LostData = 0;
    State1_<p>_<o>.Status = E2E_P01STATUS_NONEWDATA;
    State1_<p>_<o>.SyncCounter = 0;
    State1_<p>_<o>.NoNewOrRepeatedDataCounter = 0;
return E2E_E_OK;
}

Std_ReturnType E2EPW_ReadInit2_<p>_<o>(Rte_Instance Instance) {
    State2_<p>_<o>.LastValidCounter = 0;
    State2_<p>_<o>.MaxDeltaCounter = 0;
    State2_<p>_<o>.WaitForFirstData = TRUE;
    State2_<p>_<o>.NewDataAvailable = FALSE;
    State2_<p>_<o>.LostData = 0;
    State2_<p>_<o>.Status = E2E_P01STATUS_NONEWDATA;
    State2_<p>_<o>.SyncCounter = 0;
    State2_<p>_<o>.NoNewOrRepeatedDataCounter = 0;
return E2E_E_OK;
}

```

B.1.9.3.2 Receiver - E2EPW_Read and E2EPW_Read1

This chapter presents an example implementation of functions E2EPW_Read_<p>_<o>() and E2EPW_Read1_<p>_<o>().

B.1.9.3.2.1 Generation / Initialization

Generation/Initialization: RTE generates a complex data element (case A) or an opaque uint8 array (Case B).

Case A (complex data type):

The RTE Generator generates the complex data element for the receiver. The complex data element has additional two data elements crc and counter, which are unused by SW-C application part, but only by the E2E Protection Wrapper. The data element is the same on the sender and on the receiver SW-C.

```

typedef struct {
    uint8 crc; /* additional data el, unused by SW-C */
    uint8 counter; /* additional data el, unused by SW-C */
    uint8 dataIDHighByteNibble; /* for nibble configuration of
E2E profile 1 only */
    uint16 speed; /* 16-bit, but 12 bits used in I-PDU*/
    uint8 accel; /* 16-bit, but 12 bits used in I-PDU*/
} DataType;
...

```

```
static DataType AppDataElVal;  
static DataType *AppDataEl = &AppDataElVal;
```

Case B (array):

The RTE Generator generates an opaque uint8 array.

```
static uint8 AppDataEl[8];
```

B.1.9.3.2.2 Step R1

Step R1: Application calls E2E Protection Wrapper to get the data.

```
/* single channel - Read */  
uint32 wrapperRet = E2EPW_Read_<p>_<o>(Instance, AppDataEl);  
  
/* redundant - Read1 */  
uint32 wrapperRet1 = E2EPW_Read1_<p>_<o>(Instance, AppDataEl);
```

B.1.9.3.2.3 Step R2

Step R2: Wrapper (E2EPW_Read_<p>_<o>, E2EPW_Read1_<p>_<o>()) checks the parameters and then calls RTE function Rte_Read to receive the data element.

```
Std_ReturnType plausibilityChecks = E2E_E_OK, retRteRead;  
...  
/* example of possible plausibility checks */  
if (AppDataEl == NULL) {  
    return (E2E_E_INPUTERR_NULL);  
}  
  
retRteRead = Rte_Read_<p>_<o>(Instance, AppDataEl);
```

B.1.9.3.2.4 Step R3

Step R3: NewDataAvailable is set if Rte_Read_<p>_<o>() returned without error.

```
/* single channel */  
State_<p>_<o>.NewDataAvailable = (retRteRead == RTE_E_OK) ? TRUE :  
    FALSE;  
  
/* redundant */  
State1_<p>_<o>.NewDataAvailable = (retRteRead == RTE_E_OK) ? TRUE :  
    FALSE;
```

B.1.9.3.2.5 Step R4

Step R4: the E2E Protection Wrapper serializes the data to the layout identical with the one of the corresponding I-PDU. The E2E Protection wrapper needs to do the serialization (I-PDU from the received data), so that E2E Library can compute and check the CRC.

Case A (complex data type):

```

/* For storing the same layout as the one of I-PDU */

Data_<p>_<o>[0] = 0;

/* in accel, only 4 bits are used, they go To high nibble of Data[1],
   next to Counter. */
Data_<p>_<o>[1] = (AppDataEl->accel & 0x0F) << 4;

/* in speed, only 8+4 bits are used. low byte of speed goes to Data[2].
   */
Data_<p>_<o>[2] = (AppDataEl->speed & 0x00FF);

/* low nibble of high byte goes to Data[3] */
Data_<p>_<o>[3] = (AppDataEl->speed & 0x0F00) >> 8;

/* high nibble of high byte of Data[3] is unused, so it is set with 1s
   on each unused bit */
Data_<p>_<o>[3] |= 0xF0;

/* Data[4] is unused but transmitted, so it is explicitly set to 0xFF*/
Data_<p>_<o>[4] = 0xFF;

```

Case B:

The E2E Protection Wrapper (E2EPW_Read_<p>_<o>, E2EPW_Read1_<p>_<o>()) simply casts the data element to the array and copies it:

```

/* Copy from AppDataEl to Data */
memcpy(Data_<p>_<o>, AppDataEl, 8);

```

B.1.9.3.2.6 Step R5

Step R5: E2E Protection Wrapper calls the E2E library to check the data element.

```

/* single channel - Read */
Std_ReturnType retE2ECheck = E2E_P01Check(&Config_<p>_<o>, &State_<p>_<o>,
    Data_<p>_<o>);

```

The redundant step is identical, apart from "1" suffix:

```

/* redundant - Read1 */
Std_ReturnType retE2ECheck = E2E_P01Check(&Config1_<p>_<o>, &State1_<p>_<o>,
    Data_<p>_<o>);

```

B.1.9.3.2.7 Step R6

Step R6: E2E computes CRC, and executes the checks.

Figure B.23: b

B.1.9.3.2.8 Step R7

Step R7: the E2E Protection Wrapper checks if the deserialization is done correctly

Case A (complex data type):

The E2E Protection Wrapper verifies that the bit extensions done by COM are done correctly. This step is needed, because unused most significant bits of primitive data elements are simply cut out (not placed in I-PDUs). On the receiver side, these unused bits shall have a specified value (e.g. they shall be 0 for unsigned numbers). Note that the unused most significant bits of signals are not related to unused bits between signals in I-PDUs.

```

/* in accel, only 4 bits are used, they go to high nibble of Data[1],
   next to Counter. */
if( (AppDataEl->accel & 0xF0) != 0)
    plausibilityChecks = E2EPW_E_DESERIALIZATION;

/* in speed, only 8+4 bits are used. tpmost 4 bits shall be 0 */
if( (AppDataEl->accel & 0xF000) != 0)
    plausibilityChecks = E2EPW_E_DESERIALIZATION;

```

Case B (array):

Not present, as there is no bit extension done by COM

```
plausibilityChecks = E2E_E_OK;
```

B.1.9.3.2.9 Step R8

Step R8: The E2E wrapper returns to the application.

```

/* single channel */
return ( (retRteRead) | (retE2ECheck<<16) | (plausibilityChecks<<8) | (
    uint32) (State_<p>_<o>.Status)<<24 ) );

```

The redundant step is identical, apart from "1" suffix:

```
/* redundant */
return ( (retRteRead) | (retE2ECheck<<16) | (plausibilityChecks<<8) | (
    uint32) (State1_<p>_<o>.Status)<<24 ) ;
```

B.1.9.3.2.10 Step R9

Step R9: Caller SW-C checks the return value and handles errors, if any. This behavior is specific to the application. Then it copies the data from AppDataElto application buffer and consumes it.

Note that the caller may accept some errors on byte 3 (e.g. it may accept if byte 3 equals to E2E_PXXSTATUS_OKSOMELOST).

Case A (complex data type):

```
/* single channel */
if( ((wrapperRet )&0xFF != 0) ||
    ((wrapperRet>>8 )&0xFF != 0) ||
    ((wrapperRet>>16)&0xFF != 0) ||
    (((wrapperRet>>24)&0xFF != E2EPW_STATUS_OKSOMELOST) &&
    ((wrapperRet>>24)&0xFF != E2EPW_STATUS_OK) )
) {
    swc_error_handler(wrapperRet);
}

targetSpeed = AppDataEl->speed;
targetAccel = AppDataEl->accel;

/* redundant */
if( ((wrapperRet1 )&0xFF != 0) ||
    ((wrapperRet1>>8 )&0xFF != 0) ||
    ((wrapperRet1>>16)&0xFF != 0) ||
    (((wrapperRet1>>24)&0xFF != E2EPW_STATUS_OKSOMELOST) &&
    ((wrapperRet1>>24)&0xFF != E2EPW_STATUS_OK) )
) {
    swc_error_handler(wrapperRet1);
}

targetSpeed1 = AppDataEl->speed;
targetAccel1 = AppDataEl->accel;
```

Case B (array):

```
/* single channel */
if( ((wrapperRet )&0xFF != 0) ||
    ((wrapperRet>>8 )&0xFF != 0) ||
    ((wrapperRet>>16)&0xFF != 0) ||
    (((wrapperRet>>24)&0xFF != E2EPW_STATUS_OKSOMELOST) &&
    ((wrapperRet>>24)&0xFF != E2EPW_STATUS_OK) )
) {
    swc_error_handler(wrapperRet);
}
```

```

uint16 targetSpeed = (AppDataEl[2]) | (AppDataEl[3]<<8&0x0F);
uint8 targetAccel = AppDataEl[1] >> 4

/* redundant */
if( ((wrapperRet1 )&0xFF != 0) ||
    ((wrapperRet1>>8 )&0xFF != 0) ||
    ((wrapperRet1>>16)&0xFF != 0) ||
    (((wrapperRet1>>24)&0xFF != E2EPW_STATUS_OKSOMELOST) &&
    ((wrapperRet1>>24)&0xFF != E2EPW_STATUS_OK)
) {
swc_error_handler(wrapperRet1);
}

if(wrapperRet1 != 0) swc_error_handler(wrapperRet1);
uint16 targetSpeed1 = (AppDataEl[2]) | (AppDataEl[3]<<8&0x0F);
uint8 targetAccel1 = AppDataEl[1] >> 4;

```

B.1.9.3.3 Receiver - E2EPW_Read2

This chapter presents an example implementation of function E2EPW_Read2_<p>_<o>().

B.1.9.3.3.1 Step R10 - skipped

Value unused to numbering consistency.

B.1.9.3.3.2 Step R11

Step R11: Application calls the wrapper again.

```
uint32 wrapperRet2 = E2EPW_Read2_<p>_<o>(Instance, AppDataEl);
```

B.1.9.3.3.3 Step R12 - partially skipped

Contrary to step R2 RTE is not read. Both read steps use the same data from RTE. There is only checking for parameters:

```

Std_ReturnType plausibilityChecks = E2E_E_OK, retRteRead = E2E_E_OK;
...
/* example of possible plausibility checks */
if (AppDataEl == NULL) {
    return (E2E_E_INPUTERR_NULL);
}

```

B.1.9.3.3.4 Steps R13

Step R13: contrary to R3, `NewDataAvailable` is always set.

```
/* set always to true, because Rte_Read is not invoked. */  
State2_<p>_<o>.NewDataAvailable = TRUE;
```

B.1.9.3.3.5 Steps R14

The step R14 (of function `E2EPW_Read2_<p>_<o>()`) is 100% identical to Step R4 (of function `E2EPW_Read1_<p>_<o>()`).

B.1.9.3.3.6 Step R15

Step R15: E2E Protection Wrapper calls the E2E library to check the data element.

```
Std_ReturnType retE2ECheck = E2E_P01Check(Config2_<p>_<o>, State2_<p>_<o>  
o>, Data_<p>_<o>);
```

B.1.9.3.3.7 Step R16

The step R16 (of function `E2EPW_Read2_<p>_<o>()`) is 100% identical to Step R6 (of function `E2EPW_Read1_<p>_<o>()`).

B.1.9.3.3.8 Step R17

The step R17 (of function `E2EPW_Read2_<p>_<o>()`) are 100% identical to Step R7 (of function `E2EPW_Read1_<p>_<o>()`).

B.1.9.3.3.9 Step R18

Step R8: The E2E wrapper returns to the application.

```
return ( (retRteRead) | (retE2ECheck<<16) | (plausibilityChecks<<8) | (  
uint32) (State2_<p>_<o>.Status)<<24 );
```

B.1.9.3.3.10 Step R19

Step R19: Application reads the values from the complex data type, compares them (from `Read1` and from `Read2`) and consumes them.

Case A (complex data type):

```
/* copy values from data element */
uint16 targetSpeed2 = AppDataEl->speed;
uint8 targetAccel2 = AppDataEl->accel;

/* check if E2EPW_Read2 was successful */
if(wrapperRet2 != 0) swc_error_handler(wrapperRet2);

/* Check if both Read1 and Read2 report the same status. In particular,
   byte2 of ret1 and ret2 shall be identical. If not, then it means
   that there is a disagreement on evaluation of data between Read1
   and Read2 */
if(wrapperRet2 != wrapperRet1) swc_error_handlerR(wrapperRet1,
  wrapperRet2);

/* check for corruption of AppDataEl after CRC has been checked */
if(targetSpeed2 != targetSpeed1) swc_error_handlerR(wrapperRet1,
  wrapperRet2);
if(targetAccel2 != targetAccel1) swc_error_handlerR(wrapperRet1,
  wrapperRet2);

/* consume targetSpeed1/targetSpeed2 and targetAccel1/targetAccel2*/
```

Case B (array):

```
/* copy values from data element */

/* copy values from data element */
uint16 targetSpeed2 = (AppDataEl[2]) | (AppDataEl[3]<<8 & 0x0F);
uint8 targetAccel2 = AppDataEl[1] >> 4;

/* check if E2EPW_Read2 was successful */
if(wrapperRet2 != 0) swc_error_handler(wrapperRet2);

/* Check if both Read1 and Read2 report the same status. In particular,
   byte2 of ret1 and ret2 shall be identical. If not, then it means
   that there is a disagreement on evaluation of data between Read1
   and Read2 */
if(wrapperRet2 != wrapperRet1) swc_error_handlerR(wrapperRet1,
  wrapperRet2);

/* check for corruption of AppDataEl after CRC has been checked */
if(targetSpeed2 != targetSpeed1) swc_error_handlerR(wrapperRet1,
  wrapperRet2);
if(targetAccel2 != targetAccel1) swc_error_handlerR(wrapperRet1,
  wrapperRet2);

/* consume targetSpeed1/targetSpeed2 and targetAccel1/targetAccel2*/
```

B.2 COM E2E Callouts

In this approach, the E2E communication protection protects the data exchange between COM modules. The protection is done at the level of COM's signal groups, which are protected and checked by E2E Library.

This solution works with all communication models, multiplicities offered by RTE for inter-ECU communication.

The callout invokes the E2E Library, once for each E2E-protected signal group in a given I-PDU.

This solution can be used in the systems where the integrity of operation of COM and RTE is provided.

B.2.1 Functional overview

For each I-PDU, there is a separate callout function. Each I-PDU callout function "knows" if and how each signal group of the I-PDU needs to be protected/checked. This means that the callout invokes the E2E Library functions with appropriate settings and state parameters. The E2E Library does not "know" signal groups and their settings - entire information is passed as function parameters to E2E library functions.

On both receiver and sender side, if a callout returns TRUE, then COM continues. If a COM E2E Callout returns FALSE, then COM stops to process the given I-PDU (in this cycle). The COM E2E Callout returns FALSE if and only if there is an internal error, e.g. program flow error, data corruption error in E2E Lib.

The sender callout always returns TRUE if there are no runtime errors detected (e.g. wrong parameter), otherwise FALSE. The receiver callout returns TRUE if there are no runtime errors detected and the result of the check is either E2E_P02STATUS_OK or E2E_P02STATUS_OKSOMELOST.

The diagram below summarizes the COM E2E Callout solution on the sender side. The SW-C is completely not impacted, and only additional activities in COM are invocation of the generated callout (step 6). If the return value from the callout is TRUE, then the I-PDU data modified by E2E Library is then transmitted by PDU router. If false, then COM stops further processing of this I-PDU in this cycle.

Figure B.24: Callout - overall flow - P-port

The diagram below summarizes the COM E2E Callout solution. The very important step is that the E2E Library overwrites CRC byte in the signal group by the check status bits (E2E_PXXCheckStateType). Then, this overwritten CRC byte is converted by COM to signals and then by RTE to data elements. As a result, the SW-C receives in the CRC data element the E2E check bits, and not the CRC value.

Figure B.25: Callout - overall flow - R-port

B.2.1.1 Sending/Calling

On the sender COM side, when the I-PDU has been built from signals and the conversions (e.g. Endianness) have taken place, and the I-PDU is ready, then COM calls a callout function. There is a separate callout for each I-PDU (if defined). Once the callout returns, COM invokes the PDU Router to transmit the data (function PduR_ComTransmit).

The callout function is generated to protect the signal groups of one I-PDU and simply invokes the E2E Library (once per each E2E-protected signal group) with the correct hard-coded settings. The hard-coded settings have been generated from the settings described in the previous section.

When the callout returns TRUE, COM invokes PduR_ComTransmit(), to route the I-PDU through the network.

Figure B.26: Callout - sequence - sending

According to COM SWS, the callouts shall conform to the following syntax:

boolean <IPDU_CalloutName> (PduIdType TxPduId, const PduInfoType* PduInfoPtr)

[UC_E2E_00250] [The transmission callout for usage with E2E shall be the following:
IPDU_E2Eprotect_<IPDU ID>(PduIdType TxPduId, PduInfoType* PduInfoPtr).

For example, the callout to protect the I-PDU with handle 21 shall have the name IPDU_E2EProtect_21().] ([RS_E2E_08528](#))

B.2.1.2 Reception

On the receiver COM side, when the I-PDU is available at PDU Router, PDU Router invokes COM's function COM_RxIndication(). COM then calls the generated I-PDU callout (if configured for the given I-PDU). The callout, generated specifically for that I-PDU, calls the E2E Library with specific parameters (once for each E2E-protected signal group). The E2E Library executes the checks and stores the check results in the status.

Once E2E Library check function returns, the callout copies the status into the CRC byte, so that it can be analyzed, if needed, by receiver SW-C.

Figure B.27: Callout - sequence - reception

[UC_E2E_00251] [The reception callout for usage with E2E shall be the following: IPDU_E2ECheck_<IPDU ID>(PduIdType RxPduId, PduInfoType* PduInfoPtr).

For example, the callout to protect the signal groups in an I-PDU with handle 21 shall have the name `IPDU_E2ECheck_21()`.] ([RS_E2E_08528](#))

B.2.2 Methodology

Note: Different releases of AUTOSAR have different names for COM classes. The text description below is generalized to fit to different releases, but the diagrams are slightly different (main differences are different names of classes and objects).

The information how each signal group needs to be protected (e.g. which E2E Profile, which offset) is defined in [8, System Template] , [9, Software Component Template] and [10, Specification of ECU Configuration]. This configuration information is used to generate the callout functions.

By means of the settings defined by AUTOSAR templates, it is possible to generate the COM callouts for invoking the E2E Library.

The configuration is done in the following configuration areas:

- Definition of I-PDUs (system template)
- Definition of E2E settings ([9, Software Component Template])
- Association of I-PDUs to E2E protection settings (system template).
- Definition of I-PDU details (ECU configuration)

The four above steps are described in more details below.

First, according to System Template, the I-PDUs exchanged by COM are defined.

Secondly, according to Software Component Template, for each signal group to be protected, the classes `EndToEndProtection` and `EndToEndDescription` are defined. The settings include information like CRC offset.

Thirdly, according to System Template, each I-PDU to be protected is associated to a corresponding `EndToEndProtection`.

Fourth, after the extraction of ECU configuration, according to ECU configuration, the I-PDU handles (numerical I-PDU identifiers) and callout functions are defined. COM requires that there is a separate callout function for each I-PDU (separate piece of code).

All configuration options needed to generate the COM callouts automatically is available in AUTOSAR methodology. For each I-PDU to be protected/checked, a separate callout routine shall be generated, which invokes E2E Library (once or several times).

[UC_E2E_00270] [The COM E2E callout shall be generated for the I-PDU for which the corresponding `EndToEnd*` metaclasses are defined.] ([RS_E2E_08528](#))

[UC_E2E_00290] [If the E2EProtection is done via COM Callouts then the `EndToEndProtectionISignalPdu` shall be defined.] ([RS_E2E_08528](#)) See [Figure B.9](#).

Note that in R3.2 (contrary to \geq R4.0), the ISignalIPdu is called "SignalIPdu" and it inherits the unusedBitPattern attribute from IPdu.

The important settings are:

- ISignalIPdu (represents an I-PDU)
 - ISignalIPdu.unusedBitPattern: bits that are not used in an I-PDU,
- ISignalToIPduMapping: describes the mapping of signals to I-PDUs,
 - ISignalToIPduMapping.startPosition: offset in bits of a signal in the I-PDU,
- EndToEndProtectionISignalIPdu: association of one E2E protection to a one I-PDU and to one signal group,
 - EndToEndProtectionISignalIPdu.dataOffset: offset in bits of the signal group in the I-PDU.

ISignalIPdu.unusedBitPattern is not used by E2E COM callouts, because they are set by COM and E2E COM callouts operate on the same buffers.

B.2.3 Code Example

Note that the code examples for the COM E2E callouts are for the case when there is one signal group in the I-PDU. In general, it is possible to have N signal groups in an I-PDU and M signal groups protected by E2E, where $0 \leq M \leq N$. In such a case, the callout invokes E2E Library functions M times (for each of the protected signal group).

Transmitter

```
boolean IPDU_E2EProtect_21 (PduIdType RxPduId, PduInfoPtr *){
    /* At first run, instantiate the structures and set the init Values
    */
    static E2E_P01ConfigType Cfg_Write_21 = { 64, 21,
        E2E_P01_DATAID_BOTH, 1, 0, 8 };
    static E2E_P01ProtectStateType Sta_Write_21 = {0};

    Std_ReturnType ret = E2E_P01Protect(& Cfg_Write_21, & Sta_Write_21,
        IPduInfo->SduDataPtr);
    /* return TRUE if no error in protect function */
    return (ret != 0);
}
```

Receiver

```
boolean IPDU_E2ECheck_21 (PduIdType RxPduId, const PduInfoPtr *) {
    /* At first run, instantiate the structures and set the init values
    */
    static E2E_P01ConfigType Cfg_Read_21 = { 64, 21,
        E2E_P01_DATAID_BOTH, 1, 0, 8 };
    static E2E_P01CheckStateType Sta_Read_21 = {0, 0, TRUE, FALSE,
        E2E_P01STATUS_NONEWDATA};
```

```
/* If callout is invoked, this means that new data is available At
   COM */
Sta_Read_21.NewDataAvailable = TRUE;
Std_ReturnType ret = E2E_P01Check(Cfg_Read_21, Sta_Read_21,
    IPduInfo->SduDataPtr);

/* return TRUE if no error, possibly only some messages lost Within
   counter tolerance */
if(ret == E2E_OK && (Sta_Read_21.Status == E2E_P01STATUS_OK ||
    Sta_Read_21.Status == E2E_P02STATUS_OKSOMELOST) ) {
    return TRUE;
}
else {
    return FALSE;
}
}
```

B.3 Provision of the Protection Wrapper Interface on a ECU with COM Callout solution

In case an ECU can provide a safe hardware, COM Layer and RTE, it is possible to integrate SWCs which require the E2E Protection Wrapper interfaces by using a direct mapping of E2E Wrapper interfaces to RTE interfaces and perform the E2E protection according to the "COM Callout" approach. By this approach compatibility between the two solutions "E2E Protection Wrapper" and "COM Callout" is achieved. This implies that the CRC and Ctr fields are not yet filled on RTE level in Tx direction. For Rx direction the CRC and Ctr on RTE level are already evaluated by COM and filled with status information and thus do not contain the PDU checksum and counter anymore.

Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach.

B.4 Protection at RTE level through E2E Transformer

In this scenario, the RTE is considered safety-related. COM is QM. The RTE does the serialization of data elements into one dynamic-size signal, then RTE calls E2E to protect it. Then, RTE provides this E2E-protected dynamic-size signal to COM.

This solution is out-of-box, which means that AUTOSAR needs to be configured, but there is no need of integrator code for the E2E invocation.

This scenario is specified in details in SWS E2E Transformer.
