

Document Title	Software Component Template
Document Owner	AUTOSAR
Document Responsibility	AUTOSAR
Document Identification No	62

Document Status	published
Part of AUTOSAR Standard	Classic Platform
Part of Standard Release	R23-11

Document Change History			
Date	Release	Changed by	Description
2023-11-23	R23-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • Improve data type configuration • minor corrections / clarifications / editorial changes
2022-11-24	R22-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • Support for service discovery • Clarification of the role of SwBaseType • minor corrections / clarifications / editorial changes
2021-11-25	R21-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • Introduction of imposition times for constraints • Clean-up of diagnostics service needs • New writing strategy for NvRAM • minor corrections / clarifications / editorial changes
2020-11-30	R20-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • In-place Strategy for Array Data Type • New Service Use Cases • Optimization of Return Type for RTE APIs • minor corrections / clarifications / editorial changes

2019-11-28	R19-11	AUTOSAR Release Management	<ul style="list-style-type: none"> • Support for optimized access to coding data • Support for meta-data on application level • Support for optimized storing of bitfields in NvRAM • minor corrections / clarifications / editorial changes; For details please refer to the ChangeDocumentation • Changed Document Status from Final to published
2018-10-31	4.4.0	AUTOSAR Release Management	<ul style="list-style-type: none"> • Support for optional elements in structured data types • Improved description of service use cases • minor corrections / clarifications / editorial changes; For details please refer to the ChangeDocumentation
2017-12-08	4.3.1	AUTOSAR Release Management	<ul style="list-style-type: none"> • minor corrections / clarifications / editorial changes; For details please refer to the ChangeDocumentation
2016-11-30	4.3.0	AUTOSAR Release Management	<ul style="list-style-type: none"> • Improved support for Unions • Improved upstream mapping • Improved description of service use cases • Minor corrections / clarifications / editorial changes; For details please refer to the ChangeDocumentation
2015-07-31	4.2.2	AUTOSAR Release Management	<ul style="list-style-type: none"> • Minor corrections / clarifications / editorial changes; For details please refer to the ChangeDocumentation

2014-10-31	4.2.1	AUTOSAR Release Management	<ul style="list-style-type: none"> • Efficient NV data handling • Introduction of data transformation • Support for variable-size Arrays of arbitrary data types • Support for ASIL/QM development • Minor corrections / clarifications / editorial changes; For details please refer to the BWCStatement
2014-03-31	4.1.3	AUTOSAR Release Management	<ul style="list-style-type: none"> • Various fixes and clarifications
2013-10-31	4.1.2	AUTOSAR Release Management	<ul style="list-style-type: none"> • Various fixes and clarifications
2013-03-15	4.1.1	AUTOSAR Administration	<ul style="list-style-type: none"> • Introduction of PRPortPrototype • Definition of implicit communication behavior • Support for the formal analysis of resource locking • Introduction of refined scheduling of RunnableEntitys • Get information about activating RTEEvent • Connection of Mode Managers and Mode Users with different number of ModeDeclarations • Support activation of RunnableEntitys on remote ECUs • Support for ModeTransition • Support for the definition of the network representation of composite data types • ServiceNeeds for diagnostics over IP • Various fixes and clarifications

2011-12-22	4.0.3	AUTOSAR Administration	<ul style="list-style-type: none"> • Added <code>CompuMethod</code> categories <code>SCALE_LINEAR_AND_TEXTTABLE</code> and <code>SCALE_RATIONAL_AND_TEXTTABLE</code> ([TPS_SWCT_01877]) • Clarification concerning the usage of invalid values • Revised support for data filters • Support for partial networking • Support for the specification of local connections between software-components • Improved description of service needs • Change history of constraints and specification items • Miscellaneous improvements and clarifications • “Support for Standardization” moved to Standardization Template [1]
2011-04-15	4.0.2	AUTOSAR Administration	<ul style="list-style-type: none"> • Remove restriction on data type of inter-runnable variables • Rework end-to-end communication protection • Add more constraints on the usage of the meta-model • Various fixes and clarifications
2009-12-18	4.0.1	AUTOSAR Administration	<ul style="list-style-type: none"> • New requirements tracing table • Support for fixed data exchange • Implementation of meta-model cleanup • Fundamental revision of the data type concept • Support for variant handling • Support for end-to-end communication protection

			<p style="text-align: center;">△</p> <ul style="list-style-type: none"> • Support for documentation • Support for stopping and restarting of software-components • Support for triggered events • Support for explicit mapping of interface elements • Revised concept of mode management • Support for integrity and scaling at ports • Support for standardization within AUTOSAR
2008-08-13	3.1.1	AUTOSAR Administration	<ul style="list-style-type: none"> • Improved support for on-board diagnostics • Small layout adaptations made
2007-12-21	3.0.1	AUTOSAR Administration	<ul style="list-style-type: none"> • Improved support for measurement and calibration • Improved semantics of delegation ports • Introduction of abstract memory classes • Document meta information extended • Small layout adaptations made
2007-01-24	2.1.15	AUTOSAR Administration	<ul style="list-style-type: none"> • Harmonization of the document with other specifications (e.g. RTE) • Introduction of a new concept to support calibration and measurement - harmonized with RTE • Description of needs of the Software Component Template toward AUTOSAR services and of the interaction of the Software Component Template and services (on XML level) • Legal disclaimer revised • Release notes added • “Advice for users” added • “Revision information” added

△

2006-05-16	2.0.0	AUTOSAR Administration	• Second
2005-05-31	1.0.0	AUTOSAR Administration	• Initial release

Contents

1	Introduction	32
1.1	Overview	32
1.2	Scope	32
1.3	Organization of the Meta-Model	33
1.4	Structure of the Template	34
1.4.1	Description of Software Components on VFB Level	35
1.4.2	Description of Software Components on RTE Level	35
1.4.3	Descriptions of Software Components on Implementation Level	36
1.5	Document Conventions	36
1.6	About Tables	38
2	Conceptual Aspects	39
2.1	Introduction	39
2.2	Measurement and Calibration	39
2.2.1	Basic Approach of Measurement and Calibration	39
2.2.2	Calibration Parameters Overview	39
2.2.3	Using Calibration Parameters	40
2.2.3.1	Sharing Calibration Parameters within Compositions	40
2.2.3.2	Sharing Calibration Parameters between SwComponentPrototypes of the same SwComponentType	42
2.2.3.3	Providing Instance Individual Characteristic Data	43
2.3	Runtime and Data Consistency Aspects	44
2.3.1	Background: the Issues	44
2.3.1.1	Mutual Exclusion with Semaphores	45
2.3.1.2	Interrupt Disabling	45
2.3.1.3	Priority Ceiling	45
2.3.1.4	Implicit Communication by means of Variable Copies	45
2.3.2	Data Consistency at Runtime	46
2.3.3	Modeling Aspects of Data Consistency	47
2.4	Variant Handling in the Software Component Template	48
2.5	Communication Specification of Composition Component Types	50
2.5.1	Rationale	50
2.6	PRPortPrototype	51
2.6.1	Use Case 1	52
2.6.2	Use Case 2	52
2.6.3	Use Case 3	53
2.6.4	Solution	54
2.7	Variable-size Array Data Types	54
2.7.1	Overview and Use cases	54
2.7.1.1	“Old-world” dynamic-size Arrays	55
2.7.1.2	“New-world” variable-size Arrays	56
2.7.2	Modeling Aspects regarding Application Data Types	59
2.7.3	Modeling Aspects regarding Implementation Data Types	59

2.8	Optional Elements in Structures	61
2.8.1	Background	61
3	Overview: Software Components, Ports, and Interfaces	63
3.1	Introduction	63
3.2	Software Component	64
3.2.1	Overview	64
3.2.2	PortPrototype	65
3.2.3	AtomicSwComponentType	70
3.2.4	ParameterSwComponentType	72
3.2.5	Symbolic Name of a Software-Component	72
3.3	Composition	73
3.3.1	Overview	73
3.3.2	SwComponentPrototype	74
3.3.3	Connectors	78
3.3.4	Instantiation-specific RTEEvents	84
3.4	Port Interface	85
4	Details: Software Components, Ports, and Interfaces	92
4.1	Introduction	92
4.2	Port Interface Details	92
4.2.1	Introduction	92
4.2.2	Sender Receiver Communication	93
4.2.2.1	Sender Receiver Interface	93
4.2.2.2	Communication Patterns for Sender Receiver Communication	95
4.2.2.3	Invalidation Policy	96
4.2.2.4	Meta-data on the Application Software Level	97
4.2.3	Client Server Communication	100
4.2.3.1	Client Server Interface	101
4.2.3.2	Error Handling in Client/Server Communication	107
4.2.4	External Trigger Event Communication	108
4.2.5	Communication of Modes	112
4.2.5.1	Mode Switch Interface	112
4.2.5.2	Data Types used for Mode Communication	114
4.2.5.3	Relevance for Measurement and Calibration	116
4.2.6	Parameter Communication	117
4.3	PortInterface Mapping and Data Scaling	118
4.3.1	PortInterface Mapping	120
4.3.1.1	Mapping of Sender Receiver Interface, Parameter Interface and Non Volatile Data Interface Elements	123
4.3.1.2	Mapping of Client Server Interface Elements	126
4.3.1.3	Mapping of Mode Interface Elements	129
4.3.1.4	Mapping of Trigger Interface Elements	133
4.3.1.5	Mapping of Elements of a composite Data Type	134
4.3.2	Data Conversion	140
4.3.2.1	Linear Data Scaling	141

4.3.2.2	Table Conversion	142
4.3.3	Relevance for Data Transformation	147
4.4	Port Annotation	150
4.4.1	Introduction	150
4.4.2	SenderReceiverAnnotation	151
4.4.3	ClientServerAnnotation	155
4.4.4	Annotation for the I/O Hardware Abstraction Layer	156
4.4.5	Parameter Port Annotation	158
4.4.6	Mode Port Annotation	159
4.4.7	Trigger Port Annotation	160
4.4.8	Non Volatile Data Port Annotation	160
4.4.9	Delegated Port Annotations	161
4.4.10	General Annotation	162
4.5	Communication Specification	163
4.5.1	Communication Specification for Sender-Receiver Communication	168
4.5.1.1	Receiver ComSpec	169
4.5.1.2	Sender ComSpec	176
4.5.1.3	Data Filter	181
4.5.1.4	Communication between Application and NV Block Software Components	183
4.5.1.5	Communication behavior to be implemented by the Software Component	185
4.5.2	Communication Specification for Client-Server Communication	187
4.5.2.1	Client ComSpec	187
4.5.2.2	Server ComSpec	188
4.5.3	Communication Specification for Mode Switch Communication	189
4.5.3.1	Mode Switch Sender ComSpec	189
4.5.3.2	Mode Switch Receiver ComSpec	191
4.5.4	Communication Specification for Parameters	192
4.5.5	Communication Specification for NV Data	193
4.5.5.1	NV Require ComSpec	193
4.5.5.2	NV Provide ComSpec	194
4.5.6	Configuration of Data Transformation	195
4.6	Port Groups within Component Types	202
4.7	End to End Protection	204
4.8	Partial Networking	216
4.8.1	VFC Control Ports	217
4.8.2	VFC Status Ports	218
4.9	Formal Definition of implicit Communication Behavior	219
4.9.1	Consistency Needs on Receiver Side	223
4.9.2	Consistency Needs on Sender Side	224
4.9.3	Consistency Needs for Senders and receivers of the same Data inside on RunnableEntityGroup	225

5	Data Description	226
5.1	Introduction	226
5.2	Data Types	230
5.2.1	Overview	230
5.2.2	Data Type Mapping	232
5.2.3	Data Categories	236
5.2.4	Application Data Type	241
5.2.4.1	Application Primitive Data Types	244
5.2.4.2	Application Composite Data Types	251
5.2.5	Implementation Data Type	262
5.2.5.1	Overview	262
5.2.5.2	Modeling of Type Reference using Implementation Data Type	270
5.2.5.3	Modeling of Structure using Implementation Data Type	271
5.2.5.4	Modeling of Union using Implementation Data Type	274
5.2.5.5	Modeling of Array using Implementation Data Type	275
5.2.5.6	Modeling of Pointer using Implementation Data Type	285
5.2.6	Base Type	288
5.2.6.1	Big Picture	288
5.2.6.2	Category	292
5.2.6.3	Native Declaration	292
5.2.6.4	Base Type Size	293
5.2.6.5	Base Type Encoding	294
5.2.6.6	Byte Order and Memory Alignment	296
5.2.7	Data Type Terminology	298
5.2.7.1	Primitive Type	298
5.2.7.2	Compound Primitive Data Type	299
5.2.7.3	Integral Primitive Type	300
5.2.7.4	Variable-Size Array Data Type	301
5.2.7.5	Wrapped Union Data Type	301
5.2.7.6	Optional Element Structure	303
5.2.7.7	Compu Scale Literal	304
5.3	Data Prototypes	304
5.3.1	Overview	304
5.3.2	Data Constraints for DataPrototypes typed by Array DataTypes	311
5.3.3	Reference to Data Prototypes	314
5.3.3.1	AUTOSAR Variable Ref	315
5.3.3.2	AUTOSAR Parameter Ref	316
5.3.3.3	Modeling Approach	318
5.3.3.4	Access into VariableDataPrototype typed by an ImplementationDataType	321
5.3.3.5	Access into ParameterDataPrototype typed by an ImplementationDataType	323
5.4	Properties of Data Definitions	325

5.4.1	Overview	325
5.4.2	Invalid Value	339
5.4.3	Properties for Measurement	348
5.4.4	Properties of Curves and Maps	349
5.4.4.1	Specification of grouped Axes	357
5.4.4.2	Specification of fix Axes	361
5.4.5	Setting an Axis Input Value	363
5.4.6	Setting a Group Axis	368
5.4.7	Specifying Data Dependencies	373
5.4.8	Precedence of data properties with respect to data elements, axis elements, computation methods, units	375
5.5	Elements used in Properties of Data Definitions	379
5.5.1	Computation Methods	380
5.5.1.1	Category Values in the context of a CompuMethod	391
5.5.1.2	Applicability of Attributes in the context of a CompuMethod	393
5.5.1.3	CompuMethod and AutosarDataType	394
5.5.1.4	CompuMethod and A2L	396
5.5.2	Physical Dimensions	397
5.5.3	Units and Unit Groups	400
5.5.4	Data Constraints	404
5.5.4.1	Physical Limits	409
5.5.5	Addressing Methods	410
5.5.6	Record Layouts	419
5.5.6.1	Specifying Record Layouts	420
5.5.6.2	RecordLayouts and DataTypes	427
5.5.6.3	Record Layouts and Interpolation Routines	429
5.5.7	Display Presentation	431
5.6	Specification of Constant Values	432
5.6.1	Overview	432
5.6.2	Reference to Constant	440
5.6.3	Constant Specification Mapping	441
5.6.4	Values for Variable-Size Array	445
5.6.5	Values for Compound Primitive Data Types	447
5.6.6	Values for TEXTTABLE	459
5.6.7	Values for BITFIELD_TEXTTABLE	460
5.6.8	Values for Strings	461
5.6.8.1	String is modeled by ApplicationDataType	461
5.6.8.2	String is modeled by ImplementationDataType	461
5.6.9	Specification of Values based on Rules	461
5.6.9.1	Support for primitive Data Types	461
5.6.9.2	Support for composite Data Types	471
5.6.9.3	Support for compound primitive Data Types	472
5.7	Initial Values	474
5.7.1	Overview	474
5.7.2	Initial Value Representation	475

5.7.3	Initial Values For CalibrationParameters	477
5.7.4	Initial Value for optional Element	478
5.7.4.1	Initial Value for optional ApplicationRecordElement	479
5.7.4.2	Initial Value for optional ImplementationDataType-Element	481
6	Compatibility	482
6.1	Introduction	482
6.2	Compatibility of Data Types	482
6.2.1	ApplicationDataType	482
6.2.1.1	ApplicationPrimitiveDataType	482
6.2.1.2	ApplicationCompositeDataType	483
6.2.2	ImplementationDataType	484
6.2.3	Compatibility of SwBaseType	486
6.2.4	Compatibility of SwDataDefProps	486
6.2.4.1	Compatibility of Units	487
6.2.4.2	Compatibility of PhysicalDimensions	488
6.2.4.3	Compatibility of Data Constraints	489
6.2.4.4	Compatibility in case of ImplementationDataType	490
6.2.4.5	Compatibility of CompuMethods	491
6.2.5	Compatibility of ApplicationDataType and Implementation-DataType	493
6.2.5.1	General Rule	494
6.2.5.2	Category VALUE	494
6.2.5.3	Category ARRAY, VAL_BLK	495
6.2.5.4	Category STRUCTURE	495
6.2.5.5	Category BOOLEAN	496
6.2.5.6	Category COM_AXIS, RES_AXIS, CURVE, MAP, CUBOID, CUBE_4, CUBE_5	496
6.2.5.7	Forbidden Mappings	497
6.3	Compatibility of Variable Data Prototypes and Parameter Data Prototypes	498
6.4	Compatibility of Sender Receiver Interfaces, Parameter Interfaces and Non Volatile Data Interfaces	500
6.4.1	Connection of Required and Provided Port via AssemblySwConnector	500
6.4.2	Connection of Inner and Outer Port via DelegationSwConnector	501
6.4.3	Connection of Required and Provided Port via PassThroughSwConnector	502
6.4.4	Compatibility of ParameterDataPrototype and Variable-DataPrototype depending on PortInterface Type	503
6.5	Compatibility of Mode Switch Interfaces	504
6.5.1	Connection of Required and Provided Port via AssemblySwConnector	504

6.5.2	Connection of Inner and Outer Port via DelegationSwConnector	505
6.5.3	Connection of Outer and Outer Port via PassThroughSwConnector	505
6.6	Compatibility of Mode Declaration Group Prototypes	506
6.7	Compatibility of Mode Declaration Groups	506
6.8	Compatibility of Argument Prototypes	508
6.9	Compatibility of Application Errors	508
6.10	Compatibility of Client/Server Operations	508
6.11	Compatibility of Client Server Interfaces	509
6.11.1	Connection of Required and Provided Port via AssemblySwConnector	509
6.11.2	Connection of Inner and Outer Port via DelegationSwConnector	510
6.11.3	Connection of Outer and Outer Port via PassThroughSwConnector	510
6.12	Compatibility of Trigger Interfaces	511
6.12.1	Connection of Required and Provided Port via AssemblySwConnector	511
6.12.2	Connection of Inner and Outer Port via DelegationSwConnector	512
6.12.3	Connection of Outer and Outer Port via PassThroughSwConnector	512
6.13	Compatibility of Trigger	513
6.14	Entire Delegation of a Provided Port Prototype	513
6.14.1	Split and Merge of PortInterface Elements	514
6.15	Compatibility in Case of a Flat ECU Extract	515
7	Internal Behavior	516
7.1	Introduction	516
7.2	Runnable Entity	522
7.2.1	Concurrency and Reentrancy of a RunnableEntity that cannot be Invoked Concurrently	529
7.2.2	Concurrency and Reentrancy of a RunnableEntity that can be Invoked Concurrently	530
7.2.3	Timed Activation of Runnable Entities	531
7.2.4	Additional Remarks and Clarifications	532
7.2.4.1	Reentrancy and Multiple Instantiation	532
7.2.4.2	Reentrancy and “Library Functions”	533
7.2.4.3	Compatibility of ClientServerOperations triggering the same RunnableEntity	533
7.2.4.4	Categories of Runnable Entities	534
7.2.4.5	Arguments of a Runnable Entity	535
7.2.5	Activation Reason of a Runnable Entity	537
7.2.6	Runnable Entity for Initialization Purpose	539
7.3	RTEEvent	540

7.3.1	Defining an Event	547
7.3.2	Defining how to Respond to an Event	549
7.4	Communication among Runnable Entities	551
7.4.1	Description Possibility 1: Exclusive Area	552
7.4.1.1	Entire Runnable Runs in the Exclusive Area	555
7.4.1.2	Runnable would Dynamically Enter and Leave the Exclusive Area	555
7.4.1.3	Configuration of API Generation	556
7.4.2	Description Possibility 2: Inter-Runnable Variable	557
7.4.3	Inter Runnable Triggering	560
7.5	Data Access of RunnableEntities	561
7.5.1	RunnableEntities and Sender Receiver Communication	564
7.5.1.1	Terminology	565
7.5.1.2	Data Access	566
7.5.1.3	Explicit Sending and Receiving	568
7.5.1.4	Implicit Sending and Receiving	572
7.5.1.5	DataSendCompletedEvent	574
7.5.1.6	DataWriteCompletedEvent	574
7.5.1.7	DataReceivedEvent	575
7.5.1.8	DataReceiveErrorEvent	575
7.5.2	RunnableEntities and Client Server Communication	577
7.5.2.1	Invoking an Operation	577
7.5.2.2	Providing an Implementation of an Operation	582
7.5.2.3	Reacting on Data Transformation Errors	583
7.5.3	RunnableEntities and External Trigger Event Communication	583
7.5.3.1	Trigger Source	583
7.5.3.2	Trigger Sink	585
7.5.4	RunnableEntities and Parameter Access	585
7.5.4.1	InstantiationDataDefProps	587
7.5.5	RunnableEntities and Mode Communication	588
7.6	Port API Options	589
7.6.1	Enable to Take Address	591
7.6.2	Indirect API Generation	592
7.6.3	Port Defined Argument Value	592
7.6.4	Supported Features	593
7.6.4.1	Buffer Locking	594
7.7	PerInstanceMemory	595
7.7.1	PerInstanceMemory typed by "C" Data Types	596
7.7.2	PerInstanceMemory typed by AUTOSAR Data Types	598
7.8	Static Memory and Constant Memory	598
7.9	Included AUTOSAR Data Types	599
7.10	Included Mode Declaration Groups	601
7.11	Service Needs	602
7.11.1	Overview	602
7.11.2	Assignment of Service Needs to Ports and Data	604
7.12	Variation Point Proxy	612

8	Implementation	619
9	Mode Management	625
9.1	Declaration of Modes	625
9.2	Modes and Events	631
9.3	Initialization / Finalization	635
9.4	Mode Error Behavior	635
9.5	Summary Meta-Model Excerpt Related to Modes	639
10	ECU Abstraction and Complex Drivers	641
10.1	Introduction	641
10.2	High Level Hardware and Software Architecture	641
10.3	Interfaces and APIs	644
10.3.1	ECU Abstraction and its AUTOSAR Interfaces	644
10.4	Sensors/Actuators	645
10.5	I/O Hardware Abstraction	647
10.6	Complex Driver	648
11	Services	653
11.1	Overview: Generation of Service-related Model Elements	653
11.2	Service Software Component Type	656
11.3	Service Proxy Component Type	659
11.4	Non Volatile Memory	662
11.4.1	Introduction	662
11.4.2	NvBlockComponent	662
11.4.3	Software-Components using <i>NVRAM data</i> of NvBlock-Components	664
11.4.4	Software-Components connected to NvBlockComponents	667
11.4.5	NvBlockDescriptor	668
11.4.5.1	Writing Strategies	671
11.4.5.2	NvBlockNeeds	678
11.4.5.3	RAM Block and ROM Block	681
11.4.5.4	NvBlockDataMapping	682
11.4.5.5	Client Server Ports	689
11.4.6	BulkNvDataDescriptor	690
11.4.7	SwcInternalBehavior of an NvBlockSwComponentType	692
12	Software Component Documentation	696
13	Service Dependencies and Service Use Cases	701
13.1	Overview	701
13.2	NvM Service Dependencies	701
13.2.1	Nvm Use Case: Permanent RAM Block	702
13.2.2	Nvm Use Case: Temporary RAM Block	703
13.2.3	Nvm Use Case: RAM Block with explicit synchronization using Mirror Interfaces	704

13.2.4	NVM Use Case: Software-Components using Nv Data provided by NvBlockSwComponentType (not ServiceSwComponent of NvM)	705
13.3	Watchdog Service Dependencies	706
13.3.1	Watchdog Service use Case: Local Supervision	706
13.3.2	Watchdog Service use Case: <i>Global Supervision Status</i> notification	708
13.3.3	Watchdog Service use Case: Control global supervision or get global supervision status	709
13.3.4	Watchdog Service use Case: Software-component wants to obtain the status of a local supervision	710
13.3.5	Watchdog Service use Case: Software-component wants to report a checkpoint	710
13.4	COM Manager Service Needs	711
13.4.1	ComM Use Case: read current ComM Mode	711
13.4.2	ComM Use Case: request ComM Mode	712
13.4.3	ComM Use Case: Software-Component acts as a Mode Manager that influences the ECU State	712
13.4.4	Read PNC ComM Mode	713
13.5	ECU State Manager Service Needs	714
13.5.1	EcuM Use Case: read current ECU Mode	714
13.5.2	EcuM Use Case: request a certain ECU state	714
13.5.3	EcuM Use Case: select Shutdown Target	715
13.5.4	EcuM Use Case: select Boot Target	715
13.5.5	EcuM Use Case: use Alarm Clock	716
13.6	BswM	716
13.6.1	Partial Networking	716
13.6.2	Mode Manager	717
13.6.3	Mode User	719
13.6.4	Mode Requester	720
13.6.5	Service Oriented Use Cases	720
13.6.5.1	PortGroup supports Relation between Software-Component and service Instance	721
13.6.5.2	General Server interaction	722
13.6.5.3	General Client interaction	723
13.6.5.4	Event Reception Without Subscription	725
13.6.5.5	Use Case: Server Service Offer	727
13.6.5.6	Use Case: Server Service Subscription Status	728
13.6.5.7	Use Case: Client Event / Method Subscription	729
13.6.5.8	Use Case: Client Event and Method Subscription Status	730
13.7	Crypto Service Dependencies	732
13.7.1	Overview	732
13.7.2	Crypto Service Use Cases	734
13.7.2.1	Crypto Service Use Case: Hash calculation	734
13.7.2.2	Crypto Service Use Case: MAC calculation	734

13.7.2.3	Crypto Service Use Case: MAC verification	735
13.7.2.4	Crypto Service Use Case: generation of random numbers	735
13.7.2.5	Crypto Service Use Case: Encryption with Authenticated Encryption with Associated Data (AEAD)	736
13.7.2.6	Crypto Service Use Case: Decryption with Authenticated Encryption with Associated Data (AEAD)	737
13.7.2.7	Crypto Service Use Case: encryption	737
13.7.2.8	Crypto Service Use Case: decryption	738
13.7.2.9	Crypto Service Use Case: signature generation . .	738
13.7.2.10	Crypto Service Use Case: signature verification . .	739
13.7.2.11	Crypto Service Use Case: usage of key management	740
13.7.3	Crypto Service Job Use Cases	740
13.7.3.1	Crypto Service Use Case: usage of job API to set key valid	740
13.7.3.2	Crypto Service Use Case: usage of job API to create a random seed	741
13.7.3.3	Crypto Service Use Case: usage of job API to generate a key	741
13.7.3.4	Crypto Service Use Case: usage of job API to derive a key	742
13.7.3.5	Crypto Service Use Case: usage of job API to execute calculation of the public value for key exchange	742
13.7.3.6	Crypto Service Use Case: usage of job API to execute calculation of shared secret for key exchange	743
13.7.3.7	Crypto Service Use Case: usage of job API to execute certificate parsing	744
13.7.3.8	Crypto Service Use Case: usage of job API to execute certificate verification	744
13.7.4	Crypto Key Management Use Cases	745
13.7.4.1	KeyM Service Use Case: Software-Component wants check a certificate on KeyM	745
13.7.4.2	KeyM Service Use Case: Software-Component wants to retrieve a certificate from KeyM	746
13.7.4.3	KeyM Service Use Case: Software-Component wants to retrieve elements of a certificate from KeyM	746
13.7.4.4	KeyM Service Use Case: Software-Component wants to check the existence of a certificate from KeyM	747
13.7.4.5	KeyM Service Use Case: Software-Component wants to store a (derived) key in KeyM	747
13.7.4.6	KeyM Service Use Case: Software-Component wants to store a container with (encrypted) keys in KeyM	748

13.7.4.7	KeyM Service Use Case: Software-Component wants to verify if cryptographic operation was executed using a specific key	748
13.8	Diagnostic Service Dependency	749
13.8.1	Development Approach	749
13.8.2	Function Inhibition Needs	750
13.8.2.1	Function Inhibition Manager Service use Case: read function permission	751
13.8.2.2	Function Inhibition Manager Use Case: react on suppressed or unavailable events	752
13.8.3	Diagnostic Event Needs	752
13.8.3.1	Dem Service Use Case: diagnostic monitor, debouncing by Dem	763
13.8.3.2	Dem Service Use Case: diagnostic monitor, debouncing by SWC	763
13.8.3.3	Dem Service Use Case: software-component provides information about operation cycles	764
13.8.3.4	Dem Service Use Case: software-component enables reporting of DTCs in general	764
13.8.3.5	Dem Service Use Case: software-component enables storage of subsequent DTCs	765
13.8.3.6	Dem Service Use Case: retrieve information of the lamp status	765
13.8.3.7	Dem Service Use Case: DEM provides information that the fault storage overflows	767
13.8.3.8	Dem Service Use Case: software-component suppresses the storage of DTCs	767
13.8.3.9	Dem Service Use Case: software-component informs that the PTO is active	768
13.8.3.10	Dem Service Use Case: software-component needs information about any DTC status change	768
13.8.3.11	Dem Service Use Case: call operation if the data of a given diagnostic event changes (I)	769
13.8.3.12	Dem Service Use Case: call operation if the data or status of any diagnostic event changes (II)	769
13.8.3.13	Dem Service Use Case: software-component provides data for diagnostic purposes	770
13.8.3.14	Dem Service Use Case: software-component gets information about a specific DTC	771
13.8.3.15	Dem Service Use Case: Software-Component wants to be triggered on Monitor Status Changes	771
13.8.3.16	Dem Service Use Case: write parameter identifier (PID) by software-component	772
13.8.3.17	Dem Service Use Case: read parameter identifier by software-component	773

13.8.3.18	Dem Service Use Case: diagnostic monitor provides monitor data, debouncing by Dem	773
13.8.3.19	Dem Service Use Case: diagnostic monitor provides monitor data, debouncing by software-component	774
13.8.3.20	Dem Service Use Case: software-component checks whether an event is suppressed	775
13.8.3.21	Dem Service Use Case: software-component wants information about DTC clearance	775
13.8.3.22	Dem Service Use Case: software-component wants to reset a degradation state	777
13.8.3.23	Dem Service Use Case: software-component wants to clear a DTC	777
13.8.4	Diagnostic Communication Needs	778
13.8.4.1	Dcm Service Use Case: read/write current values by Client Server Interface	784
13.8.4.2	Dcm Service Use Case: read/write current values of specific DID by Client Server Interface	784
13.8.4.3	Dcm Service Use Case: read/write current values by Sender Receiver Interface or Nv Data Interface	785
13.8.4.4	Dcm Service Use Case: read/write entire DID by Sender Receiver Interface or Nv Data Interface	786
13.8.4.5	Dcm Service Use Case: start/stop or request routine results	787
13.8.4.6	Dcm Service Use Case: IO control by Client Server Interface	788
13.8.4.7	Dcm Service Use Case: IO control by Sender Receiver Interface	788
13.8.4.8	Dcm Service Use Case: Access to protocol, session and security information	791
13.8.4.9	Dcm Service Use Case: Verify the access to security level	792
13.8.4.10	Dcm Service Use Case: multiple testers access one ECU	792
13.8.4.11	Dcm Service Use Case: Service Request Notification	793
13.8.4.12	Dcm Service Use Case: read/write and IOCtrl current values by Client Server Interface	794
13.8.4.13	Dcm Service Use Case: A software-component acts as a "file server" to a diagnostic tester	794
13.8.5	OBD related Needs	795
13.8.5.1	Dem Service Use Case: In-Use-Monitor Performance Ratio calculation	798
13.8.5.2	Dcm Service Use Case: read parameter identifier via diagnostic services by Client Server Interface	799
13.8.5.3	Dcm Service Use Case: read parameter identifier via diagnostic services by Sender Receiver Interface	799

13.8.5.4	Dcm Service Use Case: Request vehicle information	800
13.8.5.5	Dem Service Use Case: Read DTR data from SW-C for OBD Service \$06	801
13.8.5.6	Dcm Service Use Case: request control of on-board system, test or component	801
13.8.5.7	Dem Service Use Case: In-Use-Monitoring Performance Ratio Denominator interface	802
13.8.5.8	Dem Service Use Case: SW-C sets DTR for OBD Service \$06	803
13.8.6	Diagnostics over IP	804
13.8.6.1	DoIP Service Use Case: GID synchronization can be necessary if the ECU is DoIP Gid synchronization master	807
13.8.6.2	DoIP Service Use Case: Vehicle information is broadcast or can be requested by the tester	808
13.8.6.3	DoIP Service Use Case: Tester could also request the power status with respect to diagnostics	808
13.8.6.4	DoIP Service Use Case: Routing activation mechanism is used which can lead to additional impact regarding authentication or confirmation	809
13.8.6.5	DoIP Service Use Case: a DoIP entity needs to be informed when an external tester is attached or activated.	810
13.8.6.6	Service Use Case: Set and reset Warning Indicator Request bit	810
13.8.6.7	DoIP Service Use Case: Atomic Software-Component provides the further action byte to the DoIP Service Component	811
13.8.7	Miscellaneous Diagnostic Service Use-Cases	812
13.8.7.1	Dcm Service Use Case: DiagnosticSessionControl	812
13.8.7.2	Dcm Service Use Case: EcuReset	813
13.8.7.3	Dcm Service Use Case: EcuReset ModeRapid-PowerShutDown	813
13.8.7.4	Dcm Service Use Case: CommunicationControl	814
13.8.7.5	Dcm Service Use Case: ControlDTCSetting	814
13.8.7.6	Dcm Service Use Case: SecurityAccess	815
13.8.7.7	Service Use Case: Atomic Software-Component implements a Hardware Shutdown	815
13.8.7.8	Service Use Case: Upload and download of data	816
13.9	Diagnostic Log and Trace Dependency	817
13.9.1	Dlt use Case:Application software component transmits debug information	817
13.10	Synchronized Time-Base Manager Dependency	818
13.10.1	StbM Use Case: start timer and potentially get notified about its expiration	819

13.10.2	StbM Use Case: Software-Components wants to get notifications of status changes	820
13.10.3	StbM Use Case: Process time snapshot obtained from global time slave for diagnostics purposes	820
13.10.4	StbM Use Case: Software-component represents a global time master	821
13.10.5	StbM Use Case: Software-component represents a global time slave	822
13.10.6	StbM Use Case: Software-component analyzes predictions about the time synchronization process	822
13.10.7	StbM Use Case: Software-Components wants to initiate the cloning of a time base	823
13.11	Secure On-Board Communication	824
13.11.1	SecOc Use Case: obtain the verification status of secure communication	824
13.11.2	SecOc Use Case: software component retires from secure communication for a given period	825
13.11.3	SecOc Use Case: deliver freshness to SecOC I	826
13.11.4	SecOc Use Case: deliver freshness to SecOC II	826
13.11.5	SecOc Use Case: deliver freshness to SecOC III	826
13.11.6	SecOc Use Case: enable the sending of Pdus even if computation of the MAC is not possible	827
13.11.7	SecOc Use Case: Receive notification about an authentication attempt	828
13.12	J1939 Communication	828
13.12.1	J1939RM Use Case: AtomicSwComponentType sends requests to the bus	829
13.12.2	J1939RM Use Case: AtomicSwComponentType accepts requests from the bus	830
13.12.3	J1939Dcm wants to retrieve calibration verification numbers from an application software-component	830
13.13	Error Tracer	831
13.13.1	Error Tracer Use Case: Default Error Tracer Service use Case: report failure	833
13.14	Vehicle-2-X Facilities	833
13.14.1	V2xFac Use Case: Application software component provides Vehicle specific data to the V2X-Stack for CAM transmission	834
13.14.2	V2xFac Use Case: Application software component triggers transmission of DENM message	835
13.15	Vehicle-2-X Management	835
13.15.1	V2xM Use Case: Application software component provides Vehicle specific data to the V2X-Stack for Position and Time information	836
13.15.2	V2xM Use Case: Application software component needs V2X specific data from the V2X Manager	837

13.15.3	V2xM Use Case: Application software component has soft-control over Pseudonym-Change within V2X Manager	837
13.15.4	V2xM Use Case: Application software component do location based calculations	838
13.16	Vehicle-2-X DataManager	838
13.16.1	V2x DM Use Case: Application software component receives V2X data	840
13.17	Hardware Test Manager	840
13.17.1	HtssM Service Use Case: Query results of hardware tests	841
13.18	Intrusion Detection System Manager	841
13.18.1	IdsM Service Use Case: AtomicSwComponentType reports security event	842
13.18.2	IdsM Service Use Case: AtomicSwComponentType reports security event using Smart Sensor API	843
13.18.3	IdsM Service Use Case: AtomicSwComponentType provides time stamp to IdsM	844
14	Rapid Prototyping Scenarios	845
14.1	Definition of Rapid Prototyping Scenario	845
14.2	Usage of RptContainers on M1	848
14.3	Usage of atpSplittable for RptContainers on M1	850
14.4	Modifications of the Meta-Model for supporting the RPT scenario	850
14.5	Extended Buffer Access Method	852
14.5.1	RP Preparation	853
14.5.2	Service Points	857
14.5.2.1	Service Functions	858

[53] Software Process Engineering Meta-Model Specification
<http://www.omg.org/spec/SPEM/2.0/>

1 Introduction

1.1 Overview

This document contains the specification of the AUTOSAR `Software-Component Template`. Actually, it has been created as a supplement to the formal definition of the `Software-Component Template` by means of the AUTOSAR meta-model. In other words, this document in addition to the formal specification provides introductory description and rationale for the part of the AUTOSAR meta-model relevant for the definition of software-components.

In this context, the term software-component refers to a formally described piece of software existing that needs the AUTOSAR RTE [2] for execution.

Please note that the general ideas behind the semantics of application software-components have been described in the specification of the `Virtual Functional Bus` [3]. The latter, however, represents conceptual work that strongly influences but does not totally govern the formal definition of software-components.

Note further that this document does not provide any “best practice” recommendations of software-component modeling nor does it require or enforce a certain methodology. Note however, that the methodology aspect is covered by the specification of the AUTOSAR methodology [4].

Although it is beyond any doubt reasonable to use a suitable AUTOSAR Authoring Tool for dealing with AUTOSAR software-components, this specification does not make any assumptions nor does it give recommendations regarding the tooling.

1.2 Scope

As already mentioned in chapter 1.1, the Scope of this document is the description of AUTOSAR software-components. This work covers the following three aspects:

- A general description of `SwComponentTypes` using `PortPrototypes` and `PortInterfaces`, i.e. this document defines the `SwComponentType` as an entity which can be described through `PortPrototypes` which provide or require `PortInterfaces`.
- A description of `CompositionSwComponentTypes` which are sub-systems consisting out of connected instances of software-components, i.e. software-components may be defined in the form of hierarchical subsystems which in turn consist of software-components again. The description of such hierarchical structures is in scope of this document.
- A description of `AtomicSwComponentType` which is implemented as a piece of software that can be mapped to an AUTOSAR ECU.
An `AtomicSwComponentType` therefore shows up in the ECU Software Archi-

ecture depicted in Figure 1.1. In this figure, the green (vertically striped) and blue (diagonally striped) borders show the aspects that are described by the Software-Component Template.

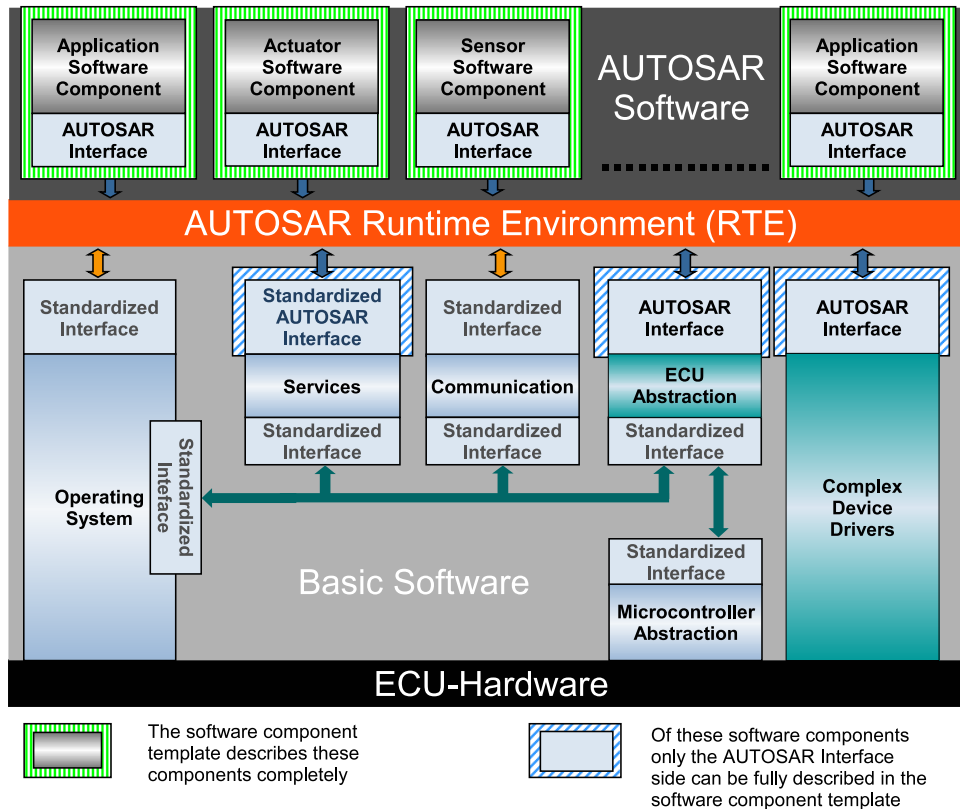

Figure 1.1: Scope of this document in the ECU SW Architecture [5]

Aspects of AUTOSAR Basic Software not relevant for the RTE are out of scope; these are covered by the Basic Software Module Description Template [6].

Also, the document does not cover aspects of timing analysis with respect to the execution of AUTOSAR software-components. This issue is explained in the Specification of Timing Extensions [7] as well as the corresponding requirement specification [8].

1.3 Organization of the Meta-Model

Figure 1.2 sketches the overall structure of the meta-model which formally defines the vocabulary required to describe AUTOSAR software-components. As the diagram points out, other template specifications (e.g. ECU Resource Template [9] and System Template [10]) also use the same modeling approach in order to define an overall consistent model of AUTOSAR software description.

The dashed arrows in the diagram describe dependencies in terms of import-relationships between the packages within the meta-model. For example, the package

SWComponentTemplate imports meta-classes defined in the packages GenericStructure [11] and ECUResourceTemplate [9].

Please note that this specification document will (with some well-defined exceptions) mostly discuss meta-model elements defined in the package SWComponentTemplate.

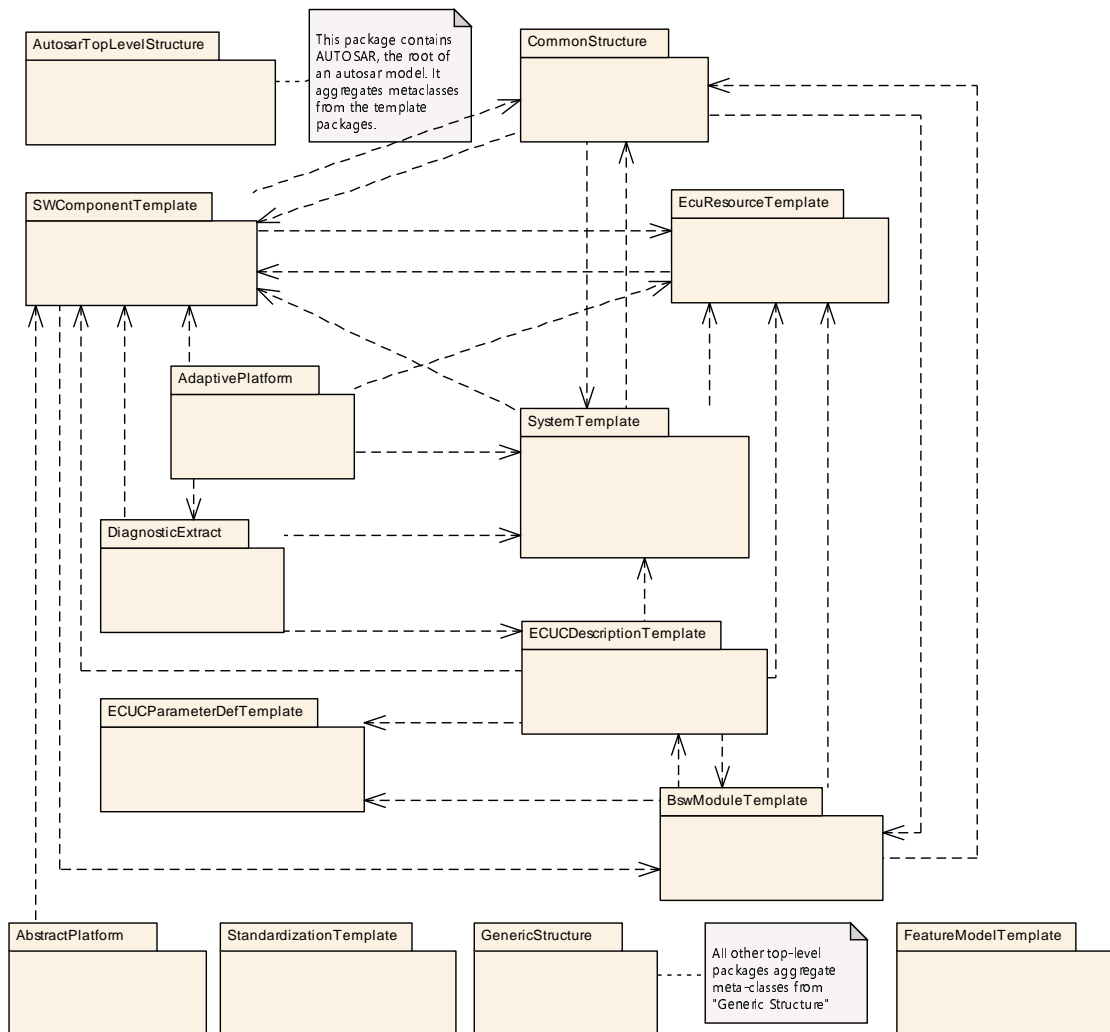

Figure 1.2: Structure of the meta-model

For clarification, please note that the package GenericStructure contains some fundamental infrastructure meta-classes and common patterns that are described in [11]. As these are used by all other template specification the dependency associations are not depicted in the diagram for the sake of clarity.

1.4 Structure of the Template

AUTOSAR software components are described on three distinctive levels, as shown in Figure 1.3.

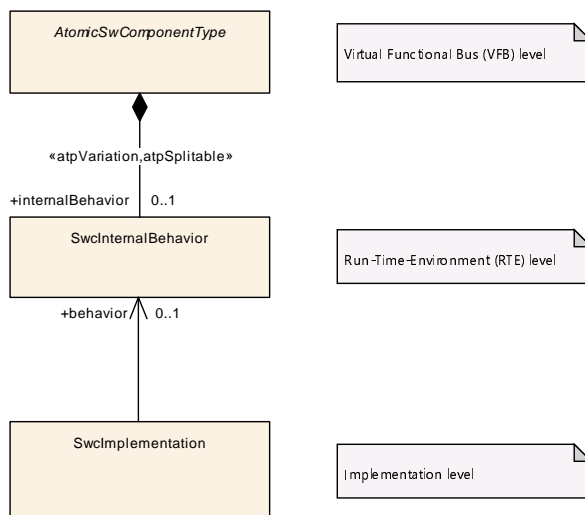

Figure 1.3: The description of a software component is done on three levels

1.4.1 Description of Software Components on VFB Level

The highest (most abstract) description level is the [Virtual Functional Bus \[3\]](#). In this document `SwComponentTypes` are described with the means of `DataTypes`, `PortInterfaces`, `PortPrototypes`, and connections between them. At this level, the fundamental communication properties of components and their communication relationships among each other are expressed.

In the diagram depicted in Figure 1.3, this aspect is expressed by means of the description of `AtomicSwComponentType`¹.

1.4.2 Description of Software Components on RTE Level

The middle level allows for behavior description of a given `AtomicSwComponentType`. The `SwcInternalBehavior` is modeled according to AUTOSAR RTE concepts, e.g. `RTEEvents` and, in terms of executable units, the `RunnableEntities`.

For instance, for a `ClientServerOperation` defined in the scope of a particular `ClientServerInterface` on the VFB, the behavior specifies which `RunnableEntity` is activated as a consequence of the invocation of the specific `ClientServerOperation`.

As sketched by Figure 1.3, there may be zero or one `SwcInternalBehaviors` aggregated by a given `AtomicSwComponentType`.

In response to the existence of the stereotype `«atpSplittable»` at one aggregation, it is possible to distribute the aggregation over several physical files.

¹To avoid clutter and require additional up-front information about the meta-model, `Composition-SwComponentTypes` have not been added to the diagram.

1.4.3 Descriptions of Software Components on Implementation Level

The lowest level of description specifies the implementation (i.e. in terms of the AUTOSAR meta-model: the `SwcImplementation`) of a given `SwcInternalBehavior` description. More precisely, the `RunnableEntity`s of such a behavior are mapped to code (source code or object code).

There may be different `SwcImplementations` that reference a specific `SwcInternalBehavior` description, e.g. in different programming languages, or with differently optimized code.

Please note that `Implementation` has been described in previous versions of this document. In response to the evolution of the AUTOSAR standard, the description of the `Implementation` aspect has been moved to the “CommonStructure” (see Figure 1.2) because it is also used for creating the Basic Software Module Description Template [6].

The `SwcImplementation` still remains in the scope of this document as it exclusively covers aspects of software-components rather than basic software modules.

1.5 Document Conventions

Technical terms are typeset in mono spaced font, e.g. `PortPrototype`. As a general rule, plural forms of technical terms are created by adding "s" to the singular form, e.g. `PortPrototypes`. By this means the document resembles terminology used in the AUTOSAR XML Schema.

This document contains constraints in textual form that are distinguished from the rest of the text by a unique numerical constraint ID, a headline, and the actual constraint text starting after the `[` character and terminated by the `]` character.

The purpose of these constraints is to literally constrain the interpretation of the AUTOSAR meta-model such that it is possible to detect violations of the standardized behavior implemented in an instance of the meta-model (i.e. on M1 level).

Makers of AUTOSAR tools are encouraged to add the numerical ID of a constraint that corresponds to an M1 modeling issue as part of the diagnostic message issued by the tool.

The attributes of the classes introduced in this document are listed in form of class tables. They have the form shown in the example of the top-level element AUTOSAR:

Please note that constraints are not supposed to be enforceable at any given time in an AUTOSAR workflow. During the development of a model, constraints may legitimately be violated because an incomplete model will obviously show inconsistencies.

However, at specific points in the workflow, constraints shall be enforced as a safeguard against misconfiguration.

The points in the workflow where constraints shall be enforced, sometimes also known as the "binding time" of the constraint, are different for each model category, e.g. on the classic platform, the constraints defined for software-components are typically enforced prior to the generation of the RTE while the constraints against the definition of an Ecu extract shall be applied when the Ecu configuration for the Com stack is created.

For each document, possible binding times of constraints are defined and the binding times are typically mentioned in the constraint themselves to give a proper orientation for implementers of AUTOSAR authoring tools.

Let [AUTOSAR](#) be an example of a typical class table. The first rows in the table have the following meaning:

Class: The name of the class as defined in the UML model.

Package: The UML package the class is defined in. This is only listed to help locating the class in the overall meta model.

Note: The comment the modeler gave for the class (class note). Stereotypes and UML tags of the class are also denoted here.

Base Classes: If applicable, the list of direct base classes.

The headers in the table have the following meaning:

Attribute: The name of an attribute of the class. Note that AUTOSAR does not distinguish between class attributes and owned association ends.

Type: The type of an attribute of the class.

Mul.: The assigned multiplicity of the attribute, i.e. how many instances of the given data type are associated with the attribute.

Kind: Specifies, whether the attribute is aggregated in the class (*aggr* aggregation), an UML attribute in the class (*attr* primitive attribute), or just referenced by it (*ref* reference). Instance references are also indicated (*iref* instance reference) in this field.

Note: The comment the modeler gave for the class attribute (role note). Stereotypes and UML tags of the class are also denoted here.

Please note that the chapters that start with a letter instead of a numerical value represent the appendix of the document. The purpose of the appendix is to support the explanation of certain aspects of the document and does not represent binding conventions of the standard.

The verbal forms for the expression of obligation specified in [TPS_STDT_00053] shall be used to indicate requirements, see Standardization Template, chapter Support for Traceability ([1]).

The representation of requirements in AUTOSAR documents follows the table specified in [TPS_STDT_00078], see Standardization Template, chapter Support for Traceability ([1]).

1.6 About Tables

There is a number of tables in this document that describe the applicability or multiplicity of model elements. These tables contain empty cells, which represent a “not applicable” meaning. Model elements that correspond to an empty cell shall not exist in the context described by the respective table cell.

If the value of a table cell shall indicate that either the existence or multiplicity of the represented model element shall be ignored anyway, the table cell gets the content “d/c” for “don’t care”. This means that if the respective model element exists, it shall be ignored in the downstream processing of the model.

2 Conceptual Aspects

2.1 Introduction

For the sake of a compact description of relevant meta-model elements the discussion and explanation of conceptual aspects has been concentrated in this chapter.

Reading this chapter is not a pre-requisite for understanding the subsequent chapters. It just provides a central place for the detailed description of conceptual aspects used in various other chapters of this document.

The actual explanation of the concept of a software-component starts in chapter 3.

2.2 Measurement and Calibration

2.2.1 Basic Approach of Measurement and Calibration

While performing the calibration process using an MCD tool (Measurement, Calibration, and Diagnostic) the calibration engineer needs to have a specific insight to the data within the CPU at runtime.

This insight is provided by access to ECU internal variables (also called measurements) as well as calibration parameters (sometimes also called characteristic value). For more details, please refer to [TPS_SWCT_01418]

The description of measurement variables and calibration parameters is basically the same. In AUTOSAR both appear finally as `DataPrototype`.

2.2.2 Calibration Parameters Overview

A `Calibration Parameter` is a parameter which characterizes the dynamics of a control algorithm. From a software implementation point of view, it is a variable with only read-access during the normal operation of an ECU.

`Calibration Parameters` (some examples are sketched in Figure 2.1) are specialized `DataPrototype` entities in terms of its associated type but are used similarly.

[TPS_SWCT_01418] **Ways to define a calibration parameter** [This means that `Calibration Parameters` can be defined

- individually for a `SwComponentPrototype` in the `SwcInternalBehavior` of a `SwComponentType` via an aggregation of an `ParameterDataPrototype` in the role of `perInstanceParameter` (similar to the supported variants of *per-instance memory*).

- sharing between all `SwComponentPrototypes` of the same `SwComponentType` in its `SwcInternalBehavior` via an aggregation of an `ParameterDataPrototype` in the role of `sharedParameter` or `constantMemory`.
- for several `SwComponentPrototypes` (using the port-/interface-concept with `ParameterInterfaces`).

)]()

Please note:

- The definition of `perInstanceParameter` is further described in chapter 2.2.3.3.
- Chapter 2.2.3.2 provides more information about the definition of `sharedParameter` or `constantMemory`.
- For more information regarding the definition of `ParameterInterface`, please refer to chapter 2.2.3.1.

Figure 2.1: Some Categories of calibration parameters

Note: the structure of various calibration objects is visualized in [12].

2.2.3 Using Calibration Parameters

As mentioned above, a `ParameterDataPrototype` can be used in the context of `SwcInternalBehavior` as well as in the context of `PortPrototypes`.

2.2.3.1 Sharing Calibration Parameters within Compositions

To provide calibration parameters for being visible in other `SwComponentTypes`, a dedicated `ParameterSwComponentType` (see Figure 3.4) that inherits from `SwComponentType` has to be used as a `SwComponentPrototype` within a `CompositionSwComponentType`.

[TPS_SWCT_01420] `SwComponentType` requiring access to shared calibration parameters needs `RPortPrototype` typed by a `ParameterInterface` [Every

`SwComponentType` requiring access to shared calibration parameters will have an `RPortPrototype` typed by a `ParameterInterface`.

The definition of this shared calibration access in the context of a `Composition-SwComponentType` will be defined by creating a `SwConnector` between the relevant `SwComponentPrototypes`.`()`

Table 2.2: ParameterInterface

[TPS_SWCT_01421] **ParameterInterface** is not restricted to parameters which can actually can be calibrated [Note that a **ParameterInterface** is not restricted to parameters which can actually can be calibrated.

It can be used whenever there shall be no write access to the data during normal operation of the software, i.e. only constant data are visible over the interface.](RS_SWCT_03190)

The compatibility rules for **ParameterInterfaces** are described in chapter 6.4; the compatibility rules for **ParameterDataPrototypes** are described in chapter 6.4.4.

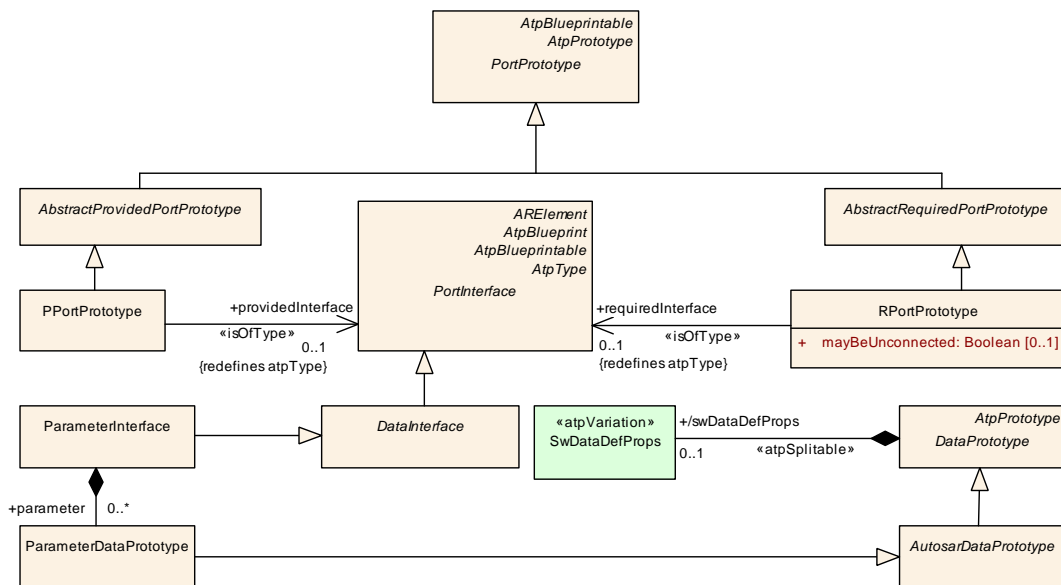

Figure 2.2: ParameterInterface

[TPS_SWCT_01422] Delegation of **PortPrototypes** typed by a **ParameterInterface** [Access to shared calibration parameters can be provided and required even over **CompositionSwComponentTypes** using **DelegationSwConnectors** and **AssemblySwConnectors**.

This means that each access to calibration parameters between **SwComponentPrototypes** is explicitly visible.

If a **SwConnector** spans after the mapping of **SwComponentPrototypes** over two different ECUs, the system generation process has to ensure the proper allocation of the **ParameterDataPrototype**. The calibration system has to cope with setting the parameter synchronously on the affected ECUs.](RS_SWCT_03190)

2.2.3.2 Sharing Calibration Parameters between SwComponentPrototypes of the same SwComponentType

To share calibration parameters between several **SwComponentPrototypes** of the same **SwComponentType**, a **ParameterDataPrototype** is attached to an **SwcInternalBehavior** in **sharedParameter** role (see [TPS_SWCT_01418]).

When the `SwcInternalBehavior` is aggregated by an `AtomicSwComponentType`, the actual calibration parameters of the `ParameterDataPrototype` carry the identical value for all `SwComponentPrototypes`.

[TPS_SWCT_01423] `ParameterDataPrototype` aggregated in the role `constantMemory` [Additionally, it is possible to describe the implementation of shared characteristic values via a `ParameterDataPrototype` which is attached to an `SwcInternalBehavior` in the role `constantMemory`.

In contrast to the `ParameterDataPrototype` in `sharedParameter` role this kind of memory is not instantiated by the RTE.

This approach enables more efficient implementations (especially for software components provided as object code) by avoidance of the additional indirection caused by the RTE's component data structure.]()

This kind of memory reduces the dependencies of the software-component's implementation to generated RTE code which is appreciated for safety related functionalities.

Nevertheless, the information about these characteristic values has to be taken into account for the A2L file generation.

A typical example for this kind of sharing code between instances is dealing with two lambda sensors in multiple cylinder-bank engines, where (at least) two `SwComponentPrototypes` for each lambda sensor will use the very same Calibration Parameters.

2.2.3.3 Providing Instance Individual Characteristic Data

[TPS_SWCT_01424] `ParameterDataPrototype` aggregated in the role `perInstanceParameter` [For the provision of instance-specific calibration parameters, a `ParameterDataPrototype` is owned by a `SwcInternalBehavior` in the role `perInstanceParameter`.

If the `SwcInternalBehavior` is attached to an `AtomicSwComponentType`, the actual calibration values are specific for each `SwComponentPrototype`.]()

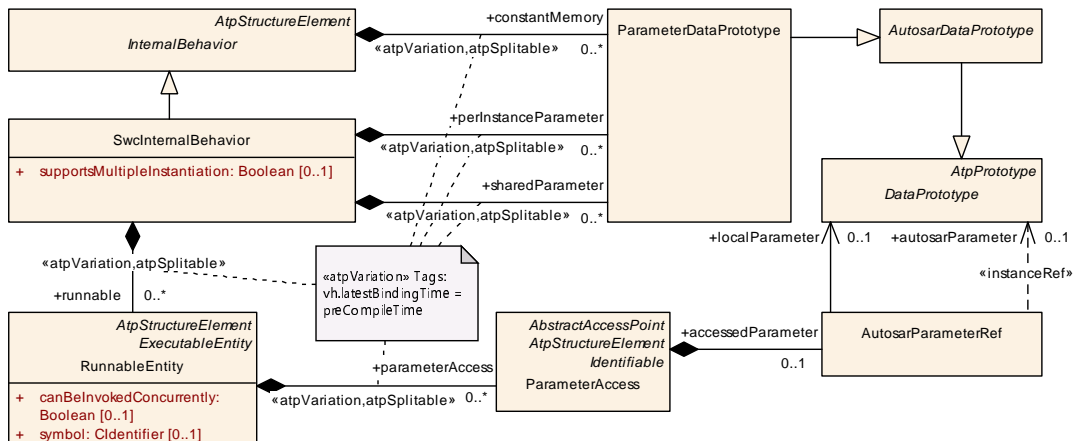

Figure 2.3: ParameterDataPrototypes in internal behavior

2.3 Runtime and Data Consistency Aspects

2.3.1 Background: the Issues

This section provides some background information and lists possible strategies concerning the implementation of the `RunnableEntity`s and the RTE with respect to efficient communication between the `RunnableEntity`s.

The communication among `RunnableEntity`s can very efficiently be implemented by means of “sharing memory”¹.

This is technically feasible because it is always guaranteed that the `RunnableEntity`s within an `AtomicSwComponentType` are always gathered at a specific processing unit (in other words: distribution is not an option).

Note that the purpose of communication among the `RunnableEntity`s is to establish a data flow scheme. The latter is a very popular pattern in the application of control theory to automotive embedded systems.

So if “global variables” are used for establishing internal communication among `RunnableEntity`s, they acquire the semantics of so called state-messages.

Nevertheless, directly sharing memory between `RunnableEntity`s requires a serious problem to be solved: the guarantee of data consistency among communicating `RunnableEntity`s.

The `RunnableEntity` will indeed be mapped to tasks so that one `RunnableEntity` of an `AtomicSwComponentType` may be preempted by a different `RunnableEntity` of the same `AtomicSwComponentType`.

¹Please note that the term “sharing memory” can be interpreted on different levels. It is e.g. in the C language possible to use variables with external linkage (a.k.a. “global variables”, although this term is not officially defined by the C language) for the purpose of inter-Runnable communication.

Please note that a purist approach to achieving data consistency not only applies to single accesses of concurrently accessed variables.

Rather, it would not be permitted that the value of a concurrently accessed variable (with state-message semantics) is unintentionally changed during the run-time of a `RunnableEntity`.

The following paragraphs describe some common strategies that can be used to ensure the required data-consistency. This document does not attempt to describe the benefits or drawbacks of these approaches.

2.3.1.1 Mutual Exclusion with Semaphores

Multi-threaded operating systems provide mutexes (mutual exclusion semaphores) that protect access to an exclusive resource that is used from within several tasks.

The RTE could use these OS-provided mutexes to make sure that the `RunnableEntities` sharing a memory-space would never run concurrently. The RTE would make sure the task running the `RunnableEntity` has taken an appropriate mutex before accessing the memory shared between the `RunnableEntities`.

2.3.1.2 Interrupt Disabling

Another alternative would be the disabling of interrupts during the run-time of `RunnableEntities` or at least for a period in time identical to the interval from the first to the last usage of a concurrently accessed variable in a `RunnableEntity`. This approach could lead to seriously non-deterministic execution timing.

2.3.1.3 Priority Ceiling

Priority ceiling allows for a non-blocking protection of shared resources. Provided that the priority scheme is static, the AUTOSAR OS is capable of temporarily raising the priority of a task that attempts to access a shared resource to the highest priority of all tasks that would ever attempt to access the resource.

By this means it is technically impossible that a task in temporary possession of a resource is ever preempted by a task that attempts to access the resource as well.

2.3.1.4 Implicit Communication by means of Variable Copies

Another alternative is the usage of copies of concurrently accessed variables with state message semantics. Note that this approach directly corresponds to the semantics of “implicit” sender-receiver communication (see 7.5.1.2).

This means in particular that for a concurrently used variable a copy is created on which a `RunnableEntity` entity can work without any danger of data inconsistency.

Figure 2.4: Generation of copy routines around `RunnableEntity`s

This concept requires additional code to write the value of the concurrently accessed variable to the copy before the `RunnableEntity` that accesses the variable is executed. The value of the copy shall be written back to the concurrently accessed variable after the `RunnableEntity` has been terminated.

This concept is sketched in Figure 2.4. Since it would be too expensive and error-prone to manually care about the copy routines it would be a good idea to leave the creation of the additional code to a suitable code generator.

The additional copy-routines, as sketched in Figure 2.4, already protect the particular `RunnableEntity`s from unintended changes of concurrently accessed variables.

It would, however, be possible to further optimize the process by reducing the additional code at the beginning and end of each task (see Figure 2.5).

2.3.2 Data Consistency at Runtime

In addition, copy routines will only be inserted where appropriate, e.g. a copy routine for writing the value of a copy back to the concurrently accessed variable will only be inserted if the `RunnableEntity` has write-access to the concurrently used variable.

Please note that the copy routines have to temporarily make sure that the copy process is not interrupted in order to be capable of consistently copying the values from and to the concurrently accessed variable.

These periods, however, are supposed to be very short compared with the overall run-time consumption of the `RunnableEntity` and thus would not have a significant impact on the runtime behavior.

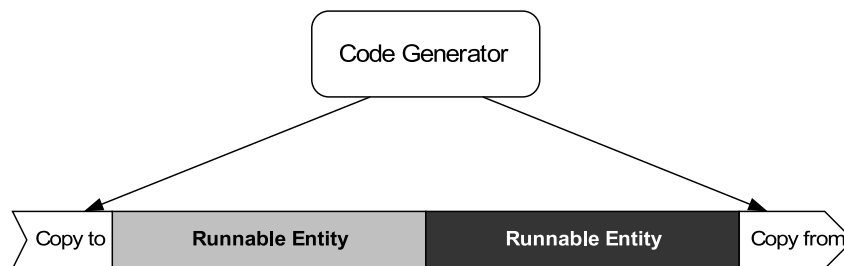

Figure 2.5: Optimized insertion of copy routines

Further optimization criteria can be applied, for example: it would be (as sketched in Figure 2.5) perfectly safe to avoid the creation of copies for `RunnableEntity`s that are scheduled in the task with the highest priority of all tasks that (via contained `RunnableEntity`s) access a certain concurrently accessed variable.

In order to keep the application code free of any dependencies from the code generation, access to concurrently accessed variables will be guarded by macros that are later resolved by the code generator.

The presence of the guard macros directly supports reuse on the level of source code. Reuse on the level of object code is only possible if the scheduling scenario (in terms of the assignment of `RunnableEntity`s to priority levels) does not change.

This concept can only be implemented properly with the aid of a code generator if the variables in question can be identified. In other words: the description of an `AtomicSwComponentType` has to expose all concurrently accessed variables to the outside world.

2.3.3 Modeling Aspects of Data Consistency

The intrinsic meaning of the terms “explicit communication” and “implicit communication” is explained in section 7.5.1.1.

It would be fair to say that the distinction between implicit and explicit communication establishes a usage pattern in the application domain, i.e. in the world of the developer of AUTOSAR software-components and their implementation.

There is another facet to this subject, however, namely the question of how this pattern is implemented in the meta-model. With respect to the application of the pattern for port-based communication the details can be found in section 7.5.1.2, more specifically in section 7.5.1.3.

The consideration of the internal communication based on so-called “inter-runnable variables” is described in section 7.4.2.

By reading the respective text sections it becomes apparent that the two applications of the pattern are modeled differently. The port-based communication uses the `VariableAccess` to formalize different roles of accessing communication elements.

Some roles used for this purpose imply explicit communication (e.g. `dataSendPoint`) and some represent implicit communication (e.g. `dataWriteAccess`).

The important thing about using the `VariableAccess`, however, is that the modeling of communication roles is abstracted from the actual communication elements and represents a uniform (meaning: it can refer to the target directly or by a so-called `InstanceRef`) modeling approach that is applied for all use cases².

Admittedly, this is handled differently for the internal communication. Here, the additional layer of abstraction is not used (although it would have been technically feasible to do so) with respect to the clear separation of “inter-runnable variables with implicit behavior” and “inter-runnable variables with explicit behavior” in the RTE.

The implementation of different communication roles (i.e. implicit vs. explicit) is done by directly aggregating `VariableDataPrototype` in the roles `explicitInterRunnableVariable` and `implicitInterRunnableVariable`.

On the other hand, access to internal communication **never** requires the usage of an `InstanceRef` and therefore the abstraction might be considered unnecessary overhead that clutters the M1 model.

2.4 Variant Handling in the Software Component Template

The Software Component Template supports the creation of *Variants* in a subset of its model elements. The full list of model elements that support variation can be found in the appendix.

[TPS_SWCT_01038] Support for Variant Handling in the in Software Component Template [The Variant Handling support in the in Software Component Template is mainly driven by the purpose to describe a variable system on the level of the `Virtual Functional Bus`[3] by varying

- the existence of `SwComponentPrototypes`
- the existence of `SwConnectors`
- the existence of `Chapters` of `SwComponentDocumentation`
- the existence of `PortPrototypes`

]([RS_SWCT_00220](#), [RS_SWCT_03140](#), [RS_SWCT_03142](#), [RS_SWCT_03154](#))

This approach supports adjusting the number and kind of software-component instances as well as their interconnection in a particular system variant.

²On a related note, even for non-communication related data access the same pattern applies implemented by `ParameterAccess`

[TPS_SWCT_01447] Applicable binding times for model elements in the scope of the Software Component Template [The first three cases are supporting *PostBuild* binding. For the existence of *PortPrototypes* only *preCompileTime* is supported as latest *Binding Time*.] ([RS_SWCT_00220](#))

[TPS_SWCT_01040] SwConnector exists depending on a PostBuild condition [A *SwConnector* that exists depending on a *PostBuild* condition has an impact on the behavior of API function calls that apply on a *PortPrototype* to which the *SwConnector* is attached.

If the *SwConnector* does not exist, the behavior of the RTE API functions need to take this caveat into account.

This means that the RTE implementation of this *PortPrototype* resembles the behavior of an unconnected *PortPrototype*.] ([RS_SWCT_00220](#), [RS_SWCT_03100](#), [RS_SWCT_03143](#))

Please find more details in the specification of the RTE [2].

[TPS_SWCT_01041] API functions of not existing SwConnector are still part of the software-component's implementation [If *SwConnectors* do not exist, the corresponding API functions are still part of the software-component's implementation. It is not possible to remove the API functions in a *PostBuild* step.

Therefore, the latest reasonable *Binding Time* for the conditional existence of a *PortPrototype* is *preCompileTime*.] ([RS_SWCT_00220](#), [RS_SWCT_03100](#))

[TPS_SWCT_01085] Variation on the behavior level [In addition to variation of the VFB-related model elements, the description of variant software-component implementations is supported. Please note that this requires a broad support of variability in the *Internal Behavior*.

The identified main use case are

- the existence of *RunnableEntitys*
- the existence of *RTEEvents*
- the existence of *VariableDataPrototypes* in the roles *implicitInterRunnableVariable* and *explicitInterRunnableVariable*
- the existence of *ParameterDataPrototypes* in the roles *perInstanceParameter*, *sharedParameter*, and *constantMemory*

] ([RS_SWCT_03149](#), [RS_SWCT_03150](#), [RS_SWCT_03151](#), [RS_SWCT_03153](#))

For the same reason that applies on the existence of *PortPrototype* the latest *Binding Time* of these kinds of variability is *preCompileTime*.

In the meta-model, all locations that may exhibit variability are decorated with the stereotype `<<atpVariation>>`. This decoration allows the definition of possible variation points.

Tagged Values are used to specify additional information, for example the latest binding time.

[TPS_SWCT_01042] Four types of locations in the meta-model which may exhibit variability [There are four types of locations in the meta-model which may exhibit variability:

- Aggregations
- Associations
- Attribute Values
- Classes providing property sets

]([RS_SWCT_00220](#), [RS_SWCT_03100](#))

The reasons for the attachment of the stereotype `<<atpVariation>>` to certain model elements and the consequences for other model elements are explained in class tables in the following chapters.

More details about the AUTOSAR Variant Handling Concept can be found in the AUTOSAR Generic Structure Template [11].

2.5 Communication Specification of Composition Component Types

[TPS_SWCT_01088] ComSpecs defined by CompositionSwComponentTypes [It shall be possible to attach ComSpecs to PortPrototypes owned by CompositionSwComponentTypes.]([RS_SWCT_03220](#))

2.5.1 Rationale

ComSpecs (these are explained in detail within section 4.5) attached to a PortPrototype owned by an AtomicSwComponentType have a direct impact on the generation of the RTE.

The RTE Generator, on the other hand, does not consider the existence of CompositionSwComponentTypes.

Nevertheless, there are some cases where the definition of a ComSpec attached to a PortPrototype owned by a CompositionSwComponentType does make sense.

That is, in case an OEM wants to submit the definition of a CompositionSwComponentType to a supplier for adding more details and implementing the behavior the OEM might want to point out that from the OEM's point of view sender `initValues` and receiver `initValues` apply for the elements of PortInterfaces used to type the delegation PortPrototypes.

The idea is that the supplier takes over the `initValues` attached to the delegation `PortPrototypes` and *copies* them to the `PortPrototypes` owned by `SwComponentPrototypes` of the `CompositionSwComponentType`.

[TPS_SWCT_01568] Consideration of `RPortComSpec` or `PPortComSpec` depending on the ownership [The RTE Generator shall take the attributes of the `RPortComSpec` or `PPortComSpec` of the `PortPrototypes` owned by `AtomicSwComponentTypes` or `ParameterSwComponentType` and ignore the attributes of the `RPortComSpec` or `PPortComSpec` attached to `PortPrototypes` owned by `CompositionSwComponentType`.] ([RS_SWCT_03220](#))

Therefore, the `initValues` of the delegation `PortPrototype` would be taken as *mere templates* for the detailing of `PortPrototypes` connected to the delegation `PortPrototypes`.

It is not required that the `initValues` of delegated `PortPrototype` and a `PortPrototype` connected by means of a `DelegationSwConnector` match.

Although this would certainly make sense in many cases, it is eventually still left to the supplier to decide on the specific `initValues` applicable inside the `CompositionSwComponentType`.

On the other hand, a requirement that the `initValues` defined on the surface of `CompositionSwComponentType` and the inside of the `CompositionSwComponentType` shall be consistent in any case might effectively prevent reuse of existing `AtomicSwComponentTypes`.

Please note that the ability to define a `ComSpec` in the context of a `CompositionSwComponentType` implies that it shall be possible to define mappings of `ApplicationDataTypes` used in a `PortInterface` to their corresponding `ImplementationDataTypes`.

For this purpose the `CompositionSwComponentType` owns a `DataTypeMappingSet` in the role `dataTypeMapping` and a `ConstantSpecificationMappingSet` in the role `constantValueMapping`.

Figure 2.6: Specification of data type mapping for `CompositionSwComponentType`

2.6 PRPortPrototype

In some cases `SwComponentTypes` need to read and write the same piece of data. One of the most prominent examples for this use case is the `NvBlockSwComponentType` that factually reads and writes blocks of NvRAM.

Without the ability to combine read and write semantics in a kind of `PortPrototype` that supports both read and write semantics, work-arounds have to be implemented that come with a certain footprint on memory and processing time.

2.6.1 Use Case 1

Without the ability to define a combined read and write semantics the definition of a combination of an `RPortPrototype` and a `PPortPrototype` is required for reading and writing the applicable data, as sketched in Figure 2.7.

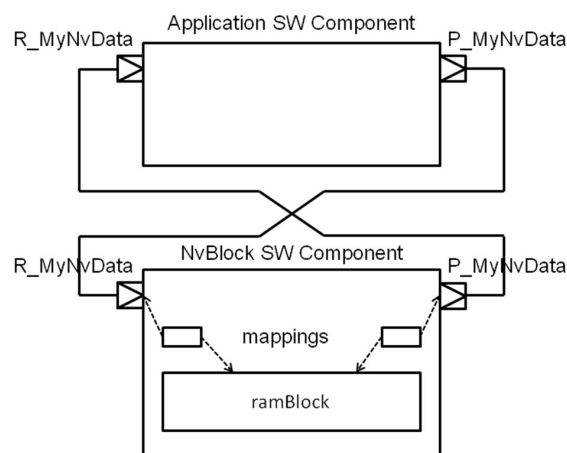

Figure 2.7: Use Case 1 for the existence of `PRPortPrototype`

Technically, this read and write access is related to the same data item in an NVRAM Block. This requires a consistent connection of the `PortPrototypes` between an `NvBlockSwComponentType` and `ApplicationSwComponentType` as well as a consistent mapping of the corresponding `RPortPrototype` and a `PPortPrototype` of the `NvBlockSwComponentType` and the related element of the `ramBlock`.

2.6.2 Use Case 2

It may happen that a `SwComponentType` need to consume the same data that it produces, as exemplified in Figure 2.8.

If the only way to achieve this was the connection of a `PPortPrototype` to an `RPortPrototype` of the same `SwComponentType` then the creator of the `SwComponentType` cannot enforce this connection as it is created on a higher level of abstraction in the context of a `CompositionSwComponentType`.

In other words, it is impossible to fully specify the semantics of the otherwise self-contained `SwComponentType`.

This means that only in the in best case one buffer for the data is needed. But depending on the mapping `RunnableEntity`s to OS tasks additional buffers may need to be allocated by the RTE to fully implement the implicit communication pattern.

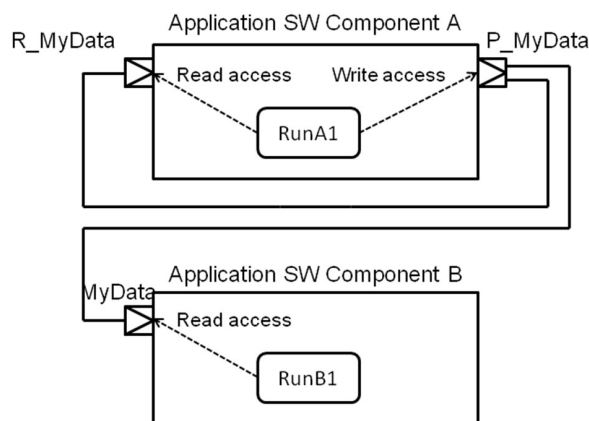

Figure 2.8: Use Case 2 for the existence of `PRPortPrototype`

As an alternative, the `ApplicationSwComponentType` could utilize inter-runnable variables but unfortunately this inhibits any optimization in the RTE and will consume additional RAM. In contrast to the previous approach, at least two buffers are needed.

2.6.3 Use Case 3

In this scenario, several `ApplicationSwComponentTypes` are iterating over the same large set of data, as sketched in Figure 2.9.

This means each `ApplicationSwComponentType` implements one out of many steps of a complex data processing algorithm applied to the same piece of data.

For example, this scenario may apply for video signal processing in camera applications. Typically, such applications will **not** be distributed over several ECUs.

It is clear that in this case the allocation of several buffers in the RTE is required to implement the individual connections between the `ApplicationSwComponentTypes`.

In most cases, the processing has to be executed at a certain point in time in a dedicated order.

Figure 2.9: Use Case 3 for the existence of [PRPortPrototype](#)

2.6.4 Solution

The solution to the above-mentioned use cases is the ability to define a [PortPrototype](#) that can read and write the same piece of data. This solves both the described problem of resource consumption and the problem of having to define multiple [PortPrototypes](#) as outlets for same piece of data item.

The technical details of the definition of [PRPortPrototype](#) are explained in chapters [3.2.2](#) and [4.2.1](#).

2.7 Variable-size Array Data Types

2.7.1 Overview and Use cases

AUTOSAR supports the definition of array data types where the size of the actual payload varies at run-time. As far as the configuration is concerned, it is possible to specify a maximum number of array elements that shall not be exceeded at run-time.

In order to properly understand the approach, it is necessary to understand that the support for [Variable-Size Array Data Types](#) has been introduced in two waves that each had a different motivation.

2.7.1.1 “Old-world” dynamic-size Arrays

In the first wave, the support for [Variable-Size Array Data Types](#) was limited to data types that basically boil down to an array where the base type is an unsigned integer data type with a length of exactly one byte.

The main use cases for this scenario are derived from diagnostics requirements as well as support for the J1939 communication protocol.

In both cases the actual length of a [Variable-Size Array Data Type](#) could be determined from the context, i.e. either by the diagnostic basic-software module or by the implementation of the J1939 TP.

For the lack of a better terminology, this specification distinguishes between “old-world” dynamic-size arrays and “new-world” [Variable-Size Array Data Types](#). It will be necessary to clearly define the characteristics that allow for a disambiguation between the “old-world” dynamic-size arrays and “new-world” [Variable-Size Array Data Types](#).

[TPS_SWCT_01641] Definition of an “old-world” dynamic-size array data type by means of an [ApplicationArrayType](#) [An [ApplicationArrayType](#) that **doesn’t define** attribute [dynamicArraySizeProfile](#) **and** that aggregates an [ApplicationArrayElement](#) where attribute [arraySizeSemantics](#) exists and is set to the value [variableSize](#) shall be considered an “old-world” dynamic-size array data type.] ([RS_SWCT_03181](#))

Please note that [\[TPS_SWCT_01641\]](#) can’t go any deeper into the specifics of the given data type because it is intentionally focused on [ApplicationDataTypes](#). There are use cases where the distinction between “old-world” dynamic-size arrays and “new-world” [Variable-Size Array Data Types](#) shall be done in the absence of a corresponding [ImplementationDataType](#).

In general, the disambiguation becomes multi-faceted (but not necessarily easier) if the definition of a corresponding [ImplementationDataType](#) is available (see [\[TPS_SWCT_01642\]](#)).

[TPS_SWCT_01642] Definition of an “old-world” dynamic-size array data type by means of an [ImplementationDataType](#) [An [ImplementationDataType](#) that (after all type references are resolved) fulfills all the following conditions shall be considered an “old-world” dynamic-size array data type:

- The value of attribute [category](#) is set to [ARRAY](#)
- The [ImplementationDataType](#) doesn’t define the attribute [dynamicArraySizeProfile](#)
- The [ImplementationDataType](#) aggregates a [subElement](#) where
 - attribute [arraySizeSemantics](#) exists and is set to the value [variableSize](#)
 - attribute [arraySizeHandling](#) does not exist

- One of the following conditions applies:
 - `subElement.category` is set to `VALUE` or `TYPE_REFERENCE` that eventually boils down to `VALUE` and the attribute `subElement.swDataDefProps.baseType.baseTypeDefinition.baseTypeSize` is set to the value `8` and the attribute `baseTypeEncoding` is set to `NONE`.
 - `subElement.category` is set to `TYPE_REFERENCE` and the attribute `subElement.swDataDefProps.implementationDataType` literally represents the Platform Data Type named `uint8`.
 - `subElement.category` is set to `TYPE_REFERENCE` and the attribute `subElement.swDataDefProps.implementationDataType.shortName` is set to `uint8` and `subElement.swDataDefProps.baseType.baseTypeDefinition.nativeDeclaration` does not exist.

]([RS_SWCT_03181](#))

By and large, the defining characteristics for “old-world” dynamic-size arrays is the **absence** of a definition of the attribute `ApplicationArrayDataType.dynamicArraySizeProfile` or `ImplementationDataType.dynamicArraySizeProfile`.

By regulation of [constr_1387], “old-world” dynamic-size arrays are not supported for transmission by means of a data transformer. The only supported kind of `Variable-Size Array Data Type` that can be transmitted using a data transformer is the “new-world” variable-size arrays.

2.7.1.2 “New-world” variable-size Arrays

In contrast to this, the second wave of support for `Variable-Size Array Data Types` was motivated by the application software layer itself.

Here, the situation is entirely different because the actual size cannot be determined by any context software module. The application itself is responsible for maintaining the proper length of a `Variable-Size Array Data Type` at run-time.

As a consequence, the specification of the actual array size at run-time needs to be reflected by the structure of the data types used for hosting the `Variable-Size Array Data Type`.

[TPS_SWCT_01644] Definition of a “new-world” variable-size array data type by means of an `ApplicationArrayDataType` [An `ApplicationArrayDataType` that fulfills all the following conditions shall be considered an “new-world” dynamic-size array data type.

- The `ApplicationArrayDataType` **defines** attribute `ApplicationArrayDataType.dynamicArraySizeProfile`.
- `ApplicationArrayDataType` aggregates an `ApplicationArrayElement` that **defines** attribute `ApplicationArrayElement.arraySizeHandling`.

](RS_SWCT_03181)

[TPS_SWCT_01645] Definition of a “new-world” variable-size array data type by means of an `ImplementationDataType` [An `ImplementationDataType` that fulfills all the following conditions shall be considered an “new-world” dynamic-size array data type.

- The `ImplementationDataType` **defines** attribute `ImplementationDataType.dynamicArraySizeProfile`.
- `ImplementationDataType` aggregates an `ImplementationDataTypeElement` that **defines** attribute `ImplementationDataTypeElement.arraySizeHandling`.

](RS_SWCT_03181)

In contrast to the first use case described above, the application-motivated `Variable-Size Array Data Type` cannot be limited in terms of the base type of the array data type, i.e. limiting the underlying data type to an unsigned integer data type with a length of exactly one byte is not an option.

On top of that, several possible structures of `Variable-Size Array Data Types` have been required. This aspect is depicted in Figure 2.10.

[TPS_SWCT_01636] Definition of profiles for the definition of `Variable-Size Array Data Types` [The possible variants for `Variable-Size Array Data Types` are:

Linear The data type of the elements of the `Variable-Size Array Data Type` itself does not consist of a `Variable-Size Array Data Type`.

This case corresponds to the possible value `VSA_LINEAR` of attribute `dynamicArraySizeProfile`.

Square The data type of the elements of the `Variable-Size Array Data Type` itself consists of `Variable-Size Array Data Types` where the maximum number of elements in all “second order” arrays is **identical** to the maximum number of elements in the “first order” array.

This case corresponds to the possible value `VSA_SQUARE` of attribute `dynamicArraySizeProfile`.

Rectangular The data type of the elements of the `Variable-Size Array Data Type` itself consists of `Variable-Size Array Data Types` where the maximum number of elements in “second order” arrays is **identical** but this value is typically **not identical**³ to the maximum number of elements in the “first order” array.

This case corresponds to the possible value `VSA_RECTANGULAR` of attribute `dynamicArraySizeProfile`.

³If it was, the case boils down to the rectangular scenario tagged (b).

Fully Flexible The data type of the elements of the [Variable-Size Array Data Type](#) itself consists of [Variable-Size Array Data Types](#) where the maximum number of elements in “second order” arrays is **not necessarily identical** with each other and (obviously) **not necessarily identical** to the maximum number of elements in the “first order” array.

This case corresponds to the possible value `VSA_FULLY_FLEXIBLE` of attribute `dynamicArraySizeProfile`.

|(RS_SWCT_03181)

The described cases directly correspond to the portrayal of different kinds of variable-size arrays in Figure 2.10:

- The value `VSA_LINEAR` corresponds to the tag (a).
- The value `VSA_SQUARE` corresponds to the tag (b).
- The value `VSA_RECTANGULAR` corresponds to the tag (c).
- The value `VSA_FULLY_FLEXIBLE` corresponds to the tag (d).

Please note that the leaf elements in a [Variable-Size Array Data Type](#) doesn't have to be primitive data types. As mentioned before, it is possible to define multiple-dimension [Variable-Size Array Data Types](#).

The “terminal” elements can be recognized as such in that they don't establish further [Variable-Size Array Data Types](#).

Figure 2.10: Structural variety of array data types with variable size

Please note further that the modeling of [Variable-Size Array Data Types](#) is a complex step governed by a collection of rules and constraints.

It is the expressed intent of this specification to keep the complexity of the rule set as low as possible while still providing the user with a powerful modeling framework.

The major consequence of this conclusion is to keep the modeling as straightforward as possible; in other words: intentionally cut away certain modeling variants for which acceptable workarounds within the modeling framework itself exist.

One concrete example for such a restriction is that for `ImplementationDataTypes`, `Variable-Size Array Data Types` can only be defined on the level of an `AutosarDataType`.

It is intentionally not supported to define a `Variable-Size Array Data Type` on the level of an `ImplementationDataTypeElement` because the intended semantics can be realized by assigning the value `TYPE_REFERENCE` to the `ImplementationDataTypeElement.category` and then let it reference to another `ImplementationDataType` that in turn implements the `Variable-Size Array Data Type`.

2.7.2 Modeling Aspects regarding Application Data Types

In the context of the AUTOSAR layered data type concept, the level of `ApplicationDataTypes` is not concerned about the structure of how the `Variable-Size Array Data Types`.

In other words, aspects of the implementation of this kind of data type is intentionally abstracted as much as possible in order to support the idea behind the definition of `ApplicationDataTypes` as a concept that is independent of an implementation to the applicable degree.

Consequently, the support for `Variable-Size Array Data Types` on the level of `ApplicationDataTypes` requires the addition of a couple of additional attributes. Details can be found in chapter 5.2.4.2.

If a `Variable-Size Array Data Type` is modeled on the level of `ApplicationDataType` it is necessary to also provide a companion `ImplementationDataType` as well as a `DataTypeMap` that refers to both the `ApplicationDataType` and the `ImplementationDataType`.

The contrary is **not applicable**, i.e. it is possible to define a `Variable-Size Array Data Type` with only an `ImplementationDataType`, see [TPS_SWCT_01622].

2.7.3 Modeling Aspects regarding Implementation Data Types

On the other hand, the data type used for the actual hosting of the `Variable-Size Array Data Type` corresponds directly to the level of the `ImplementationDataType`.

Here, it is possible to define how an `ImplementationDataType` can be used to define a `Variable-Size Array Data Type`.

The definition of `ImplementationDataType` in the AUTOSAR meta-model comes with a certain level of generic nature the support for `Variable-Size Array Data Types` on this level comes as a mixture of dedicated attributes in the meta-model and

a set of recipes how to support different use cases of [Variable-Size Array Data Types](#).

This means that the definition of [ImplementationDataTypes](#) for the purpose of creating [Variable-Size Array Data Types](#) only has a chance to take off if the structure of these data types is replicated in different implementations of AUTOSAR software.

Therefore, AUTOSAR defines a common way of how [ImplementationDataTypes](#) for the purpose of creating [Variable-Size Array Data Types](#) shall be defined such that the [ImplementationDataType](#) shall be of `category` STRUCTURE with the following sub-elements:

1. A numerical value that determines the actual size. This element shall be called the `Size Indicator` throughout this document.
2. An array of the base-type of the [Variable-Size Array Data Type](#) that implements the payload of the [Variable-Size Array Data Type](#). The dimension of the array shall be defined such that the intended maximum number of elements fits in.

A `Size Indicator` of a [Variable-Size Array Data Type](#) holds the number of valid elements of the array. This information is necessary for the RTE to handle the array efficiently.

On the sender-side this indicator is actively updated by the software-component, which is the only instance that knows how many elements of the array are valid.

So the number of valid elements and the `Size Indicator` have to be kept consistent by the application. When the software-component sends the data over to the RTE, the RTE hands the data over to the transformer.

The transformer may evaluate the `Size Indicator` (depends on the transformer) and only work on the valid array elements. The output of the transformer can vary in length and only contain necessary data. Therefore, it can be more resource saving.

On the receiver side, the last transformer in the execution order restores the data elements of the array and the value of the `Size Indicator`. This output is handed over by the RTE to the software-component. The application is now aware of the number of valid elements in the array.

The details of how [ImplementationDataTypes](#) need to be modeled for the implementation of [Variable-Size Array Data Types](#) can be found in chapter [5.2.5](#) and a couple of examples is available in the appendix [B.1.3](#).

2.8 Optional Elements in Structures

2.8.1 Background

The *AUTOSAR classic platform* supports the usage of a TLV⁴ data encoding on the SOME/IP transport layer. TLV is typically used where at least a part of the transmitted data is only *optionally* existing and filled with meaningful values.

In other words: an optional part of a data structure may exist and carry meaningful values in one instance of data transmission and be completely missing in another instance of the data transmission.

The receiving software needs to be able to identify whether the optional part exists and read its value accordingly.

The receiving software also needs to be able to still execute meaningfully if the optional part of such a data structure does not exist in the specific communication instance.

Consequently, it is necessary to be able to precisely identify the parts of a data structure that may become optional for specific instances of data transmission.

In terms of the AUTOSAR meta-model, the identification could - in principle - be attached at various levels of abstraction:

AutosarDataType In this case the optionality that is only needed for communication purposes would still be existing in all other usages of data types. This seems unbalanced.

Admittedly, the definition of different optionality configurations for the same data type may lead to the existence of a bunch of structurally identical data types that only vary in terms of optionality. The existence of variation points may help to mitigate this effect, though.

PortInterface In this case the optionality is defined where it is actually required. However, different optionality could - in principle - be defined for *DataPrototypes* typed by the same *AutosarDataType*.

This would lead to an increased effort for the definition of C data types in the context of the same *PortInterface*.

Additional constraints have been identified in the context of the definition of RTE APIs of the AUTOSAR classic platform that finally render this option as not viable.

ComSpec In this case (for more information please refer to section 4.5) the definition of optionality would even be more specific in comparison to the definition of optionality on the level of *PortInterfaces*.

⁴This abbreviation stands for tag-length-value

On top of that, the task to define optionality in the vast majority of cases is done by an OEM, whereas the model definition on the level of `ComSpec` requires the existence of `SwComponentTypes` and this definition is in many cases in the domain of a supplier.

As a result of this consideration, AUTOSAR has opted for implementation of the concept of defining the optionality on the level of the `AutosarDataType`.

3 Overview: Software Components, Ports, and Interfaces

3.1 Introduction

The detailed introduction of all aspects of the `Software Component Template` in one move is considered too complex. This chapter therefore provides an overview of the main conceptual aspects of software components, ports and interfaces.

The overview will then be broken down into further details in chapter 4.

One of the goals of the AUTOSAR concept is the support of re-usability on the level of application software.

In other words: it should be possible to re-use existing artifacts to create further model elements instead of being forced to create every single modeling detail from scratch.

One of the consequences of this approach is the application of the so-called type-prototype pattern [11].

The type-prototype pattern is created by using references from prototype to type that are decorated with the `<<isOfType>>`. The existence of such references is governed by [constr_2633], see [11].

Among other things, this concept allows for creating hierarchical structures of software-components with arbitrary complexity. However, the creation of hierarchical structures itself does not have an impact on the run-time behavior of the overall system.

The actual behavior is completely defined within the individual software-components.

This conclusion is backed by the understanding that software-components are developed against the so-called `Virtual Functional Bus` (VFB), an abstract communication channel without direct dependency on ECUs and communication buses.

The VFB does not provide any means for expressing a hierarchy of software-components.

Of course, the usage of the VFB has further consequences on the design of software-components which shall not directly call the operating system or the communication hardware.

As a result, software-components can be deployed to actual ECUs at a rather late stage in the development process.

In order to make the description more precise, the following text preferably uses accurate meta-model terms instead of the rather vague terminology of “composition” and “software-component”.

3.2 Software Component

3.2.1 Overview

Application software within AUTOSAR is organized in self-contained units called *AtomicSwComponentTypes*. Such *AtomicSwComponentTypes* encapsulate the implementation of their functionality and behavior and merely expose well-defined connection points, called *PortPrototypes*, to the outside world.

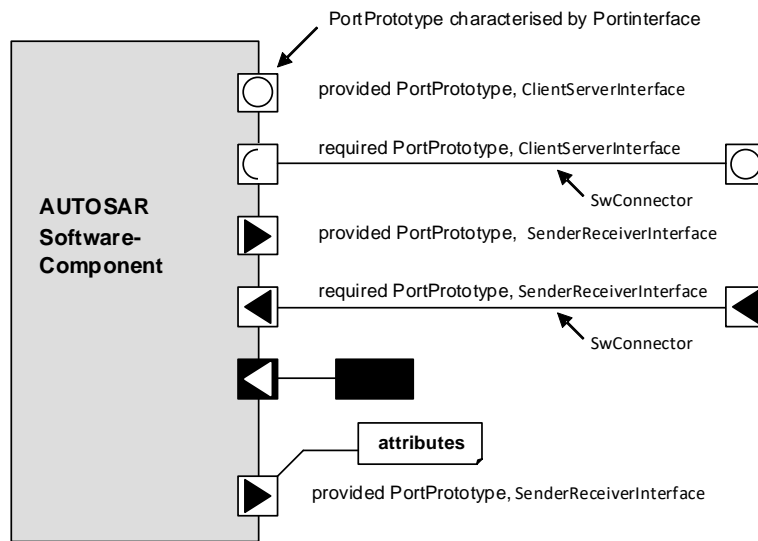

Figure 3.1: Graphical representation of software-components in AUTOSAR

unitGroup	UnitGroup	*	ref	This allows for the specification of which UnitGroups are relevant in the context of referencing SwComponentType.

Table 3.1: SwComponentType

3.2.2 PortPrototype

Please note that [PortPrototypes](#) of a [SwComponentType](#) are supposed to be used for attaching [SwConnectors](#) that establish an actual connection between [SwComponentPrototypes](#) (see chapter 3.3).

[TPS_SWCT_01002] [SwComponentTypes](#) may only interact by means of their [PortPrototypes](#) [[AtomicSwComponentTypes](#) (and also the more general [SwComponentTypes](#) may only interact by means of their [PortPrototypes](#)). Hidden communication dependencies that are *not* expressed by means of [PortPrototypes](#) are strictly forbidden.]([RS_SWCT_00020](#), [RS_SWCT_00030](#), [RS_SWCT_00150](#), [RS_SWCT_00160](#), [RS_SWCT_00200](#), [RS_SWCT_00210](#), [RS_SWCT_02010](#), [RS_SWCT_02030](#))

Therefore, software-components are in theory exchangeable as long as they implement the same functionality and provide the same public communication interface to the remaining system.

[TPS_SWCT_01111] [PortPrototypes](#) need an additional model artifact, the [PortInterface](#) [Please note that [PortPrototypes](#) actually need an additional

model artifact, the `PortInterface`, for fully describing the details of the `PortPrototype`.] ([RS_SWCT_00010](#))

The concept of the `PortInterface` as another means for establishing a high degree of re-usability is described in chapter 3.4.

Class	<code>PortPrototype</code> (abstract)

Table 3.2: PortPrototype

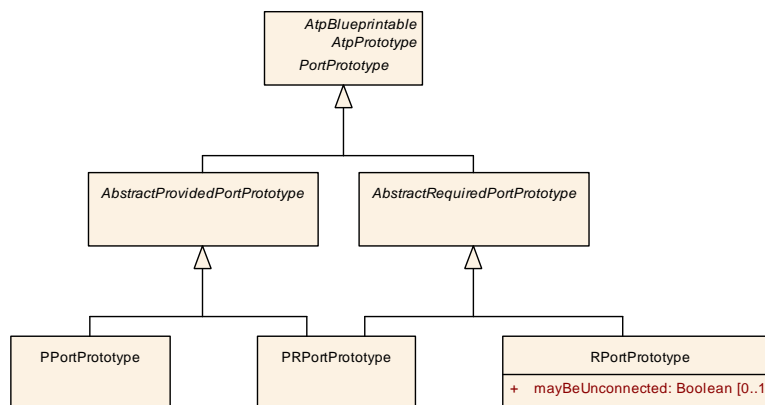

Figure 3.2: Overview of PortPrototype

[[TPS_SWCT_01112](#)] **Semantics of PortPrototypes** [PortPrototypes can have the following semantics:

- A require-port (in technical terms: `RPortPrototype`) requires certain services or data.

- A provide-port (or [PPortPrototype](#)) on the other hand provides services or data.
- A provide-require-port (or [PRPortPrototype](#)) combines the ability to provide and require services or data in one entity.

]([RS_SWCT_03250](#))

The semantics of [PortPrototype](#) is also depicted in Figure 3.2,

[TPS_SWCT_01573] A [PRPortPrototype](#) is never considered unconnected [A [PRPortPrototype](#) is never considered unconnected, even if there are no [SwConnectors](#) actually referring to it.]([RS_SWCT_00010](#), [RS_SWCT_03250](#), [RS_SWCT_03130](#))

Please note that [\[TPS_SWCT_01573\]](#) represents the immediate consequence of the semantics defined in [\[TPS_SWCT_01112\]](#).

[TPS_SWCT_01113] Connecting two [PortPrototypes](#) [Two [SwComponentPrototypes](#) are eventually connected by hooking up a [PPortPrototype](#) or [PRPortPrototype](#) of one [SwComponentPrototype](#) to a compatible [RPortPrototype](#) or [PRPortPrototype](#) of the other [SwComponentPrototypes](#).]([RS_SWCT_03130](#), [RS_SWCT_03250](#))

Please find more information concerning the definition of “compatibility” in section 6.

Table 3.7: PRPortPrototype

[TPS_SWCT_01096] **PortGroup** [**PortPrototypes** can be logically grouped into **PortGroups**. This mechanism is used for implementing mode management features.] (*RS_SWCT_03201*)

Further explanations about the semantics of meta-class **PortGroup** can be found in chapter 4.6.

There are cases where an **RPortPrototype** is intentionally left unconnected. Such a scenario would typically be reported if the RTE Generator is executed in strict mode.

By means of setting attribute **RPortPrototype.maybeUnconnected**, the designer of the respective software-component has the ability to express that the "open" **RPort-Prototype** is part of the final design and shall not be reported, even in strict mode.

The attribute can be used in combination of an **RPortPrototype** and any kind of **PortInterface**.

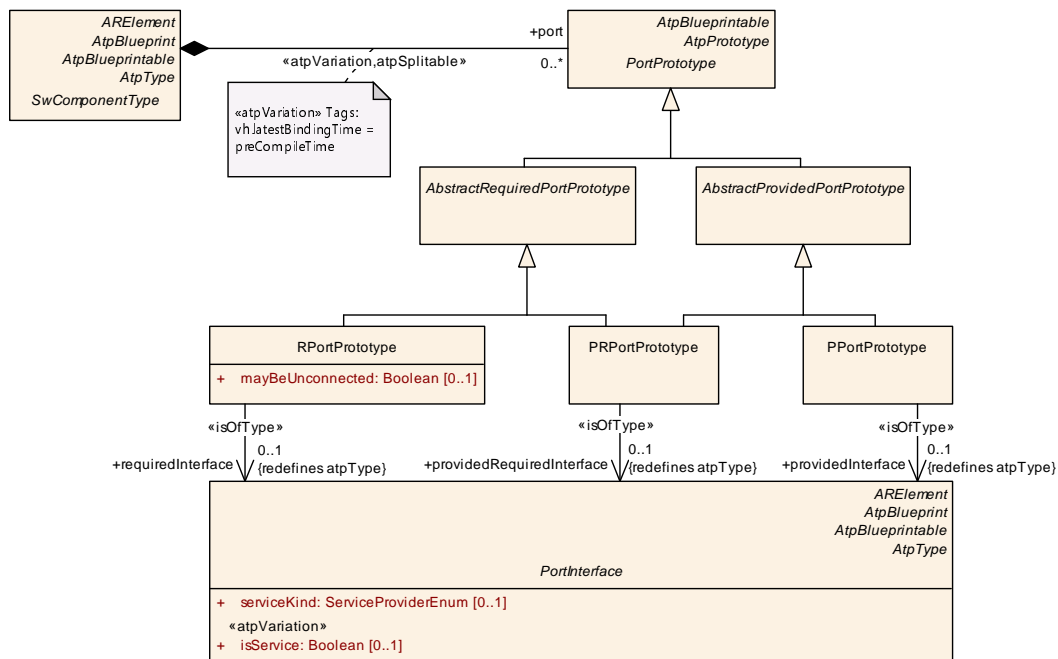

Figure 3.3: Components and Ports

Note that the attribute applies to the entire **RPortPrototype**, not to individual elements of the applicable **PortInterface**.

In other words, the attribute does not affect the case, where e.g. only one **dataElement** of several sender/receiver **RPortPrototype** is left unconnected, as described by [TPS_SWCT_01101].

Please note that the usage of **RPortPrototype.maybeUnconnected** is potentially dangerous because it removes a warning and this can be harmful if the suppression of a legitimate warning were done by mistake.

It is therefore advised to handle the existence of **RPortPrototype.maybeUnconnected** with care.

3.2.3 AtomicSwComponentType

[TPS_SWCT_01108] Added value of an **AtomicSwComponentType** [As mentioned before, the term *AtomicSwComponentType* is a specific form of the general concept of the *SwComponentType*. The added value of an *AtomicSwComponentType* is that it can aggregate an *InternalBehavior*] (*RS_SWCT_03040*)

More information regarding the semantics of *InternalBehavior* can be found in chapter 7.

[TPS_SWCT_01109] Adding the **SwcInternalBehavior** in a later process step [The aggregation of *SwcInternalBehavior* is stereotyped <<atpSplitable>> to allow for adding the *SwcInternalBehavior* in a later process step. In other words, it is possible to completely develop the VFB view of a software-component and later add more details like *InternalBehavior*.]()

Class	<i>AtomicSwComponentType</i> (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	An atomic software component is atomic in the sense that it cannot be further decomposed and distributed across multiple ECUs.			
Base	<i>ARElement</i> , <i>ARObject</i> , <i>AtpBlueprint</i> , <i>AtpBlueprintable</i> , <i>AtpClassifier</i> , <i>AtpType</i> , <i>CollectableElement</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>PackageableElement</i> , <i>Referrable</i> , <i>SwComponentType</i>

symbolProps	<i>SymbolProps</i>	0..1	aggr	This represents the <i>SymbolProps</i> for the <i>AtomicSwComponentType</i> . Stereotypes: atpSplitable Tags: atp.Splitkey=symbolProps.shortName

Table 3.8: AtomicSwComponentType

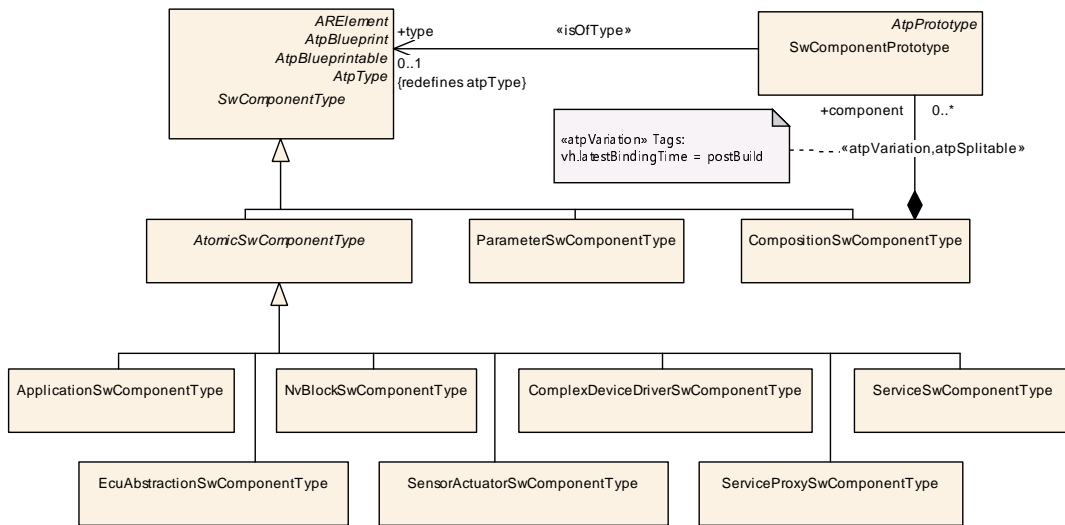

Figure 3.4: Overview of Component Types

There are several specialized `SwComponentTypes` to describe specific software-components used in the different parts of the AUTOSAR Layered Architecture [5]. Further details are mentioned in chapter 10 and 11.

The `ApplicationSwComponentType` is a specialization of `AtomicSwComponentType` for representing hardware-independent application software. The `ParameterSwComponentType` is a specialization of `SwComponentType` that can - in contrast to `AtomicSwComponentType` - not aggregate `SwcInternalBehavior`.

The purpose of the `NvBlockSwComponentType` is described in detail in section 11.4.2. The `ServiceSwComponentType` is described in section 11.2. Further on, the `EcuAbstractionSwComponentType` and the `ComplexDeviceDriverSwComponentType` are discussed in detail in section 10.

A description of the `ServiceProxySwComponentType` can be found in section 11.3 while the `SensorActuatorSwComponentType` is described in section 10.4.

Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table 3.9: ApplicationSwComponentType

3.2.4 ParameterSwComponentType

[constr_1092] Restrictions for the ParameterSwComponentType [The following restrictions exist for a `ParameterSwComponentType`:

- it shall never aggregate a `SwcInternalBehavior` and
- the only aggregated `PortPrototypes` shall be `PPortPrototypes` of type `ParameterInterface`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01847] Define role-specific data properties of elements of composite data types used for the definition of calibration parameters [A `ParameterSwComponentType` shall have the ability to aggregate `InstantiationDataDefProps`. By this means it is possible to define role-specific data properties of elements of composite data types used for the definition of calibration parameters in the scope of a `ParameterSwComponentType`.]()

For more information about this aspect please refer to section 7.5.4.

Figure 3.5: Details of `ParameterSwComponentType`

3.2.5 Symbolic Name of a Software-Component

Please note that an `AtomicSwComponentType` manifests itself in the source code of an RTE into which an instance of the `AtomicSwComponentType` is deployed. This implies potential naming conflicts if instances of `AtomicSwComponentType` that have identical `shortNames` are deployed into a specific RTE.

[TPS_SWCT_01110] Symbolic name of a software-component [To mitigate this potential hazard it is possible to provide the `AtomicSwComponentType` along with an accompanying symbolic name that can be used for resolving the name clash. The symbolic name is provided by means of the attribute `symbol` of the meta-class `SymbolProps` owned by `AtomicSwComponentType` in the role `symbolProps`.]()

Please note that more information about the symbolic name provided by means of the attribute `symbol` of the meta-class `SymbolProps` owned by `AtomicSwComponentType` in the role `symbolProps` can be found in Figure 3.6.

For more detailed information about how `SymbolProps` can be used to mitigate name clashes occurring during the integration of software-components on an AUTOSAR ECU, please refer to [4].

[TPS_SWCT_01000] Usage of attribute `symbol` of the `symbolProps` [In particular, the RTE generator shall take over the value of the attribute `symbol` of the `symbolProps` owned by a given `AtomicSwComponentType`. If and only if `symbolProps` is not defined the RTE generator shall take the `shortName` of the `AtomicSwComponentType`. For the generation of `symbols` for `RunnableEntity`s [TPS_SWCT_01001] shall be observed.] (*RS_SWCT_00230*)

[TPS_SWCT_01001] Prefix symbols generated for the `RunnableEntity` [If and only if the attribute `symbol` of a `symbolProps` owned by an `AtomicSwComponentType` exists, its value shall also be taken for prefixing the symbols generated for the `RunnableEntity`s owned by the `AtomicSwComponentType`.] (*RS_SWCT_00230*)

Note: if `symbolProps` is not defined the behavior of the RTE generator is fully backwards compatible, i.e. existing implementations of `RunnableEntity`s do not have to be touched in order to conform with this version of the AUTOSAR standard.

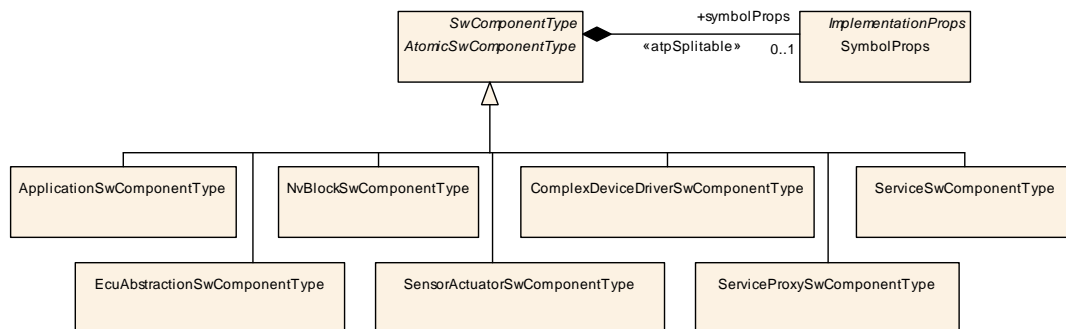

Figure 3.6: Overview of `AtomicSwComponentType`

This is a further measure to mitigate the risk of potential name clashes in the RTE code.

[TPS_SWCT_01635] Naming conventions may support the effectiveness of `SymbolProps` [Of course, there is a residual risk that even in the presence of `SymbolProps` name clashes may occur.

Therefore, the definition of naming conventions may facilitate the avoidance of name clashes to the further degree.] (*RS_SWCT_00230*)

3.3 Composition

3.3.1 Overview

[TPS_SWCT_01032] `CompositionSwComponentType` [The purpose of an AUTOSAR `CompositionSwComponentType` is to allow the encapsulation of specific

functionality by aggregating existing software-components.]([RS_SWCT_00190](#), [RS_SWCT_02000](#), [RS_SWCT_02020](#), [RS_SWCT_03000](#))

[TPS_SWCT_01033] Nested definition of `CompositionSwComponentTypes`
 [Since a `CompositionSwComponentType` is also a `SwComponentType`, it again may be aggregated in further `CompositionSwComponentTypes`.]([RS_SWCT_00190](#), [RS_SWCT_02000](#), [RS_SWCT_02020](#), [RS_SWCT_03000](#))

This recursive relation is formally expressed in Figure 3.7.

It is important to understand that while compositions allow for (sub-) system abstraction, they are solely an *architectural element for the implementation of model scalability*. They simply group existing software-components and thereby take away complexity when viewing or designing logical software architecture.

Therefore, the definition of `CompositionSwComponentTypes` has no effect on how software-components interact with the `Virtual Functional Bus (VFB)`. `CompositionSwComponentTypes` do not add any new functionality to what is already provided by the software-components they aggregate.

Figure 3.7: The recursive relation of software-components and compositions

[TPS_SWCT_01034] `CompositionSwComponentTypes` do not have any binary footprint
 [As the main consequence, `CompositionSwComponentTypes` do not have any binary footprint in the ECU software.]([RS_SWCT_00190](#), [RS_SWCT_02000](#), [RS_SWCT_02020](#), [RS_SWCT_03000](#))

3.3.2 SwComponentPrototype

[TPS_SWCT_01035] `CompositionSwComponentType` aggregates `SwComponentPrototypes`
 [In terms of the AUTOSAR meta-model, a composition of software-components realized by the meta-class `CompositionSwComponentType` aggregates `SwComponentPrototypes` which in turn are typed by a `SwComponentType`.]([RS_SWCT_00190](#), [RS_SWCT_02000](#), [RS_SWCT_02020](#), [RS_SWCT_03000](#))

Please note that a `CompositionSwComponentType` is also a `SwComponentType`.

[TPS_SWCT_01036] `SwComponentPrototype` implements a specific role
 [Therefore, a `SwComponentPrototype` implements the usage of a `SwComponentType` in a specific *role*.]([RS_SWCT_00190](#), [RS_SWCT_02000](#), [RS_SWCT_02020](#), [RS_SWCT_03000](#))

[TPS_SWCT_01037] arbitrary numbers of **SwComponentPrototypes** can be created [In general, arbitrary numbers of **SwComponentPrototypes** that refer to specific **SwComponentTypes** can be created.] (*RS_SWCT_00190, RS_SWCT_02000, RS_SWCT_02020, RS_SWCT_03000*)

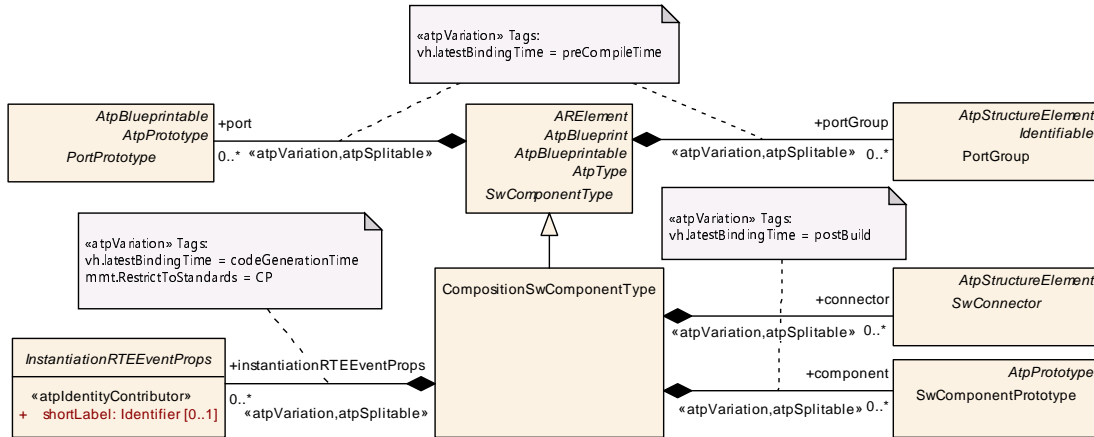

Figure 3.8: Composition and the meta-classes aggregated

Class	CompositionSwComponentType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	A CompositionSwComponentType aggregates SwComponentPrototypes (that in turn are typed by SwComponentTypes) as well as SwConnectors for primarily connecting SwComponentPrototypes among each others and towards the surface of the CompositionSwComponentType . By this means, a hierarchical structures of software-components can be created. Tags: atp.recommendedPackage=SwComponentTypes			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable , SwComponentType			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
component	SwComponentPrototype	*	aggr	The instantiated components that are part of this composition. The aggregation of SwComponentPrototype is subject to variability with the purpose to support the conditional existence of a SwComponentPrototype . Please be aware: if the conditional existence of SwComponentPrototypes is resolved post-build, the deselected SwComponentPrototypes are still contained in the ECUs build but the instances are inactive in that they are not scheduled by the RTE. The aggregation is marked as <code>atpSplitable</code> in order to allow the addition of service components to the ECU extract during the ECU integration. The use case for having 0 components owned by the CompositionSwComponentType could be to deliver an empty CompositionSwComponentType to e.g. a supplier for filling the internal structure. Stereotypes: <code>atpSplitable</code> ; <code>atpVariation</code> Tags: <code>atp.Splitkey=component.shortName, component.variationPoint.shortLabel</code> <code>vh.latestBindingTime=postBuild</code>

Class	CompositionSwComponentType			
connector	SwConnector	*	aggr	<p>SwConnectors have the principal ability to establish a connection among PortPrototypes. They can have many roles in the context of a CompositionSwComponentType. Table 3.11: SwComponentPrototype

Example 3.1

A [SwComponentPrototype](#) “LeftDoorControl” fulfills the role of implementing the [SwComponentType](#) “DoorControl” for the left door of a vehicle while the [SwComponentPrototype](#) “RightDoorControl” fulfills the role of the [SwComponentType](#) “DoorControl” for the right door.

[TPS_SWCT_01080] Delegation ports [Note that being a [SwComponentType](#), a [CompositionSwComponentType](#) also exposes [PortPrototypes](#) to the outside world. However, the [PortPrototypes](#) are only delegated and do not play the same role as [PortPrototypes](#) attached to [AtomicSwComponentTypes](#).] ([RS_SWCT_03130](#))

[TPS_SWCT_01081] Implications of being a delegation port [Being a [PortPrototype](#) attached to a [CompositionSwComponentType](#) has the following implications:

- The delegation has to follow the rules for basic compatibility.
- By creating [PortPrototypes](#) on the surface of a specific [CompositionSwComponentType](#) it is explicitly decided whether the contents of an “inner” port contained in the [CompositionSwComponentType](#) is exposed to the outside world.

] ([RS_SWCT_03130](#))

Please note that the rules for compatibility are described in chapter 6.

Please note further that the semantics of the delegation of `PortPrototypes` are similar to encapsulation mechanisms like public and private members in object-oriented programming languages.

One implication of the concept of `CompositionSwComponentType` is that the application software of an entire vehicle eventually is represented by one `CompositionSwComponentType`. This so-called top-level composition has a special role in the context of the AUTOSAR System Template [10].

However, please note that a top-level composition might have (unconnected) `PortPrototypes` in order to allow for reuse as part of another system.

[constr_1035] Recursive definition of `CompositionSwComponentType` [The recursive definition of a `CompositionSwComponentType` that eventually contains a `SwComponentPrototype` typed by the same `CompositionSwComponentType` shall not be feasible **at the time when the creation of the `CompositionSwComponentType` is finished.**]()

3.3.3 Connectors

[TPS_SWCT_01079] `SwConnector` [Note that `CompositionSwComponentType` also aggregates the abstract meta-class `SwConnector` for connecting the contained `SwComponentPrototypes` among each other.](*RS_SWCT_03130*)

More information can be found in Figure 3.8.

`CompositionSwComponentTypes` contain three kinds of `SwConnectors`:

- **[TPS_SWCT_01082] `AssemblySwConnector`** [`AssemblySwConnectors` interconnect `PortPrototypes` of `SwComponentPrototypes` that are part of the `CompositionSwComponentType`.](*RS_SWCT_03130*)
- **[TPS_SWCT_01083] `DelegationSwConnector`** [`DelegationSwConnectors` connect from “inner” `PortPrototypes` to delegated “outer” `PortPrototypes`.](*RS_SWCT_03130*)

[TPS_SWCT_01084] Outer `PortPrototype` is referenced by multiple `DelegationSwConnectors` [In the case that an outer `PortPrototype` is referenced by multiple `DelegationSwConnectors` the semantic is the multiplication of the `AssemblySwConnectors` referencing the outer `PortPrototypes`.](*RS_SWCT_03130*)

- `PassThroughSwConnector`, see [TPS_SWCT_01507].

[constr_1086] `SwConnector` between two specific `PortPrototypes` [Each pair of `PortPrototypes` can only be connected by one and only one `SwConnector` **at the time when the RTE is generated.**]()

In other words, it is not supported to create two different `SwConnectors` that connect the same pair of `PortPrototypes`.

[TPS_SWCT_01638] Existence of `SwConnector` between two `PRPortPrototypes` `[constr_1086]` applies also in the case that two `PRPortPrototypes` are connected with each other. In particular, the roles

- `AssemblySwConnector.requester`
- `AssemblySwConnector.provider`
- `PassThroughSwConnector.providedOuterPort`
- `PassThroughSwConnector.requiredOuterPort`

do **not** establish a direction in this case. `()`

For clarification, `[TPS_SWCT_01638]` means that the `SwConnector` represents the ability for bi-directional communication between the two `PRPortPrototypes`.

[constr_1087] `AssemblySwConnector` inside `CompositionSwComponentType` `[An AssemblySwConnector can only connect PortPrototypes of SwComponentPrototypes that are owned by the same CompositionSwComponentType at the time when the creation of the CompositionSwComponentType is finished.]()`

[constr_1088] `DelegationSwConnector` inside `CompositionSwComponentType` `[A DelegationSwConnector can only connect a PortPrototype of a SwComponentPrototype that is owned by the same CompositionSwComponentType that also owns the connected delegation PortPrototype at the time when the creation of the CompositionSwComponentType is finished.]()`

In the context of attaching a `DelegationSwConnector` to an inner `PRPortPrototype` there is some ambiguity to be considered. In particular, from the formal point of view it would be feasible to use **either** a `PPortInCompositionInstanceRef` or a `RPortInCompositionInstanceRef`.

The ability to use one or the other meta-class arbitrarily is considered confusing. Therefore, `[TPS_SWCT_01515]` has been defined to remove the unnecessary degree of freedom.

[TPS_SWCT_01515] `PPortInCompositionInstanceRef` shall be used for attaching `DelegationSwConnector` to an inner `PRPortPrototype` `[For the implementation of the attachment of a DelegationSwConnector to an inner PRPortPrototype the meta-class PPortInCompositionInstanceRef shall be used.](RS_SWCT_03130)`

[constr_1100] Unconnected `RPortPrototype` typed by a `DataInterface` `[For any element in an unconnected RPortPrototype typed by a DataInterface, there shall be a requiredComSpec that defines an initValue at the time when the RTE is generated.]()`

Class	SwConnector (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	The base class for connectors between ports. Connectors have to be identifiable to allow references from the system constraint template.			
Base	ARObject, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable , MultilanguageReferrable , Referrable			
Subclasses	AssemblySwConnector , DelegationSwConnector , PassThroughSwConnector			
Aggregated by	AtpClassifier.atpFeature, CompositionSwComponentType.connector			
Attribute	Type	Mult.	Kind	Note
mapping	PortInterfaceMapping	0..1	ref	Reference to a PortInterfaceMapping specifying the mapping of unequal named PortInterface elements of the two different PortInterfaces typing the two PortPrototypes which are referenced by the ConnectorPrototype.

Table 3.12: SwConnector

One specific use case for the application of [SwConnectors](#) is exemplified by the figures [3.9](#) and [3.11](#). A specific [CompositionSwComponentType](#) exists in two variants where one (more complex) variant foresees the existence of a [SwComponentPrototype](#) inside the [CompositionSwComponentType](#) (depicted by [3.9](#)) and the other (because it is implementing a simpler semantics) does not need the [SwComponentPrototype](#).

Class	AssemblySwConnector			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	AssemblySwConnectors are exclusively used to connect SwComponentPrototypes in the context of a CompositionSwComponentType.			
Base	ARObject, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable , MultilanguageReferrable , Referrable , SwConnector			
Aggregated by	AtpClassifier.atpFeature, CompositionSwComponentType.connector			
Attribute	Type	Mult.	Kind	Note
provider	AbstractProvidedPortPrototype	0..1	iref	Instance of providing port. InstanceRef implemented by: PPortInCompositionInstanceRef
requester	AbstractRequiredPortPrototype	0..1	iref	Instance of requiring port. InstanceRef implemented by: RPortInCompositionInstanceRef

Table 3.13: AssemblySwConnector

Class	DelegationSwConnector			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	A delegation connector delegates one inner PortPrototype (a port of a component that is used inside the composition) to a outer PortPrototype of compatible type that belongs directly to the composition (a port that is owned by the composition).			
Base	ARObject, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable , MultilanguageReferrable , Referrable , SwConnector			
Aggregated by	AtpClassifier.atpFeature, CompositionSwComponentType.connector			
Attribute	Type	Mult.	Kind	Note

Class	DelegationSwConnector			
innerPort	PortPrototype	0..1	iref	The port that belongs to the ComponentPrototype in the composition Tags: xml.typeElement=true InstanceRef implemented by: PortInCompositionType InstanceRef
outerPort	PortPrototype	0..1	ref	The port that is located on the outside of the Composition Type

Table 3.14: DelegationSwConnector

[constr_1860] Multiplicity of DelegationSwConnector.innerPort [For each DelegationSwConnector, the reference DelegationSwConnector.innerPort shall exist **at the time when the creation of the CompositionSwComponentType is finished.**]()

[constr_1861] Multiplicity of DelegationSwConnector.outerPort [For each DelegationSwConnector, the reference DelegationSwConnector.outerPort shall exist **at the time when the creation of the CompositionSwComponentType is finished.**]()

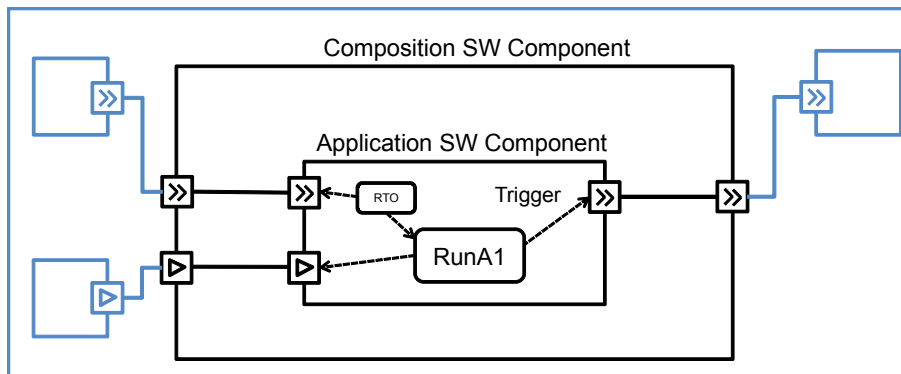

Figure 3.9: Use case for PassThroughSwConnector (I)

Without the ability to define a PassThroughSwConnector the second variant could only be implemented by defining a dummy SwComponentPrototype inside the CompositionSwComponentType. However, the dummy SwComponentPrototype would need to define RunnableEntities that are created for the sole purpose of being able to shove the data from (e.g. for sender-receiver communication) RPortPrototypes to PPortPrototypes.

This would not only be cumbersome it would also obviously require additional resources (memory and code) at run-time. Plus, the existence of addition RunnableEntities also unnecessarily increases the propagation delay of information flowing around inside the ECU.

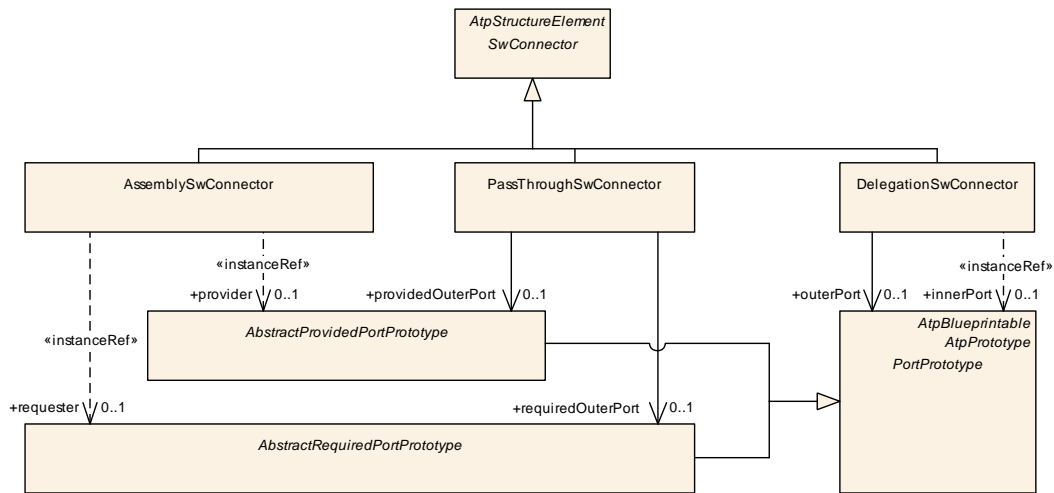

Figure 3.10: Connectors

[TPS_SWCT_01507] The role of **PassThroughSwConnector** [PassThroughSwConnector can be taken to connect PortPrototypes owned by the same CompositionSwComponentType. In other words, PassThroughSwConnector creates a bypass inside a CompositionSwComponentType from the requiredOuterPort to the providedOuterPort (or vice versa) without involving SwComponentPrototypes.] (RS_SWCT_03130)

[constr_1252] Creation of a loop involving a **PassThroughSwConnector** is not allowed [A PassThroughSwConnector is not allowed if the required outer PortPrototype is directly or indirectly connected to the provided outer PortPrototype without the placement of a SwComponentPrototype typed by an AtomicSwComponentType in the chain of SwConnectors.

This rule shall be imposed at the time when the creation of the CompositionSwComponentType is finished.]()

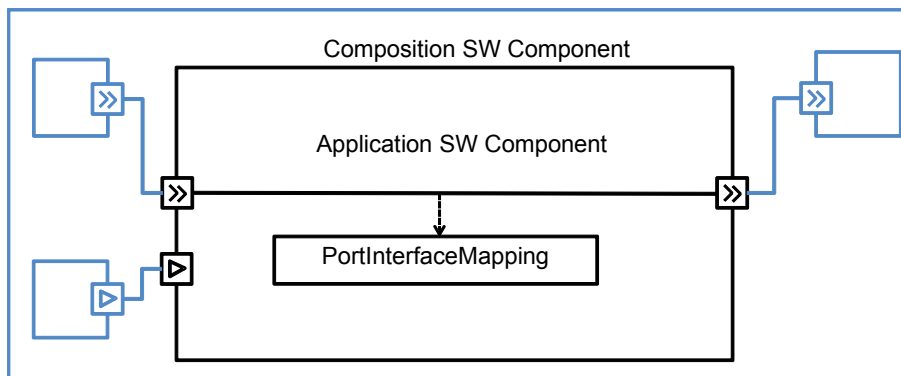

Figure 3.11: Use case for PassThroughSwConnector (II)

In other words, according to [constr_1252] it is not allowed to create a “infinite loop” by means of a PassThroughSwConnector and at least one AssemblySwConnector that connects the requiredOuterPort to the providedOuterPort.

Class	PassThroughSwConnector			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	This kind of SwConnector can be used inside a CompositionSwComponentType to connect two delegation PortPrototypes.			
Base	ARObject, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable , MultilanguageReferrable , Referrable , SwConnector			
Aggregated by	AtpClassifier.atpFeature, CompositionSwComponentType.connector			
Attribute	Type	Mult.	Kind	Note
providedOuterPort	AbstractProvidedPortPrototype	0..1	ref	This represents the provided outer delegation Port Prototype of the PassThroughSwConnector.
requiredOuterPort	AbstractRequiredPortPrototype	0..1	ref	This represents the required outer delegation Port Prototype of the PassThroughSwConnector.

Table 3.15: PassThroughSwConnector

[constr_1862] Multiplicity of [PassThroughSwConnector.requiredOuterPort](#)
 [For each [PassThroughSwConnector](#), the reference [PassThroughSwConnector.requiredOuterPort](#) shall exist **at the time when the creation of the CompositionSwComponentType is finished.**]()

[constr_1863] Multiplicity of [PassThroughSwConnector.providedOuterPort](#)
 [For each [PassThroughSwConnector](#), the reference [PassThroughSwConnector.providedOuterPort](#) shall exist **at the time when the creation of the CompositionSwComponentType is finished.**]()

[TPS_SWCT_01843] Value of [PassThroughSwConnector.category](#) [Meta-class [PassThroughSwConnector](#) can be used in different contexts:

- The [PassThroughSwConnector](#) is designed to implement VFB communication and therefore is considered in the generation of the RTE. In this case the attribute [PassThroughSwConnector.category](#) should either not exist or should be set to the value VFB.
- The [PassThroughSwConnector](#) is used to support the early design of a signal/service translation. At some point, the early design is replaced by actual [ApplicationSwComponentTypes](#) that finally implement the intended communication path sketched by the early design on the VFB.

For more details about designing a signal/service translation by means of a [PassThroughSwConnector](#), please refer to the TPS System Template [10]. To indicate the usage of the [PassThroughSwConnector](#) for the early design purpose, the value of the attribute [PassThroughSwConnector.category](#) should be set to S2S_DESIGN.

] ([RS_SWCT_03130](#))

Please note that, on the AUTOSAR adaptive platform, the [PassThroughSwConnector](#) is also used for the design of a signal/service translation in a way that is very similar to the approach described in the TPS System Template [10]. More details can be found in the TPS Manifest Specification [13].

3.3.4 Instantiation-specific RTEEvents

[TPS_SWCT_02507] Instantiation-specific RTEEvents [It is possible to specify instantiation specific properties of an RTEEvent by applying *InstantiationRTEEventProps* in the role *instantiationRTEEventProps*.

This allows to use the same *ApplicationSwComponentType* in different timing scenarios. Even if the scheduling is an issue of the *SwcInternalBehavior*, the instance specific definition of timing needs to be specified on the level of a *CompositionSwComponentType*.] (*RS_SWCT_03046*, *RS_SWCT_03270*)

As an example for [TPS_SWCT_02507], please consider a software-component that implements a closed-loop control algorithm.

This software-component can potentially be deployed to “slow” and “fast” control scenarios. As the actual time-base of the control algorithm is derived from the scheduling implemented in the RTE it obviously facilitates the overall design if the timing can be defined on “instance” level.

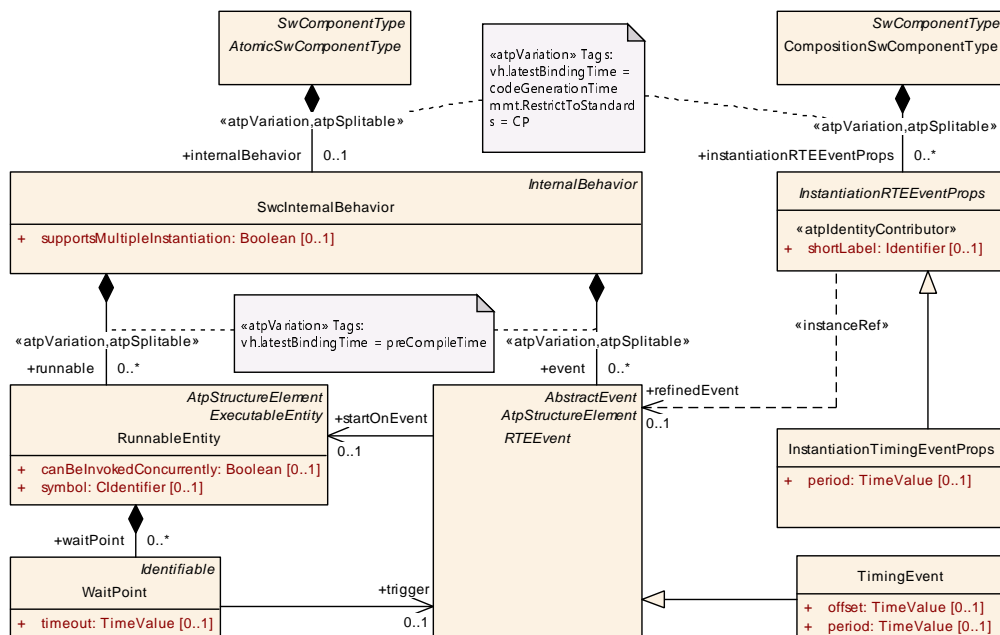

Figure 3.12: Instantiation specific Properties of RTEEvents

[constr_1233] InstantiationTimingEventProps shall only reference TimingEvent [An *InstantiationTimingEventProps* shall only reference *TimingEvent* in the role *refinedEvent*. A reference to other kinds of *RTEEvents* is not supported.

This rule shall be imposed **at the time when the RTE is generated.**]()

Class	InstantiationTimingEventProps			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	This meta-class represents the ability to refine a timing event for particular instances of a software component. This approach supports an instance specific timing.			
Base	ARObject, InstantiationRTEEventProps			
Aggregated by	CompositionSwComponentType.instantiationRTEEventProps			
Attribute	Type	Mult.	Kind	Note
period	TimeValue	0..1	attr	This attribute represents the value of the refined activation period.

Table 3.16: InstantiationTimingEventProps

[constr_1864] Multiplicity of [InstantiationRTEEventProps.refinedEvent](#)
 [For each [InstantiationRTEEventProps](#), the instance-reference [InstantiationRTEEventProps.refinedEvent](#) shall exist **at the time when the RTE is generated.**]()

Please note that the attribute [shortLabel](#) only contributes to model semantics if the ability to split the definition of the aggregation [CompositionSwComponentType.instantiationRTEEventProps](#) over several physical files is actually utilized¹.

More explanation about the ability to split models over physical files can be found in [11].

Class	InstantiationRTEEventProps (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	This meta-class represents the ability to refine the properties of RTEEvents for particular instances of a software component.			
Base	ARObject			
Subclasses	InstantiationTimingEventProps			
Aggregated by	CompositionSwComponentType.instantiationRTEEventProps			
Attribute	Type	Mult.	Kind	Note
refinedEvent	RTEEvent	0..1	iref	This instance ref denotes the Timing Event for which the period shall be refined on an instance level. InstanceRef implemented by: InstanceEventInCompositionInstanceRef
shortLabel	Identifier	0..1	attr	The main purpose of the shortLabel is to contribute to the splitkey of aggregations that are <<atpSplittable>>. Stereotypes: atpIdentityContributor

Table 3.17: InstantiationRTEEventProps

3.4 Port Interface

[TPS_SWCT_01025] The role of [PortPrototypes](#) in the AUTOSAR architecture
 [A [PortPrototype](#) mainly contributes the functionality of being a *connection point* to the AUTOSAR concept.

¹In which case the [shortLabel](#) serves as a part of the splitkey

The details, i.e. with respect to what kind of information is actually transported between two `PortPrototypes` is defined by the `PortInterface`.^{](RS_SWCT_00010, RS_SWCT_00080, RS_SWCT_00110, RS_SWCT_02030, RS_SWCT_03010)}

[TPS_SWCT_01026] The role of `PortInterfaces` in the AUTOSAR architecture [`PortInterfaces` are used to support a design-by-contract work-flow, i.e. a `PortInterface` provides means to formally verify structural and dynamic compatibility between software-components.]^(RS_SWCT_00010, RS_SWCT_00080, RS_SWCT_00110, RS_SWCT_02030, RS_SWCT_03010)

In other words: `PortInterfaces` (see Figure 3.14) represent a pivotal point in the AUTOSAR concept.

Please note that a `PortInterface` creates a name space for the information contained. This allows for defining the details of a specific `PortInterface` without having to care for possible side effects on other `PortInterfaces`. Again, this property of the AUTOSAR concept directly supports re-usability.

[TPS_SWCT_01027] Different flavors of `PortInterfaces` [Within the AUTOSAR concept, different flavors of `PortInterfaces` are defined:

- `SenderReceiverInterface`
- `NvDataInterface`
- `ParameterInterface`
- `ModeSwitchInterface`
- `ClientServerInterface`
- `TriggerInterface`

]^(RS_SWCT_00010, RS_SWCT_00080, RS_SWCT_00110, RS_SWCT_02030)

Figure 3.13: `DataInterface` as an abstract base class

[TPS_SWCT_01069] `DataInterface` is defined as abstract base class [Please note that the conceptual relationship of `SenderReceiverInterface`, `NvDataInterface`, and `ParameterInterface` is expressed by the definition of the abstract base class `DataInterface`.]^(RS_SWCT_00010, RS_SWCT_00080, RS_SWCT_00110, RS_SWCT_03010)

Please find more details about the specialization of the `PortInterface` concept in chapter 4.2.3 and 4.2.2.

Class	PortInterface (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	Abstract base class for an interface that is either provided or required by a port of a software component.			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Subclasses	ClientServerInterface , DataInterface , ModeSwitchInterface , TriggerInterface			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
isService	Boolean	0..1	attr	This flag is set if the PortInterface is to be used for communication between an <ul style="list-style-type: none"> • ApplicationSwComponentType or • ServiceProxySwComponentType or • SensorActuatorSwComponentType or • ComplexDeviceDriverSwComponentType • ServiceSwComponentType • EcuAbstractionSwComponentType and a ServiceSwComponentType (namely an AUTOSAR Service) located on the same ECU. Otherwise the flag is not set. Stereotypes: atpVariation Tags: vh.latestBindingTime=blueprintDerivationTime
serviceKind	ServiceProviderEnum	0..1	attr	This attribute provides further details about the nature of the applied service.

Table 3.18: PortInterface

[TPS_SWCT_01070] **PortInterface** acts as a *type* for a **PortPrototype** [From an abstract point of view, a **PortInterface** acts as a *type* for a **PortPrototype**. This means in particular that several **PortPrototypes** can be typed by the same **PortInterface**.] ([RS_SWCT_00010](#), [RS_SWCT_00080](#), [RS_SWCT_00110](#), [RS_SWCT_03010](#))

Class	DataInterface (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	The purpose of this meta-class is to act as an abstract base class for subclasses that share the semantics of being concerned about data (as opposed to e.g. operations).			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , PortInterface , Referrable			
Subclasses	NvDataInterface , ParameterInterface , SenderReceiverInterface			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table 3.19: DataInterface

Of course, this aspect facilitates the creation of valid connections between software-components dramatically. By using a specific **PortInterface** for typing particular **PortPrototypes** the latter are eligible for being connected to each other by definition.

However, the creation of a valid connection does not need to be based on the usage of identical **PortInterfaces**. It is also possible to use different, but *compatible*

PortInterfaces. The details about compatibility of *PortInterfaces* are described in chapter 6.

[constr_1036] Connect kinds of *PortInterfaces* [It shall not be possible to connect *PortPrototypes* typed by *PortInterfaces* of different kinds **at the time when the RTE is generated**.

Subclasses of *DataInterface* make an exception to this rule and can be used for creating connections to each other.]()

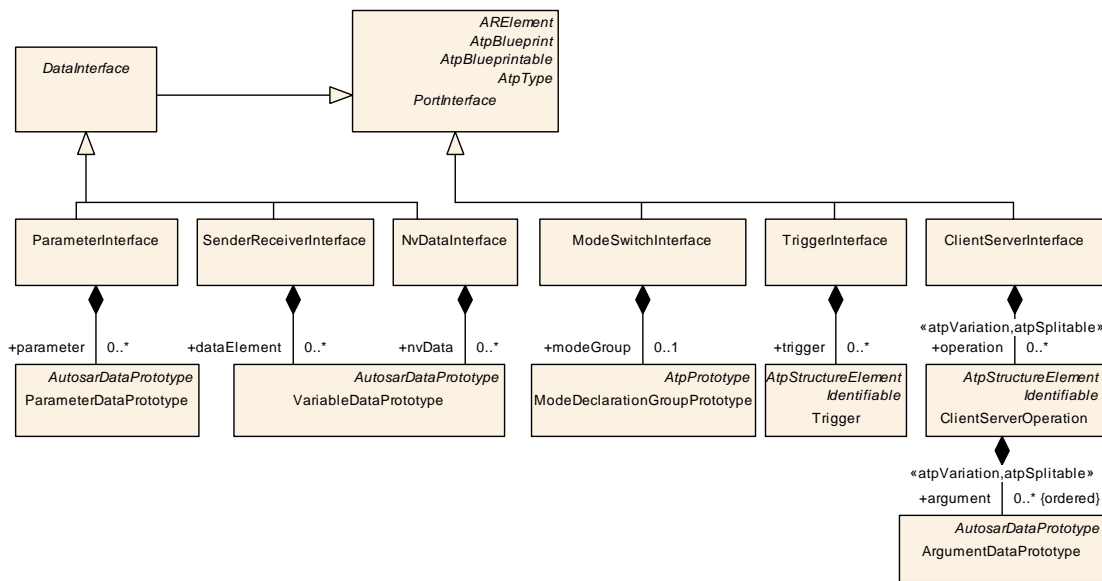

Figure 3.14: *PortInterfaces* in the AUTOSAR meta-model

For clarification, a connection between a *PortPrototype* typed by a *SenderReceiverInterface* and a *PortPrototype* typed by a *ClientServerInterface* shall not be possible. However, the creation of a connection between a *PortPrototype* typed by a *SenderReceiverInterface* and a *PortPrototype* typed by a *ParameterInterface* is supported.

[constr_1137] Applicability of *ParameterInterface* [A *PPortPrototype* typed by a *ParameterInterface* can **only** be owned by a *ParameterSwComponentType* or a *CompositionSwComponentType* **at the time when the RTE is generated**.]()

Please note that *PortInterfaces* also play an important role in the context of defining so-called AUTOSAR services. In particular, by means of the attribute *isService* a *PortInterface* can define whether it is supposed to be used in the context of an AUTOSAR service and in addition to this it may define (by means of the attribute *serviceKind*) what kind of service is intended.

The creation of an *AssemblySwConnector* between *PortPrototypes* where the respective *PortInterfaces* have set attribute *isService* to *true* puts requirements on the nature of the enclosing *SwComponentTypes*.

For example, it does not make sense to establish a service communication between two `SwComponentPrototypes` that each are typed by `ApplicationSwComponentTypes`. For service communication, at least one of the participating `SwComponentPrototypes` has to be typed by a `ServiceSwComponentType`.

[constr_10067] Creation of `AssemblySwConnector` for service communication

[If an `AssemblySwConnector` is created between two `PortPrototypes` and the affected `PortInterfaces` set the attribute `isService` to the value `true`, then at least one of the `SwComponentPrototypes` shall be typed by a `ServiceSwComponentType`. This constraint shall be imposed **at the time when the RTE is generated.**]()

The information contained in `serviceKind` can be used in various ways. The primary intent is to distinguish between the usage of standardized AUTOSAR services from the usage of a vendor-specific service. This information may have an impact on the development- and build process of software-components that use the `PortInterface`.

In addition, it is also possible to use the information contained in `serviceKind` for filtering the presentation of an AUTOSAR model in an AUTOSAR authoring tool and e.g. display the nature of the service `PortPrototypes` independently of the content of the corresponding `PortInterface`.

[TPS_SWCT_01003] Inconsistencies regarding the value of `serviceKind` and the actual implementation of the `PortInterface`

[In case of inconsistencies between the value of `serviceKind` and the actual implementation of the `PortInterface` the implementation of the `PortInterface` wins over the value of attribute `PortInterface.serviceKind` (which, for the intended purpose shall be considered an annotation rather than a semantically binding information).] ([RS_SWCT_00030](#))

[TPS_SWCT_01004] Specific default value if `serviceKind` is not defined [if the attribute `serviceKind` is not defined in the context of a specific `PortInterface` the default value `anyStandardized` shall be assumed.] ([RS_SWCT_00030](#))

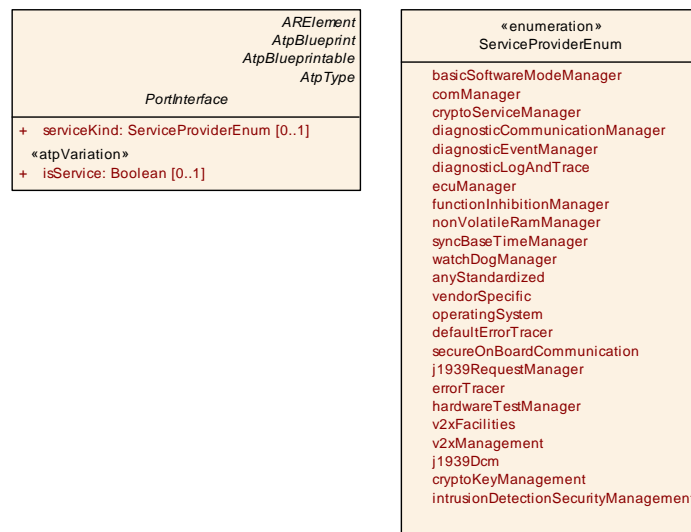

Figure 3.15: `PortInterfaces` and AUTOSAR services

[constr_1174] PortInterfaces used in the context of CompositionSwComponentTypes cannot refer to AUTOSAR services [CompositionSwComponentTypes shall not own PortPrototypes typed by PortInterfaces where the attribute isService is set to true at the time when the creation of the CompositionSwComponentType is finished.]()

Enumeration	ServiceProviderEnum

Table 3.20: ServiceProviderEnum

Please find more details about the relation of [PortInterfaces](#) to AUTOSAR services in chapter 11.

4 Details: Software Components, Ports, and Interfaces

4.1 Introduction

The specification of the [Virtual Functional Bus \(VFB\)](#) [3] explains the main communication paradigms for communication among software-components: *client/server* for operation-based communication, and *sender/receiver* for data-based communication.

The nature of the two communication paradigms is quite different, and so is the modeling of [SenderReceiverInterfaces](#) and [ClientServerInterfaces](#) and their related meta-classes.

[TPS_SWCT_01516] [PortInterface](#) describes the static structure of information interchange [[PortInterfaces](#) are limited to the description of the static structure of the exchanged information; the dynamic attributes relevant for communication are attached to [PortPrototypes](#).] ([RS_SWCT_00010](#), [RS_SWCT_00080](#), [RS_SWCT_00110](#), [RS_SWCT_02030](#), [RS_SWCT_03010](#))

Please note that the dynamic attributes relevant for communication are described in chapter [4.5](#).

4.2 Port Interface Details

4.2.1 Introduction

The usage of value encodings (for more information please refer to section [5.2.6](#)) is limited within the context of [PortInterfaces](#).

[constr_10383] Supported value encodings for [SwBaseType](#) in the context of [PortInterfaces](#) where attribute [isService](#) is set to `false` [The supported value encodings for the usage within a [PortInterface](#) where attribute [isService](#) is set to `false` are:

- [2C](#): Two's complement
- [IEEE754](#): floating-point numbers
- [ISO-8859-1](#): single-byte coded character
- [ISO-8859-2](#): single-byte coded character
- [WINDOWS-1252](#): single-byte coded character
- [UTF-8](#): UCS Transformation Format 8

- **UTF-16**: Character encoding for Unicode code points based on 16 bit code units [14]
- **UCS-2**: Universal Character Set 2
- **NONE**: Unsigned Integer
- **BOOLEAN**: This represents an integer to be interpreted as boolean.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Please note that the limitation formulated in [constr_10383] is **only applicable for non-service communication**. Service-level communication can utilize further encodings, as documented in [TPS_SWCT_01845].

[constr_1046] Applicability of [TPS_SWCT_01845] [[TPS_SWCT_01845] applies **at the time when the contract phase generation is executed only** if the value of the attribute `isService` is set to `false`.]()

[constr_1295] PortInterfaces and category DATA_REFERENCE [A `DataPrototype` defined in the context of a `PortInterface` used by an `ApplicationSwComponentType` or `SensorActuatorSwComponentType` that is (after potential indirections via `TYPE_REFERENCE` are resolved) either typed by or mapped to an `ImplementationDataType` of category `DATA_REFERENCE` shall only be used if either the provider or the requester of the information represents a `ServiceSwComponentType`, a `ComplexDeviceDriverSwComponentType`, a `ParameterSwComponentType`, or an `NvBlockSwComponentType`, or the `EcuAbstractionSwComponentType`.

This rule shall be imposed **at the time when the RTE is generated.**]()

Note: [constr_1295] corresponds to [SWS_Rte_07670].

4.2.2 Sender Receiver Communication

4.2.2.1 Sender Receiver Interface

[TPS_SWCT_01114] SenderReceiverInterface [`SenderReceiverInterfaces` allow for the specification of the typically asynchronous communication pattern where a sender provides data that is required by one or more receivers.

While the actual communication takes place via the respective `PortPrototypes`, a `SenderReceiverInterface` allows for formally describing what kind of information is sent and received.](*RS_SWCT_02030*)

Class	SenderReceiverInterface			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	A sender/receiver interface declares a number of data elements to be sent and received. Tags: atp.recommendedPackage=PortInterfaces			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , DataInterface , Identifiable , MultilanguageReferrable , PackageableElement , PortInterface , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
dataElement	VariableDataPrototype	*	aggr	The data elements of this SenderReceiverInterface.
invalidationPolicy	InvalidationPolicy	*	aggr	InvalidationPolicy for a particular dataElement
metaDataItemSet	MetaDataItemSet	*	aggr	This aggregation defines fixed sets of meta-data items associated with dataElements of the enclosing Sender ReceiverInterface

Table 4.1: SenderReceiverInterface

A [SenderReceiverInterface](#) focuses on the description of information items represented by [VariableDataPrototypes](#) (see section 5.3).

A [VariableDataPrototype](#) aggregated in the role of [dataElement](#) represents an atomic¹ piece of information transmitted among [PortPrototypes](#) typed by a [SenderReceiverInterface](#).

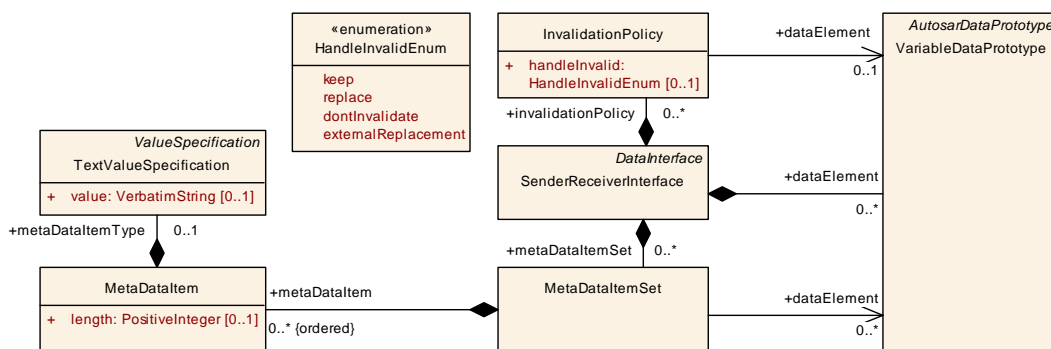

Figure 4.1: dataElements of a SenderReceiverInterface

Note that a [SenderReceiverInterface](#) provides a name space for the definition of [VariableDataPrototypes](#).

In terms of the AUTOSAR meta-model this aspect is indicated by the inheritance relation to [DataPrototype](#) (which in turn inherits from [Identifiable](#)). Please find more information on the creation of name spaces in [11].

[TPS_SWCT_01116] [swImplPolicy](#) [The [swImplPolicy](#) indicates the way how a [VariableDataPrototype](#) shall be processed at the receiver’s side. If set to [queued](#) the semantics is that the corresponding [VariableDataPrototype](#) needs to be added to a [queue](#) (or in other words: a FIFO data structure) from which it is later consumed by the actual receiver software-component.] ([RS_SWCT_02030](#))

¹Note that the term “atomic” does not have any implication on the implementation on a concrete computing platform

Please note that the `swImplPolicy` is described in section 5.4.

[constr_1200] Queued communication is not applicable for `dataElements` owned by `PRPortPrototype` [The `swImplPolicy` shall not be set to `queued` for any `dataElement` owned by a `PRPortPrototype` **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01176] last-is-best semantics for sender-receiver communication [If `swImplPolicy` is set to any other valid value of `SwImplPolicyEnum` then *last is best* semantics applies.]()

Please note that the definition of `VariableDataPrototype` may come very close to the reader's idea of a *signal*. However, different kinds of signals have a specific meaning in the AUTOSAR concept, especially in the context of the AUTOSAR System Template [10].

4.2.2.2 Communication Patterns for Sender Receiver Communication

[TPS_SWCT_01117] Communication patterns for sender-receiver communication [`PortPrototypes` typed by a `SenderReceiverInterface` may be connected to establish a 1:n (i.e. one sender, multiple receivers) communication relationship. It is also possible to establish an n:1 (i.e. many senders, one receiver) communication pattern.](*RS_SWCT_02030*)

[constr_1033] Communication scenarios for sender/receiver communication [For sender/receiver communication, it is not allowed to create a communication scenario where n sender are connected to m receivers where m and n are **both** greater than 1 **at the time when the creation of the `CompositionSwComponentType` is finished.**]()

Factually, `[constr_1033]` is not applicable to a scenario where several `PRPortPrototypes` are connected by a chain of `AssemblySwConnectors` or `PassThroughSwConnectors`.

[constr_1202] Supported connections by `AssemblySwConnector` between `PortPrototypes` typed by a `SenderReceiverInterface` or `NvDataInterface` [

4.2.2.3 Invalidation Policy

[TPS_SWCT_01115] `invalidationPolicy` [An `invalidationPolicy` specifies whether the sending component can actively invalidate a particular `dataElement` and which strategy of handling the reception of `invalidValue` on the receiver side shall be implemented.] (*RS_SWCT_02030*)

Further information about the related concept of an `invalidValue` is provided in chapter 5.4.2

Figure 4.2: Modeling of invalidation policy of a `SenderReceiverInterface`

[constr_1865] Existence of `InvalidationPolicy.dataElement` [For each `InvalidationPolicy`, the reference `InvalidationPolicy.dataElement` shall exist **at the time when the contract phase generation is executed.**]()

[constr_10118] Structural consistency of the modeling of `InvalidationPolicy` [A `dataElement` referenced by an `InvalidationPolicy` shall be owned by the `SenderReceiverInterface` that also owns the `InvalidationPolicy` **at the time when the contract phase generation is executed.**]()

Technically, even in the presence of [constr_10118], it would still be possible to refer to the same `SenderReceiverInterface.dataElement` from different `InvalidationPolicies`.

Therefore, a further constraint applies: for each `dataElement` owned by a `SenderReceiverInterface`, at most a single `InvalidationPolicy` shall be defined.

[constr_10119] **SenderReceiverInterface.dataElement** shall be referenced by at most one **InvalidationPolicy** [Any **SenderReceiverInterface.dataElement** shall be referenced by at most one **InvalidationPolicy** in the role **InvalidationPolicy.dataElement** at the time when the contract phase generation is executed.]()

Class	InvalidationPolicy			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	Specifies whether the component can actively invalidate a particular dataElement. If no invalidationPolicy points to a dataElement this is considered to yield the identical result as if the handleInvalid attribute was set to dontInvalidate.			
Base	ARObject			
Aggregated by	SenderReceiverInterface.invalidationPolicy			
Attribute	Type	Mult.	Kind	Note
dataElement	VariableDataPrototype	0..1	ref	Reference to the dataElement for which the Invalidation Policy applies.
handleInvalid	HandleInvalidEnum	0..1	attr	This attribute controls how invalidation is applied to the dataElement.

dontInvalidate	Invalidation is switched off. Tags: atp.EnumerationLiteralIndex=0
external Replacement	Replace a received invalidValue. The replacement value is sourced from the aggregation in the role replaceWith. Tags: atp.EnumerationLiteralIndex=1
keep	The application software is supposed to handle signal invalidation on RTE API level either by Data ReceiveErrorEvent or check of error code on read access. Tags: atp.EnumerationLiteralIndex=2
replace	Replace a received invalidValue. The replacement value is specified by the initValue. Tags: atp.EnumerationLiteralIndex=3

Table 4.3: HandleInvalidEnum

4.2.2.4 Meta-data on the Application Software Level

There are cases where information available on different levels in the AUTOSAR basic software stack need to be made available as meta-data on the application layer in order to make the overall software function properly.

One example could be a software-component that is involved with communication using the J1939 protocol.

In such a case, the semantics of the information transmitted is strongly bound to the source address and the sender needs to be able to set the source address individually.

Figure 4.3: Modeling of meta-data of a [SenderReceiverInterface](#)

[TPS_SWCT_01801] Support for Meta-Data [Meta-data on the application software level can only be made available in the context of a [SenderReceiverInterface](#). No other kind of [PortInterface](#) supports the definition of meta-data.] ([RS_SWCT_02030](#))

[TPS_SWCT_01802] Definition of meta-data in the context of a [Sender-ReceiverInterface](#) [The definition of meta-data in the context of a [Sender-ReceiverInterface](#) involves two aspects:

- The available meta-data are defined by means of an ordered aggregation of meta-class [MetaDataItem](#) at [MetaDataItemSet](#) that in turn is aggregated in the role [SenderReceiverInterface.metaDataItemSet](#).
- The involvement of [dataElements](#) with meta-data is specified by means of the reference [MetaDataItemSet.dataElement](#). In other words, the [dataElements](#) that are referenced by a [MetaDataItemSet](#) in the role [dataElement](#) are involved with meta-data handling.

]()

Class	MetaDataItem			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	This meta-class represents a single meta-data item.			
Base	<i>ARObject</i>			
Aggregated by	MetaDataItemSet.metaDataItem			
Attribute	Type	Mult.	Kind	Note
length	PositiveInteger	0..1	attr	This attribute determines the length of the MetaDataItem at run-time.
metaDataItem Type	TextValueSpecification	0..1	aggr	This aggregation contributes the specification of the concrete meta-data item type.

Table 4.4: MetaDataItem

Class	MetaDataItemSet			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	This meta-class represents the ability to define a set of meta-data items to be used in SenderReceiver Interfaces.			
Base	ARObject			
Aggregated by	SenderReceiverInterface.metaDataItemSet			
Attribute	Type	Mult.	Kind	Note
dataElement	VariableDataPrototype	*	ref	This reference identifies the dataElement for which the ordered list of meta-data items is defined.
metaDataItem (ordered)	MetaDataItem	*	aggr	This aggregation represents the ordered definition of meta-data items.

Table 4.5: MetaDataItemSet

[constr_1726] Ordering of MetaDataItemSet.metaDataItem [The ordering of the elements of `MetaDataItemSet.metaDataItem` shall be **descending** with respect to the value of `MetaDataItem.length`, such that the `MetaDataItem` with the largest value of attribute `length` is located in the first position and the `MetaDataItem` with the smallest value of attribute `length` is located in the last position.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Although the ordering is significant by way of the meta-model, it is still true that for the creation of the ordered collection it is possible to put `MetaDataItems` with the same value of attribute `length` with arbitrary order into the collection.

In an existing collection, however, the ordering is semantically relevant even for elements with same value of attribute `length`.

[TPS_SWCT_01804] Standardized values of attribute MetaDataItem.metaDataItemType.value [The following values of attribute `MetaDataItem.metaDataItemType.value` are standardized by AUTOSAR:

- PRIORITY_8
- SOURCE_ADDRESS_16
- TARGET_ADDRESS_16
- ADDRESS_EXTENSION_8
- SOCKET_CONNECTION_ID_16
- LIN_NAD_8
- CAN_ID_32
- ETHERNET_MAC_32

]()

[constr_1866] Existence of `MetaDataItem.length` [For each `MetaDataItem`, attribute `length` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1867] Existence of `MetaDataItem.metaDataItemType` [For each `MetaDataItem`, attribute `metaDataItemType` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1868] Existence of `MetaDataItemSet.dataElement` [For each `MetaDataItemSet` that aggregates at least one `metaDataItem`, at least one reference to a `dataElement` shall exist **at the time when the contract phase generation is executed.**]()

[constr_10120] Structural consistency of the modeling of `MetaDataItemSet` [A `dataElement` referenced by an `MetaDataItemSet` in the role `dataElement` shall be owned by the `SenderReceiverInterface` that also owns the `MetaDataItemSet` **at the time when the contract phase generation is executed.**]()

Technically, even in the presence of [constr_10120], it would still be possible to refer to the same `SenderReceiverInterface.dataElement` from different `MetaDataItemSets`.

However, this is not allowed because the aggregation of `MetaDataItem` at `MetaDataItemSet` is qualified as `ordered`, and therefore it would be very difficult to semantically merge the content of different `MetaDataItemSets` to one set of meta data items in the implementation.

Therefore, a further constraint applies: for each `dataElement` owned by a `SenderReceiverInterface`, at most a single `MetaDataItemSet` shall be defined.

[constr_10121] `SenderReceiverInterface.dataElement` shall be referenced by at most one `MetaDataItemSet` [Any `SenderReceiverInterface.dataElement` shall be referenced by at most one `MetaDataItemSet` in the role `MetaDataItemSet.dataElement` **at the time when the contract phase generation is executed.**]()

4.2.3 Client Server Communication

The underlying semantics of a client/server communication is that a client may initiate the execution of an operation by a server that supports the operation.

The server executes the operation and, when completed, it provides the client with the result (synchronous operation call) or else the client checks for the completion of the operation by itself (asynchronous operation call).

[constr_1037] Client shall not be connected to multiple servers [A client shall not be connected to multiple servers such that an operation call would be handled by more than one server **at the time when the RTE is generated.**]()

4.2.3.1 Client Server Interface

A `ClientServerInterface`, to some extent, is a counterpart to the `SenderReceiverInterface`².

Instead of defining pieces of information to be transferred among software-components, a `ClientServerInterface` defines a collection of `ClientServerOperations`.

Class	ClientServerInterface			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	A client/server interface declares a number of operations that can be invoked on a server by a client. Tags: atp.recommendedPackage=PortInterfaces			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , PortInterface , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
operation	ClientServerOperation	*	aggr	ClientServerOperation(s) of this ClientServerInterface. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=operation.shortName, operation.variation Point.shortLabel vh.latestBindingTime=blueprintDerivationTime
possibleError	ApplicationError	*	aggr	Application errors that are defined as part of this interface.

Table 4.6: ClientServerInterface

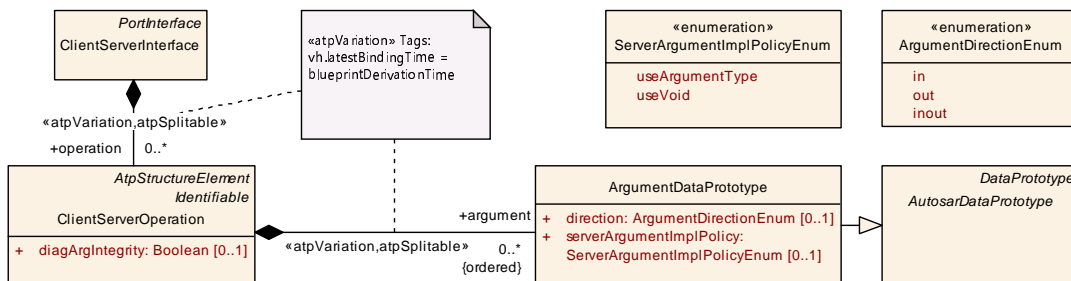

Figure 4.4: ClientServerOperations of a ClientServerInterface

[TPS_SWCT_01118] **ClientServerInterface** [A `ClientServerInterface` is composed of `ClientServerOperations`, i.e. a `ClientServerOperation` cannot be reused in the context of a different `ClientServerInterface`.] ([RS_SWCT_02030](#))

[TPS_SWCT_01106] **ClientServerOperation** [A `ClientServerOperation` consists of 0..* `ArgumentDataPrototypes`. The latter may be

- passed to the operation (i.e. the direction is “in”)
- passed to and returned from the operation (i.e. the direction is “inout”)
- returned from the operation (i.e. the direction is “out”)

²However, different connection patterns apply, see [[constr_1037](#)]

The aggregation represents a variation point. | ([RS_SWCT_02030](#), [RS_SWCT_03141](#))

[TPS_SWCT_01844] Optional method arguments [AUTOSAR does not support the existence of optional [arguments](#) within a [ClientServerOperation](#).]()

The reason for the existence of the restriction in [\[TPS_SWCT_01844\]](#) on the *AUTOSAR classic platform* is that the RTE does not have an API to handle optional method arguments.

Class	ClientServerOperation			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	An operation declared within the scope of a client/server interface.			
Base	ARObject , AtpClassifier , AtpFeature , AtpStructureElement , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	ApplicationInterface.command, AtpClassifier.atpFeature , ClientServerInterface.operation , DiagnosticDataElementInterface.read, DiagnosticDataIdentifierInterface.read, DiagnosticDataIdentifierInterface.write, DiagnosticRoutineInterface.requestResult, DiagnosticRoutineInterface.start, DiagnosticRoutineInterface.stop, PhmRecoveryActionInterface.recovery, ServiceInterface.method			
Attribute	Type	Mult.	Kind	Note
argument (ordered)	ArgumentDataPrototype	*	aggr	An argument of this ClientServerOperation Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=argument.shortName, argument.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime
diagArgIntegrity	Boolean	0..1	attr	This attribute shall only be used in the implementation of diagnostic routines to support the case where input and output arguments are allocated in a shared buffer and might unintentionally overwrite input arguments by tentative write operations to output arguments. This situation can happen during sliced execution or while output parameters are arrays (call by reference). The value true means that the ClientServerOperation is aware of the usage of a shared buffer and takes precautions to avoid unintentional overwrite of input arguments. If the attribute does not exist or is set to false the Client ServerOperation does not have to consider the usage of a shared buffer.
possibleError	ApplicationError	*	ref	Possible errors that may be raised by the referring operation.

Table 4.7: ClientServerOperation

Class	ArgumentDataPrototype			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	An argument of an operation, much like a data element, but also carries direction information and is owned by a particular ClientServerOperation.			
Base	ARObject , AtpFeature , AtpPrototype , AutosarDataPrototype , DataPrototype , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	AtpClassifier.atpFeature , ClientServerOperation.argument			
Attribute	Type	Mult.	Kind	Note
direction	ArgumentDirectionEnum	0..1	attr	This attribute specifies the direction of the argument prototype.

Class	ArgumentDataPrototype			
serverArgument ImplPolicy	ServerArgumentImpl PolicyEnum	0..1	attr	This defines how the argument type of the servers RunnableEntity is implemented. If the attribute is not defined this has the same semantics as if the attribute is set to the value useArgumentType for primitive arguments and structures.

Table 4.8: ArgumentDataPrototype

[TPS_SWCT_01119] Direction of [ArgumentDataPrototypes](#) [To cover these cases, [ArgumentDataPrototype](#) defines an attribute `direction`, possible values are `in` (pass to operation), `out` (return from operation), and `inout` (pass to and return from operation).] ([RS_SWCT_02030](#))

In many common programming languages (like C), an operation is yet another data type. This makes it for example possible to pass a reference to an operation as an argument to another operation.

This is *not* allowed in the AUTOSAR concept.

Essentially, all [ArgumentDataPrototypes](#) in a [ClientServerOperation](#) can be passed (conceptually) by value (from the client to the server and/or from the server to the client depending on the `direction` of the [ArgumentDataPrototype](#)).

[constr_1869] Existence of attribute [ArgumentDataPrototype.direction](#) [For each [ArgumentDataPrototype](#), attribute `direction` shall be defined **at the time when the contract phase generation is executed.**] ()

[TPS_SWCT_01120] Client needs to provide [ArgumentDataPrototypes](#) [When the client invokes an operation, it needs to provide a value for each [ArgumentDataPrototype](#) that is of direction `in` or `inout`.] ([RS_SWCT_02030](#))

[TPS_SWCT_01121] Pass correct data type [The value passed to an [ArgumentDataPrototype](#) of direction `in` or `inout` needs to be of the corresponding `Datatype`.] ([RS_SWCT_02030](#))

[TPS_SWCT_01122] Synchronous call of [ClientServerOperation](#) [In the case of synchronous operation call, the client expects to receive a response to the invocation of the operation.

As part of the response, it receives a value (of the correct [AutosarDataType](#)) for each [ArgumentDataPrototype](#) that is of direction `out` or `inout`.] ([RS_SWCT_02030](#))

Each [ClientServerOperation](#) provides a name space for its [ArgumentDataPrototypes](#) and therefore has a unique identifier which identifies the operation within the corresponding [ClientServerInterface](#).

Enumeration	ArgumentDirectionEnum
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes
Note	Use cases: <ul style="list-style-type: none"> • Arguments in ClientServerOperation can have different directions that need to be formally indicated because they have an impact on how the function signature looks like eventually. • Arguments in BswModuleEntry already determine a function signature, but the direction is used to specify the semantics, especially of pointer arguments.
Aggregated by	ArgumentDataPrototype.direction , SwServiceArg.direction
Literal	Description
in	The argument value is passed to the callee. Tags: atp.EnumerationLiteralIndex=0
inout	The argument value is passed to the callee but also passed back from the callee to the caller. Tags: atp.EnumerationLiteralIndex=1
out	The argument value is passed from the callee to the caller. Tags: atp.EnumerationLiteralIndex=2

Table 4.9: ArgumentDirectionEnum

The [ClientServerOperations](#) have no ordering within a [ClientServerInterface](#) (there is no such thing as the “first” operation)³.

[TPS_SWCT_01123] No default values for [ArgumentDataPrototypes](#) [It is not possible to define default values for [ArgumentDataPrototypes](#) defined in the context of a [ClientServerOperation](#). Default values might lead to complicated mappings to programming languages.]()

[TPS_SWCT_01124] Definition of [ArgumentDataPrototypes](#) within the context of a [ClientServerOperation](#) is ordered [In contrast to the unordered relationship of [ClientServerInterface](#) to [ClientServerOperation](#), the definition of [ArgumentDataPrototypes](#) within the context of a [ClientServerOperation](#) is ordered, i.e. a [ClientServerOperation](#) may have a *first* argument⁴.] ([RS_SWCT_02030](#))

Please note that [ArgumentDataPrototype](#) inherits from [AutosarDataPrototype](#) and therefore has a reference to a concrete [AutosarDataType](#).

³In different parts of the definition of a [ClientServerInterface](#), a “calling-order” of the [ClientServerOperations](#) might be prescribed: the client might be required to use the [ClientServerOperations](#) in a certain logical ordering.

However, this ordering has nothing to do with the order in which the [ClientServerOperations](#) are listed in the definition of a [ClientServerInterface](#)

⁴Giving the [ArgumentDataPrototypes](#) of a [ClientServerOperation](#) both an ordering and a unique identifier might seem redundant.

For example, in the operation “foo(a, b, c)”, we can refer to the “second argument” or to “the argument named b”. In many common programming languages (like C or Java), only the *ordering* is actually used by the client during the invocation of the server (the client invokes the operation as “foo(1,2,3)” not as “foo(a=1,c=3,b=2)”).

In addition, the names of the arguments represent an arbitrary choice made when implementing of the invocation. In C, only the data types and ordering of the arguments constitute the signature, *not* the names of the arguments.

The RTE Generator uses the referred `AutosarDataTypes` to determine the data types of the arguments depending on the value of the attribute `ArgumentDataPrototype.serverArgumentImplPolicy`.

Enumeration	ServerArgumentImplPolicyEnum
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface
Note	This defines how the argument type of the servers <code>RunnableEntity</code> is implemented.
Aggregated by	<code>ArgumentDataPrototype.serverArgumentImplPolicy</code>
Literal	Description
useArgumentType	The argument type of the <code>RunnableEntity</code> is derived from the <code>AutosarDataType</code> of the <code>ArgumentPrototype</code> . Tags: atp.EnumerationLiteralIndex=0
useVoid	The argument type of the <code>RunnableEntity</code> is void. Tags: atp.EnumerationLiteralIndex=2

Table 4.10: ServerArgumentImplPolicyEnum

[constr_1286] `serverArgumentImplPolicy` and `ArgumentDataPrototype` typed by primitive data types [The value of the attribute `ArgumentDataPrototype.serverArgumentImplPolicy` shall **not** be set to `useVoid` for an `ArgumentDataPrototype` of `direction in` that is typed by an `AutosarDataType` that boils down to a primitive C data type (see [TPS_SWCT_01565]).

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

There is one use case for executing multiple `ClientServerOperations` using the exact same `RunnableEntity`. This use case is sketched in Figure 4.5.

In such a case, it may happen that the `ClientServerOperations` own `ArgumentDataPrototypes` that are typed by an array data type.

It may also happen that the individual `ArgumentDataPrototypes` that are typed by array data types refer to a compatible element data type, but define a different number of elements.

Figure 4.5: Use case for one server `RunnableEntity` processes calls from different `PortPrototypes`

Please note that the server `RunnableEntity` needs information about the currently used array length respectively structure size by usage of additional arguments passed by the Client. This aspect is exemplified by Figure 4.5.

It is only natural that in such a case a `Variable-Size Array Data Type` would be used because it comes with a built-in capability to indicate the number of elements currently stored in the array without the need to add further arguments to the signature of the `RunnableEntity`.

Note further that a `ClientServerInterface` does not define any timing information (how quickly the client expects a response of the server). It does not define how the threading works (if the client for example blocks until the response comes back from the server).

It also does not define explicitly how information is passed between an implementation of the client and the server and the underlying RTE (for example: through “pointers” or “by value”).

[constr_1204] Supported connections by `AssemblySwConnector` between `PortPrototypes` typed by a `ClientServerInterface`, `ModeSwitchInterface`, or `TriggerInterface` [

This rule shall be imposed **at the time when the creation of the `CompositionSwComponentType` is finished.**

]()

Please note that a restriction concerning the usage of attribute `ClientServerOperation.diagArgIntegrity` is described in section 13.8.4.5.

4.2.3.2 Error Handling in Client/Server Communication

This section describes the handling of errors occurring either within an application software-component or during the communication across the VFB [3]. Errors that are created and consumed by basic software modules are not in the scope of this document and therefore will not be discussed.

Therefore, errors in the scope of this document are divided into two simple classes:

- infrastructure errors and
- application errors.

A software-component implementation uses RTE API methods to communicate with other software-components. During this communication certain errors can occur as a result of infrastructure faults, like a bus is not working, or an expected data value was not arriving in time.

These errors are listed in the RTE specification [2], as they are an inherent feature of the infrastructure provided by the VFB. Software-components will therefore typically not raise infrastructure errors on their own.

Instead, the AUTOSAR basic software and the RTE will determine infrastructure faults and communicate the corresponding error codes to the relevant software-components.

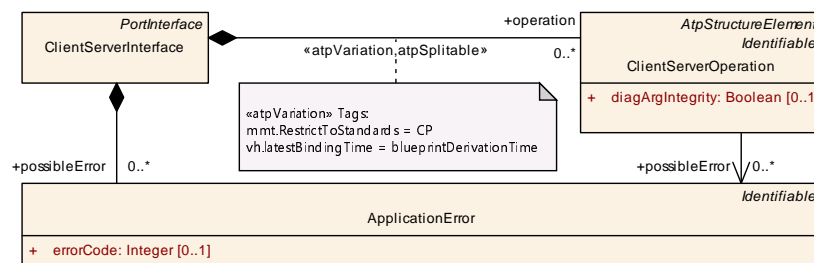

Figure 4.6: Application error meta-model

[TPS_SWCT_01491] AUTOSAR system does not need to explicitly describe infrastructure errors [As the fixed set of infrastructure errors is defined as an implicit part of the VFB, a developer of an AUTOSAR system does not need to explicitly describe these.

It is assumed that these might occur at run-time and application developers should take measures to handle them.]()

Application errors, on the other hand, are specific to the functionality or information that is described in form of a [PortInterface](#). It is not possible to define such errors up front, instead they are defined at design time of a certain [PortInterface](#).

In principle, such [ApplicationErrors](#) could be part of all kinds of [PortInterfaces](#).

[constr_1102] ApplicationError in the scope of one SwComponentType [If a `SwComponentType` has `PortPrototypes` typed by different `ClientServerInterfaces` with equal `shortName` and `ApplicationErrors` defined then the following condition applies: `ApplicationErrors` with the same `shortName` shall have **identical values** of `errorCodes`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Rationale for the existence of [constr_1102]: the RTE generator creates symbols for the error codes in which the `shortName` of the `ClientServerInterface` and the `shortName` of the `ApplicationError` occur.

[constr_1108] Existence and value of attribute ApplicationError.errorCode [Attribute `ApplicationError.errorCode` shall exist **at the time when the contract phase generation is executed** and its value shall not exceed the closed interval 1 .. 63.

The following exception applies: **only** if attribute `possibleError` is supposed to represent the error code `E_OK`, the value 0 shall be allowed.]()

By [constr_1108] it is possible to ensure that only the six least significant bits of a return value shall be used for indicating an application error.

Class	ApplicationError			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	This is a user-defined error that is associated with an element of an AUTOSAR interface. It is specific for the particular functionality or service provided by the AUTOSAR software component.			
Base	<i>ARObject, Identifiable, MultilanguageReferrable, Referrable</i>			
Aggregated by	<code>ClientServerInterface.possibleError</code>			
Attribute	Type	Mult.	Kind	Note
<code>errorCode</code>	Integer	0..1	attr	The RTE generator is forced to assign this value to the corresponding error symbol. Note that for error codes certain ranges are predefined (see RTE specification).

Table 4.11: ApplicationError

Consequently, `ClientServerOperations` may be associated with a number of `ApplicationErrors` they possibly raise. These errors are defined as part of the `ClientServerInterface`.

[constr_1038] Reference to ApplicationError [A `possibleError` referenced by a `ClientServerOperation` shall be owned by the `ClientServerInterface` that also owns the `ClientServerOperation` **at the time when the contract phase generation is executed.**]()

4.2.4 External Trigger Event Communication

[TPS_SWCT_01196] Semantics of an external trigger event communication [The underlying semantics of an external trigger event communication is that a trigger source

may initiate the execution of `RunnableEntity`s in the connected trigger sinks. Typically, (but not necessarily) these `RunnableEntity`s are executed in a sequential order. [\(RS_SWCT_02030\)](#)

[TPS_SWCT_01197] `TriggerInterface` [The `TriggerInterface` defines a set of `Trigger` to be communicated between software-components. The Trigger represents a special kind of events at which occurrence the trigger sinks shall react in a particular manner.] ()

Class	TriggerInterface			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface

Table 4.15: CseCodeType

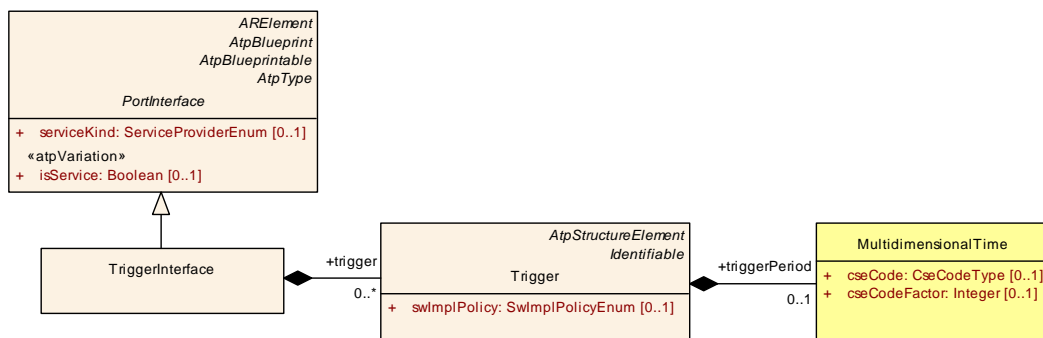

Figure 4.7: Trigger of a TriggerInterface

As illustrated in Figure 4.7, a [TriggerInterface](#) is composed of [Trigger](#).

[TPS_SWCT_01198] **Period for periodic triggering** [A [Trigger](#) can optionally define a period for periodic triggering. It is expressed via the meta-class [MultidimensionalTime](#) in terms of time or angle. Note that the main use case for this is

to specify the properties if the trigger is coming from the Basic Software e.g. from a Complex Driver, it is not used as an input for the RTE generator.]([RS_SWCT_02030](#))

Apart from this, a `TriggerInterface` does not define any timing information (e.g. how quickly the source expects a reaction of the sinks). This is property of the timing information in the templates.

[constr_1104] Trigger communication shall not implement an n:1 pattern [An `RPortPrototype` typed by a `TriggerInterface` shall not be connected to `PortPrototypes` typed by `TriggerInterfaces` such that a given `Trigger` in the `TriggerInterface` of the `RPortPrototype` is connected to more than one compatible (see [\[constr_1081\]](#), [\[constr_1082\]](#), and [\[constr_1251\]](#)) `Trigger` in the `TriggerInterfaces` of the connected `PortPrototypes` **at the time when the RTE is generated.**]()

[\[constr_1104\]](#) boils down to the rule that trigger communication shall not be implemented an n:1 (where $n > 1$) scenario.

This condition shall be observed (in a similar way as it is observed for individual `dataElements` in a sender/receiver communication) on the basis of individual `Triggers` rather than the connection between entire `PortPrototypes`.

Please note that the constraint applies for connections created by `AssemblySwConnectors` and `DelegationSwConnectors` in the same way. This is the reason why [\[constr_1104\]](#) does not get more specific about the nature of the `PortPrototypes` on opposite end of the connection to the `RPortPrototype`.

To be clear, the n:1 (where $n > 1$) scenario is not supported for trigger communication because there is no active use case for it.

[TPS_SWCT_01199] Queued processing of Triggers [It may happen that at least tentatively a `Trigger` source fires `Triggers` faster than they can be processed on the side of the `Trigger` sink. To support this use case it is possible to process trigger event communication in a queued manner.

In this case the `Triggers` are added to a queue from where the foremost trigger is dequeued and processed when the processing of the current `Trigger` is done. Please note that the queue size is **not** subject to definition in the scope of this document. The actual queue size is defined during the process of RTE configuration.

The specification of whether a `Trigger` is subject to queued processing is controlled by the attribute `Trigger.swImplPolicy`.]()

[constr_1169] Allowed values for Trigger.swImplPolicy [The **only** allowed values for the attribute `Trigger.swImplPolicy` are either `STANDARD` (in which case the `Trigger` processing does not use a queue) or `QUEUED` (in which case the processing of `Triggers` positively uses a queue). **at the time when the contract phase generation is executed.**]()

Please note that the value of `Trigger.swImplPolicy` is not the final word on the implementation of a queue for the specific `Trigger`. The integrator still has the power to overrule the application software developer’s verdict if applicable.

For more information regarding the ability to connect different kinds of `PortPrototypes` typed by a `TriggerInterface` to each other please refer to [constr_1204] and [constr_1205].

4.2.5 Communication of Modes

4.2.5.1 Mode Switch Interface

There are two distinctive use cases for the communication of modes via ports:

1. An actual mode transition can be communicated from a mode manager component to its client components to enforce a mode switch.
2. A request for a mode transition can be communicated from any component to a mode manager.

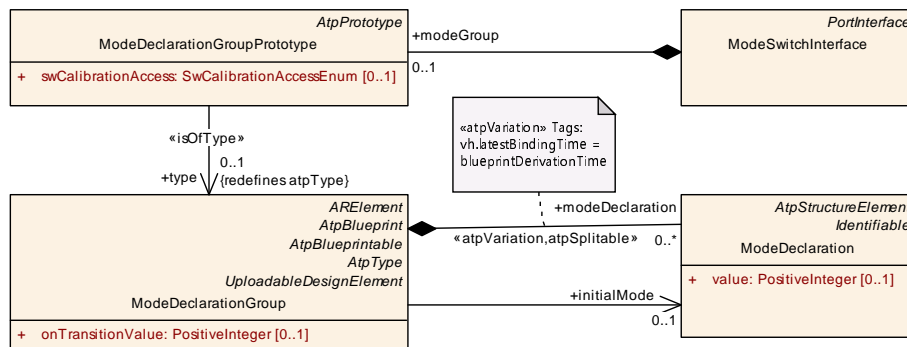

Figure 4.8: Mode Switch Interface

[TPS_SWCT_01087] **Propagation of mode information** [For communicating a mode switch (i.e. the first use case), the Software-Component Template describes the concept of the communication of `ModeDeclarationGroupPrototypes` similar to the communication of `VariableDataPrototypes` but it uses a special type of `PortInterface`: the collections of `ModeDeclarations` that are required or provided by a `SwComponentType` are defined by means of `ModeSwitchInterfaces` used to type the `PortPrototypes` owned by the `SwComponentType`.] ([RS_SWCT_02030](#), [RS_SWCT_03203](#))

This aspect is depicted in Figure 4.8.

type	ModeDeclarationGroup	0..1	tref	The "collection of ModeDeclarations" (= ModeDeclarationGroup) supported by a component Stereotypes: isOfType

Table 4.17: ModeDeclarationGroupPrototype

[constr_2049] Different ModeDeclarationGroups shall have different shortNames. [A software component is not allowed to type multiple PortPrototypes with ModeSwitchInterfaces where the contained ModeDeclarationGroupPrototypes are referencing ModeDeclarationGroups with identical shortNames but different ModeDeclarations at the time when the contract phase generation is executed]()

Obviously, the rationale for [constr_2049] is to avoid conflicts in generated RTE files.

For instance:

Two ModeDeclarationGroups with identical shortName "Foo" are defined.

ModeDeclarationGroup "Foo"
contains the ModeDeclarations "X", "Y", "Z"

ModeDeclarationGroup "Foo*"
contains the ModeDeclarations "W", "X", "Y", "Z"

In this case a software component is only allowed to use either "Foo" or "Foo*"

[TPS_SWCT_01200] ModeDeclarationGroupPrototype per ModeSwitchInterface [The multiplicity of the aggregation of `ModeDeclarationGroupPrototype` to `ModeSwitchInterface` is pragmatically limited to 1.]([RS_SWCT_03203](#))

Admittedly, there would be no technical restriction to support a 0..* multiplicity but on the other hand it does not seem as if any reasonable use case for such a scenario exists.

If somehow a `SwComponentType` would have to consider two or even more `ModeDeclarationGroupPrototypes` it is very likely that these would be part of different `ModeSwitchInterfaces`.

The containment of a `ModeDeclarationGroupPrototype` in a `ModeSwitchInterface` allows for explicitly defining `SwConnectors` which communicate between `SwComponentPrototypes` and to define service interfaces for communication with `ServiceSwComponentTypes`.

Due to the compatibility rules of `PortInterfaces` (see chapter 6) each `SwComponentType` can rely on the availability of required mode activations.

Please note that each `SwComponentType` can define (via their `PortPrototypes` and `ModeSwitchInterfaces`) a list of required and provided `ModeDeclarationGroupPrototypes`.

[TPS_SWCT_01201] CompositionSwComponentType requires and provides the modes that are required or provided by its contained SwComponentPrototypes [Eventually, a `CompositionSwComponentType` requires and provides the modes that are required or provided by its contained `SwComponentPrototypes`.

The delegation of these modes from `SwComponentPrototypes` to the enclosing `CompositionSwComponentType` is explicitly described by `DelegationSwConnectors`.]([RS_SWCT_03202](#), [RS_SWCT_03203](#))

The formal description of a software-component does not make any assumptions about the semantics of the required and provided `ModeDeclarationGroupPrototypes`.

It just requires and provides the `ModeDeclarationGroupPrototypes` by name. For more information about mode declaration refer to section 9.1.

4.2.5.2 Data Types used for Mode Communication

[TPS_SWCT_01086] Request mode change [The ability to request a mode (i.e. the second use case) is modeled on the VFB via a `SenderReceiverInterface` and for the RTE it is like a usual communication, that means the connector can also cross ECU boundaries and the communicated `dataElements` have to be based on `AutosarDataTypes`.]([RS_SWCT_03202](#), [RS_SWCT_03203](#))

However, for semantic consistency with the first use case mentioned at the beginning of section 4.2.5.1, a communicated mode request shall also be mapped to a corresponding `ModeDeclarationGroup`. This can be defined by the mapping class `ModeRequestTypeMap`, as shown in figure 4.9.

The `ImplementationDataType` mapped to a certain `ModeDeclarationGroup` can then be used in a `PortInterface` to represent a `ModeDeclaration` of the associated `ModeDeclarationGroup` as a numerical value.

[constr_4002] Unambiguous mapping of modes to data types [Within one `DataTypeMappingSet`, a `ModeDeclarationGroup` shall not be mapped to different `ImplementationDataTypes` at the time when the contract phase generation is executed.]()

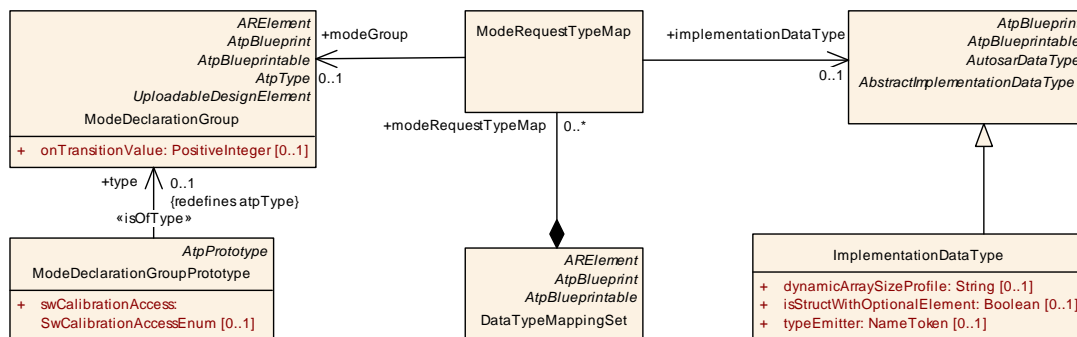

Figure 4.9: Mapping of modes to data types

Class	ModeRequestTypeMap			
Package	M2::AUTOSARTemplates::CommonStructure::ModeDeclaration			
Note	Specifies a mapping between a ModeDeclarationGroup and an ImplementationDataType. This ImplementationDataType shall be used to implement the ModeDeclarationGroup.			
Base	ARObject			
Aggregated by	DataTypeMappingSet.modeRequestTypeMap			
Attribute	Type	Mult.	Kind	Note
implementationDataType	AbstractImplementationDataType	0..1	ref	This is the corresponding AbstractImplementationDataType. It shall be modeled along the idea of an "unsigned integer-like" data type.
modeGroup	ModeDeclarationGroup	0..1	ref	This is the corresponding ModeDeclarationGroup.

Table 4.18: ModeRequestTypeMap

[constr_1166] Restrictions of ModeRequestTypeMap [For every `ModeDeclarationGroup` referenced by a `ModeDeclarationGroupPrototype` used in a `PortPrototype` typed by a `ModeSwitchInterface` a `ModeRequestTypeMap` shall exist that points to the `ModeDeclarationGroup` and also to an eligible `ImplementationDataType`.

The `ModeRequestTypeMap` shall be aggregated by a `DataTypeMappingSet` which is referenced from the `SwcInternalBehavior` that is owned by the `ApplicationSwComponentType` that also owns the `PortPrototype`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1871] Existence of attribute `ModeRequestTypeMap.implementationDataType` [For each `ModeRequestTypeMap`, attribute `implementationDataType` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1872] Existence of attribute `ModeRequestTypeMap.modeGroup` [For each `ModeRequestTypeMap`, attribute `modeGroup` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1167] ImplementationDataTypes used as `ModeRequestTypeMap.implementationDataType` [The `ImplementationDataType` referenced by a `ModeRequestTypeMap` shall **either** be

- of category `VALUE` or
- of category `TYPE_REFERENCE` that in turn references an `ImplementationDataType` of category `VALUE`.

The `baseType` referenced by the `ImplementationDataType` shall have set the value of the attribute `BaseTypeDirectDefinition.baseTypeEncoding` to `NONE`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01202] `ApplicationDataType` defines a subset of the values used in the `ModeDeclarationGroup` [Please note that the corresponding `ApplicationDataType` is defining a subset of the values used in the `ModeDeclarationGroup` and the used labels may differ from the names used for the `ModeDeclarations`.

It is in the responsibility of a system designer to maintain the data types and `ModeDeclarationGroups` according to the functional needs.

For example, a `ModeRequester` may only request a subset of the available Modes (via `SenderReceiverInterface` or `ClientServerInterface`). The `ModeManager` may additionally decide to indicate failure.] (*RS_SWCT_03203*)

For more information regarding the ability to connect different kinds of `PortPrototypes` typed by a `ModeSwitchInterface` to each other please refer to [constr_1204] and [constr_1205].

4.2.5.3 Relevance for Measurement and Calibration

Please note that by aggregating `SwCalibrationAccessEnum` in the role `swCalibrationAccess`, a `ModeDeclarationGroupPrototype` gains the ability to become measurable. This implies the following constraint:

[constr_1172] Allowed values of `SwCalibrationAccessEnum` for `ModeDeclarationGroupPrototype` [The only allowed values of `swCalibrationAccess` aggregated by `ModeDeclarationGroupPrototype` are

- `notAccessible` and
- `readOnly`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01566] Define literals for an MCD system in the context of a `FlatInstanceDescriptor` [If `ModeDeclarationGroupPrototype.swCalibrationAccess` is set to `readOnly`, a referenced `FlatInstanceDescriptor.swDataDefProps` may in turn refer to a `CompuMethod` that defines the particular literals used in the MCD system for displaying values of the measured `ModeDeclarationGroupPrototypes`.](*RS_SWCT_03203*)

The existence of this use case is the reason for putting “AI” at the intersection of `compuMethod` and `FlatInstanceDescriptor` in **[constr_1015]**.

Another possible scenario⁵ is that a `FlatInstanceDescriptor` does not exist⁶, but still it would be good to have the ability to define particular literals for displaying values in an MCD system.

This case can be supported by the AUTOSAR standard as well by the appearance of “S” at the intersection of `compuMethod` and `McDataInstance` in **[constr_1015]**.

4.2.6 Parameter Communication

Of course, the “communication” of `ParameterDataPrototypes` as part of a `ParameterInterface` does not establish an actual transmission of data.

The term is used in a conceptual meaning; and the existence of something like a `ParameterInterface` is justified by the mere idea of unifying the exposure of calibration parameters at the surface of a software-component on the same formal level as the exposure of other pieces of data, i.e. by means of a `PortPrototype` typed by a `PortInterface`.

[constr_1312] `PortPrototypes` typed by a `ParameterInterface` [PortPrototypes typed by a `ParameterInterface` can either be `PPortPrototypes` or `RPortPrototypes`. The usage of `PRPortPrototypes` that are typed by a `ParameterInterface` is not supported **at the time when the contract phase generation is executed.**]()

⁵that does not necessarily have to be related to `ModeDeclarationGroupPrototypes`, but to the definition of literals for MCD systems in general

⁶e.g. because the affected piece of data exists in the basic software

4.3 PortInterface Mapping and Data Scaling

In former versions of this specification, the requirements on `PortInterfaces` to match each other could lead to situations where `PortInterfaces` that were “practically” compatible would nevertheless be rejected because of formal reasons (e.g. `shortNames` of `dataElements` do not match).

In order to also support scenarios where the developer of a `CompositionSwComponentType` needs to connect `PortPrototypes` that would match to each other but don't fulfill formal requirements the concept of “port interface mapping” has been introduced.

[TPS_SWCT_01158] Cases for `PortInterfaceMapping` [In general, the existence of a `PortInterfaceMapping` is suitable in the following cases:

1. Two `PortPrototypes` shall be connected and the `PortInterface` elements are compatible except the unequal `shortNames`. This requires a pure logical mapping of the `PortInterface` elements.
2. `PortInterface` elements are logically equivalent but the range and resolution is differently. This requires a data conversion respectively a re-scaling of the provided data and arguments to the required data and arguments range and resolution.
3. `invalidationPolicy` of `PortInterface` elements is different. This might require the implementation of different invalidation handling strategies for the same `dataElement` in parallel on the same ECU.
4. Two `PortPrototypes` shall be connected and the `PortInterface` elements shall be converted using the AUTOSAR data transformer approach.

]([RS_SWCT_03210](#))

More information about the AUTOSAR data transformer approach can be found in section [4.3.3](#).

Typically, the mapping of such `PortInterface` is agreed once between the different component vendors and system designer in the early phase of a project.

[TPS_SWCT_01159] Mapping is described separately from the `SwConnector` as reusable `ARElement` [The mapping is described separately from the `SwConnector` as reusable `ARElement`. A set of `PortInterfaceMappings` is grouped in a `PortInterfaceMappingSet`.]([RS_SWCT_03210](#))

[TPS_SWCT_01543] `PortInterfaceMapping` overrides all other compatibility rules [The existence of a `PortInterfaceMapping` overrides all other compatibility rules given that the following statements are fulfilled:

- [[constr_1071](#)] applies also for the application of a `PortInterfaceMapping`.
- [[constr_1268](#)] applies also for the application of a `PortInterfaceMapping`.

- [constr_1269] applies also for the application of a [PortInterfaceMapping](#).
- [constr_1270] applies also for the application of a [PortInterfaceMapping](#).
- A structural difference between mapped [DataPrototypes](#) can be mitigated by means of a [SubElementMapping](#). This includes the case that a “structure” data type is mapped to an “array” data type and vice versa. [TPS_SWCT_01195] is also applicable.

When using a [PortInterfaceMapping](#), the developer of a software-component needs to properly understand the consequences in terms of model semantics.]([RS_SWCT_03210](#))

Please note that [TPS_SWCT_01543] does not require a tool implementation to ignore and let go unreported deviations of all other compatibility rules in the presence of a [PortInterfaceMapping](#).

If this is considered helpful, the tool **may** still issue warnings with respect to compatibility rules defined in section 6 but this is not mandated by the AUTOSAR standard. The tool, however, **shall not** report errors in this case.

Table 4.20: PortInterfaceMapping

4.3.1 PortInterface Mapping

By default, the `shortNames` of `PortInterface` elements are used to identify the matching element pairs of connected `PortPrototypes`. In case of non-matching `shortNames` (this might be due to distributed development, off-the-shelves development, or reuse of software-components) it is required to explicitly specify which elements of `PortInterfaces` shall correlate to each other.

This definition is provided with `PortInterfaceMappings`.

Please note that the `PortInterfaceMapping` is a very powerful tool for expert users to accommodate for various differences in the `PortInterfaces` of two `PortPrototypes` that shall be connected.

In general, it is possible to define a `PortInterfaceMapping` for all sub-classes of `SwConnectors`. To make this possible, it is necessary to avoid talking about “provided” or “required” ends because this could lead to confusion.

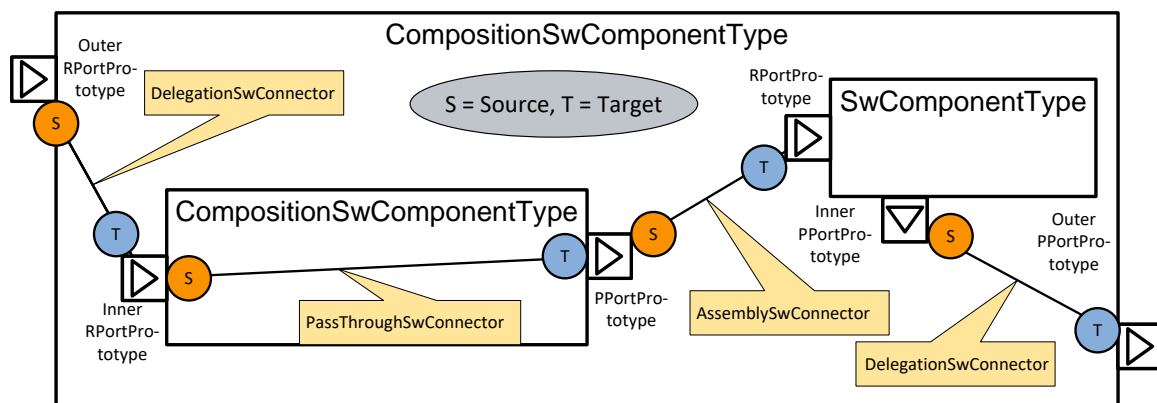

Figure 4.10: “Source” and “Target” end of a `SwConnector` in a sender/receiver-style scenario

Specifically, it is possible that inside a `CompositionSwComponentType` a `PassThroughSwConnector` is connected to a `PPortPrototype`.

From the perspective of the `PassThroughSwConnector`, however, the `PPortPrototype` might represent the “required” end of the communication relation inside the `CompositionSwComponentType`.

To avoid further confusion, the rules for the specification of the `PortInterfaceMapping` are specified **from the perspective of the `SwConnector` rather than the `PortPrototype`**.

For each `SwConnector`, a “source” and “target” end is postulated, reflecting the direction of communication implemented by the `SwConnector`. This understanding is depicted in Figure 4.10.

Please note that the “sender/receiver-style communication” (see section 4.2.2) is conceptually also applicable for other kinds of communication:

- Mode switch communication⁷, see section 4.2.5
- External Trigger communication, see section 4.2.4
- NvData communication, see section 11.4.2
- Parameter “communication”, see 4.2.6

Note further that the association of the “source” and “target” end of an *SwConnector* that represents a client/server communication (see section 4.2.3) is aligned along the “primary” interaction, i.e. the call of a *ClientServerOperation*, see Figure 4.11.

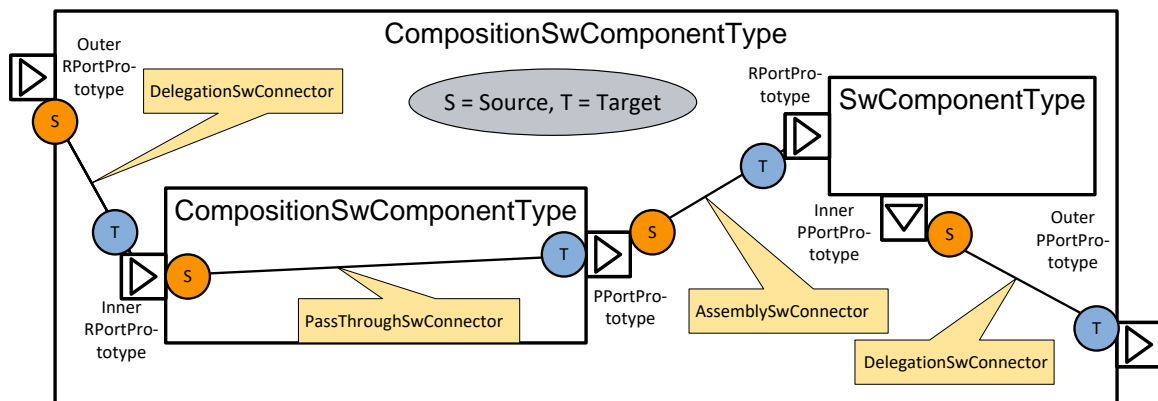

Figure 4.11: “Source” and “Target” end of a *SwConnector* in a client/server-style scenario

The conclusion of Figure 4.10 regarding “source” and “target” end of an *SwConnector* for a sender/receiver-style interaction is summarized in [TPS_SWCT_01873].

[TPS_SWCT_01873] Definition of “source” and “target” of an *SwConnector* for a sender/receiver-style interaction [

Sender/Receiver	Source	Target
<i>DelegationSwConnector</i>	Outer required <i>PortPrototype</i>	Inner required <i>PortPrototype</i>
<i>DelegationSwConnector</i>	Inner provided <i>PortPrototype</i>	Outer provided <i>PortPrototype</i>
<i>AssemblySwConnector</i>	Provided <i>PortPrototype</i>	Required <i>PortPrototype</i>
<i>PassThroughSwConnector</i>	Required <i>PortPrototype</i>	Provided <i>PortPrototype</i>

]()

The conclusion of Figure 4.11 regarding “source” and “target” end of an *SwConnector* for a client/server-style interaction is summarized in [TPS_SWCT_01874].

⁷A mode request is implemented by a sender/receiver communication anyway and does therefore not represent a dedicated communication pattern.

[TPS_SWCT_01874] Definition of “source” and “target” of an SwConnector for a client/server-style interaction [

Client/Server	Source	Target
DelegationSwConnector	Inner required PortPrototype	Outer required PortPrototype
DelegationSwConnector	Outer provided PortPrototype	Inner provided PortPrototype
AssemblySwConnector	Required PortPrototype	Provided PortPrototype
PassThroughSwConnector	Provided PortPrototype	Required PortPrototype

]()

There are some documented restrictions for the application of PortInterfaceMappings. But in general, the PortInterfaceMapping could potentially be used in a harmful way by specifying mapping approaches that have no chance to be implementable in the context of an ECU, resulting in undefined semantics in the RTE, i.e. the RTE Generator wouldn't be able to properly process such a model.

[TPS_SWCT_01099] PortInterfaceMapping [Each PortInterfaceMapping describes the mapping of the PortInterface elements of exactly two PortInterfaces.] (RS_SWCT_03155, RS_SWCT_03210)

To apply the PortInterfaceMapping a SwConnector has to reference a PortInterfaceMapping.

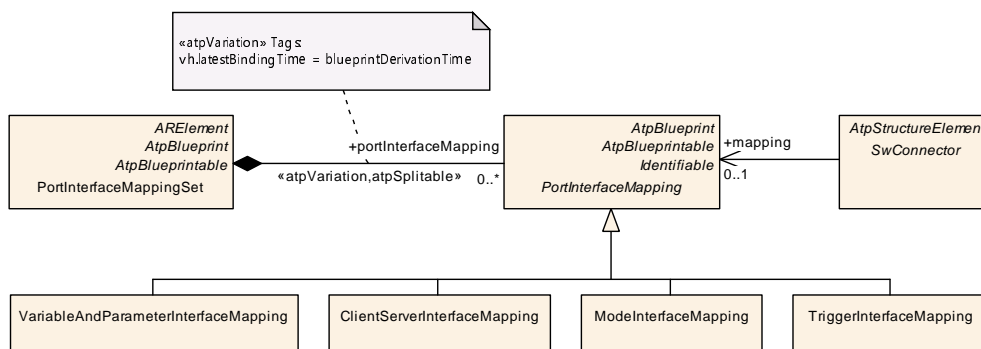

Figure 4.12: Relevant meta-classes for PortInterface element mapping

[constr_1151] Applicability of PortInterfaceMapping [A PortInterfaceMapping is only applicable and valid for a SwConnector if the two PortPrototypes which are referenced by the SwConnector are typed by the same two PortInterfaces which are mapped by the PortInterfaceMapping. This rule shall be imposed at the time when the RTE is generated.]()

[TPS_SWCT_01100] Precedence of PortInterfaceMapping [The mapping via PortInterfaceMapping has a higher precedence than the mapping by equal shortNames as defined in compatibility rules.

If a connector references an associated PortInterfaceMapping, this mapping shall be strictly binding with respect to the number of mapped data elements.] (RS_SWCT_03155, RS_SWCT_03210)

Please note that the compatibility rules are described in chapter 6.

[TPS_SWCT_01101] Unmapped elements of PortInterfaces [Unmapped `PortInterface` elements will not be connected by the referencing `SwConnector`.] ([RS_SWCT_03155](#), [RS_SWCT_03210](#))

[constr_1583] PortInterfaceMapping for DataPrototype typed by Compound Primitive Data Type [There is one very limited use case to apply `PortInterfaceMapping` for a `DataPrototype` typed by a `Compound Primitive Data Type`: adjustment of the `shortName` of the `DataPrototype`. Everything else is **not supported**. This rule shall be imposed **at the time when the contract phase generation is executed**.] ()

4.3.1.1 Mapping of Sender Receiver Interface, Parameter Interface and Non Volatile Data Interface Elements

[TPS_SWCT_01102] VariableAndParameterInterfaceMapping [The `VariableAndParameterInterfaceMapping` defines the correlation of `VariableDataPrototypes` and `ParameterDataPrototypes` defined in the context of `DataInterfaces`, i.e. `SenderReceiverInterface`, `NvDataInterface`, or `ParameterInterface`.] ([RS_SWCT_03155](#), [RS_SWCT_03210](#), [RS_SWCT_03170](#))

[constr_1159] Consistency of VariableAndParameterInterfaceMapping with respect to the referenced DataInterfaces [Within one `VariableAndParameterInterfaceMapping` all `firstDataPrototypes` shall belong to one and only one `DataInterface` and all `secondDataPrototypes` shall belong to one other and only one other `DataInterface` **at the time when the RTE is generated**.] ()

Please note that the relation of the “source” and “target” end of a `SwConnector` to the roles `firstDataPrototype` and `secondDataPrototype` is not defined.

[TPS_SWCT_01103] Mapping between different kinds of PortInterfaces [Thereby it is possible to describe the mapping between different kinds of `PortInterfaces` for instance a `ParameterInterface` and `SenderReceiverInterface`.] ([RS_SWCT_03155](#), [RS_SWCT_03210](#), [RS_SWCT_03170](#))

[TPS_SWCT_01104] Possible mappings are restricted by the swImplPolicy [Nevertheless, the possible mappings of `VariableDataPrototypes` and `ParameterDataPrototypes` are restricted by the `swImplPolicy` attribute.] ([RS_SWCT_03155](#), [RS_SWCT_03210](#), [RS_SWCT_03170](#))

For more explanation of [\[TPS_SWCT_01104\]](#), please refer to [\[constr_1071\]](#).

[constr_1039] Relevance of swImplPolicy [It is not possible to define a mapping between an element where the `swImplPolicy` is set to `queued` and another element where the `swImplPolicy` is set differently. This rule shall be imposed **at the time when the RTE is generated**.] ()

This is required to fulfill the compatibility rules defined in [\[constr_1071\]](#).

[constr_1635] Relevance of attribute `isOptional` [If a `SubElementMapping` is defined for the elements of a structured data type then the attribute `isOptional`⁸ shall either not exist for the `firstElement` and `secondElement` or it shall have the identical value for the `firstElement` and `secondElement`. This rule shall be imposed **at the time when the RTE is generated.**] ()

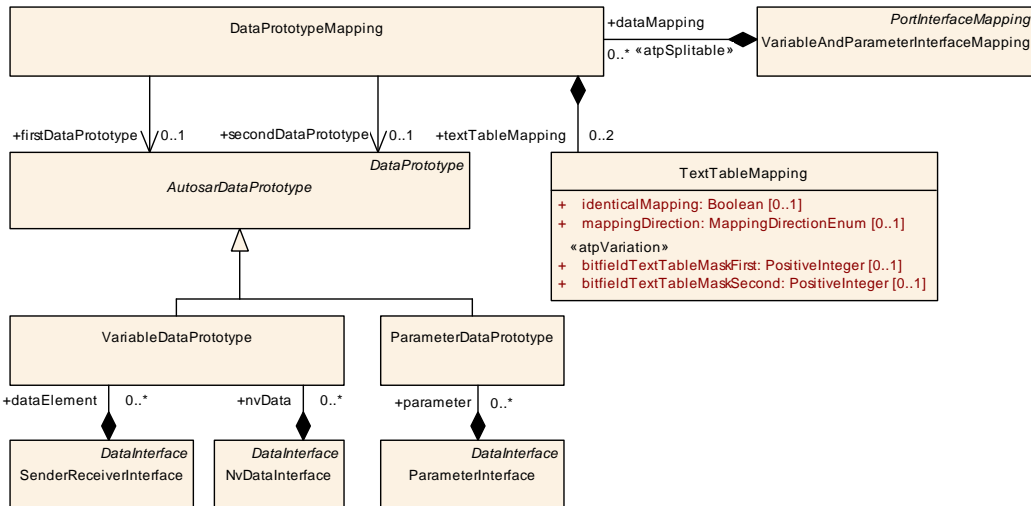

Figure 4.13: Mapping of Sender Receiver Interface, Parameter Interface and Non Volatile Data Interface elements

[constr_1040] Conversion of `SenderReceiverInterfaces` [The conversion of elements of `SenderReceiverInterfaces` is possible if one of the following conditions applies **at the time when the RTE is generated**:

- The `AutosarDataTypes` of the referred `DataPrototypes` are compatible.
- A conversion of the data is available.
- A `DataPrototypeMapping.firstToSecondDataTransformation` is defined.

] ()

The compatibility of `AutosarDataTypes` is described in section 6.2. A description of the conversion of data can be found in section 4.3.2.

Class	VariableAndParameterInterfaceMapping			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	Defines the mapping of VariableDataPrototypes or ParameterDataPrototypes in context of two different SenderReceiverInterfaces, NvDataInterfaces or ParameterInterfaces.

Attribute	Type	Mult.	Kind	Note
firstMode	ModeDeclaration	*	ref	This represents the first ModeDeclaration of the Mode DeclarationMapping. This reference has the multiplicity 1 .. * to support use cases where e.g. one mode of the mode user is mapped to several modes of the mode manager.
secondMode	ModeDeclaration	0..1	ref	This represents the second ModeDeclaration of the Mode DeclarationMapping.

Table 4.29: ModeDeclarationMapping

[constr_1879] Existence of reference `ModeDeclarationMapping.firstMode`
[For each `ModeDeclarationMapping`, at least one reference `firstMode` shall exist at the time when the RTE is generated.]()

[constr_1880] Existence of reference `ModeDeclarationMapping.secondMode`
[For each `ModeDeclarationMapping`, the reference `secondMode` shall exist at the time when the RTE is generated.]()

[TPS_SWCT_01464] `ModeDeclaration` of a mode user is mapped to exactly one `ModeDeclaration` of a mode manager
[The mode that corresponds to the `ModeDeclaration` of the Mode User is entered or exited when the mode of the mode manager that corresponds to the mapped (i.e. referenced by the same `ModeDeclarationMapping`) `ModeDeclaration` of the mode manager is entered or exited.]
(*RS_SWCT_03115*)

[TPS_SWCT_01465] `ModeDeclaration` of a mode user is mapped to several `ModeDeclarations` of a mode manager
[The mode that corresponds to the mapped

`ModeDeclaration` of the mode user is entered when any of the modes of the Mode Manager that correspond to `ModeDeclarations` referenced by the applicable `ModeDeclarationMapping` is entered.

The mode that corresponds to the mapped `ModeDeclaration` of the mode user is exited when any of the modes of the Mode Manager that correspond to `ModeDeclarations` referenced by the applicable `ModeDeclarationMapping` is exited if the new mode is not mapped to related mode of the mode user.](*RS_SWCT_03115*)

Please note if one `ModeDeclaration` of a mode user is mapped to **several** `ModeDeclarations` of a mode manager by means of several `ModeDeclarationMappings` the intended semantics is defined in a way that the individual mode transitions of the mode manager are representing “exit” and “enter” events for the Mode User. In other words, the individual transitions are recognizable by the mode user.

If one `ModeDeclaration` of a mode user is (by utilizing the multiplicity of the role `firstMode`) mapped to several `ModeDeclarations` of a mode manager in the context of a single `ModeDeclarationMapping`, the semantics is defined in a way that the individual mode transitions of the Mode Manager are not recognizable to the Mode User.

[constr_1209] Mapping of `ModeDeclarations` of mode user to `ModeDeclaration` of mode manager [A configuration that maps **several** `ModeDeclarations` representing modes of a mode user to **one** `ModeDeclaration` representing a mode of a mode manager shall be rejected **at the time when the RTE is generated.**]()

[constr_1210] Mapping of `ModeDeclarations` of mode user to all `ModeDeclarations` of mode manager [If a `ModeDeclarationMapping` exists that references a `ModeDeclaration` representing a mode of the mode manager, then `ModeDeclarationMappings` shall exist that map all modes of the mode manager to modes of the mode user **at the time when the RTE is generated.**]()

Please note that [constr_1210] prevents the existence of configurations where the mode user is not in a defined mode when no transition is ongoing.

[TPS_SWCT_01545] `ModeDeclaration` of a *mode user* that is not mapped to a `ModeDeclaration` of a *mode manager* [A `ModeDeclaration` of a *mode user* that is not mapped to a `ModeDeclaration` of a *mode manager* represents a valid model. In this case the related mode is never entered nor exit during runtime of the ECU.](*RS_SWCT_03115*)

4.3.1.4 Mapping of Trigger Interface Elements

[constr_1881] Existence of reference [TriggerMapping.firstTrigger](#) [For each [TriggerMapping](#), the reference [firstTrigger](#) shall exist **at the time when the RTE is generated.**.]()

[constr_1882] Existence of reference [TriggerMapping.secondTrigger](#) [For each [TriggerMapping](#), the reference [secondTrigger](#) shall exist **at the time when the RTE is generated.**.]()

Figure 4.17: Mapping of [TriggerInterface](#) elements

4.3.1.5 Mapping of Elements of a composite Data Type

The mapping of elements of [PortInterfaces](#) is not limited to mapping entire [DataPrototypes](#) onto each other.

[TPS_SWCT_01023] Mapping of elements of composite data types [For applications of [DataInterfaces](#) it is also possible to formally describe the mapping of elements of [ApplicationCompositeDataTypes](#) or [ImplementationDataTypes](#) of

category STRUCTURE or ARRAY onto each other.](RS_SWCT_03210, RS_SWCT_03135)

This ability (for which [constr_10087] applies) can be used if e.g. dataElements on the “source” and “target” end side are typed by different ApplicationRecord-DataTypes.

In this case the mapping of elements of ApplicationCompositeDataTypes or ImplementationDataTypes of category STRUCTURE or ARRAY onto each other allows for the definition of specific pairs of elements that fulfill the compatibility rules.

[constr_10087] Restriction for the existence of a SubElementMapping [The existence of a DataPrototypeMapping.subElementMapping is only supported if the PortPrototypes that are referenced by the respective SwConnector are typed by a DataInterface **at the time when the RTE is generated.**]()

[TPS_SWCT_01551] Mapping of elements on the “source” end to elements on the “target” end [Unless the attribute swImplPolicy is set to queued, it is not required that all elements on the “source” end need to be mapped to elements on the “target” end to achieve compatibility.](RS_SWCT_03210, RS_SWCT_03135)

The details regarding the compatibility rules are explained in chapter 6.3.

[constr_1279] Unmapped elements of ApplicationCompositeDataTypes or ImplementationDataTypes and the attribute swImplPolicy [If the attribute swImplPolicy is set to queued, then it is not allowed to have unmapped elements of ApplicationCompositeDataTypes or ImplementationDataTypes of category STRUCTURE or ARRAY on the “target” end **at the time when the RTE is generated.**]()

[constr_1280] Unmapped dataElement on the “target” end shall have an initialValue [If elements of ApplicationCompositeDataTypes or ImplementationDataTypes of category STRUCTURE or ARRAY are not considered in a SubElementMapping **and** the NonqueuedReceiverComSpec is aggregated by an AbstractRequiredPortPrototype referenced by the “target” end, then the enclosing dataElement shall have an initialValue.

This rule shall be imposed **at the time when the RTE is generated.**]()

[TPS_SWCT_01024] Combination of ApplicationCompositeDataType and nested ImplementationDataType [The mapping of elements of ApplicationCompositeDataTypes or ImplementationDataTypes of category STRUCTURE or ARRAY works for both ApplicationCompositeDataType and nested ImplementationDataTypes and even for combinations of them, i.e. one PortInterface may use an ApplicationCompositeDataType while the other PortInterface uses a nested ImplementationDataType.](RS_SWCT_03210, RS_SWCT_03135)

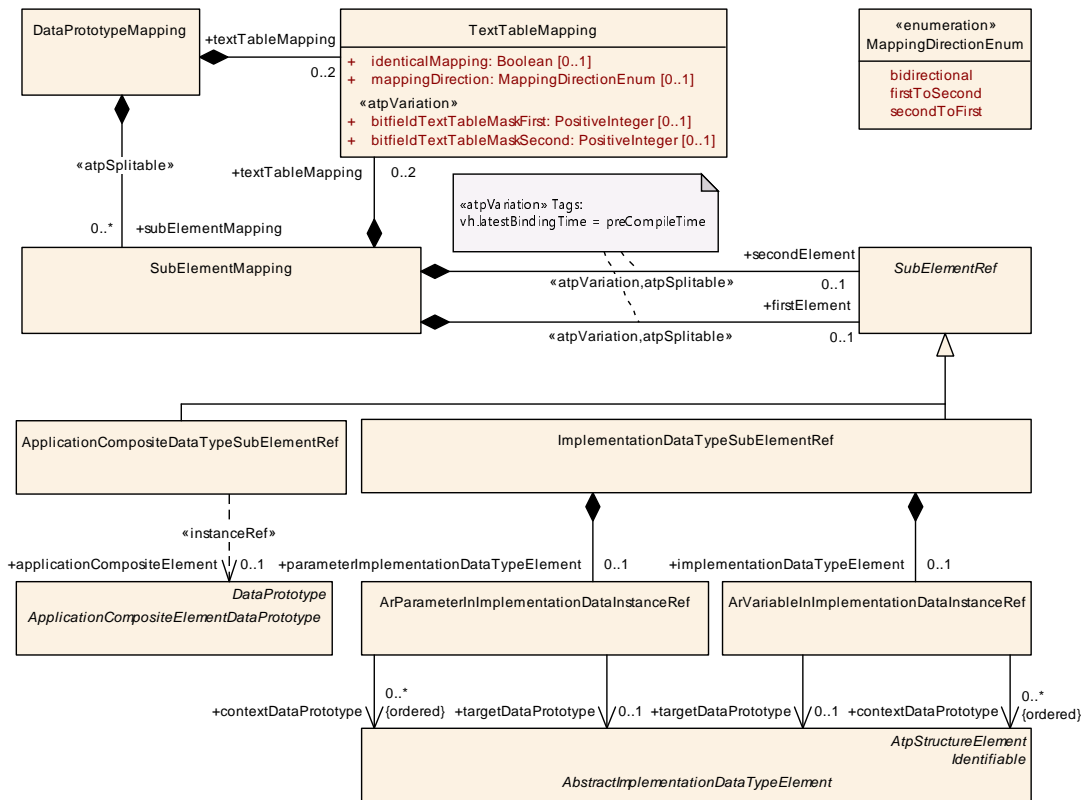

Figure 4.18: Mapping of elements of composite data types

[TPS_SWCT_01195] Mapping of composite element to primitive DataPrototype

[It is also possible to map an element of a composite data type on the “source” end to a primitive DataPrototype on the “target” end.

For this purpose the multiplicity of the dataElement/nvData contained in the PortPrototype on the “source” end shall be set to 1 and the multiplicity of the dataElement/nvData contained in the PortPrototype on the “target” end shall be set to 0.] (RS_SWCT_03136)

In general, the multiplicity of the respective dataElement/nvData contained in the PortPrototype on the “source” end can technically also be set to 0 but this case is reserved for future use.

[constr_1190] Only one mapping for composite to primitive use case [In the case described by [TPS_SWCT_01195] only one subElementMapping shall exist at the enclosing DataPrototypeMapping at the time when the RTE is generated.]()

[constr_1300] Primitive DataPrototype on the “source” end shall not be mapped to element of a composite data type on the “target” end of the SwConnector [The usage of DataPrototypeMapping or SubElementMapping does not support the following configuration:

- The `AutosarDataPrototype` contained in the `PortPrototype` on the “source” end of an `SwConnector` is typed by an `ApplicationPrimitiveDataType` of category `VALUE` or `ImplementationDataType` of category `VALUE` or category `TYPE_REFERENCE` that eventually resolves to category `VALUE`.
- The `DataPrototypeMapping` aggregates a `subElementMapping` that refers to a `ImplementationDataTypeElement` or `ApplicationCompositeElementDataPrototype` contained in the `PortPrototype` on the “target” end.

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1611] Existence of `ImplementationDataTypeSubElementRef.implementationDataTypeElement` as opposed to `ImplementationDataTypeSubElementRef.parameterImplementationDataTypeElement` [For any given `ImplementationDataTypeSubElementRef`, either the aggregation

- `ImplementationDataTypeSubElementRef.implementationDataTypeElement` or
- `ImplementationDataTypeSubElementRef.parameterImplementationDataTypeElement`

shall exist **at the time when the RTE is generated.**]()

In other words, the `ImplementationDataTypeSubElementRef` shall **either** refer to the nested hierarchy inside a `VariableDataPrototype` **or** a `ParameterDataPrototype`.

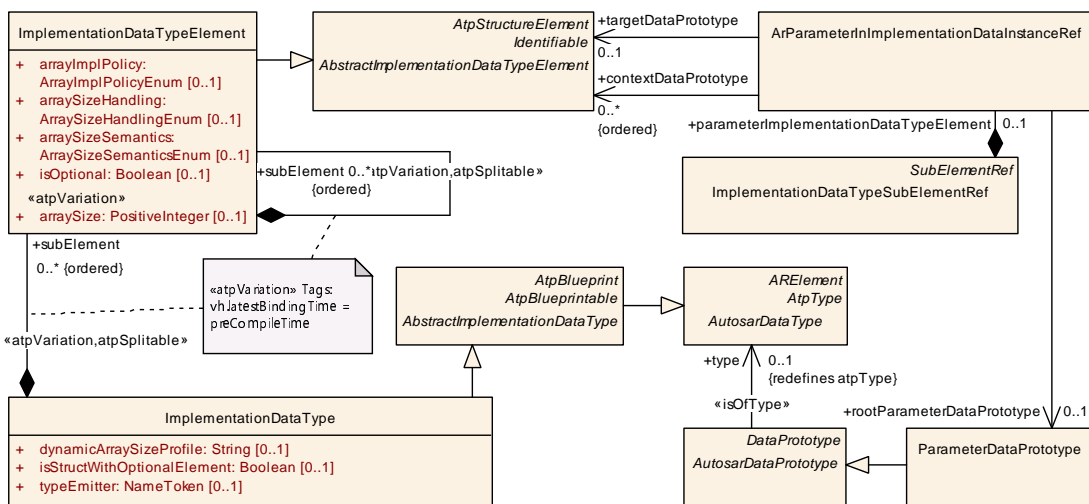

Figure 4.21: Implementation of the InstanceRef for the mapping of elements of a **ParameterDataPrototype** typed by a composite implementation data type

4.3.2 Data Conversion

[TPS_SWCT_01560] Supported **categorys** of **CompuMethods** for data conversion [Data conversion shall be supported for `AutosarDataTypes` that refer to `CompuMethods` of `category`

- `LINEAR`,
- `IDENTICAL`,
- `SCALE_LINEAR_AND_TEXTTABLE`, as long as there is **only one linear scale**,
- `TEXTTABLE`,
- `BITFIELD_TEXTTABLE`, and
- `RAT_FUNC` - as long as the semantics of the latter comes down to a reciprocal linear data scaling.

] (`RS_SWCT_03210`)

[TPS_SWCT_01561] Application of data conversion to composite Autosar-DataTypes [Data conversion is also applicable for composite `AutosarDataTypes`. The actual conversion, however, shall be individually applied to each leaf element of a given composite `AutosarDataType`.] ([RS_SWCT_03210](#))

4.3.2.1 Linear Data Scaling

A *Linear Data Scaling* can be defined under following preconditions:

[TPS_SWCT_01549] Definition of linear data scaling [The term `Linear Scaling` is defined as follows:

1. Regarding the existence of `CompuMethods` one of the following cases shall apply:
 - (a) The involved `AutosarDataTypes` refer to `CompuMethods` of category `IDENTICAL`, `LINEAR`, or `RAT_FUNC`.
 - (b) If one side (sender or receiver) does not refer to a `CompuMethod` then a “default” `CompuMethod` of category `IDENTICAL` shall be assumed.
2. The `CompuMethods` refer either to compatible `Units` or to `Units` that in turn refer to compatible definitions of `PhysicalDimension`.
3. Both `CompuMethods` fulfill the following condition:

$$Int = \frac{N_0 * phys^0 + N_1 * phys^1 + N_2 * phys^2 + \dots + N_i * phys^i}{D_0 * phys^0 + D_1 * phys^1 + D_2 * phys^2 + \dots + D_i * phys^i}$$

with

- $N_2=N_3=\dots=N_i=0$
- $D_1=D_2=\dots=D_i=0$
- $N_1 \neq 0$
- $D_0 \neq 0$

The coefficient N_0 represents the offset and can take any value.

] ([RS_SWCT_03210](#))

[TPS_SWCT_01550] Definition of reciprocal linear data scaling [The term `Reciprocal Linear Scaling` is defined as follows:

1. The involved `AutosarDataTypes` refer to `CompuMethods` of category `RAT_FUNC`.
2. The `CompuMethods` refer either to compatible `Units` or to `Units` that in turn refer to compatible definitions of `PhysicalDimension`.

3. Both `CompuMethods` fulfill the following condition:

$$Int = \frac{N_0 * phys^0 + N_1 * phys^1 + N_2 * phys^2 + \dots + N_i * phys^i}{D_0 * phys^0 + D_1 * phys^1 + D_2 * phys^2 + \dots + D_i * phys^i}$$

with

- $N_1=N_2=\dots=N_i=0$
- $D_2=D_3=\dots=D_i=0$
- $N_0 \neq 0$
- $D_1 \neq 0$

The coefficient D_0 represents the (reciprocal) offset and can take any value.

]([RS_SWCT_03210](#))

[TPS_SWCT_01168] Linear conversion factor can be calculated [In such cases a linear conversion factor can be calculated out of the `factorSiToUnit` and `offsetSiToUnit` attributes of the referred `Units` and the `CompuRationalCoeffs` of a `compuInternalToPhys/compuPhysToInternal` of the referred `CompuMethods`.]
([RS_SWCT_03210](#))

4.3.2.2 Table Conversion

[TPS_SWCT_01162] Existence of `TextTableMapping` [A `TextTableMapping` can be defined if the `AutosarDataTypes` refer to `CompuMethods` of category `TEXTTABLE`, `SCALE_LINEAR_AND_TEXTTABLE`, and `BITFIELD_TEXTTABLE`.]
([RS_SWCT_03210](#))

Please note that the use case behind the appearance of `BITFIELD_TEXTTABLE` in [\[TPS_SWCT_01162\]](#) is the fact that BSW modules such as the `Dem` need to put data into the `NVRAM` that has the nature of single bits embedded into a composite data type.

The `TextTableMapping` is defined as a table based conversion.

[TPS_SWCT_01163] Conversion from `firstValue` to `secondValue` [A `firstValue` of a `valuePair` is converted into the `secondValue` in case of a data flow from the `firstDataPrototype` to the `secondDataPrototype`.]
([RS_SWCT_03210](#))

[TPS_SWCT_01164] Conversion from `secondValue` to `firstValue` [In case of a data flow from the `secondDataPrototype` to `firstDataPrototype` the `secondValue` is substituted by the `firstValue`.]
([RS_SWCT_03210](#))

[TPS_SWCT_01165] Invertible mapping [If the `mappingDirection` attribute is set to `bidirectional` then the `TextTableMapping` has to be invertible. This requires that the list of all `firstValues` and the list of all `secondValues` do not contain identical values inside a list.]
([RS_SWCT_03210](#))

[TPS_SWCT_01166] **Non-invertible mapping** [For non-invertible `TextTableMapping`, a dedicated `TextTableMapping` for each direction can be defined.]([RS_SWCT_03210](#))

[constr_1303] **Applicability of `TextTableMapping` depending on the value of `CompuMethod.category`** [If – at the time when the RTE is generated – a `DataPrototypeMapping` aggregates a `TextTableMapping` then only certain combinations of the value of the applicable `CompuMethod.category` are supported:

- `category` of `firstDataPrototype`: `TEXTTABLE`,
`category` of `secondDataPrototype`: `TEXTTABLE`
- `category` of `firstDataPrototype`: `SCALE_LINEAR_AND_TEXTTABLE`,
`category` of `secondDataPrototype`: `TEXTTABLE`
- `category` of `firstDataPrototype`: `TEXTTABLE`,
`category` of `secondDataPrototype`: `SCALE_LINEAR_AND_TEXTTABLE`
- `category` of `firstDataPrototype`: `BITFIELD_TEXTTABLE`,
`category` of `secondDataPrototype`: `TEXTTABLE`
- `category` of `firstDataPrototype`: `TEXTTABLE`,
`category` of `secondDataPrototype`: `BITFIELD_TEXTTABLE`
- `category` of `firstDataPrototype`: `BITFIELD_TEXTTABLE`,
`category` of `secondDataPrototype`: `BITFIELD_TEXTTABLE`

]()

To some extent, *bitfields* can be regarded as a hybrid between a primitive and a structured data type:

- On the one hand, a *bitfield* is defined in the context of a primitive `ImplementationDataType`.
- On the other hand, by means of the definition of a `mask`, it is possible to define **isolated parts** within the primitive `ImplementationDataType` that potentially can be totally independent of each other with respect to the semantics of the data that match the `mask`.

In other words, the existence of semantically independent and potentially isolated parts within the primitive `ImplementationDataType` creates a **similar characteristic** as if the definitions of the isolated parts were created by means of defining primitive `ImplementationDataTypeElements` within the context of a composite `ImplementationDataType`.

And because it is possible to regard the “mission statement” of a `DataPrototype` that refers to a `CompuMethod` of `category BITFIELD_TEXTTABLE` as to mimic the semantics of a structured data type it is also possible to apply some rules that are already in place for structured data types in this specific case as well.

This conclusion, in combination with the existence of [TPS_SWCT_01551], sets the stage for [TPS_SWCT_01583].

[TPS_SWCT_01583] Completeness of `TextTableMapping` is not a requirement [If a `DataPrototypeMapping` contains one or more `TextTableMapping`(s) where the `DataPrototype` on the **sender side** refers to a `CompuMethod` of category `BITFIELD_TEXTTABLE` it is **not** required that for each possible value and each possible bit mask on the sender side corresponding values on the receiver side are specified.](*RS_SWCT_03210*)

With respect to [TPS_SWCT_01583] it is still important to observe that within a single mask **all values on the sender side shall have a mapping** to the receiver side.

Otherwise, the RTE generator would not be able to create mapping code that unambiguously takes care of mapping the correct values onto each other.

[constr_1313] Completeness of `TextTableMapping` for the values of a given bit mask on the sender side [If a `DataPrototypeMapping` contains one or more `TextTableMapping`(s) where the `DataPrototype` on the **sender side** refers to a `CompuMethod` of category `BITFIELD_TEXTTABLE` then all `DataPrototypeMapping.textTableMapping` shall aggregate a collection of `TextTableMapping.valuePair` where each possible value of the **sender bit mask**⁹ is represented by exactly one `TextTableValuePair.firstValue` ([TPS_SWCT_01163]) or `TextTableValuePair.secondValue` ([TPS_SWCT_01164]).

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1304] Existence of attribute `bitfieldTextTableMaskFirst` [The attribute `bitfieldTextTableMaskFirst` shall be defined **only if** the `firstDataPrototype` of a `DataPrototypeMapping` refers to a `CompuMethod` that has the value of `category` set to `BITFIELD_TEXTTABLE`.

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1305] Existence of attribute `bitfieldTextTableMaskSecond` [The attribute `bitfieldTextTableMaskSecond` shall be defined **only if** the `secondDataPrototype` of a `DataPrototypeMapping` refers to a `CompuMethod` that has the value of `category` set to `BITFIELD_TEXTTABLE`.

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1306] Limitation of `TextTableMapping` for `CompuMethods` that have the value of `category` set to `BITFIELD_TEXTTABLE` [For any `TextTableMapping` where both `firstDataPrototype` and `secondDataPrototype` refer to `CompuMethods` that have the value of `category` set to `BITFIELD_TEXTTABLE` **and** where the attribute `TextTableMapping.valuePair` exists the value of attribute `TextTableMapping.identicalMapping` shall be set to `false`.

⁹Depending on the applicable case this means either `bitfieldTextTableMaskFirst` (applies if [TPS_SWCT_01163] is in place) or `bitfieldTextTableMaskSecond` for the case of [TPS_SWCT_01164].

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1307] Consistency of values and masks in `TextTableMapping` [If a `TextTableMapping` element defines bit masks as `bitfieldTextTableMaskFirst` or `bitfieldTextTableMaskSecond` then all contained `TextTableMapping.valuePair.firstValues` as well as all `TextTableMapping.valuePair.secondValues` shall **not** specify a value that would be ruled out when - depending on the given value of `TextTableMapping.mappingDirection` - the relevant bit mask is applied.

This rule shall be imposed **at the time when the RTE is generated.**]()

Example 4.1

Example for **[constr_1307]**: For a bit mask `0b00001000`, only the corresponding values 8 and 0 are allowed.

Class	TextTableMapping

4.3.3 Relevance for Data Transformation

One (prominent) use-case for item 4 in [TPS_SWCT_01158] is the interaction between the `NvBlockSwComponentType` and the AUTOSAR Dcm.

Specifically, the RTE will call a data transformer to convert the `uint8`-array representation of the diagnostic data available from a `PortPrototype` owned by the Dcm `ServiceSwComponentType` to a `VariableDataPrototype` owned by a `PortPrototype` of `NvBlockSwComponentType`.

For the configuration of this purpose, the applicable `DataPrototypeMapping` refers to a `DataTransformation` in the role `firstToSecondDataTransformation` and - for the case of two connected `PortPrototypes` that use asymmetric data transformation - `secondToFirstDataTransformation` (see Figure 4.23).

Figure 4.23: Configuration of Ecu-internal data transformation

Note that for this specific interaction between an `ApplicationSwComponentType` and a `ServiceSwComponentType` [TPS_SWCT_01579]/[TPS_SWCT_01831] applies which defines that attribute `isService` shall be set to `false` for the `dataElements` in `PortPrototypes` typed by a `SenderReceiverInterface`.

[TPS_SWCT_01768] Semantics of DataPrototypeMapping.secondToFirstDataTransformation [For symmetric data transformations (i.e. the value of attribute `DataTransformation.dataTransformationKind` is set to `DataTransformationKindEnum.symmetric`) it is sufficient to specify the reference `firstToSecondDataTransformation`.

There are, however, use cases for asymmetric data transformations between two connected `PortPrototypes` and in this case it is necessary to specify each direction separately.

For this purpose, the reference `secondToFirstDataTransformation` exists in addition to `firstToSecondDataTransformation`.] ([RS_SWCT_03210](#))

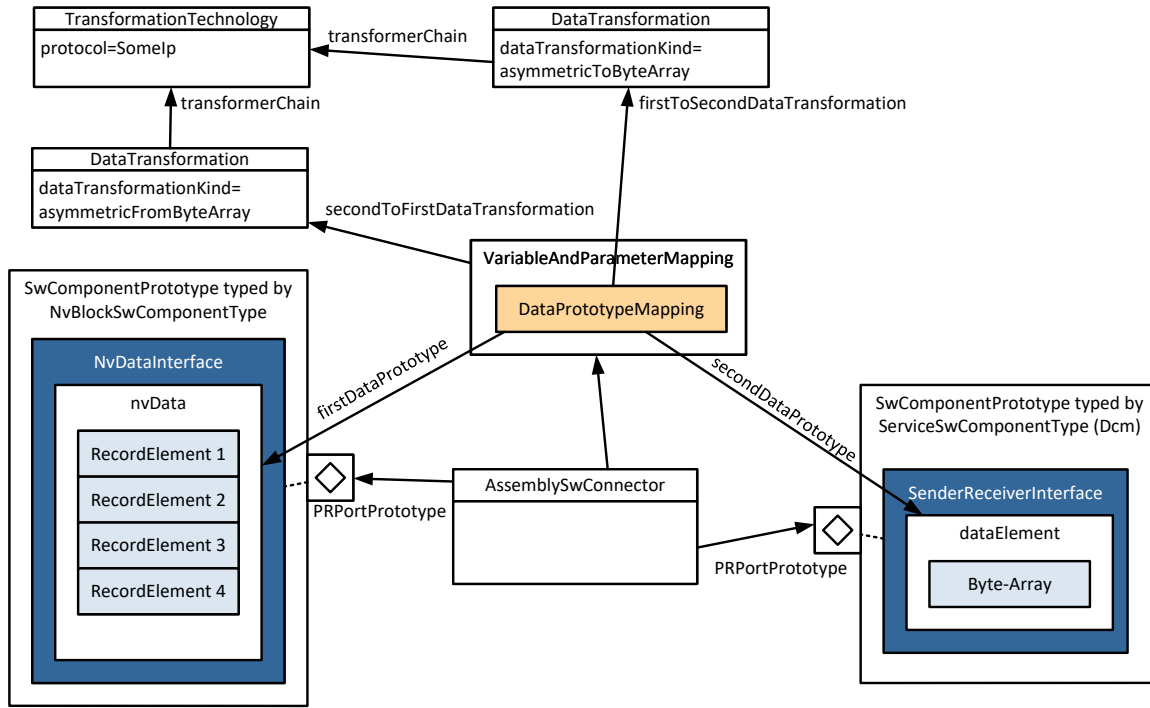

Figure 4.24: Use case for the existence of asymmetric data transformation in both directions

Figure 4.24 describes the most prominent use case for the necessity to specify both `firstToSecondDataTransformation` and `secondToFirstDataTransformation`.

An `SwComponentPrototype` typed by `NvBlockSwComponentType` exposes a `PRPortPrototype` that is connected to another `PRPortPrototype` attached to an `SwComponentPrototype` that represents the Dcm service software-component.

The `PRPortPrototype` on the side of the `NvBlockSwComponentType` is typed by an `NvDataInterface` that in turn aggregates a single `nvData`. The data type used to define the `nvData` is a structured data type.

The service software-component representing the Dcm, however, is not capable of dealing with structured data types. It can only handle primitive types and arrays of primitive types, e.g. bytes.

Therefore, the existence of (asymmetric) data transformers is conveniently utilized to serialize the content of the structured data type into a linear array and vice versa.

To expressly define this intended semantics, the `DataPrototypeMapping` defines two references:

- `firstToSecondDataTransformation` that refers to a `DataTransformation` where attribute `dataTransformationKind` is set to the value `asymmetricToByteArray`. This reference represents the direction from the `NvBlockSwComponentType` to the `Dcm`.
- `secondToFirstDataTransformation` that refers to a `DataTransformation` where attribute `dataTransformationKind` is set to the value `asymmetricFromByteArray`. This reference represents the direction from the `Dcm` to the `NvBlockSwComponentType`.

This approach to modeling is formalized in [\[constr_1631\]](#) and [\[constr_1632\]](#).

[constr_1631] Applicability of `DataPrototypeMapping.secondToFirstDataTransformation` [The reference to `DataTransformation` in the role `DataPrototypeMapping.secondToFirstDataTransformation` shall only exist if reference `DataPrototypeMapping.firstToSecondDataTransformation` exists and refers to a `DataTransformation` where attribute `dataTransformationKind` exists and is **not** set to the value `symmetric`.

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1632] Restriction for `firstToSecondDataTransformation` and `secondToFirstDataTransformation` [If – **at the time when the RTE is generated** – both the reference `firstToSecondDataTransformation` and the reference `secondToFirstDataTransformation` exist in the context of the same `DataPrototypeMapping` then

- the `firstToSecondDataTransformation` shall refer to a `DataTransformation` with attribute `dataTransformationKind` set to `asymmetricToByteArray` and
- the `secondToFirstDataTransformation` shall refer to a `DataTransformation` with attribute `dataTransformationKind` set to `asymmetricFromByteArray`.

4.4 Port Annotation

4.4.1 Introduction

[TPS_SWCT_01203] [PortPrototype](#) may own port annotations [In addition to the formal specification required to implement the communication via ports, a [PortPrototype](#) may own so-called port annotations.

They do not directly influence the signature of calls via this [PortPrototype](#), but contain further information that may be useful for the application developers of the components on both sides of the connection.] ([RS_SWCT_02110](#))

A summary of port-level annotations can be found in Figure [4.25](#).

[TPS_SWCT_01204] [GeneralAnnotation](#) [Beside formally specified attributes it is also possible to place textual information as provided in [GeneralAnnotation](#).] ([RS_SWCT_02110](#))

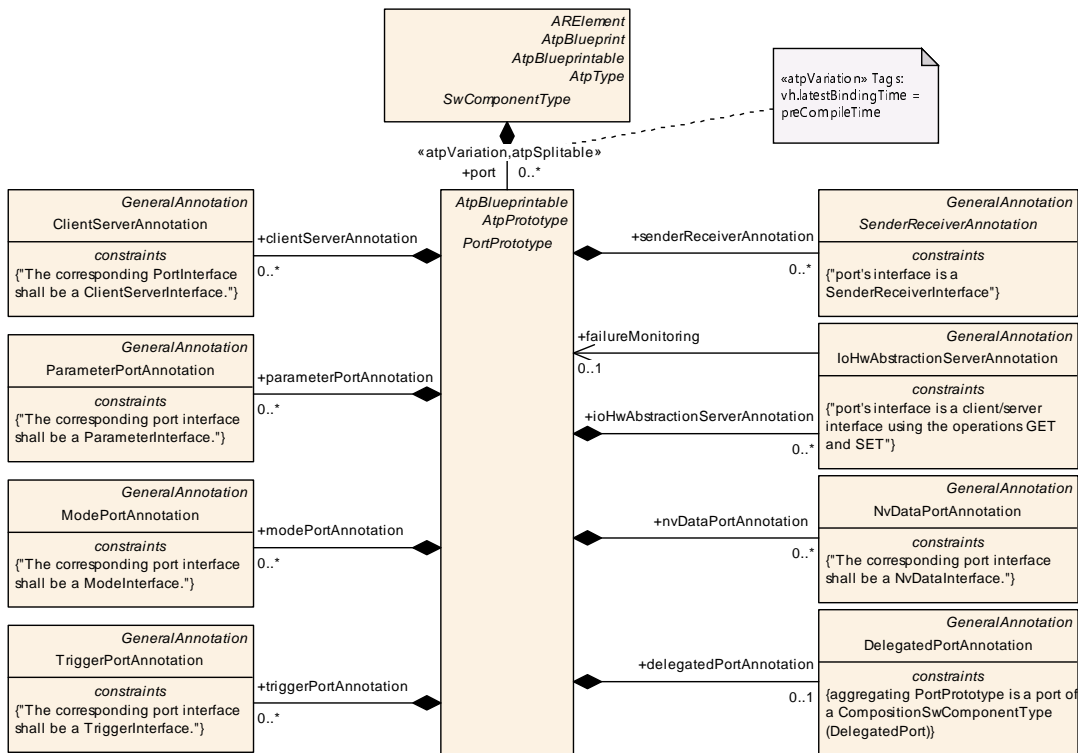

Figure 4.25: Application Level Port Annotations Overview

4.4.2 SenderReceiverAnnotation

Embedded automotive software is used to implement open-loop and closed-loop control-algorithms. Therefore, a software-component description has to accommodate typical control engineering description means which have only indirect influence of the embedded software itself.

These annotations provide the (function-) developer with a direct indication whether a certain software-component is appropriate for the control-algorithm to be designed. A typical annotation is the signal quality which is characterized by several properties. Each of the property is an annotation in its own.

[TPS_SWCT_01205] Typical annotations for sender/receiver communication

[Typical annotations for sender/receiver communication are:

- **Signal Age**: this attribute expresses that the associated software-component will only work correctly given that the propagation of the signal from a sensor to a consumer can be finished within a particular time-limit. Of course, this cannot be identified on component or role level, but has to take into account the instance view as well as the actual ECU- and bus-scheduling.
- **Raw**: a raw signal is typically taken directly from the basic software modules of the ECU abstraction layer. In particular, no sensor software-component has

filtered its original value. A `dataElement` in an `RPortPrototype` of a `SwComponentType` using this annotation indicates to the control engineer (who develops a control-algorithm for this component) that the signal has to be filtered (This relationship applies for `SenderReceiverInterfaces`).

- **Filtered:** this attribute indicates that a raw signal has been manipulated by some application software-components by using a certain filter.
- **Computed:** this attribute indicates that this signal is not measured directly but calculated from tentatively several other measured or calculated signals. In a vehicle, there might be alternative signals to be used from other components having a better quality, e.g. a raw signal.
- **Min:** this annotation indicates that the signal carries a minimum value. If, for example, a reference value computed in the software-component is below that value some dedicated actions (e.g. failure-mode) might have to be taken.
- **Max:** this annotation indicates that the signal carries a maximum value. If, for example, a reference value computed in the software-component is above that value some dedicated actions (e.g. failure-mode) might have to be taken.

In the meta-model this aspect is implemented by the abstract meta-class `SenderReceiverAnnotation` which represents the base class of both `SenderAnnotation` and `ReceiverAnnotation`.] (*RS_SWCT_02110*)

The relationship of abstract meta-class `SenderReceiverAnnotation` to `SenderAnnotation` and `ReceiverAnnotation` is depicted in Figure 4.26.

Class	<code>SenderReceiverAnnotation</code> (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::ApplicationAttributes			
Note	Annotation of the data elements in a port that realizes a sender/receiver interface.			
Base	<code>ARObject</code> , <code>GeneralAnnotation</code>			
Subclasses	<code>ReceiverAnnotation</code> , <code>SenderAnnotation</code>			
Aggregated by	<code>PortPrototype.senderReceiverAnnotation</code>			
Attribute	Type	Mult.	Kind	Note
computed	Boolean	0..1	attr	Flag whether this data element was not measured directly but instead was calculated from possibly several other measured or calculated values.
dataElement	<code>VariableDataPrototype</code>	0..1	ref	The instance of <code>VariableDataPrototype</code> annotated.
limitKind	<code>DataLimitKindEnum</code>	0..1	attr	This min or max has not to be mismatched with the min- and max for data-value in a compu-method. For example, this annotation shows when the result of the calculation performed in a <code>RunnableEntity</code> owned by one <code>AtomicSwComponentType</code> is transmitted to another <code>AtomicSwComponentType</code> whose <code>RunnableEntity</code> will use this value as a limit, e.g. the <code>max.power</code> which can be used by that software-component, or the <code>current.min.slip</code> .
processingKind	<code>ProcessingKindEnum</code>	0..1	attr	This attribute controls how data is processed according to the possible values of <code>ProcessingKindEnum</code> .

Table 4.41: SenderReceiverAnnotation

Note	Annotation of a receiver port, specifying properties of data elements that don't affect communication or generation of the RTE. The given attributes are requirements on the required data.			
Base	ARObject, GeneralAnnotation , SenderReceiverAnnotation			
Aggregated by	PortPrototype.senderReceiverAnnotation			
Attribute	Type	Mult.	Kind	Note
signalAge	MultidimensionalTime	0..1	aggr	The maximum allowed age of the signal since it was originally read by a sensor. This is a requirement specified on the receiver side.

Table 4.43: ReceiverAnnotation

Enumeration	ProcessingKindEnum			
Package	M2::AUTOSARTemplates::SWComponentTemplate::ApplicationAttributes			
Note	Kind of processing which has been applied to a data element.			
Aggregated by	SenderReceiverAnnotation.processingKind			
Literal	Description			
filtered	Indicates that a raw signal has been manipulated by some application software components by using filters. Tags: atp.EnumerationLiteralIndex=0			
none	Indicates that none of the other option apply. Tags: atp.EnumerationLiteralIndex=1			
raw	Specifies that a signal is taken directly from the basic software modules, i.e. from the ECU abstraction layer. It indicates to a developer that the control algorithm in the software has to provide filters. Tags: atp.EnumerationLiteralIndex=2			

Table 4.44: ProcessingKindEnum

Enumeration	DataLimitKindEnum			
Package	M2::AUTOSARTemplates::SWComponentTemplate::ApplicationAttributes			
Note	Indicates whether the data element carries a minimum or maximum value, thereby limiting the current range of another value.			
Aggregated by	SenderReceiverAnnotation.limitKind			
Literal	Description			
max	Limitation to maximum value Tags: atp.EnumerationLiteralIndex=0			

Enumeration	DataLimitKindEnum
min	Limitation to minimum value Tags: atp.EnumerationLiteralIndex=1
none	No limitation applicable Tags: atp.EnumerationLiteralIndex=2

Table 4.45: DataLimitKindEnum

[TPS_SWCT_01206] Min and Max annotations are valid for a certain amount of time [The Min and Max annotations are valid for a certain amount of time. The value is likely to change to another valid value while the ECU is running. e.g. the maximal torque which can be requested from an engine is a typical use-case.] ([RS_SWCT_02110](#))

This value might vary depending on e.g. the status of the climate control system. Therefore, these annotations shall not be mismatched with the min and max attributes of [CompuMethods](#).

The application level port annotations for sender/receiver communication have to be associated to each [dataElement](#) in a [PortPrototype](#), e.g. there might be a “raw” [dataElement](#) and a “filtered” [dataElement](#) in the same [PortPrototype](#)!

[TPS_SWCT_01207] VariableDataPrototypes use the same application-level SenderReceiverAnnotation [Furthermore, if two [VariableDataPrototypes](#) use the same application-level [SenderReceiverAnnotation](#), a reference from the annotation to the [VariableDataPrototypes](#) will be established by an appropriate tool.] ([RS_SWCT_02110](#))

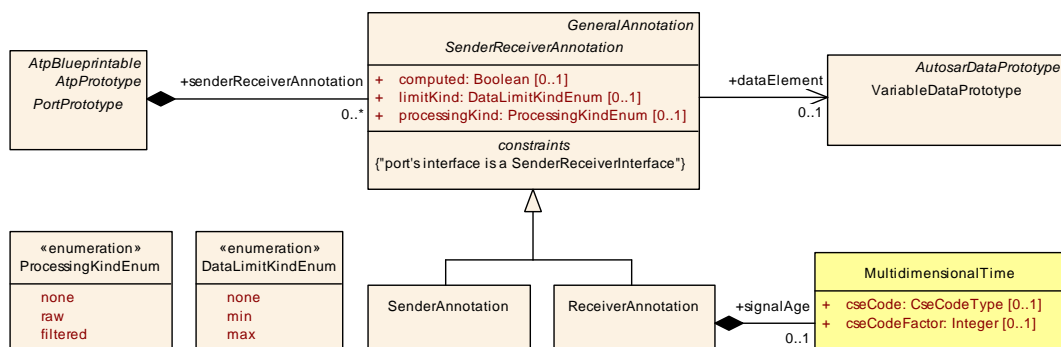

Figure 4.26: SenderReceiverAnnotation

[TPS_SWCT_01208] Grouping for SenderReceiverAnnotation [The [SenderReceiverAnnotation](#) for sender/receiver communication are grouped into

- processing type, indicating to some extent the direct quality of the signal,
- computed, which is just a flag or,
- limit type, showing the component expects an actual limit.

In the case of an `RPortPrototype`, the signal age of the value, carried by the associated `SwConnector`, can be specified. Each of these groups can be interpreted as a property of the signal-quality. *(RS_SWCT_02110)*

For more information about meta-class `SenderReceiverAnnotation` please refer to Figure 4.26.

[constr_4004] Context of `SenderReceiverAnnotation` [A `SenderReceiverAnnotation` shall only be aggregated by a `PortPrototype` typed by a `SenderReceiverInterface` at the time when the contract phase generation is executed.] *(RS_SWCT_02110)*

4.4.3 ClientServerAnnotation

[TPS_SWCT_01209] `ClientServerAnnotation` [The `ClientServerAnnotation` can be used to provide more information with respect to the `ClientServerOperation` of the `PortPrototype`.] *(RS_SWCT_02110)*

Class	<code>ClientServerAnnotation</code>			
Package	M2::AUTOSARTemplates::SWComponentTemplate::ApplicationAttributes			
Note	Annotation to a port regarding a certain Operation.

Attribute	Type	Mult.	Kind	Note
operation	<code>ClientServerOperation</code>	0..1	ref	This represents the <code>ClientServerOperation</code> that the <code>ClientServerAnnotation</code> corresponds to.

Table 4.46: `ClientServerAnnotation`

The main use-case is to define additional information related to the `ClientServerOperation`.

Figure 4.27: `ClientServerAnnotation`

[constr_4005] Context of `ClientServerAnnotation` [A `ClientServerAnnotation` shall only be aggregated by a `PortPrototype` typed by a `ClientServerInterface` at the time when the contract phase generation is executed.] *(RS_SWCT_02110)*

4.4.4 Annotation for the I/O Hardware Abstraction Layer

Within the ECU-Abstraction Layer there are ECU-signals defined. These signals represent the electrical signals as they arrive in the micro-controller peripheral and are fetched from the registers via the MCAL.

Access to the I/O Hardware Abstraction Layer is done via service interfaces, i.e. the I/O Hardware Abstraction Layer provides GET- and SET-operations at the specified service ports of a [SensorActuatorSwComponentType](#).

[TPS_SWCT_01524] Usage of [IoHwAbstractionServerAnnotation](#) [[IoHwAbstractionServerAnnotation](#) can be used for all kinds of [PortInterfaces](#) except [NvDataInterface](#).] ([RS_SWCT_02110](#))

Class	IoHwAbstractionServerAnnotation			
Package	M2::AUTOSARTemplates::SWComponentTemplate::ApplicationAttributes			
Note	The IoHwAbstractionServerAnnotation will only be used from a sensor- or an actuator component while interacting with the IoHwAbstraction layer. Note that the "server" in the name of this meta-class is not meant to restrict the usage to ClientServer Interfaces.			
Base	ARObject , GeneralAnnotation			
Aggregated by	PortPrototype.ioHwAbstractionServerAnnotation			
Attribute	Type	Mult.	Kind	Note
age	MultidimensionalTime	0..1	aggr	In case of a SET operation, the age will be interpreted as Delay while in a GET operation (input) it specifies the Lifetime of the signal within the IoHwAbstraction Layer Tags: xml.sequenceOffset=10
argument	ArgumentDataPrototype	0..1	ref	Reference to the corresponding ArgumentDataPrototype. Tags: xml.sequenceOffset=20
bswResolution	Float	0..1	attr	This value is determined by an appropriate combination of the range, the unit as well as the data-elements type, i.e. $(\text{ecuSignalRange.upperLimit} - \text{ecuSignalRange.lowerLimit}) / (2^{\text{datatypeLength}} - 1)$ Tags: xml.sequenceOffset=30
dataElement	VariableDataPrototype	0..1	ref	Reference to the corresponding VariableDataPrototype. Tags: xml.sequenceOffset=40
failure Monitoring	PortPrototype	0..1	ref	This is only applicable in SET operations. If it is enabled, the IoHwAbstraction layer will monitor the result of the operation and issue an diagnostic signal. This means especially, that an additional client-server port has to be created. Tools can use this information to cross-check whether for each data-element in a SET operation with FailureMonitoring enabled an additional port is created The referenced port monitors a failure in the to be monitored VariableDataPrototype of the IoHwAbstraction layer. The referenced port has to be another port of the same Actuator or Sensor Component. Tags: xml.sequenceOffset=50

Table 4.57: MultilanguageLongName

4.5 Communication Specification

[TPS_SWCT_01218] **Big picture of ComSpec** [The highest level of description of information exchanged between components in an AUTOSAR system is the [PortInterfaces](#), as shown in earlier sections.

Such [PortInterface](#) however, only describes structure and does not include information about whether communication needs to be done reliably, or whether an initial value exists in case the real data is not yet available.

This information is role-specific, i.e. it shall be applied on the level of [PortPrototypes](#) rather than [PortInterfaces](#). Therefore, most communication-relevant attributes are related to the [PortPrototypes](#) of an [SwComponentType](#).

The communication attributes are organized in a so-called **communication specification** (in terms of the meta-model: `ComSpec`) classes. | ([RS_SWCT_02030](#))

Note that the communication specification is optional, i.e. its existence is not required in any case. Figures 4.34 and 4.35 provide an overview of communication specifications. The derived meta-classes are explained in the following sub-chapters.

As explained before, `ComSpec` meta-classes which are required on the level of a `SwComponentType` are attached to the `PortPrototype` declarations which in turn are part of the definition of a `SwComponentType`.

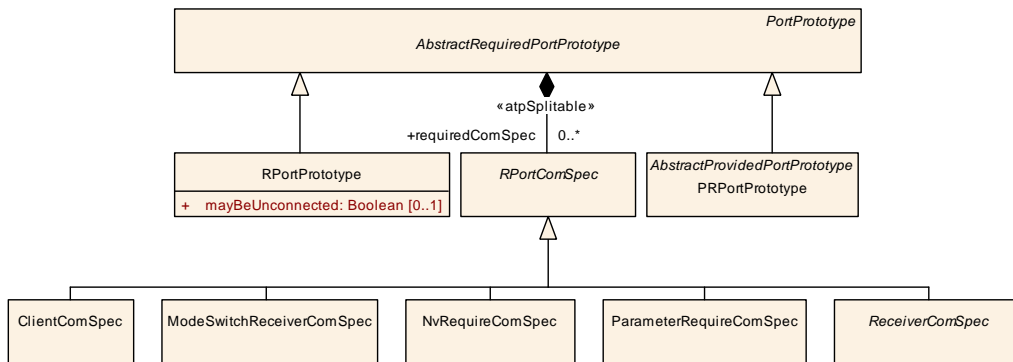

Figure 4.34: Overview of communication attributes of `RPortPrototype`

Nevertheless, the usage of `ComSpecs` is **not** restricted to the `PortPrototypes` of `AtomicSwComponentTypes` (for more details please refer to section 2.5).

Sections 7.5.1 and 7.5.2 then explain the sender-receiver and client-server communication patterns with respect to the RTE, the RTE events and the corresponding communication attributes.

Several `ComSpecs` allow defining `initValues` in relation to the associated `DataPrototype`. For further details about the representation of `initValues` please refer to section 5.7.2.

Furthermore, [[constr_1043](#)] applies such that only specific subclasses of `ComSpec` can be owned by `PortPrototypes` typed by the corresponding kind of `PortInterface`.

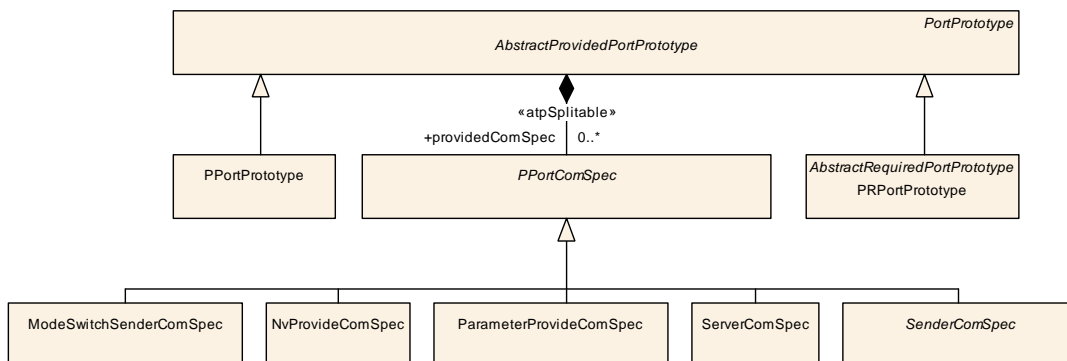

Figure 4.35: Overview of communication attributes of `PPortPrototype`

[constr_1290] Limitation on the number of PPortComSpecs in the context of one PPortPrototype [Within the context of one PPortPrototype, there can only be one (sub-class of) PPortComSpec that references a given

- dataElement (in the case of SenderComSpec),
- operation (in the case of ServerComSpec),
- modeGroup (in the case of ModeSwitchSenderComSpec),
- variable (in the case of NvProvideComSpec), or
- parameter (in the case of ParameterProvideComSpec)

at the time when the contract phase generation is executed.]()

In other words, it is not allowed that two or more PPortComSpec exist in the context of a one PPortPrototype that refer to the same dataElement or operation.

[constr_1291] Limitation on the number of RPortComSpecs in the context of one PPortPrototype [Within the context of one RPortPrototype, there can only be one RPortComSpec that references a given

- dataElement (in the case of ReceiverComSpec),
- operation (in the case of ClientComSpec),
- modeGroup (in the case of ModeSwitchReceiverComSpec),
- variable (in the case of NvRequireComSpec), or
- parameter (in the case of ParameterRequireComSpec)

at the time when the contract phase generation is executed.]()

In other words, it is not allowed that two or more RPortComSpec exist in the context of a one RPortPrototype that refer to the same dataElement or operation.

[TPS_SWCT_01454] PRPortPrototype can own both RPortComSpecs and PPortComSpecs [In contrast to PPortPrototype and RPortPrototype, PRPortPrototype can own both RPortComSpecs and PPortComSpecs at the same time.] (RS_SWCT_02030, RS_SWCT_03250)

Figure 4.36: Modeling of ComSpecs for PRPortPrototype

Nevertheless, the following restriction applies:

[constr_1292] Limitation on the number of RPortComSpecs/PPortComSpecs in the context of one PRPortPrototype [Within the context of one PRPortPrototype, there can only be one RPortComSpec and one PPortComSpec that references a given

- dataElement (in the case of ReceiverComSpec/SenderComSpec),
- operation (in the case of ClientComSpec/ServerComSpec),
- modeGroup (in the case of ModeSwitchReceiverComSpec/ModeSwitch-SenderComSpec), or
- variable (in the case of NvRequireComSpec/NvProvideComSpec)

at the time when the contract phase generation is executed.]()

In other words, it is not allowed that two or more PPortComSpec exist in the context of a one PRPortPrototype that refer to the same dataElement or operation.

In the same manner, it is not allowed that two or more RPortComSpec exist in the context of one PRPortPrototype that refer to the same dataElement or operation.

The rationale for the existence of [constr_1290], [constr_1291], and [constr_1292] is that the AUTOSAR communication layer needs an unambiguous specification of the communication behavior.

The existence of redundant RPortComSpecs/PPortComSpecs may easily be contradicting each other and this would inhibit the creation of a valid configuration for the AUTOSAR Com.

As explained in section 2.5, there are cases where PortPrototypes owned by a CompositionSwComponentType could have initValues.

Therefore, it is possible that PortPrototypes owned by CompositionSwComponentTypes can have ComSpecs. It is *not* required that the ComSpecs defined on the composition level match the ComSpecs defined inside the CompositionSwComponentType.

If consistency would be required this constraint might be a major obstacle for integrating existing AtomicSwComponentTypes into a CompositionSwComponentType that has PortPrototypes with ComSpecs.

Class	<i>PPortComSpec</i> (abstract)

- the *Role of Element* that is referenced from the *Type of ComSpec* shall be aggregated by the exact same *Type of PortInterface* that is also referenced by the enclosing *Type of PortPrototype* in the role *Role of Type-Ref*.

]()

4.5.1 Communication Specification for Sender-Receiver Communication

Communication specification applies in different ways to specific kinds of communication.

[TPS_SWCT_01219] ComSpec for queued and non-queued sender-receiver communication [Sender-receiver communication might be queued or non-queued. This aspect is primarily reflected in the value of `dataElement.swDataDefProps.swImplPolicy`.

If the value of this attribute is set to `queued` then `QueuedSenderComSpec` and/or `QueuedReceiverComSpec` shall be defined. In all other applicable cases `NonqueuedSenderComSpec` or `NonqueuedReceiverComSpec` shall be used.

Thus, the constraints [constr_1129], [constr_1130], [constr_1131], and [constr_1132] shall apply.

While in the case of queued communication the `queueLength` attribute remains the only information item the non-queued case foresees several attributes for controlling communication behavior.]()

4.5.1.1 Receiver ComSpec

Figure 4.37 shows the meta-model of the communication attributes relevant sender-receiver communication at an `RPortPrototype`.

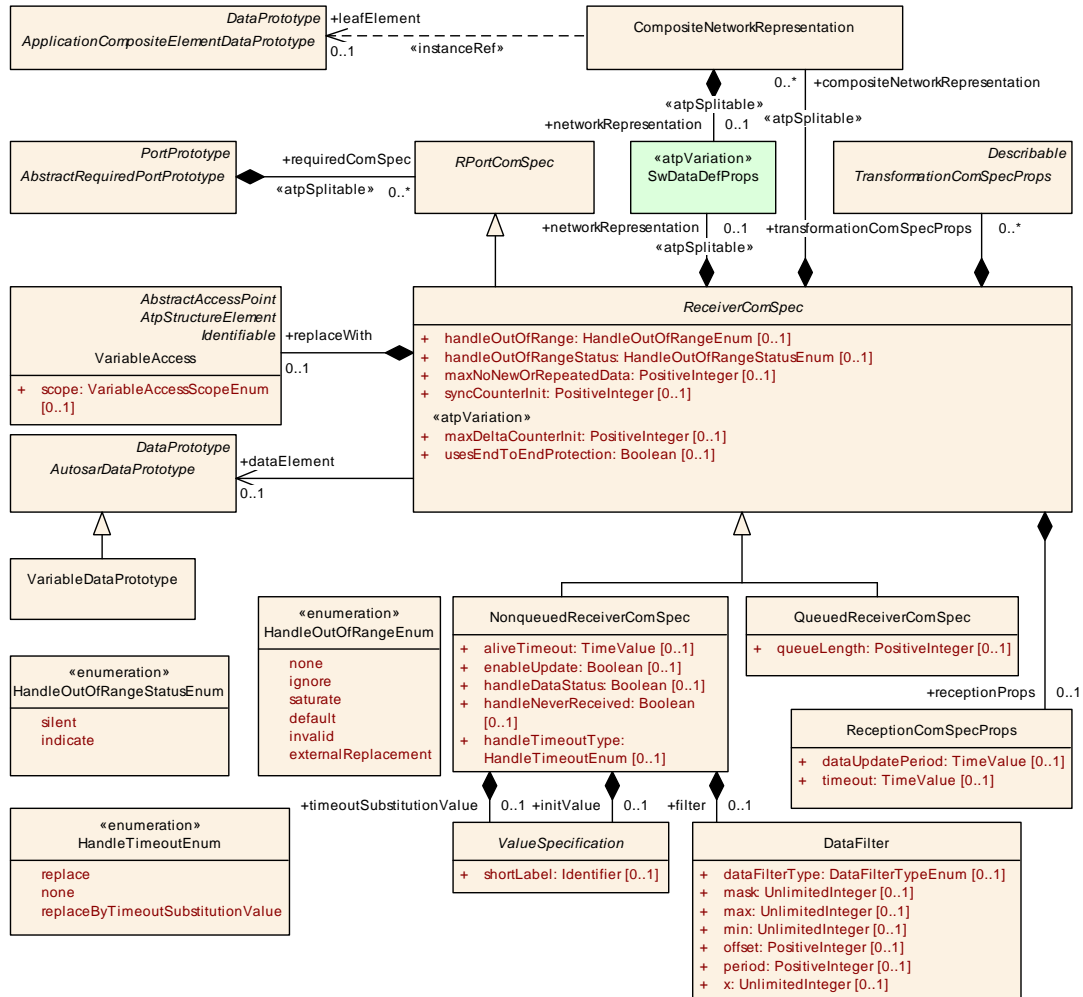

Figure 4.37: Communication attributes of `RPortPrototype` with respect to sender-receiver communication.

[constr_1538] Restriction for reference `ReceiverComSpec.dataElement` [The reference `ReceiverComSpec.dataElement` shall not refer to an `ArgumentDataPrototype` or `ParameterDataPrototype` at the time when the contract phase generation is executed.]()

[constr_1103] `NonqueuedReceiverComSpec` and `enableUpdate` [A `NonqueuedReceiverComSpec` that has the value of attribute `enableUpdate` set to true at the time when the contract phase generation is executed may not reference a `dataElement` that in turn is referenced by a `VariableAccess` in the role `dataReadAccess`.]()

In general, it is considered beneficial for software-components to define `initValues` for all the `dataElements` received by `RPortPrototypes`.

These `initValues` are required by the RTE for several functionalities, e.g. :

- Providing a default value for not yet received `dataElements` (see [TPS_SWCT_01220]).
- Providing default values in case of unconnected `RPortPrototypes` (see [constr_1100]).
- Partial mapping of composite data (see [constr_1280])

Therefore, the availability of `initValue` increases the flexibility of the usage of the software-component in different scenarios.

On the other hand, there are also use cases where `initValues` are not mandatory, i.e. the `DataPrototype` remains intentionally uninitialized. This is expressed by applying a `SwAddrMethod` where the `sectionInitializationPolicy` is set to `NO-INIT`, or when the software component is intentionally only prepared for intra-partition communication.

In response to these conflicting objectives [TPS_SWCT_01688] is written as a recommendation as opposed to a binding constraint.

[TPS_SWCT_01688] `initValue` should exist in an `RPortPrototype` [The optional attribute `initValue` should exist if the enclosing `NonqueuedReceiverComSpec` is owned by an `RPortPrototype`.]()

[TPS_SWCT_01455] Duplicate existence of `initValue` in the context of a `PRPortPrototype` [If an `initValue` is defined in a `NonqueuedReceiverComSpec` owned by a `PRPortPrototype`, its value shall be ignored.](*RS_SWCT_03250*)

[TPS_SWCT_01220] `initValue` defines an initial value that shall be taken if the corresponding `dataElement` has not yet been received [The aggregation of `ValueSpecification` in the role `initValue` defines an initial value that shall be taken if the corresponding `dataElement` has not yet been received but the application software is attempting to access its value.]()

[constr_1891] Existence of attribute `NonqueuedReceiverComSpec.initValue` [For each `NonqueuedReceiverComSpec`, attribute `initValue` shall exist at the time when the contract phase generation is executed.]()

Class	<i>ReceiverComSpec</i> (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Receiver-specific communication attributes (<code>RPortPrototype</code> typed by <code>SenderReceiverInterface</code>).

Class	ReceiverComSpec (abstract)			
composite Network Representation	CompositeNetworkRepresentation	*	aggr	This represents a CompositeNetworkRepresentation defined in the context of a ReceiverComSpec. The purpose of this aggregation is to be able to specify the network representation of leaf elements of Application CompositeDataTypes. Stereotypes: atpSplitable Tags: atp.Splitkey=compositeNetworkRepresentation
dataElement	AutosarDataPrototype	0..1	ref	Data element these attributes belong to.
handleOutOfRange	HandleOutOfRangeEnum	0..1	attr	This attribute controls how values that are out of the specified range are handled according to the values of HandleOutOfRangeEnum.
handleOutOfRangeStatus	HandleOutOfRangeStatusEnum	0..1	attr	Control the way how return values are created in case of an out-of-range situation.
maxDelta CounterInit	PositiveInteger	0..1	attr	Initial maximum allowed gap between two counter values of two consecutively received valid Data, i.e. how many subsequent lost data is accepted. For example, if the receiver gets Data with counter 1 and MaxDeltaCounter Init is 1, then at the next reception the receiver can accept Counters with values 2 and 3, but not 4. Note that if the receiver does not receive new Data at a consecutive read, then the receiver increments the tolerance by 1. Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime
maxNoNewOr RepeatedData	PositiveInteger	0..1	attr	The maximum amount of missing or repeated Data which the receiver does not expect to exceed under normal communication conditions. Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach.
network Representation	SwDataDefProps	0..1	aggr	A networkRepresentation is used to define how the data Element is mapped to a communication bus. Stereotypes: atpSplitable Tags: atp.Splitkey=networkRepresentation
receptionProps	ReceptionComSpec Props	0..1	aggr	"This aggregation represents the definition transmission props in the context of the enclosing ReceiverComSpec.
replaceWith	VariableAccess	0..1	aggr	This aggregation is used to identify the AutosarData Prototype to be taken for sourcing an external replacement in the out-of-range and invalidValue handling.

Class	ReceiverComSpec (abstract)			
syncCounterInit	PositiveInteger	0..1	attr	<p>Number of Data required for validating the consistency of the counter that shall be received with a valid counter (i.e. counter within the allowed lock-in range) after the detection of an unexpected behavior of a received counter.</p> <p>Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach.</p>
transformationComSpecProps	TransformationComSpecProps	*	aggr	<p>This references the TransformationComSpecProps which define port-specific configuration for data transformation.</p>
usesEndToEndProtection	Boolean	0..1	attr	<p>This indicates whether the corresponding dataElement shall be transmitted using end-to-end protection.</p> <p>Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach.</p> <p>Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime</p>

Table 4.60: ReceiverComSpec

Enumeration	HandleOutOfRangeStatusEnum
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication
Note	This enumeration defines how the RTE handles values that are out of range.
Aggregated by	ReceiverComSpec.handleOutOfRangeStatus
Literal	Description
indicate	<p>The RTE sets the return status to RTE_E_OUT_OF_RANGE if the received value is out of range and the attribute handleOutOfRange is not set to "none" or "invalid".</p> <p>Tags: atp.EnumerationLiteralIndex=0</p>
silent	<p>The RTE sets the return status to RTE_E_OK</p> <p>Tags: atp.EnumerationLiteralIndex=1</p>

Table 4.61: HandleOutOfRangeStatusEnum

Class	NonqueuedReceiverComSpec			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Communication attributes specific to non-queued receiving.			
Base	ARObject , RPortComSpec , ReceiverComSpec			
Aggregated by	AbstractRequiredPortPrototype.requiredComSpec , PortPrototypeBlueprint.requiredComSpec			
Attribute	Type	Mult.	Kind	Note

Class	NonqueuedReceiverComSpec			
aliveTimeout	TimeValue	0..1	attr	Specify the amount of time (in seconds) after which the software component (via the RTE) needs to be notified if the corresponding data item have not been received according to the specified timing description. If the aliveTimeout attribute is 0 no timeout monitoring shall be performed.
enableUpdate	Boolean	0..1	attr	This attribute controls whether application code is entitled to check whether the value of the corresponding VariableDataPrototype has been updated.
filter	DataFilter	0..1	aggr	The applicable filter algorithm for filtering the value of the corresponding dataElement.
handleData Status	Boolean	0..1	attr	If this attribute is set to true, then the Rte_IStatus API shall exist. If the attribute does not exist or is set to false, then the Rte_IStatus API may still exist in response to the existence of further conditions.
handleNever Received	Boolean	0..1	attr	This attribute specifies whether for the corresponding VariableDataPrototype the "never received" flag is available. If yes, the RTE is supposed to assume that initially the VariableDataPrototype has not been received before. After the first reception of the corresponding VariableDataPrototype the flag is cleared. <ul style="list-style-type: none"> • If the value of this attribute is set to "true" the flag is required. • If set to "false", the RTE shall not support the "never received" functionality for the corresponding VariableDataPrototype.
handleTimeout Type	HandleTimeoutEnum	0..1	attr	This attribute controls the behavior with respect to the handling of timeouts.
initValue	ValueSpecification	0..1	aggr	Initial value to be used in case the sending component is not yet initialized. If the sender also specifies an initial value, then the receiver's value will be used.
timeout Substitution Value	ValueSpecification	0..1	aggr	This attribute represents the substitution value applicable in the case of a timeout.

Table 4.62: NonqueuedReceiverComSpec

Class	QueuedReceiverComSpec			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Communication attributes specific to queued receiving.			
Base	<i>ARObject</i> , <i>RPortComSpec</i> , <i>ReceiverComSpec</i>

Attribute	Type	Mult.	Kind	Note
queueLength	PositiveInteger	0..1	attr	Length of queue for received events.

Table 4.63: QueuedReceiverComSpec

[constr_1889] Existence of attribute [QueuedReceiverComSpec.queueLength](#)
 [For each [QueuedReceiverComSpec](#), attribute [queueLength](#) shall exist at the time when the contract phase generation is executed.]()

Class	ReceptionComSpecProps			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	This meta-class defines a set of reception attributes which the application software is assumed to implement.			
Base	ARObject			
Aggregated by	ReceiverComSpec.receptionProps			
Attribute	Type	Mult.	Kind	Note
dataUpdatePeriod	TimeValue	0..1	attr	This attribute defines the period in which the application shall check for updated data. This attribute is used for the configuration of the E2E protection, but may also indicate a general data reception period.
timeout	TimeValue	0..1	attr	This attribute defines the time interval after which the application shall assume that the to be received data reception has timed out, i.e. the respective data has not been received for that amount of time.

Table 4.64: ReceptionComSpecProps

Enumeration	HandleTimeoutEnum
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication
Note	Strategies of handling a reception timeout violation.
Aggregated by	NonqueuedReceiverComSpec.handleTimeoutType
Literal	Description
none	If set to none no replacement shall take place. Tags: atp.EnumerationLiteralIndex=0
replace	If set to replace, the replacement value shall be the ComInitValue. Tags: atp.EnumerationLiteralIndex=1
replaceByTimeoutSubstitutionValue	If set to replace, the replacement value shall be the timeout substitution value. Tags: atp.EnumerationLiteralIndex=2

Table 4.65: HandleTimeoutEnum

Primitive	TimeValue
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes
Note	This primitive type is taken for expressing time values. The numerical value is supposed to be interpreted in the physical unit second. Tags: xml.xsd.customType=TIME-VALUE xml.xsd.type=double

Table 4.66: TimeValue

[constr_1129] [swImplPolicy](#) and [NonqueuedReceiverComSpec](#) [The attribute [swImplPolicy](#) of a [dataElement](#) referenced by a [NonqueuedReceiverComSpec](#) shall not be set to the value **queued at the time when the contract phase generation is executed.**]()

[constr_1130] [swImplPolicy](#) and [QueuedReceiverComSpec](#) [The attribute [swImplPolicy](#) of a [dataElement](#) referenced by a [QueuedReceiverComSpec](#) shall be set to the value **queued at the time when the contract phase generation is executed.**]()

[constr_1188] Existence of `ReceiverComSpec.replaceWith` [The aggregation of `VariableAccess` in the role `ReceiverComSpec.replaceWith` shall exist **if and only if at least one of the following conditions is fulfilled**:

- Attribute `ReceiverComSpec.handleOutOfRange` is set to the value `externalReplacement`.
- Attribute `SenderReceiverInterface.invalidationPolicy.handleInvalid` is set to the value `externalReplacement`.

This rule shall be applied **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01753] Application of compatibility rules for `ReceiverComSpec.replaceWith` [Compatibility rules as formulated by [constr_1068] and [constr_1187] shall be applicable for the reference `ReceiverComSpec.replaceWith`.]()

[TPS_SWCT_01223] `networkRepresentation` defines how a specific `dataElement` is represented on a communication bus [For sender-receiver communication, it is possible to specify how `dataElements` are represented given that the communication requires the usage of a dedicated communication bus.

That is, by means of the `networkRepresentation` it is possible to define how a specific `dataElement` is represented on a communication bus. For this purpose the `networkRepresentation` is implemented as an aggregation of `SwDataDefProps`.]()

[TPS_SWCT_01224] `CompuMethods` of `dataElement` and the `networkRepresentation` are used for conversion purposes [The attached `CompuMethods` of both the `dataElement` and the `networkRepresentation` can be used to identify the conversion between the two.

The advantage of this approach is that this can also be used without any modifications in combination with a general remapping and rescaling of `dataElements` between different `SwComponentTypes`, regardless whether they are located on the same or on different ECUs.]()

Please note that the decision whether to take the `networkRepresentation` for data mapping is done in the context of the AUTOSAR System Template [10]. Please find more detailed information about this aspect in the applicable specification.

[TPS_SWCT_01452] Applicability of `networkRepresentation` for `ApplicationCompositeDataType` [The aggregation of `networkRepresentation` at the `ReceiverComSpec` or `SenderComSpec` only applies for `dataElements` typed by `ApplicationPrimitiveDataTypes`.

For the case of using an `ApplicationCompositeDataType` an additional mechanism shall be used.

In particular, `compositeNetworkRepresentation` shall be used to define the `networkRepresentation` of **leaf elements** of `ApplicationCompositeDataTypes`.]()

[constr_1196] Existence of `networkRepresentation` vs. `compositeNetworkRepresentation` [If a `ReceiverComSpec` or `SenderComSpec` aggregates `networkRepresentation` it shall **not** aggregate `compositeNetworkRepresentation` (and vice versa) **at the time when the contract phase generation is executed.**]()

[constr_1197] Existence of `compositeNetworkRepresentation` shall be comprehensive [If at least one `compositeNetworkRepresentation` exists then for each leaf `ApplicationCompositeElementDataPrototype` of the affected `ApplicationCompositeDataType` exactly one `compositeNetworkRepresentation` shall be defined **at the time when the contract phase generation is executed.**

For each such `compositeNetworkRepresentation`, attributes `leafElement` and `networkRepresentation` shall exist **at the time when the contract phase generation is executed.**]()

Granted, the definition of **[constr_1197]** to some extent has a recursive character. The meaning is that if it is actually intended to define a `compositeNetworkRepresentation` then the definition shall be completely covering the entire set of leaf elements of the corresponding `ApplicationCompositeDataType`. In other words, it's all or nothing.

[TPS_SWCT_01593] Semantics of attribute `ReceiverComSpec.transformationComSpecProps` [The `ReceiverComSpec.transformationComSpecProps` is used to configure `PortPrototype`-specific properties for data transformation in case of receiving inter-ECU communication.]()

[TPS_SWCT_01682] Relevance of E2E-related attributes in a `ReceiverComSpec` if a `TransformationComSpecProps` of type `EndToEndTransformationComSpecProps` is defined. [The attributes

- `ReceiverComSpec.usesEndToEndProtection`
- `ReceiverComSpec.syncCounterInit`
- `ReceiverComSpec.maxDeltaCounterInit`
- `ReceiverComSpec.maxNoNewOrRepeatedData`

have no meaning if a `TransformationComSpecProps` of type `EndToEndTransformationComSpecProps` is defined in the same `ReceiverComSpec` in the role `transformationComSpecProps` .]()

4.5.1.2 Sender ComSpec

The communication attributes on the sender side are sketched in Figure 4.38.

[constr_1131] `swImplPolicy` and `NonqueuedSenderComSpec` [The attribute `swImplPolicy` of a `dataElement` referenced by a `NonqueuedSenderComSpec`

shall not be set to the value `queued at the time when the contract phase generation is executed.`]()

[constr_1132] `swImplPolicy` and `QueuedSenderComSpec` [The attribute `swImplPolicy` of a `dataElement` referenced by a `QueuedSenderComSpec` shall be set to the value `queued at the time when the contract phase generation is executed.`]()

[TPS_SWCT_01751] The meaning of E2E-related attributes in a `SenderComSpec` if a `TransformationComSpecProps` of type `EndToEndTransformationComSpecProps` is defined [The attribute `usesEndToEndProtection` has no meaning if a `TransformationComSpecProps` of type `EndToEndTransformationComSpecProps` is defined in the same `SenderComSpec.`]()

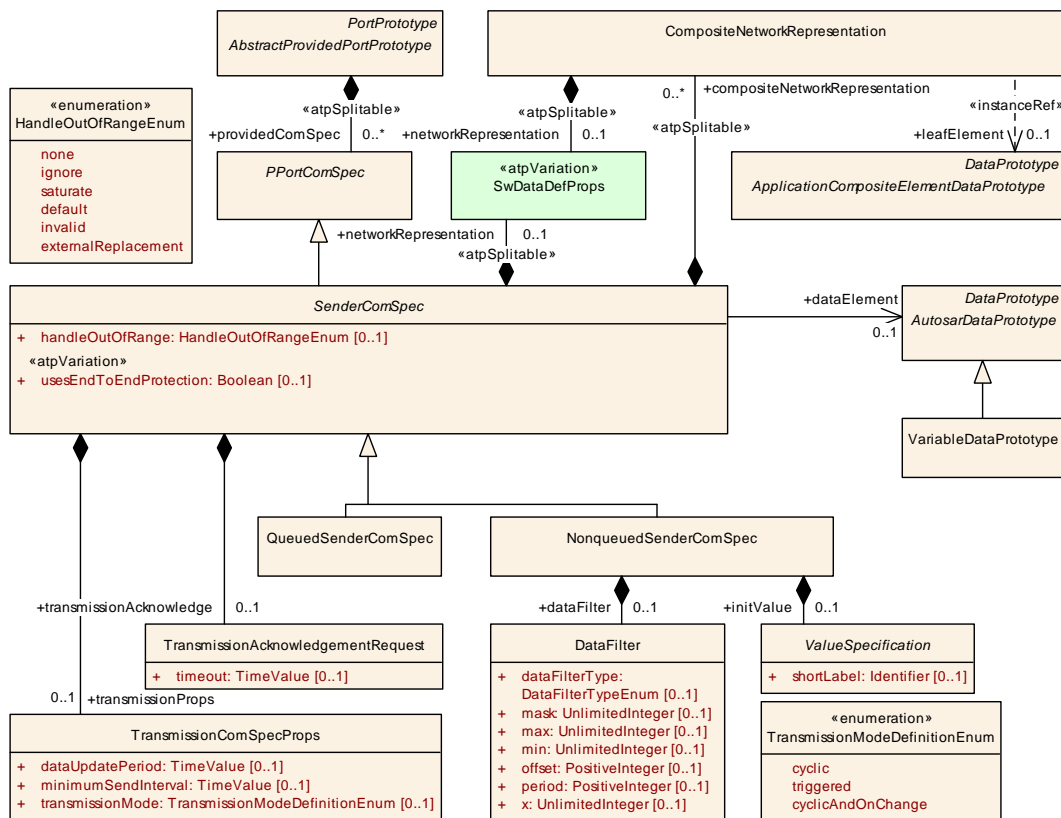

Figure 4.38: Communication attributes of `PortPrototype` with respect to sender-receiver communication.

Please note:

- `SenderComSpec.usesEndToEndProtection` does not have any influence on code generation.

It could be used, for example, by a validation framework to make sure that, if set to `true` the `dataElement` meets a transformer configuration for all respective `SwConnectorsProps` connecting to the `PortPrototype` that owns the `SenderComSpec`.

- `SenderComSpec.usesEndToEndProtection` could be used as a statement from the application developer that the given `dataElement` shall be end-to-end protected.

However, it seems far-fetched for an application developer to expressly state that a `dataElement` shall **not** be end-to-end protected. This goes beyond the responsibility of an application developer.

Therefore, two relevant states for `SenderComSpec.usesEndToEndProtection` can be expected:

- attribute exists and is set to `true` (application developer asserts the necessity to end-to-end protect the `dataElement`)
- attribute does not exist (application developer doesn't care)
- The application developer may not have enough oversight to envision how the `dataElement` is communicated, i.e. local vs. network communication. Setting `usesEndToEndProtection` to `true` and then deploy the enclosing software-component such that it communicates only locally on the respective `PortPrototype` also seems unusual for the current situation regarding transformer-based communication.

[constr_1539] Restriction for `SenderComSpec.dataElement` [The reference `SenderComSpec.dataElement` shall not refer to an `ArgumentDataPrototype` or `ParameterDataPrototype` at the time when the contract phase generation is executed.]()

4.5.1.3 Data Filter

Figure 4.39 shows the model of the communication attributes relevant for defining data filters.

Figure 4.39: DataFilter and its communication attributes.

[TPS_SWCT_01221] **DataFilter** [For every `RPortPrototype` or `PPortPrototype` typed by a `SenderReceiverInterface`, a `DataFilter` can be defined given that non-queued communication is foreseen.]()

Several filter algorithms formally described by the enumeration type `DataFilterTypeEnum` in the meta-model are taken from the ISO 17356-4 specification [17] that is referenced by the RTE specification [2].

[TPS_SWCT_01222] **Applicability of DataFilter** [This ISO 17356-4 specification states that “filtering is only used for messages that can be interpreted as C language unsigned integer types (characters, unsigned integers and enumerations).”] (*RS_SWCT_03221*)

[constr_1044] **Applicability of DataFilter** [According to the origin of `DataFilter`, i.e. ISO 17356-4 specification [17], `DataFilters` can only be applied to values with an integer base type **at the time when the contract phase generation is executed.**]()

Class	DataFilter			
Package	M2::AUTOSARTemplates::CommonStructure::Filter			
Note	Base class for data filters. The type of the filter is specified in attribute <code>dataFilterType</code> . Some of the filter types require additional arguments which are specified as attributes of this class.			
Base	<code>ARObject</code>			
Aggregated by	<code>ISignalPort.dataFilter</code> , <code>NonqueuedReceiverComSpec.filter</code> , <code>NonqueuedSenderComSpec.dataFilter</code> , <code>SignalBasedEventElementToSignalTriggeringMapping.filter</code> , <code>SignalBasedFieldToSignalTriggeringMapping.filter</code> , <code>SignalServiceTranslationElementProps.filter</code> , <code>TransmissionModeCondition.dataFilter</code>			
Attribute	Type	Mult.	Kind	Note
<code>dataFilterType</code>	<code>DataFilterTypeEnum</code>	0..1	attr	This attribute specifies the type of the filter.
<code>mask</code>	<code>UnlimitedInteger</code>	0..1	attr	Mask for old and new value.
<code>max</code>	<code>UnlimitedInteger</code>	0..1	attr	Value to specify the upper boundary
<code>min</code>	<code>UnlimitedInteger</code>	0..1	attr	Value to specify the lower boundary
<code>offset</code>	<code>PositiveInteger</code>	0..1	attr	Specifies the initial number of messages to occur before the first message is passed
<code>period</code>	<code>PositiveInteger</code>	0..1	attr	Specifies number of messages to occur before the message is passed again
<code>x</code>	<code>UnlimitedInteger</code>	0..1	attr	Value to compare with

Table 4.75: DataFilter

[constr_1890] **Existence of attribute DataFilter.dataFilterType** [For each `DataFilter`, attribute `dataFilterType` shall exist **at the time when the RTE is generated.**]()

Enumeration	DataFilterTypeEnum
Package	M2::AUTOSARTemplates::CommonStructure::Filter
Note	This enum specifies the supported <code>DataFilterTypes</code> .
Aggregated by	<code>DataFilter.dataFilterType</code>
Literal	Description

Enumeration	DataFilterTypeEnum
always	No filtering is performed so that the message always passes. Tags: atp.EnumerationLiteralIndex=0
maskedNewDiffers MaskedOld	Pass messages where the masked value has changed. (new_value&mask) !=(old_value&mask) new_value: current value of the message old_value: last value of the message (initialized with the initial value of the message, updated with new_value if the new message value is not filtered out) Tags: atp.EnumerationLiteralIndex=1
maskedNewDiffers X	Pass messages whose masked value is not equal to a specific value x (new_value&mask) != x new_value: current value of the message Tags: atp.EnumerationLiteralIndex=2
maskedNewEquals X	Pass messages whose masked value is equal to a specific value x (new_value&mask) == x new_value: current value of the message Tags: atp.EnumerationLiteralIndex=3
never	The filter removes all messages. Tags: atp.EnumerationLiteralIndex=4
newIsOutside	Pass a message if its value is outside a predefined boundary. (min > new_value) OR (new_value > max) Tags: atp.EnumerationLiteralIndex=5
newIsWithin	Pass a message if its value is within a predefined boundary. min <= new_value <= max Tags: atp.EnumerationLiteralIndex=6
oneEveryN	Pass a message once every N message occurrences. Algorithm: occurrence % period == offset Start: occurrence = 0. Each time the message is received or transmitted, occurrence is incremented by 1 after filtering. Length of occurrence is 8 bit (minimum). Tags: atp.EnumerationLiteralIndex=7

Table 4.76: DataFilterTypeEnum

4.5.1.4 Communication between Application and NV Block Software Components

In many cases, communication between an [NvBlockSwComponentType](#) (see section 11.4.2) and an [ApplicationSwComponentType](#) is implemented based on mixed communication approaches, i.e. the [ApplicationSwComponentType](#) most likely uses a [PortPrototype](#) typed by a [SenderReceiverInterface](#) while the [NvBlockSwComponentType](#) uses a [PortPrototype](#) typed by an [NvDataInterface](#).

[constr_10071] Allowed multiplicities of `SenderComSpec` attributes for communication between `ApplicationSwComponentType` and `NvBlockSwComponentType` [

Sender	<code>ApplicationSwComponentType</code>	
Receiver	<code>NvBlockSwComponentType</code>	
Queuing Configuration	non-queued	queued
<code>SenderComSpec.transmissionAcknowledge</code>	d/c	
<code>SenderComSpec.dataElement</code>	1	
<code>SenderComSpec.handleOutOfRange</code>	d/c	
<code>SenderComSpec.usesEndToEndProtection</code>	d/c	
<code>SenderComSpec.transmissionProps.dataUpdatePeriod</code>	0..1	
<code>SenderComSpec.transmissionProps.minimumSendInterval</code>	0..1	
<code>SenderComSpec.transmissionProps.transmissionMode</code>	0..1	
<code>SenderComSpec.networkRepresentation</code>	d/c	
<code>SenderComSpec.compositeNetworkRepresentation</code>	d/c	
<code>NonqueuedSenderComSpec.dataFilter</code>	d/c	
<code>NonqueuedSenderComSpec.initValue</code>	0..1	

This rule shall be imposed **at the time when the RTE is generated**.

]()

In such a case it is necessary to clarify the usage of attributes of the respective `ComSpec` on both the sender and receiver side. For this purpose, the constraints **[constr_10071]** and **[constr_10072]** are defined¹⁰.

Please note that the abbreviation “d/c”, as mentioned in **[constr_10071]**, stands for “don’t care”.

[constr_10072] Allowed multiplicities of `SenderComSpec` attributes for communication between `NvBlockSwComponentType` and `ApplicationSwComponentType` [

Sender	<code>NvBlockSwComponentType</code>	
Receiver	<code>ApplicationSwComponentType</code>	
Queuing Configuration	non-queued	queued
<code>ReceiverComSpec.replaceWith</code>	0	
<code>ReceiverComSpec.dataElement</code>	1	
<code>ReceiverComSpec.receptionProps.dataUpdatePeriod</code>	0	
<code>ReceiverComSpec.receptionProps.timeout</code>	0	
<code>ReceiverComSpec.usesEndToEndProtection</code>	0	
<code>ReceiverComSpec.maxDeltaCounterInit</code>	0	

¹⁰As a general rule, queued communication between `ApplicationSwComponentType` and `NvBlockSwComponentType` is not supported by AUTOSAR. The **[constr_10071]** and **[constr_10072]** nevertheless contain a column that represents the case of queued communication for the sake of completeness. But consequently, this column is consistently filled with ‘empty cells in the respective tables.

Sender	NvBlockSwComponentType	
Receiver	ApplicationSwComponentType	
Queuing Configuration	non-queued	queued
ReceiverComSpec.handleOutOfRange	0	
ReceiverComSpec.handleOutOfRangeStatus	0	
ReceiverComSpec.maxNoNewOrRepeatedData	0	
ReceiverComSpec.syncCounterInit	0	
ReceiverComSpec.transformationComSpecProps	0	
ReceiverComSpec.networkRepresentation	0	
ReceiverComSpec.compositeNetworkRepresentation	0	
QueuedReceiverComSpec.queueLength		
NonqueuedReceiverComSpec.filter	0	
NonqueuedReceiverComSpec.timeoutSubstitutionValue	0	
NonqueuedReceiverComSpec.initValue	0..1	
NonqueuedReceiverComSpec.aliveTimeout	0	
NonqueuedReceiverComSpec.enableUpdate	0	
NonqueuedReceiverComSpec.handleDataStatus	0	
NonqueuedReceiverComSpec.handleNeverReceived	0..1	
NonqueuedReceiverComSpec.handleTimeoutType	0	

This rule shall be imposed **at the time when the RTE is generated.**

⌋()

It is noted that the content of [[constr_10071](#)] and [[constr_10072](#)] only partially matches the criteria for the content of a constraint.

For example, the constraints contain statements about the optional existence of attributes or even declare that the existence of attributes has a "don't care" nature.

But on the other hand, these constraints also contain content that is definitely relevant for a constraint and the presentation of all these regulations, condensed into one table, is considered valuable.

This aspect of easily getting an overview would get lost if the constraints were spit into different tables that are wrapped into a spec item and a constraint.

4.5.1.5 Communication behavior to be implemented by the Software Component

AUTOSAR supports the handling of periodic data transmission and reception timeout checking in the Classic AUTOSAR Basic Software layer. The definition of the transmission modes and time values is defined using the [TPS_SystemTemplate](#) [10].

The only value which is also available at the [NonqueuedReceiverComSpec](#) is the [aliveTimeout](#) - as this value configures both communication stack timeout handling

(in case of remote communication) and RTE timeout handling (in case of local communication).

With the introduction of the transformer technology the aspects of periodic data transmission and checking for timeout on reception may have to be implemented by the application code. The main reason is that the E2E-Transformer needs to be called periodically in order to keep its state machine up to date.

So, the application code needs to call the transmission / reception APIs periodically in order to fulfill these timing requirements. But there may also be other reasons why the application shall take care of the periodicity, for example in case the LdCom module (which doesn't have any timing features) is used.

The meta-classes `TransmissionComSpecProps` and `ReceptionComSpecProps` have been introduced to define the expected communication behavior to be implemented by the application code.

As the `TransmissionComSpecProps` and `ReceptionComSpecProps` define what the expected communication behavior is, the values can also be utilized by communication (network) measurement tools to verify whether the application code actually implements the attributes properly.

The attribute `ReceptionComSpecProps.dataUpdatePeriod` defines the time period in which the receiving application shall call the reception API to check for new data.

The attribute `ReceptionComSpecProps.timeout` defines the time after which the application shall assume that the to-be-received data reception has timed out.

The attribute `NonqueuedReceiverComSpec.aliveTimeout` might be defined as well, resulting in duplicate timeout checks.

The communication stack / RTE would check for the value of attribute `aliveTimeout` and the application code would check for the `ReceptionComSpecProps.timeout`. Although it does not seem sensible to perform a timeout check twice, it is not forbidden.

The attribute `TransmissionComSpecProps.dataUpdatePeriod` defines the time period in which the sending application shall call the send API.

The attributes `TransmissionComSpecProps.minimumSendInterval` and `TransmissionComSpecProps.transmissionMode` define values which influence the transmission behavior, implemented by the application code.

Note that the communication stack might also have a periodicity, minimum sending time and transmission mode defined. And such doubled implementation might lead to undesired effects. However AUTOSAR does not regulate the usage of the mechanisms to be exclusive.

4.5.2 Communication Specification for Client-Server Communication

4.5.2.1 Client ComSpec

The communication aspects relevant for client communication are sketched in Figure 4.40.

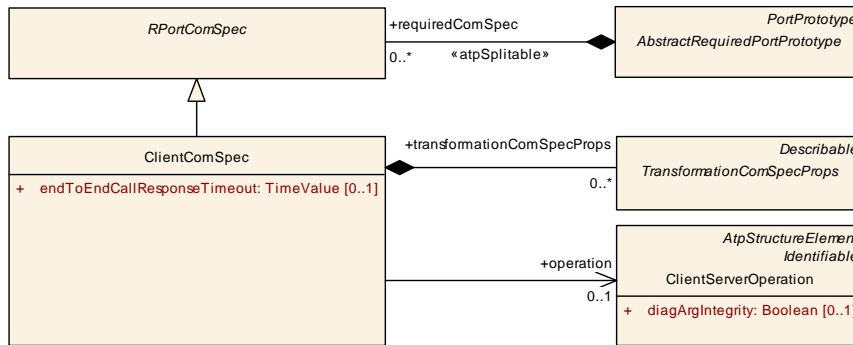

Figure 4.40: Communication attributes of RPortPrototype with respect to client-server communication.

[constr_1540] Existence of ClientComSpec.operation [The reference ClientComSpec.operation shall exist if the AbstractRequiredPortPrototype that owns the ClientComSpec is typed by a ClientServerInterface. This rule shall be imposed at the time when the contract phase generation is executed.]()

Class	ClientComSpec			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Client-specific communication attributes (RPortPrototype typed by ClientServerInterface).			
Base	ARObject, RPortComSpec			
Aggregated by	AbstractRequiredPortPrototype.requiredComSpec, PortPrototypeBlueprint.requiredComSpec			
Attribute	Type	Mult.	Kind	Note
endToEndCallResponseTimeout	TimeValue	0..1	attr	This attribute defines the maximum time interval in which the application shall expect the servers's response (time between the sending of the call invocation until the arrival of the server's response).
operation	ClientServerOperation	0..1	ref	This represents the corresponding ClientServerOperation.
transformationComSpecProps	TransformationComSpecProps	*	aggr	This references the TransformationComSpecProps which define port-specific configuration for data transformation.

Table 4.77: ClientComSpec

Note: on the AUTOSAR adaptive platform the ClientComSpec can also be used in the context of RPortPrototypes typed by PortInterfaces that are not available on the AUTOSAR classic platform. This is the motivation for the existence of [constr_1540].

[TPS_SWCT_01595] Semantics of attribute ClientComSpec.transformationComSpecProps [The attribute ClientComSpec.transformationComSpecProps

shall be used to configure `PortPrototype`-specific properties for data transformation in case of Client/Server inter-ECU communication for the reception of the server's response. *(RS_SWCT_03221)*

4.5.2.2 Server ComSpec

The server side looks very similar but provides an attribute for specifying the queue length.

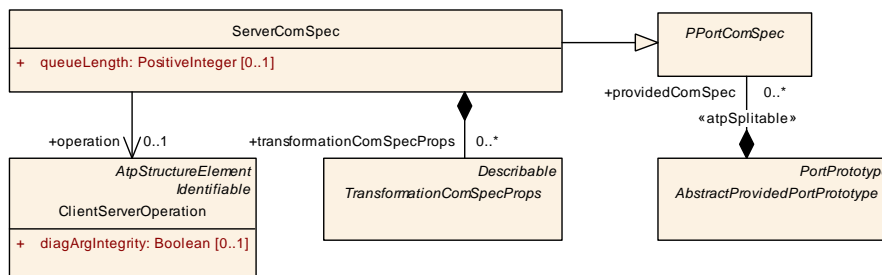

Figure 4.41: Communication attributes of `PPortPrototype` with respect to client-server communication.

[constr_1541] Existence of `ServerComSpec.operation` [The reference `ServerComSpec.operation` shall exist if the `AbstractProvidedPortPrototype` that owns the `ServerComSpec` is typed by a `ClientServerInterface`.

This rule shall be imposed **at the time when the contract phase generation is executed.** *()*

Note: on the *AUTOSAR adaptive platform* the `ServerComSpec` can also be used in the context of `RPortPrototypes` typed by `PortInterfaces` that are not available on the *AUTOSAR classic platform*. This is the motivation for the existence of **[constr_1541]**.

Class	ServerComSpec			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Communication attributes for a server port (<code>PPortPrototype</code> and <code>ClientServerInterface</code>).			
Base	<code>ARObject</code> , <code>PPortComSpec</code>			
Aggregated by	<code>AbstractProvidedPortPrototype.providedComSpec</code> , <code>PortPrototypeBlueprint.providedComSpec</code>			
Attribute	Type	Mult.	Kind	Note
operation	<code>ClientServerOperation</code>	0..1	ref	Operation these communication attributes apply to.
queueLength	PositiveInteger	0..1	attr	Length of call queue on the server side. The queue is implemented by the RTE. The value shall be greater or equal to 1. Setting the value of queueLength to 1 implies that incoming requests are rejected while another request that arrived earlier is being processed.
transformationComSpecProps	<code>TransformationComSpecProps</code>	*	aggr	This references the <code>TransformationComSpecProps</code> which define port-specific configuration for data transformation.

Table 4.78: ServerComSpec

The definition of `ServerComSpec.queueLength` is optional on the level of a software-component. Even if a value is specified, it may be overridden in the configuration of the RTE, at the discretion of an integrator.

[TPS_SWCT_01225] `RunnableEntity` implements the functionality of more than one `ClientServerOperations` [A single `RunnableEntity` can implement the functionality of more than one `ClientServerOperations`.

For this purpose, one `OperationInvokedEvent` for each affected `ClientServerOperation` shall reference the respective `RunnableEntity`.

The attribute `ServerComSpec.queueLength` shall be taken for the determination of the resulting queue length, **[constr_1128]** applies.]()

For more information about requirements towards `ClientServerOperations` triggering the same `RunnableEntity` can be found in section 7.2.4.3, specifically **[constr_2000]**.

[constr_1128] Queue length of `ClientServerOperations` associated with the same `RunnableEntity` [If two or more `OperationInvokedEvents` reference a single `RunnableEntity` the value of the `ServerComSpec` attribute `queueLength` shall be **identical** for all `ServerComSpecs` owned by `PPortPrototypes` of the enclosing `SwComponentType` that reference one of the `ClientServerOperations` that are also referenced by the `OperationInvokedEvents`.

This rule shall be imposed **at the time when the RTE is generated.**]()

[TPS_SWCT_01596] Semantics of attribute `ServerComSpec.transformationComSpecProps` [The attribute `ServerComSpec.transformationComSpecProps` shall be used to configure `PortPrototype`-specific properties for data transformation in case of Client/Server inter-ECU communication for the reception of the client's request.] (*RS_SWCT_03221*)

See chapter 4.5.6 for details.

4.5.3 Communication Specification for Mode Switch Communication

4.5.3.1 Mode Switch Sender ComSpec

In analogy to the previous section, Figure 4.42 shows the meta-model elements relevant for a mode switch communication.

On the sender side it is possible to specify that an acknowledgement is supposed to be returned that indicates the successful processing of the mode switch request.

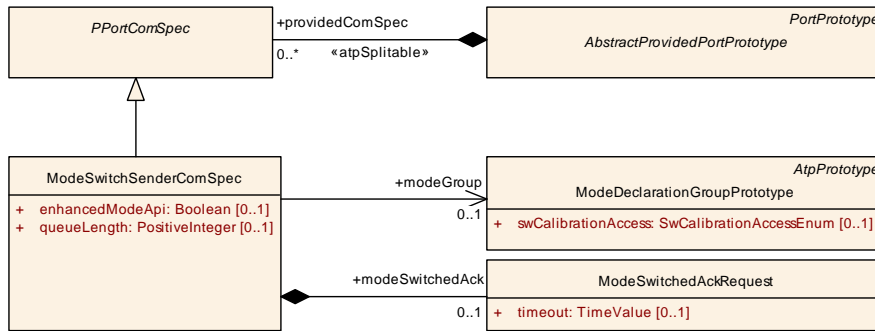

Figure 4.42: Communication attributes of PPortPrototype with respect to mode switch communication.

Class	ModeSwitchSenderComSpec			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Communication attributes of PPortPrototypes with respect to mode communication			
Base	ARObject, PPortComSpec			
Aggregated by	AbstractProvidedPortPrototype.providedComSpec, PortPrototypeBlueprint.providedComSpec			
Attribute	Type	Mult.	Kind	Note
enhancedMode Api	Boolean	0..1	attr	This controls the creation of the enhanced mode API that returns information about the previous mode and the next mode. If set to "true" the enhanced mode API is supposed to be generated. For more details please refer to the SWS_RTE.
modeGroup	ModeDeclarationGroup Prototype	0..1	ref	ModeDeclarationGroupPrototype (of the same Port Interface) to which these communication attributes apply.
modeSwitched Ack	ModeSwitchedAck Request	0..1	aggr	If this aggregation exists an acknowledgement for the successful processing of the mode switch request is required.
queueLength	PositiveInteger	0..1	attr	Length of call queue on the mode user side. The queue is implemented by the RTE. The value shall be greater or equal to 1. Setting the value of queueLength to 1 implies that incoming requests are rejected while another request that arrived earlier is being processed.

Table 4.79: ModeSwitchSenderComSpec

Class	ModeSwitchedAckRequest			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Requests acknowledgements that a mode switch has been proceeded successfully			
Base	ARObject			
Aggregated by	ModeSwitchSenderComSpec.modeSwitchedAck			
Attribute	Type	Mult.	Kind	Note
timeout	TimeValue	0..1	attr	Number of seconds before an error is reported or in case of allowed redundancy, the value is sent again.

Table 4.80: ModeSwitchedAckRequest

[constr_1894] Existence of attribute ModeSwitchSenderComSpec.queueLength
 [For each ModeSwitchSenderComSpec, attribute queueLength shall exist **at the time when the RTE is generated.**]()

[constr_1895] Existence of attribute `ModeSwitchSenderComSpec.modeGroup`
[For each `ModeSwitchSenderComSpec`, attribute `modeGroup` shall exist at the time when the contract phase generation is executed.]()

4.5.3.2 Mode Switch Receiver ComSpec

[TPS_SWCT_01514] Duplicate existence of `enhancedModeApi` in the context of a `PRPortPrototype` [If the attribute `enhancedModeApi` is defined in a `ModeSwitchReceiverComSpec` owned by a `PRPortPrototype`, its value shall be ignored.](*RS_SWCT_03250*)

Figure 4.43: Communication attributes of `PRPortPrototype` with respect to mode switch communication.

Class	<code>ModeSwitchReceiverComSpec</code>				
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication				
Note	Communication attributes of <code>RPortPrototypes</code> with respect to mode communication				
Base	<code>ARObject</code> , <code>RPortComSpec</code>				
Aggregated by	<code>AbstractRequiredPortPrototype.requiredComSpec</code> , <code>PortPrototypeBlueprint.requiredComSpec</code>				
Attribute	Type	Mult.	Kind	Note	
enhancedMode Api	Boolean	0..1	attr	This controls the creation of the enhanced mode API that returns information about the previous mode and the next mode. If set to "true" the enhanced mode API is supposed to be generated. For more details please refer to the SWS_RTE.	
modeGroup	<code>ModeDeclarationGroup Prototype</code>	0..1	ref	ModeDeclarationGroupPrototype (of the same Port Interface) to which these communication attributes apply.	
supports Asynchronous ModeSwitch	Boolean	0..1	attr	This attribute controls the behavior of the corresponding <code>RPortPrototype</code> with respect to the question whether it can deal with asynchronous mode switch requests, i.e. if set to true, the <code>RPortPrototype</code> is able to deal with an asynchronous mode switch request.	

Table 4.81: `ModeSwitchReceiverComSpec`

[constr_1896] Existence of attribute `ModeSwitchReceiverComSpec.modeGroup`
[For each `ModeSwitchReceiverComSpec`, attribute `modeGroup` shall exist at the time when the contract phase generation is executed.]()

4.5.4 Communication Specification for Parameters

Granted, the definition of a `ComSpec` for `ParameterDataPrototypes` looks strange on first sight. A `ParameterDataPrototype` owned by a `PPortPrototype` typed by a `ParameterInterface` is not actually transmitted over any communication medium. Therefore, the term *communication* should in this case be taken with a grain of salt.

However, it is generally necessary to be able to define role-specific initial values for `ParameterDataPrototypes` aggregated in a `ParameterInterface`. In other words, the actual problem closely resembles the definition of initial values in the case of sender-receiver communication.

[TPS_SWCT_01226] `initValue` on the level of a `ComSpec` is relevant for connections to the corresponding `PortPrototype` [Please note that (along the example of sender-receiver communication) only the `initValue` defined in the context of a `ParameterProvideComSpec` or `ParameterRequireComSpec` is relevant for connections to the corresponding `PortPrototype`. An `initValue` defined in the scope of a `ParameterDataPrototype` is ignored.]()

Therefore, it is only reasonable to apply the existing and well-known pattern to the definition of initial values for `ParameterDataPrototypes` aggregated in a `ParameterInterface`. The actual modeling is sketched in Figure 4.44 for provided `ParameterDataPrototypes` and in Figure 4.45 for required `ParameterDataPrototypes`.

Figure 4.44: Communication attributes of `ParameterDataPrototypes` with respect to `PPortPrototype`

Attribute	Type	Mult.	Kind	Note
initValue	ValueSpecification	0..1	aggr	The initial value owned by the NvComSpec
variable	VariableDataPrototype	0..1	ref	The VariableDataPrototype the ComSpec applies for.

Table 4.84: NvRequireComSpec

[constr_1899] **Existence of reference NvRequireComSpec.variable** [For each **NvRequireComSpec**, the reference **variable** shall exist **at the time when the contract phase generation is executed**.]()

4.5.5.2 NV Provide ComSpec

[TPS_SWCT_01228] **NvProvideComSpec** [As communication with an **NvBlock-SwComponentType** is in most cases bi-directional it is also necessary to consider role-specific communication attributes for **AbstractProvidedPortPrototypes** typed by an **NvDataInterface**. For this purpose the **NvProvideComSpec** is defined.

The main purpose of this kind of **ComSpec** is the definition of initial values for the **RAM Block** and the **ROM Block** that corresponds to an **nvData** defined in the context of the **NvDataInterface** used to type the given **AbstractProvidedPortPrototype**.](RS_SWCT_03225)

More information about **NvProvideComSpec** please refer to Figure 4.47.

Note that these initial values can be taken as an input for designing an **NvBlock-SwComponentType**, in particular the **ramBlocks** and **romBlocks** of **NvBlockDescriptors** owned by the **NvBlockSwComponentType**. Further details are explained in Figure 11.5.

Also, note that the `romBlockInitValue` provided in the `NvProvideComSpec` does not necessarily have to be identical to the respective section within `romBlock` in the `NvBlockDescriptor`.

This could happen if an `NvBlockSwComponentType` is already existing and an `ApplicationSwComponentType` is connected to it. Finally, the `romBlock` inside the `NvBlockDescriptor` is the only relevant information for the RTE generation.

Figure 4.47: Communication attributes of a provided `VariableDataPrototypes` used in the context of an `NvDataInterface`

In other words, by means of the `NvProvideComSpec` the author of an `ApplicationSwComponentType` can express detailed requirements on the later design of a corresponding `NvBlockSwComponentType`.

Class	NvProvideComSpec			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Communication attributes of PPortPrototypes with respect to Nv data communication on the provided side.

Attribute	Type	Mult.	Kind	Note
ramBlockInit Value	ValueSpecification	0..1	aggr	This represents the initial value of the RAM Block that corresponds to the referenced variable.
romBlockInit Value	ValueSpecification	0..1	aggr	This represents the initial value of the ROM block that corresponds to the referenced variable.
variable	VariableDataPrototype	0..1	ref	This represents the variable for which the ComSpec is specified.

Table 4.85: NvProvideComSpec

[constr_1900] Existence of reference `NvProvideComSpec.variable` [For each `NvProvideComSpec`, the reference `variable` shall exist **at the time when the contract phase generation is executed.**]()

4.5.6 Configuration of Data Transformation

The big picture of data transformation in AUTOSR is explained in the TPS System Template [10]. This chapter focuses on the aspects of data transformation that are related to the configuration of software-components.

Using the [TransformationComSpecProps](#) it is possible to define configuration options for specific transformers of inter-ECU communication which is subject to data transformation.

[TPS_SWCT_01594] Semantics of TransformationComSpecProps [The definition of a [TransformationComSpecProps](#) can always be provided in the SWC description but the configuration shall **only** have an effect if

1. the actual communication involves at least two [EcuInstances](#)
2. the respective data transformer (given by the used [TransformationComSpecProps](#)) is used during data transformation (see [DataTransformation](#))

]([RS_SWCT_03221](#))

For clarification, the configuration given in [TransformationComSpecProps](#) will simply be ignored if the conditions defined by [\[TPS_SWCT_01594\]](#) do not apply.

[TPS_SWCT_01597] PortPrototype-specific data transformation configuration [Meta-class [TransformationComSpecProps](#) shall be used for the specification of [PortPrototype](#)-specific configuration options for data transformation of inter-ECU communication.] ([RS_SWCT_03221](#))

Please note that only some transformers offer [PortPrototype](#)-specific configuration (e.g. SOME/IP transformer doesn't have [TransformationComSpecProps](#)).

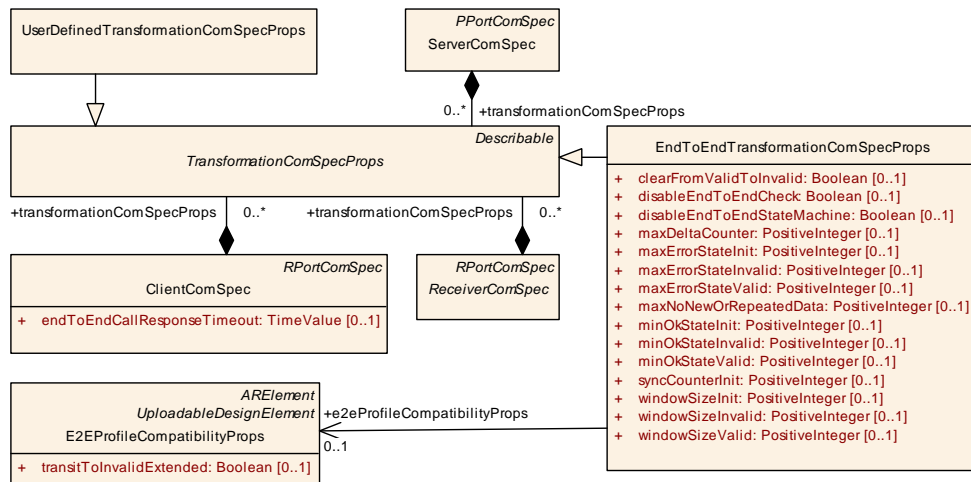

Figure 4.48: Specification of data transformation properties within [ReceiverComSpec](#), [ServerComSpec](#), and [ClientComSpec](#)

Class	<i>TransformationComSpecProps</i> (abstract)
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication
Note	TransformationComSpecProps holds all the attributes for transformers that are port specific.
Base	<i>ARObject</i> , <i>Describable</i>
Subclasses	EndToEndTransformationComSpecProps , UserDefinedTransformationComSpecProps

Class	<i>TransformationComSpecProps</i> (abstract)			
Aggregated by	ClientComSpec.transformationComSpecProps, ReceiverComSpec.transformationComSpecProps, ServerComSpec.transformationComSpecProps			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table 4.86: TransformationComSpecProps

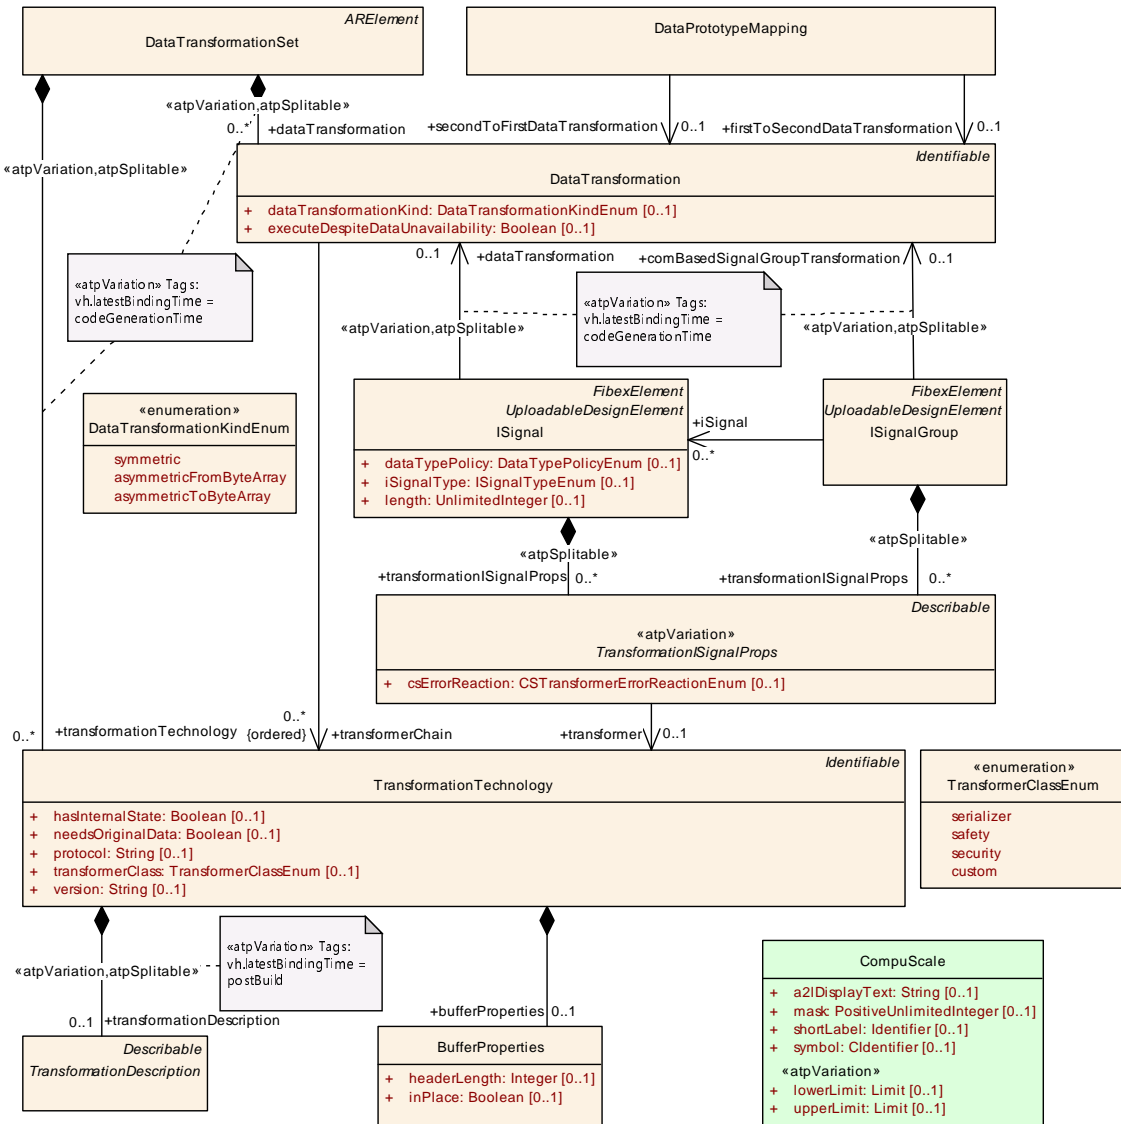

Figure 4.49: Big picture of data transformation in the AUTOSAR meta-model

It can be determined by the specific [TransformationComSpecProps](#) to which transformer this configuration is applicable:

- The configuration in [EndToEndTransformationComSpecProps](#) is applicable to E2E transformer (**protocol** of [TransformationTechnology](#) is set to End-To-End).

- The configuration in `UserDefinedTransformationComSpecProps` is applicable to a user-defined transformer.

[TPS_SWCT_01598] More than one user-defined transformer is used within one transformer chain [If more than one user-defined transformer is used within one transformer chain (defined by meta-class `TransformationTechnology`), the `UserDefinedTransformationComSpecProps` shall be assigned to the correct user-defined custom transformer in `TransformationTechnology`.] (*RS_SWCT_03221*)

[constr_1400] Reference to a specific `DataTransformation` [A specific `DataTransformation` shall only be referenced by either

- a `DataPrototypeMapping` in the role `firstToSecondDataTransformation` (and potentially `secondToFirstDataTransformation`) **or**
- an `ISignal` in the role `dataTransformation` **or**
- an `ISignalGroup` in the role `comBasedSignalGroupTransformation` **or**
- a `ClientServerOperationMapping` in the role `firstToSecondDataTransformation`

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1401] Restrictions on the relation between `DataPrototypeMapping` and `DataTransformation` [A `VariableDataPrototype` in the context of a `PortPrototype` shall – **at the time when the RTE is generated** – not be referenced by a `DataPrototypeMapping` that references a `DataTransformation` while a `DataMapping` exists that points to this `VariableDataPrototype` (via the `SystemSignal`) that also refers to an `ISignal` that in turn references a `DataTransformation`.]()

In other words: a `VariableDataPrototype` can either become a part of a `DataPrototypeMapping`-based data transformation or of an `ISignal`-based data transformation.

Please note that in a composite software structure the `VariableDataPrototype` can be delegated throughout the `CompositionSwComponentType` and **[constr_1401]** still applies.

Table 4.94: PortGroup

[TPS_SWCT_01065] **PortPrototype** may belong to more than one **PortGroups** [A **PortPrototype** may belong to more than one **PortGroups** and **PortGroups** can be associated with the "inner" **PortGroups** of **SwComponentPrototypes** which are aggregated by the same **SwComponentType** as the **PortGroup**.

By this, **PortGroups** can be locally defined but still traced down the component hierarchy.] ([RS_SWCT_03200](#), [RS_SWCT_03201](#))

[TPS_SWCT_01066] PortGroups can be associated with certain ServiceNeeds
[PortGroups can be associated with certain ServiceNeeds in order to trace the information down to the configuration of the basic software.](RS_SWCT_03200, RS_SWCT_03201)

For more details, see chapter 7.11.2.

[constr_1147] Standardized values for the attribute category of meta-class PortGroup [

The following values of the attribute `category` of meta-class `PortGroup` are reserved by the AUTOSAR standard:

- `MODE_MANAGEMENT`: This represents the usage of the `PortGroup` for the purpose of mode management
- `PARTIAL_NETWORKING`: This represents the usage of the `PortGroup` for the purpose of partial networking

This rule shall be imposed **at the time when the creation of the CompositionSwComponentType is finished.**]()

4.7 End to End Protection

The aspect of end-to-end protection has seen different support by the AUTOSAR meta-model.

On the one hand, there is the definition of dedicated meta-classes, e.g. `EndToEndDescription`, which aim at an implementation that uses a so-called E2E wrapper (an approach with a software component above RTE invoking the E2E library) or AUTOSAR Com module callout mechanism (with Com callouts used to invoke E2E library).

This approach is documented in chapter 4.7 of this document.

As an alternative approach, it is possible to implement end-to-end protection using so-called data transformers.

The detailed description of how this approach can be configured is beyond the scope of this document. Please refer to the TPS System Template [10] where the details of the alternative approach are explained.

Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR, see [18]). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach.

As described in [19], there are cases where safety-related software-components protect the data exchanged between each other. For this purpose modeling support is provided by the software-component template.

Note that several end-to-end profiles are selectable for a specific application. The specific end-to-end profile is represented by the attribute `category` of meta-class `EndToEndDescription`.

Semantically, the `category` value represents an identification of the specific end-to-end profile applicable for the communication of the corresponding data element. According to [19] there are two pre-defined profiles that can be used.

[TPS_SWCT_01089] end-to-end communication protection [The information specific to each profile is expressed by the set of attributes of `EndToEndDescription` owned by `EndToEndProtection` in the role `endToEndProfile`.] (*RS_SWCT_03240*)

Class	EndToEndDescription			
Package	M2::AUTOSARTemplates::SWComponentTemplate::EndToEndProtection			
Note	This meta-class contains information about end-to-end protection. The set of applicable attributes depends on the actual value of the category attribute of EndToEndProtection.			
Base	<i>ARObject</i>			
Aggregated by	EndToEndProtection.endToEndProfile			
Attribute	Type	Mult.	Kind	Note
category	NameToken	0..1	attr	The category represents the identification of the concrete E2E profile. The applicable values are specified in a semantic constraint and determine the applicable attributes of EndToEndDescription. Tags: xml.sequenceOffset=-100
counterOffset	PositiveInteger	0..1	attr	Bit offset of Counter from the beginning of the Array representation of the Signal Group/VariableDataPrototype (MSB order, bit numbering: bit 0 is the least important). The offset shall be a multiplicity of 4 and it should be 8 whenever possible. For example, offset 8 means that the counter will take the low nibble of the byte 1, i.e. bits 8 .. 11. If counterOffset is not present the value is defined by the selected profile. Tags: xml.sequenceOffset=-50
crcOffset	PositiveInteger	0..1	attr	Bit offset of CRC from the beginning of the Array representation of the Signal Group/VariableDataPrototype (MSB order, bit numbering: bit 0 is the least important). The offset shall be a multiplicity of 8 and it should be 0 whenever possible. For example, offset 8 means that the CRC will take the byte 1, i.e. bits 8..15. If crcOffset is not present the value is defined by the selected profile. Tags: xml.sequenceOffset=-60

Class	EndToEndDescription			
dataId (ordered)	PositiveInteger	*	attr	<p>This represents a unique numerical identifier.</p> <p>Note: ID is used for protection against masquerading. The details concerning the maximum number of values (this information is specific for each E2E profile) applicable for this attribute are controlled by a semantic constraint that depends on the category of the EndToEnd Protection.</p> <p>Tags: xml.sequenceOffset=-90</p>
dataIdMode	PositiveInteger	0..1	attr	<p>There are three inclusion modes how the implicit two-byte Data ID is included in the one-byte CRC:</p> <ul style="list-style-type: none"> • dataIdMode = 0: Two bytes are included in the CRC (double ID configuration) This is used in variant 1A. • dataIdMode = 1: One of the two bytes byte is included, alternating high and low byte, depending on parity of the counter (alternating ID configuration). For even counter low byte is included; For odd counters the high byte is included. This is used in variant 1B. • dataIdMode = 2: Only low byte is included, high byte is never used. This is applicable if the IDs in a particular system are 8 bits. • dataIdMode = 3: The low byte is included in the implicit CRC calculation, the low nibble of the high byte is transmitted along with the data (i.e. it is explicitly included), the high nibble of the high byte is not used. This is applicable for the IDs up to 12 bits. <p>Tags: xml.sequenceOffset=-85</p>
dataIdNibble Offset	PositiveInteger	0..1	attr	<p>Bit offset of the low nibble of the high byte of Data ID. The applicability of this attribute is controlled by [constr_1261].</p> <p>Tags: xml.sequenceOffset=-25</p>
dataLength	PositiveInteger	0..1	attr	<p>This attribute represents the length of the Array representation of the Signal Group/VariableDataPrototype including CRC and Counter in bits.</p> <p>Tags: xml.sequenceOffset=-80</p>
maxDelta CounterInit	PositiveInteger	0..1	attr	<p>Initial maximum allowed gap between two counter values of two consecutively received valid Data, i.e. how many subsequent lost data is accepted. For example, if the receiver gets Data with counter 1 and MaxDeltaCounter Init is 1, then at the next reception the receiver can accept Counters with values 2 and 3, but not 4.</p> <p>Note that if the receiver does not receive new Data at a consecutive read, then the receiver increments the tolerance by 1.</p> <p>Tags: xml.sequenceOffset=-70</p>
maxNoNewOr RepeatedData	PositiveInteger	0..1	attr	<p>The maximum amount of missing or repeated Data which the receiver does not expect to exceed under normal communication conditions.</p> <p>Tags: xml.sequenceOffset=-40</p>
syncCounterInit	PositiveInteger	0..1	attr	<p>Number of Data required for validating the consistency of the counter that shall be received with a valid counter (i.e. counter within the allowed lock-in range) after the detection of an unexpected behavior of a received counter.</p> <p>Tags: xml.sequenceOffset=-30</p>

Table 4.95: EndToEndDescription

[constr_1901] Existence of attribute `EndToEndDescription.category` [For each `EndToEndDescription`, attribute `category` shall exist **at the time when the contract phase generation is executed.**](*)*

[TPS_SWCT_01090] `EndToEndProtection` [`EndToEndProtection` is the `Identifiable` class that owns specific elements for referencing the to-be-protected data elements and signals

- `EndToEndProtectionVariablePrototype`: a specific `dataElement` owned by a specific `PortPrototype`
- `EndToEndProtectionISignalIPdu`: a specific `ISignalGroup` in the context of an `ISignalIPdu`. For more details please refer to [10]

](*RS_SWCT_03240*)

[TPS_SWCT_01091] Two cases for end-to-end protection [In order to protect a `VariableDataPrototype` the `EndToEndProtectionVariablePrototype` shall be defined. If communication is defined between ECUs using AUTOSAR COM the `EndToEndProtectionISignalIPdu` shall be defined as well.](*RS_SWCT_03240*)

The following features apply:

- **[constr_1000] End-to-end protection is limited to sender/receiver communication** [A `VariableDataPrototype` referenced in the roles
 - `EndToEndProtectionVariablePrototype.sender`
 - `EndToEndProtectionVariablePrototype.receiver`

shall be aggregated in the role `dataElement` at a `SenderReceiverInterface` **at the time when the contract phase generation is executed.**](*)*

- The value of the `dataId` is assigned by a central authority rather than by the developer of the software-component.
- The information about the `dataId` shall be available at both the sender and the receiver(s).
- **[TPS_SWCT_01508] Scope of end-to-end protection** [End-to-end protection applies to local (i.e. within the ECU) as well as remote (i.e. ECU to ECU) communication.](*RS_SWCT_03240*)

[TPS_SWCT_01092] `EndToEndProtectionSet` [The meta-class `EndToEndProtectionSet` provides a container for `EndToEndProtection`. The aggregation is stereotyped `<<atpSplittable>>` because the information about end-to-end protection is added at a later step in the development workflow.](*RS_SWCT_03240*)

It also has the stereotype `<<atpVariation>>` because this allows for implementing the software-component in two variants, one that uses end-to-end protection and one that does not use it. It also might happen that the communication ends themselves are variant.

`EndToEndProtection` maintains `InstanceRefs` to one `dataElement` in the role of `sender` and to one or many `dataElements` in the role of `receiver`. By this means it is possible to support a 1:n communication scenario.

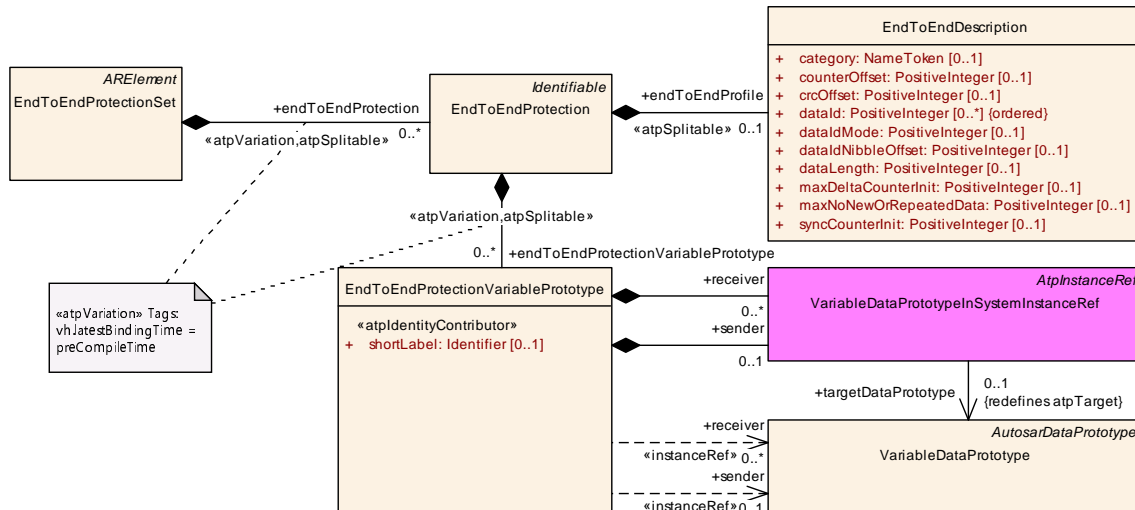

Figure 4.51: Details of the modeling of end-to-end protection

[TPS_SWCT_01093] Aggregation `EndToEndProtection.endToEndProfile` is splittable [`EndToEndProtection` aggregates `EndToEndDescription` using stereotype `«atpSplittable»`].

By this means it is for the integrator of an ECU possible to generally specify the nature of a specific end-to-end protection but leave the actual assignment of values (e.g. for `dataId`) to a later process step. (RS_SWCT_03240)

According to [19] the following constraints apply on the attributes of `EndToEndProtection` (note that additional M1 constraints apply as described in [19]):

[TPS_SWCT_01094] Standardized values of attribute `EndToEndDescription.category` [The following values for the `category` of `EndToEndDescription` are standardized and reserved for being used in the way the AUTOSAR standard foresees:

- NONE
- PROFILE_01
- PROFILE_02

In addition, it is positively possible to use other than the standardized values for the `category` if it is ensured that the proprietary values do not clash with an extension of the standardized values, e.g. by using a company-specific prefix. (RS_SWCT_03240)

The semantics of the standardized values of attribute `EndToEndDescription.category` is explained below:

NONE This value indicates that the E2E framework shall be enabled for the given `sender/receiver` respectively the given `iSignalIPdu`. The wrapper code

shall be generated but it shall not invoke E2E library protection routines. E2E wrapper works as pass-through.

This may be used when a profile selection or profile options are not yet selected in a given system but it is required that the system can be built successfully under consideration of the E2E library. This would also be applicable for migrating from/to a system with/without E2E protection.

[TPS_SWCT_01095] category set to NONE [If attributes exist in the presence of the `category` being set to `NONE`, the attributes shall be ignored.] ([RS_SWCT_03240](#))

PROFILE_01 This value indicates that the settings of E2E profile 1 (that uses a SAE CRC8, implicit 16-bit data ID, and a 4 bit alive counter) apply.

[constr_1113] Existence of attributes in PROFILE_01 [In `PROFILE_01`, the following attributes shall exist:

- `dataLength`
- `dataId`

at the time when the contract phase generation is executed.]()

Please note that the attribute `maxDeltaCounterInit` is also part of `PROFILE_01` but it does not necessarily have to exist provided that `ReceiverComSpec.maxDeltaCounterInit` exists.

[TPS_SWCT_01850] Usage of attribute RPortPrototype.requiredComSpec.maxDeltaCounterInit vs. EndToEndProtection.endToEndProfile.maxDeltaCounterInit [If

- the value of reference `EndToEndProtection.endToEndProtectionVariablePrototype.receiver` is identical to the value of the reference `RPortPrototype.requiredComSpec.dataElement` **and**
- attribute `RPortPrototype.requiredComSpec.maxDeltaCounterInit` exists,

then the value of attribute `RPortPrototype.requiredComSpec.maxDeltaCounterInit` **shall be preferred** over the value of attribute `EndToEndProtection.endToEndProfile.maxDeltaCounterInit`.] ([RS_SWCT_03240](#))

[constr_1170] Existence of attribute EndToEndDescription.maxDeltaCounterInit for PROFILE_01 [If the value of attribute `EndToEndDescription.category` is set to `PROFILE_01` **and either**

- the condition described in [\[TPS_SWCT_01850\]](#) concerning the referenced `VariableDataPrototype` is not fulfilled **or**
- attribute `RPortPrototype.requiredComSpec.maxDeltaCounterInit` does not exist,

then attribute `EndToEndProtection.endToEndProfile.maxDeltaCounterInit` shall exist at the time when the contract phase generation is executed.]()

[constr_1111] Constraints of `dataId` in `PROFILE_01` [In `PROFILE_01`, there shall be only one element in the set and the applicable range of values is [0 .. 65535].

This rule shall be imposed at the time when the contract phase generation is executed.]()

[constr_1112] Constraints of `dataIdMode` in `PROFILE_01` [In `PROFILE_01`, the applicable range of values for `dataIdMode` is [0 .. 3].

This rule shall be imposed at the time when the contract phase generation is executed.]()

[constr_1114] Constraints of `crcOffset` in `PROFILE_01` [In `PROFILE_01`, the applicable range of values for `crcOffset` is [0 .. 65535]. For the value of this attribute the constraint $value \bmod 4 = 0$ applies.

This rule shall be imposed at the time when the contract phase generation is executed.]()

[constr_1115] Constraints of `counterOffset` in `PROFILE_01` [In `PROFILE_01`, the applicable range of values for `counterOffset` is [0 .. 65535]. For the value of this attribute the constraint $value \bmod 4 = 0$ applies.

This rule shall be imposed at the time when the contract phase generation is executed.]()

[constr_1116] Constraints of `dataLength` in `PROFILE_01` [In `PROFILE_01`, the applicable range of values for `dataLength` is [0 .. 240]. For the value of this attribute the constraint $value \bmod 8 = 0$ applies.

This rule shall be imposed at the time when the contract phase generation is executed.]()

[constr_1117] Constraints of `maxDeltaCounterInit` in `PROFILE_01` [In `PROFILE_01`, the applicable range of values for `EndToEndDescription.maxDeltaCounterInit` and `ReceiverComSpec.maxDeltaCounterInit` is [0 .. 14].

This rule shall be imposed at the time when the contract phase generation is executed.]()

[constr_1211] Constraints of `maxNoNewOrRepeatedData` in `PROFILE_01` [In `PROFILE_01`, the applicable range of values for `EndToEndDescription.maxNoNewOrRepeatedData` and `ReceiverComSpec.maxNoNewOrRepeatedData` is [0 .. 14].

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1212] Constraints of `syncCounterInit` in `PROFILE_01` [In `PROFILE_01`, the applicable range of values for `EndToEndDescription.syncCounterInit` and `ReceiverComSpec.syncCounterInit` is [0 .. 14].

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01851] Usage of attribute `RPortPrototype.requiredComSpec.maxNoNewOrRepeatedData` vs. `EndToEndProtection.endToEndProfile.maxNoNewOrRepeatedData` [If

- the value of reference `EndToEndProtection.endToEndProtectionVariablePrototype.receiver` is identical to the value of the reference `RPortPrototype.requiredComSpec.dataElement` **and**
- attribute `RPortPrototype.requiredComSpec.maxNoNewOrRepeatedData` exists,

then the value of `RPortPrototype.requiredComSpec.maxNoNewOrRepeatedData` **shall be preferred** over the value of `EndToEndProtection.endToEndProfile.maxNoNewOrRepeatedData.`] (*RS_SWCT_03240*)

[constr_1215] Existence of attribute `EndToEndDescription.maxNoNewOrRepeatedData` for `PROFILE_01` [If the value of attribute `EndToEndDescription.category` is set to `PROFILE_01` **and either**

- the condition described in [TPS_SWCT_01851] concerning the referenced `VariableDataPrototype` is not fulfilled **or**
- attribute `RPortPrototype.requiredComSpec.maxNoNewOrRepeatedData` does not exist,

then attribute `EndToEndProtection.endToEndProfile.maxNoNewOrRepeatedData` **shall exist at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01852] Usage of attribute `RPortPrototype.requiredComSpec.syncCounterInit` vs. attribute `EndToEndProtection.endToEndProfile.syncCounterInit` [If

- the value of reference `EndToEndProtection.endToEndProtectionVariablePrototype.receiver` is identical to the value of the reference `RPortPrototype.requiredComSpec.dataElement` **and**
- attribute `RPortPrototype.requiredComSpec.syncCounterInit` exists,

then the value of `RPortPrototype.requiredComSpec.syncCounterInit` shall be preferred over the value of `EndToEndProtection.endToEndProfile.syncCounterInit`.] (*RS_SWCT_03240*)

[constr_1216] Existence of attribute `EndToEndDescription.syncCounterInit` for `PROFILE_01` [If the value of attribute `EndToEndDescription.category` is set to `PROFILE_01` and either

- the condition described in [*TPS_SWCT_01852*] concerning the referenced `VariableDataPrototype` is not fulfilled or
- attribute `RPortPrototype.requiredComSpec.syncCounterInit` does not exist,

then the attribute `EndToEndProtection.endToEndProfile.syncCounterInit` shall exist at the time when the contract phase generation is executed.]()

[constr_1261] Applicability for `EndToEndDescription.dataIdNibbleOffset` [`EndToEndDescription.dataIdNibbleOffset` shall be used only if `EndToEndDescription.dataIdMode` is set to the value 3 and at the same time `EndToEndDescription.category` is set to `PROFILE_01`.

This rule shall be imposed at the time when the contract phase generation is executed.]()

[TPS_SWCT_01529] Default value for `EndToEndDescription.dataIdNibbleOffset` [If `EndToEndDescription.dataIdMode` is set to the value 3 and at the same time `EndToEndDescription.category` is set to the value `PROFILE_01` and `EndToEndDescription.dataIdNibbleOffset` is not specified, then the default value of 12 (bits) shall be assumed for the attribute `EndToEndDescription.dataIdNibbleOffset`.] (*RS_SWCT_03240*)

PROFILE_02 This value indicates that the settings of E2E profile 2 apply.

[constr_1118] Existence of attributes in `PROFILE_02` [In `PROFILE_02`, only the following attributes shall exist:

- `dataLength`
- `dataId`

at the time when the contract phase generation is executed]()

Please note that the attribute `maxDeltaCounterInit` is also part of `PROFILE_01` but it does not necessarily have to exist provided that `ReceiverComSpec.maxDeltaCounterInit` exists.

[constr_1171] Existence of attribute `EndToEndDescription.maxDeltaCounterInit` for `PROFILE_02` [If the value of `EndToEndDescription.category` is set to `PROFILE_02` and either

- the condition described in [TPS_SWCT_01850] concerning the referenced `VariableDataPrototype` is not fulfilled **or**
- attribute `RPortPrototype.requiredComSpec.maxDeltaCounterInit` does not exist,

then attribute `EndToEndProtection.endToEndProfile.maxDeltaCounterInit` **shall exist at the time when the contract phase generation is executed.**]()

[constr_1119] Constraints of `dataLength` in `PROFILE_02` [In `PROFILE_02`, the applicable range of values for `dataLength` is [0 .. 65535]. For the value of this attribute the constraint *value mod 8 = 0* applies.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1120] Constraints of `dataId` in `PROFILE_02` [In `PROFILE_02`, there shall be exactly ordered 16 elements in the set and the applicable range of values is [0 .. 255].

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1121] Constraints of `maxDeltaCounterInit` in `PROFILE_02` [In `PROFILE_02`, the applicable range of values for `EndToEndDescription.maxDeltaCounterInit` and `ReceiverComSpec.maxDeltaCounterInit` is [0 .. 15].

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Please note that using end-to-end protection it is explicitly supported that one sender may correspond to one or more receivers.

[constr_1183] EndToEndProtectionVariablePrototypes aggregated by EndToEndProtection [All [EndToEndProtectionVariablePrototypes](#) aggregated by the same [EndToEndProtection](#) shall refer to the identical sender at the time when the contract phase generation is executed.]()

4.8 Partial Networking

[TPS_SWCT_01169] Support for partial networking [On the level of the Software Component Template, partial networking is supported by means of the concept of a “Virtual Function Cluster” (VFC).

The latter groups all communication on the VFB with respect to a given function. However, the conceptual idea of a Virtual Function Cluster is not represented in the meta-model as such.

Instead, [PortGroups](#) are used to specify the grouping of [PortPrototypes](#) to the higher conceptual level of a Virtual Function Cluster.] ([RS_SWCT_03241](#), [RS_SWCT_03201](#))

Please note that more information regarding the semantics of [PortGroups](#) can be found in chapter 4.6.

There are no restrictions regarding the structure of [PortGroup](#) definitions on M1. One [PortPrototype](#) may become a member of several [PortGroups](#), thereby creating overlapping [PortGroups](#).

[TPS_SWCT_01170] Purpose of Virtual Function Cluster [The purpose of Virtual Function Cluster within the Software Component Template mainly has three aspects:

1. assign `PortPrototypes` (non service related) of Sender Receiver or Client Server communication to Virtual Function Clusters.
2. control the behavior of the corresponding function in terms of whether it is required at a given point in time. This aspect is implemented by the concept of a **control port**. Software-components that implement control ports of a Virtual Function Cluster conceptually become **VFC Controllers**.
3. allow for the application software to retrieve the status of a given Virtual Function Cluster. This aspect is implemented by the concept of a **status port**.

](RS_SWCT_03241)

The usage of the generic concept of `PortGroups` for the purpose of partial networks shall be indicated by setting the value of the attribute `category` of `PortGroup` to `PARTIAL_NETWORKING`, see [constr_1147].

4.8.1 VFC Control Ports

[TPS_SWCT_01171] Purpose of a control port [The purpose of a control port is to request or release a VFC. Requesting means that the VFC is actively using communication resources while *release* boils down to the VFC being inactive, i.e. the corresponding partial network may be shut down until further notice.

As the requesting and releasing semantics is implemented by means of interfacing the BSW the corresponding control ports need to be typed by a `PortInterface` that has the attribute `isService` set to `true`.](RS_SWCT_03241)

[TPS_SWCT_01172] Requesting and releasing partial networks [For requesting and releasing partial networks, the BSW can be interfaced in two alternative (i.e. either one or the other) ways:

- **ComM:** `ClientServerInterface` using the standardized `ComM_UserRequest.RequestComMode` [20]
- **BswM:** `SenderReceiverInterface` using the standardized `AppModeRequestInterface.requestedMode` [21]

](RS_SWCT_03241)

[TPS_SWCT_01173] Control port shall not become a part of the `PortGroup` [Please note that the control port shall **not** become a part of the `PortGroup` that defines the particular VFC the control port is going to service.

The relationship is implemented by means of a specific `SwcServiceDependency` that owns a `RoleBasedPortAssignment` to the intended control port **and** refers to a `PortGroup` (that comprises the VFC) in the role `representedPortGroup`.](RS_SWCT_03241, RS_SWCT_03201)

For further information, please refer to [TPS_SWCT_01126].

4.8.2 VFC Status Ports

[TPS_SWCT_01175] Actively query the status of a partial network [Very much like mode management, the concept of partial networking supports the ability to actively query the status of a partial network.

This can be done by means of interfacing the BSW in three alternative (as in “one of”) ways:

- **ComM:** `ClientServerInterface` using the standardized `ComM_UserRequest.GetCurrentComMode` [20]
- **ComM:** `ModeSwitchInterface` using the standardized `ComM_CurrentMode.currentMode` [20]
- **BswM:** `ModeSwitchInterface` using the standardized `AppModeInterface.currentMode` [21]

]([RS_SWCT_03241](#))

As mentioned above, the status of the ComM can be retrieved by either a `ClientServerInterface` or a `SenderReceiverInterface`. Which of the two alternatives applies in a specific case is up to the author of a software-component¹¹.

When using one of the possible `SenderReceiverInterfaces`, the correspondence of the status port concept with mode management extends to the point that the status of the partial network is returned as an actual `ModeDeclaration`.

This implies that all mechanisms foreseen by the Software Component Template to react on mode changes are in place and can be used within the application software.

To assure that the communication via `PortPrototypes` that belong to a partial network is valid the software component shall consider the status of the partial network before communicating in order to assert its activity.

[TPS_SWCT_01174] Status port shall not become a member of the `PortGroup` [A status port shall **not** become a member of the `PortGroup` that corresponds to the partial network subject to the status port.

The relationship is implemented by means of a specific `SwcServiceDependency` that owns a `RoleBasedPortAssignment` to the intended status port **and** refers to a `PortGroup` (that comprises the VFC) in the role `representedPortGroup`.]([RS_SWCT_03241](#), [RS_SWCT_03201](#))

For further information, please refer to [[TPS_SWCT_01126](#)].

¹¹The usage of the `ClientServerInterface` effectively implements a “pull” approach for the mode information while the usage of the `SenderReceiverInterface` resembles a “push” approach if it is used in combination with a `SwcModeSwitchEvent`.

4.9 Formal Definition of implicit Communication Behavior

[TPS_SWCT_01509] **Implicit communication behavior** [The purpose of the formal definition of the behavior of a `SwComponentType` with respect to the *implicit* communication can conceptually condense to two basic aspects:

- **Stable** data during the execution of a group of `RunnableEntity`s. This means that all data values read by different `RunnableEntity`s are from the same age. Therefore, the value is not changing during the execution of the chain of `RunnableEntity`s.
- **Coherent** data consumption and propagation for a group of `DataPrototypes`. This means that a set of interdependent data values are from the same calculation iteration. Therefore, the set of values has to be propagated at once to `RunnableEntity`s requiring the complete result of the calculation. `RunnableEntity`s which are part of the calculation chain may still consume partly updated values.

]([RS_SWCT_03065](#))

[TPS_SWCT_01481] **The meaning of the term *stability* with respect to `ConsistencyNeeds`** [The meaning of the term *stability* is that the values of a group of `VariableDataPrototypes` shall not change values during the execution of a group of `RunnableEntity`s.]([RS_SWCT_03065](#))

[TPS_SWCT_01482] **The meaning of the term *coherence* with respect to `ConsistencyNeeds`** [The meaning of the term *coherence* means that the values of a group of `VariableDataPrototypes` shall not be read by receiving `RunnableEntity`s until all the producing `RunnableEntity`s are terminated.]([RS_SWCT_03065](#))

In response to these goals the meta-model provides means to express the correlation between a group of `RunnableEntity`s and a group of `DataPrototypes`. These groups might be defined **hierarchically**.

The information (in terms of `ConsistencyNeeds`) can be defined primarily during the design of an `AtomicSwComponentType` but it is just as well possible to specify this `ConsistencyNeeds` during the definition of `CompositionSwComponentTypes`.

For example, the existence of stable data is typically expected for the execution of `RunnableEntity`s of several `AtomicSwComponentTypes`.

Please note that the two aspects *stability* and *coherence* are not necessarily connected to each other. It is possible to require *stability* without *coherence* and vice versa. For this purpose the roles `dpgDoesNotRequireCoherency` and `regDoesNotRequireStability` are needed.

[TPS_SWCT_01480] ***Stability and/or coherence is not required*** [In order to be able to clearly separate the aspect of *stability* from *coherence* it is possible to use the roles `dpgDoesNotRequireCoherency` to express that a group of `VariableDataPrototypes` explicitly does not require *consistency*.

Likewise, `regDoesNotRequireStability` can be used to express that for a group of `RunnableEntity`s *stability* with respect to data access is not required.]([RS_SWCT_03065](#))

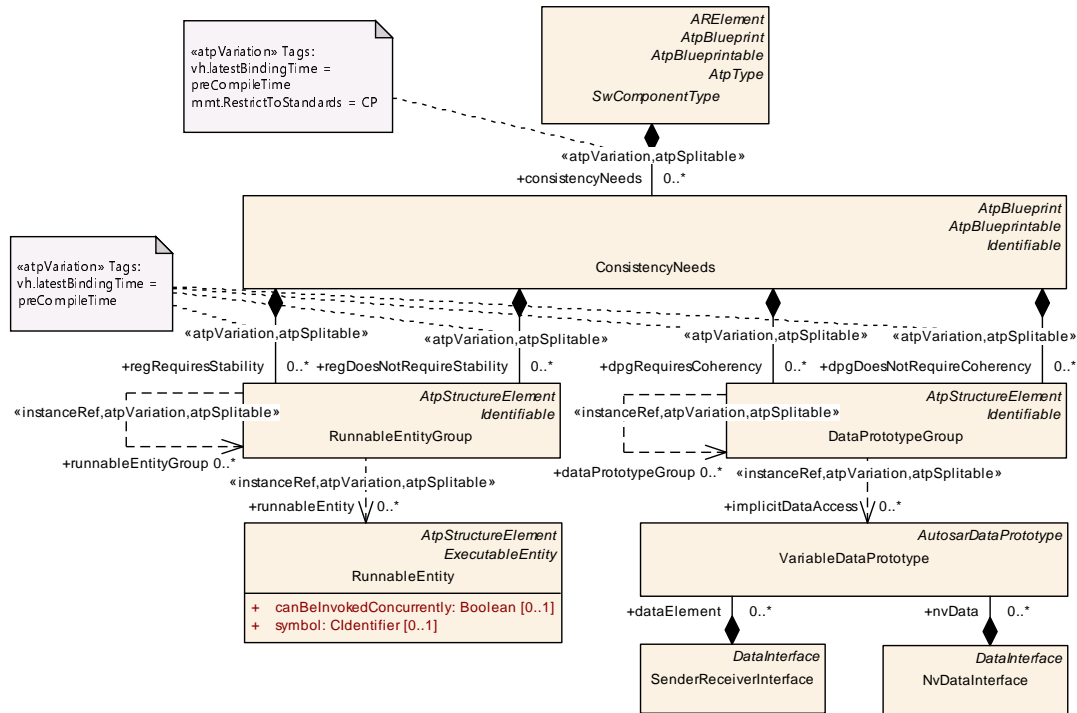

Figure 4.52: Formal definition of implicit communication behavior

[TPS_SWCT_01479] **Applicability of ConsistencyNeeds** [ConsistencyNeeds can only be applied to RunnableEntity)s that make use of “implicit” communication.]([RS_SWCT_03065](#))

[TPS_SWCT_01466] **ConsistencyNeeds applied on RunnableEntity)s that do not use implicit communication** [If a ConsistencyNeeds is applied on RunnableEntity)s that do not use implicit communication, it shall be ignored.]([RS_SWCT_03065](#))

The formal definition of the implicit communication behavior foresees the grouping of model elements in order to indicate their relevance for consistent implicit communication.

[TPS_SWCT_01470] **RunnableEntityGroup** [A RunnableEntity)s belongs to a specific RunnableEntityGroup if it is associated either directly with the given RunnableEntityGroup or if the RunnableEntityGroup the RunnableEntity belongs to is eventually (there can be more than one nesting level) referenced by the given RunnableEntityGroup.]([RS_SWCT_03065](#))

[TPS_SWCT_01471] **DataPrototypeGroup** [A VariableDataPrototypes belongs to a specific DataPrototypeGroup if it is associated either directly with the

given `DataPrototypeGroup` or if the `DataPrototypeGroup` the `VariableDataPrototype` belongs to is eventually (there can be more than one nesting level) referenced by the given `DataPrototypeGroup`.] (*RS_SWCT_03065*)

[constr_1231] ConsistencyNeeds aggregated by CompositionSwComponentType [If `ConsistencyNeeds` are aggregated by a `CompositionSwComponentType` the associations stereotyped `<<instanceRef>>` may only refer to context and target elements within the context of this `CompositionSwComponentType`.

This rule shall be imposed **at the time when the creation of the `CompositionSwComponentType` is finished.**] ()

For clarification, **[constr_1231]** includes `VariableDataPrototypes` owned by delegation `PortPrototypes` of the owning `CompositionSwComponentType`, `VariableDataPrototypes` in delegation `PortPrototypes` of `CompositionSwComponentType` instantiated in the enclosing `CompositionSwComponentType`, or `VariableDataPrototypes` in `PortPrototypes` owned by `AtomicSwComponentTypes` instantiated inside the context of the enclosing `CompositionSwComponentType`.

[constr_1232] ConsistencyNeeds aggregated by AtomicSwComponentType [If `ConsistencyNeeds` are aggregated by a `AtomicSwComponentType` the associations stereotyped `<<instanceRef>>` may only refer to context and target elements within the context of this `AtomicSwComponentType` **at the time when the contract phase generation is executed.**] ()

Strictly speaking, these are the `RunnableEntity`s and `PortPrototypes` of this particular `AtomicSwComponentType` or `RunnableEntityGroups` and `DataPrototypeGroups` which are owned by the same `AtomicSwComponentType`.

Please note that pre-defined values for the `category` of `RunnableEntityGroup` and `DataPrototypeGroup` are described in [1].

Table 4.101: DataPrototypeGroup

4.9.1 Consistency Needs on Receiver Side

[TPS_SWCT_01472] Receiving [SwComponentType](#) owns a [DataPrototypeGroup](#) in the role [dpgRequiresCoherency](#) [If a receiving [SwComponentType](#) owns a [DataPrototypeGroup](#) in the role [dpgRequiresCoherency](#) for one or several of its [RunnableEntities](#) it is required that [VariableDataPrototypes](#) belonging to the same [DataPrototypeGroup](#) are produced coherently. This means that the

values of the `VariableDataPrototypes` shall be of the same age.](*RS_SWCT_03065*)

[TPS_SWCT_01473] Receiving `SwComponentType` owns a `RunnableEntityGroup` in the role `regRequiresStability` [If a receiving `SwComponentType` owns a `RunnableEntityGroup` in the role `regRequiresStability` for one or several of its `RunnableEntities` it is required that the values of implicitly communicated `VariableDataPrototypes` are kept stable over the execution of all `RunnableEntities` belonging to the given `RunnableEntityGroup`.](*RS_SWCT_03065*)

[TPS_SWCT_01474] Receiving `SwComponentType` owns a `RunnableEntityGroup` in the role `regRequiresStability` and also owns one or several `DataPrototypeGroups` in the role `dpgRequiresCoherency` [If a receiving `SwComponentType` owns a `RunnableEntityGroup` in the role `regRequiresStability` and also owns one or several `DataPrototypeGroups` in the role `dpgRequiresCoherency` it is required that values of `VariableDataPrototypes` belonging to the same `DataPrototypeGroup` are produced coherently.

This means that the values of the `VariableDataPrototypes` shall be of the same age **and** are kept stable over the execution of all `RunnableEntities` belonging to the given `RunnableEntityGroup`.](*RS_SWCT_03065*)

4.9.2 Consistency Needs on Sender Side

[TPS_SWCT_01475] Sending `SwComponentType` owns a `DataPrototypeGroup` in the role `dpgRequiresCoherency` [If a sending `SwComponentType` owns a `DataPrototypeGroup` in the role `dpgRequiresCoherency` for one or several of its `RunnableEntities` it is required that `VariableDataPrototypes` belonging to the same `DataPrototypeGroup` are propagated at the same point of time to `RunnableEntities` which do not belong to the group of **producing** `RunnableEntities` (which may, but don't have to be formally described as a `RunnableEntityGroup`).](*RS_SWCT_03065*)

The coherence is created at the point in time when the `RunnableEntities` of the producing group of `RunnableEntities` terminate (and the implicit data get updated).

If those `RunnableEntities` are reading the data also, those read accesses will not read the coherent values but the intermediary values written by `RunnableEntities` of the same group.

For all other `RunnableEntities` that are not member of the producing group of `RunnableEntities` it appears as if the data have been updated at this very point coherently.

In order to avoid incorrect configurations its possible to explicitly define the group of `RunnableEntities` for which the coherency does not apply.

[TPS_SWCT_01625] Sending `SwComponentType` owns a `DataPrototypeGroup` in the role `dpgRequiresCoherency` and also `RunnableEntityGroups`

[If a sending `SwComponentType` owns a `DataPrototypeGroup` in the role `dpgRequiresCoherency`, `RunnableEntityGroups` in the role `regDoesNotRequireStability` may exist.

Read accesses from `RunnableEntities` in those `RunnableEntityGroups` will not read the coherent values but the intermediary values written by `RunnableEntities` of the same group.]([RS_SWCT_03065](#))

4.9.3 Consistency Needs for Senders and receivers of the same Data inside on `RunnableEntityGroup`

[**TPS_SWCT_01476** **Sender and receiver of the same implicitly communicated `VariableDataPrototypes` are associated with the same `RunnableEntityGroup`** [For the case of sender and receiver of the same implicitly communicated `VariableDataPrototypes` are associated with the same `RunnableEntityGroup` [[TPS_SWCT_01472](#)], [[TPS_SWCT_01473](#)], [[TPS_SWCT_01475](#)] as well as [[TPS_SWCT_01475](#)] apply with the exception that updates of the values of implicitly communicated `VariableDataPrototypes` inside the given `RunnableEntityGroup` become visible **immediately** after the producing `RunnableEntity` was terminated.]([RS_SWCT_03065](#))

5 Data Description

5.1 Introduction

In the context of defining data types and prototypes, the AUTOSAR concept distinguishes between three different levels of abstraction as depicted in [TPS_SWCT_01229].

[TPS_SWCT_01229] **Three different levels of abstraction regarding the definition of data types** [

Application Data Level
Implementation Data Level
Supplemental Base Type Level

](RS_SWCT_03215, RS_SWCT_03216, RS_SWCT_03217)

[TPS_SWCT_01230] **Application Data Level** [The **Application Data Level** is the common level at which `ApplicationSwComponentTypes` specify a data type or prototype.

This level allows to define all the data attributes which are needed from the application point of view, in order to exchange data between software components or between a software component and a measurement and calibration tool. It is possible to specify data communication of a complete `Virtual Functional Bus` based on this level only.

This level includes among other things the numerical range of values, the data structure as well as the physical semantics.

Data semantics (e.g. physical units) is not in the focus¹ for the RTE in order to make communication technically possible.

However, it is important for a unique interpretation of data in the application software and in measurement and calibration systems.](RS_SWCT_03216)

Please note that `ApplicationDataTypes` – by virtue of being platform-independent by definition – do not become visible as data types in the code implementation of software-components.

In former version of this specification, this level was not clearly separated from the implementation level. These had the following drawbacks which are now solved:

- The model of primitive types (like integer, boolean, real, opaque) was anticipating implementation aspects already on a very high level of design.

¹There are some aspects that affect the RTE, e.g. scaling of `dataElements`

- The data type model used within ports, focusing on communication via the RTE, was not sufficient to model all type-aspects of variables and parameters which are visible within an AUTOSAR system for other purposes than RTE-communication, namely NvM-data access, calibration, measurement, diagnostics, BSW-module interfaces. Using a uniform type system covering all these aspects is now favored.
- Calibration parameters were not completely incorporated into the data type concept. Some of their attributes (especially for curves and maps) could be specified only on the level of prototypes or were not completely formalized within AUTOSAR (like [SwRecordLayout](#)).
- The data type system was not compatible with the usage in calibration standards like ASAM-MCD (namely the usage of [categorys](#)).
- Adding implementation specific elements like a base type, was not possible without formally changing the data type used in a VFB design. A mapping mechanism that could be used in later project phases and is common in other parts of AUTOSAR (e.g. for mapping components to ECUs) was missing.
- The RTE Specification contained many default rules and assumptions on how to implement certain data types or prototypes in C. With a more formal description of all relevant implementation aspects, the generation of C-interfaces is better determined. But these aspects should be separated from the application level design.
- Since there could be many data types on the application level in a big system, the probability of name clashes in the interfaces to the RTE was rather high. Using a separate set of types to implement the RTE interfaces solves this issue.

[TPS_SWCT_01231] Application level may impose strong requirements on the design of the corresponding implementation level [It should be pointed out, that with the specification of computation methods and record layouts, the application level imposes strong requirements on the design of the corresponding implementation level. It might even be the case, that when anticipating different implementations, these elements might be chosen differently.

This is due to the nature of these elements which form a bridge from the physical world to the numerical representation (and vice versa). Nonetheless, we consider the specification of these elements as belonging to the application level.

On the one hand, this information is required by MCD-tools and thus shall be part of a rather high-level design. On the other hand, this approach will allow to use a limited set of implementation data types.] ([RS_SWCT_03215](#), [RS_SWCT_03216](#), [RS_SWCT_03217](#))

Further information about the compatibility requirements between application level and implementation level can be found in section [6.2.5](#).

[TPS_SWCT_01232] Implementation Data Level [The **Implementation Data Level** is closer to the actual code implementation in a programming language like C, though it is still an abstraction of the code.

Its values correspond to the actual binary numbers handled by the programming language on the CPU. It contains concepts like pointers and unions which relate to the organization of data in memory and are not relevant for the application level.

This level also defines structure, but it can be more granular. For example, the application level may define a text to be transferred to an instrument cluster as a primitive type (if the structure is not relevant for the application), whereas on the implementation level it could be modeled as an array of bytes.]([RS_SWCT_03217](#))

[TPS_SWCT_01233] Use case for the Implementation Data Level [There are several use cases for this level in AUTOSAR:

- First, the *Implementation Data* level can be used in the description of interfaces, and data (e.g. debug data) within the basic software, see [6] for more details on these use cases.
- `ImplementationDataTypes` should also be used to describe the interfaces of libraries which operate on a purely numerical level.
- *Implementation Data* is also used for the description of interfaces between software-components and the basic software (namely AUTOSAR Services), because these typically cover implementation aspects only.
- It is possible to define communication in a VFB system directly on this level if the physical and semantical abstraction is not of interest.
- Last not least the input for the RTE generator is defined by data descriptions on this level. This means that in case a SWC defines its data only on application level a corresponding set of implementation data types shall be created (or generated) as part of the ECU extract before the RTE can be generated.

]([RS_SWCT_03217](#))

[TPS_SWCT_01234] Base Type Level [The **Base Type Level** is used to contribute “low-level” aspects in terms of bits and bytes from which the implementation data is built up. It is considered as a separate level in order to allow for reuse of the basic types defined on this level.

These base types still do not completely determine the actual implementation on a programming language, but they impose strong restrictions for this as they define, for example, the number of bits and bytes to be used, as well as the byte order and the encoding of primitive “leaf” objects.

The base type layer does not represent a “standalone” way to define a data type in AUTOSAR. A `DataPrototype` may be typed by an `AutosarDataType`, i.e. either an `ApplicationDataType` or an `AbstractImplementationDataType`. There is no option to use the base type level exclusively to type a `DataPrototype`.]()

[TPS_SWCT_01235] Mapping of data defined on the *Application* level to the *Implementation* and *Base Type* level [It is important to understand, that the mapping of data defined on the *Application* level to the *Implementation* and *Base Type* level depends on the medium on which the data is transported.

For example, if a physical value can be expressed with sufficient accuracy and range by a 16-bit unsigned integer, it still might look very different when sent over CAN, when seen by a software-component on a *big-endian* 32-bit machine or when seen by a software-component on a *little-endian* 16-bit processor.

Conversion between several data implementations of the same application data type might be necessary in case of communication between components on different ECUs. AUTOSAR COM [22] is responsible for this.

It implies that the configuration depends on the definition of the data that are transmitted between components².] ([RS_SWCT_03215](#), [RS_SWCT_03216](#), [RS_SWCT_03217](#))

AUTOSAR COM might need to convert a 16-bit integer between *little-endian* and *big-endian* representations; whereas an array of 16 bytes does not need to be swapped even if the endianness changes. In case of intra-ECU communication byte order conversion is not necessary, since the software-components reside on the same machine.

[TPS_SWCT_01236] Big picture of data types [Another way of approaching the concept of data types in AUTOSAR (especially with respect to the question of what “kind” of data type in related to which modeling meta-level) is to sketch the following “big picture” of data types:

ApplicationDataType Defined on **M2** - provides the meta-model for data types on application level. It covers the application-relevant aspects of a data type.

An `ApplicationDataType` shall finally be mapped to an `ImplementationDataType`.

ImplementationDataType Defined on **M2** - provides the meta-model for data types on implementation level. With respect to C source code, an `ImplementationDataType` finally boils down to a `typedef`.

BaseType Defined on **M2** - provides the platform-dependent part of an `ImplementationDataType`. the dependency on the platform covers the following aspects:

- Definition on the level of the C language - using `nativeDeclaration`
- Technical representation on the target platform (byte order, alignment, encoding) as required for the support of MCD systems.
- The modeling of this level based on `SwBaseType` is not restricted to the definition of data types in the software domain. It is used in several different contexts in AUTOSAR whenever exact knowledge of the bits and bytes is required.

²More exactly speaking, the data shall be converted to and from a so-called `SystemSignal`.

Platform Data Type Defined on **M1** - provided by AUTOSAR. Platform types shall be available on each platform on which an AUTOSAR-System can run.

The name of the [Platform Data Type](#) and the properties with respect to the interface between modules / components is the same on every platform.

The particular representation varies from platform to platform.

[Platform Data Types](#) shall be **modeled** using [ImplementationDataTypes](#).

Note that in AUTOSAR R3.x the platform types are implemented manually and could even not be expressed on ARXML model (see [SRS_Rte_00150]). In AUTOSAR R4.1 the [Platform Data Types](#) can be represented in the ARXML model. Subsequent releases of AUTOSAR may generate the [Platform Data Types](#) directly from the ARXML Model.

Standard Type Defined on **M1** - provided by AUTOSAR. Standard types are defined by referring to platform types.

|(RS_SWCT_03215, RS_SWCT_03216, RS_SWCT_03217)

[TPS_SWCT_01237] [SwDataDefProps](#) [The properties of data are summarized in the meta-class [SwDataDefProps](#). This meta-class itself is the superset of all applicable properties.](RS_SWCT_03216, RS_SWCT_03217)

Subsets of [SwDataDefProps](#) are applicable in specific case, for a summary please refer to the following tables:

- The data [categorys](#) are summarized in [[constr_1006](#)].
- Properties for [ApplicationDataTypes](#) are summarized in [[constr_1007](#)].
- Properties for [ImplementationDataTypes](#) are summarized in [[constr_1009](#)].
- Properties for [DataPrototypes](#) typed by [ApplicationDataTypes](#) are summarized in [[constr_1289](#)].
- Properties for [DataPrototypes](#) typed by [ImplementationDataTypes](#) are summarized in [[constr_1288](#)].
- Applicability of [SwDataDefProps](#) is summarized in [[constr_1015](#)].

5.2 Data Types

5.2.1 Overview

As explained in section 5.1 it is possible to describe data provided by a software-component from the application as well as from the implementation point of view.

[TPS_SWCT_01072] **ApplicationDataType** and **ImplementationDataType** [The common concept behind this is expressed by the abstract meta-class *AutosarDataType*, from which an *ApplicationDataType* and an *ImplementationDataType* is derived.] (*RS_SWCT_03215*, *RS_SWCT_03216*, *RS_SWCT_03217*)

[TPS_SWCT_01073] **Composite ApplicationDataType** [An *ApplicationDataType* can be composed (in form of a record or an array) of elements which themselves are typed by another *ApplicationDataType*.] (*RS_SWCT_03215*, *RS_SWCT_03216*)

[TPS_SWCT_01074] **Composite ImplementationDataType** [An *ImplementationDataType* can also be composed of elements but in this case no type/prototype concept (see [11]) has been applied. Both concepts will be explained in the following chapters in more detail.] (*RS_SWCT_03215*, *RS_SWCT_03217*)

Figure 5.1 shows a summary of the basic meta-classes used for the definition of *AutosarDataTypes*.

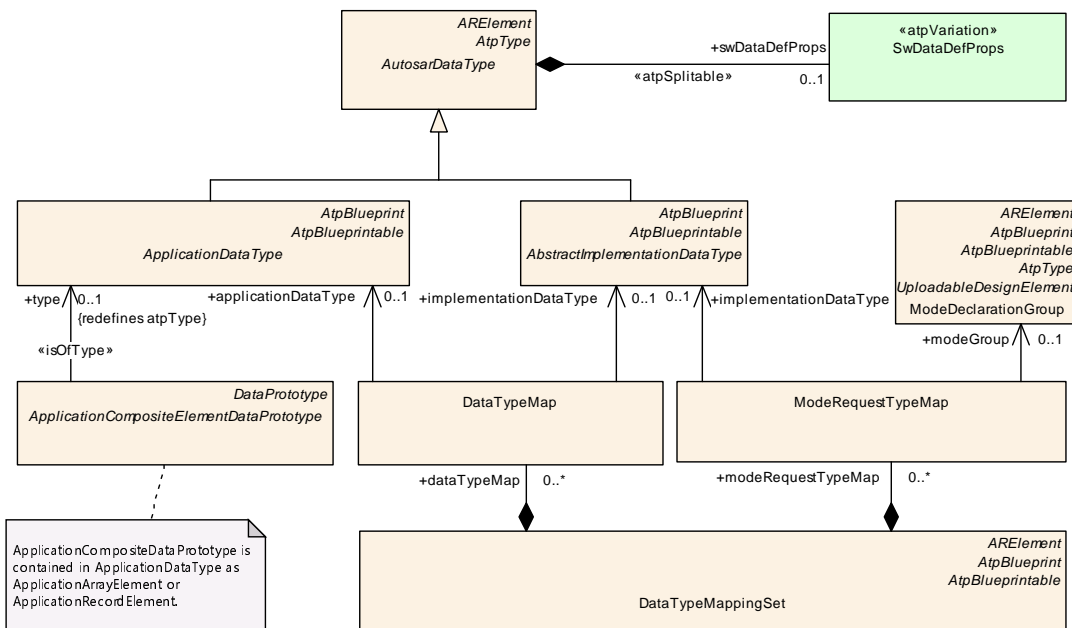

Figure 5.1: Summary of *AutosarDataType*

Class	<i>AutosarDataType</i> (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	Abstract base class for user defined AUTOSAR data types for software.			
Base	<i>ARElement</i> , <i>ARObject</i> , <i>AtpClassifier</i> , <i>AtpType</i> , <i>CollectableElement</i> , <i>Identifiable</i> , <i>Multilanguage</i> , <i>Referrable</i> , <i>PackageableElement</i> , <i>Referrable</i>			
Subclasses	<i>AbstractImplementationDataType</i> , <i>ApplicationDataType</i>			
Aggregated by	<i>ARPackage.element</i>			
Attribute	Type	Mult.	Kind	Note

Class	AutosarDataType (abstract)			
swDataDef Props	SwDataDefProps	0..1	aggr	The properties of this AutosarDataType. Stereotypes: atpSplittable Tags: atp.Splitkey=swDataDefProps

Table 5.1: AutosarDataType

Class	ApplicationDataType (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	ApplicationDataType defines a data type from the application point of view. Especially it should be used whenever something "physical" is at stake. An ApplicationDataType represents a set of values as seen in the application model, such as measurement units. It does not consider implementation details such as bit-size, endianness, etc. It should be possible to model the application level aspects of a VFB system by using ApplicationDataTypes only.			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , AutosarDataType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Subclasses	ApplicationCompositeDataType , ApplicationPrimitiveDataType			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table 5.2: ApplicationDataType

5.2.2 Data Type Mapping

As explained above, the concept of application data types as well as that of implementation data types can be used to instantiate a data prototype in an M1 model. However, there are use cases, especially in order to generate the RTE contract for [ApplicationSwComponentTypes](#), where it is required to consider both levels for one given data prototype.

[TPS_SWCT_01189] [DataTypeMap](#) [This is supported by the meta-class [DataTypeMap](#) by which an [ApplicationDataType](#) and an [ImplementationDataType](#) can be mapped to each other in order to describe both aspects of one [dataElement](#).] ([RS_SWCT_03216](#), [RS_SWCT_03217](#), [RS_SWCT_03215](#))

Class	DataTypeMap			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	This class represents the relationship between ApplicationDataType and its implementing AbstractImplementationDataType .			
Base	ARObject			
Aggregated by	DataTypeMappingSet.dataTypeMap			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Class	DataTypeMap			
applicationDataType	ApplicationDataType	0..1	ref	This is the corresponding ApplicationDataType
implementationDataType	AbstractImplementationDataType	0..1	ref	This is the corresponding AbstractImplementationDataType.

Table 5.3: DataTypeMap

If, for example, a `dataElement` in a `SenderReceiverInterface` is typed by an `ApplicationDataType` it shall additionally be associated to an `ImplementationDataType` in order to be able to generate the RTE.

[constr_1903] Existence of reference `DataTypeMap.applicationDataType` [For each `DataTypeMap`, reference `applicationDataType` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1904] Existence of reference `DataTypeMap.implementationDataType` [For each `DataTypeMap`, reference `implementationDataType` shall exist **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01190] `ModeRequestTypeMap` [Another mapping class, `ModeRequestTypeMap`, has been introduced in order to allow the transport of mode related information via “normal” sender-receiver communication. Apart from this, mode information is not handled by the usual type system but needs special meta-classes.] (*RS_SWCT_03110*)

This aspect is explained in more detail in chapter 4.2.5.

Note that the mapping classes instead of direct associations have been introduced for process reasons: It allows maintaining application and implementation types in separate M1 artifacts without direct links.

For example, if a software component is moved to another hardware platform the mapping between application and implementation types might be changed in the scope of the specific component without changing the overall VFB model.

[TPS_SWCT_01191] mapped `ApplicationDataType` and `ImplementationDataType` shall be compatible [In order to set up a valid `DataTypeMap` between an `ApplicationDataType` and an `ImplementationDataType` the two types shall be compatible.

Of course, if `ImplementationDataTypes` are generated from existing `ApplicationDataTypes` it is expected that they will be automatically compatible.] (*RS_SWCT_03216, RS_SWCT_03217*)

Please note that the compatibility between an `ApplicationDataType` and an `ImplementationDataType` mapped onto each other is clarified in chapter 6.2.5.

Furthermore, the various mappings are aggregated in a container `DataTypeMappingSet` for easier maintenance in artifacts.

Class	DataTypeMappingSet			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	This class represents a list of mappings between ApplicationDataTypes and ImplementationDataTypes. In addition, it can contain mappings between ImplementationDataTypes and ModeDeclarationGroups. Tags: atp.recommendedPackage=DataTypeMappingSets			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
dataTypeMap	DataTypeMap	*	aggr	This is one particular association between an Application Data Type and its AbstractImplementationDataType.
modeRequestTypeMap	ModeRequestTypeMap	*	aggr	This is one particular association between an Mode DeclarationGroup and its AbstractImplementationData Type.

Table 5.4: DataTypeMappingSet

Note that the meta-classes [AutosarDataType](#), [ModeDeclarationGroup](#) and [DataTypeMappingSet](#) are derived from [ARElement](#). This means that these and the meta-classes derived from them can be declared on the M1 level as part of an [ARPackage](#) and thus can be used in some Software Component or Basic Software Module Descriptions.

How to organize [DataTypeMappingSet](#)s for a software system, for example whether there is a separate mapping set for each ECU or even for each software component, is considered as project specific. However, the RTE generator needs a well-defined [DataTypeMappingSet](#) as input in relation those artifacts which might define data typed as [ApplicationDataTypes](#).

[TPS_SWCT_01192] Meta-classes that have an association to a [DataTypeMappingSet](#) [Therefore, the following meta-classes in the scope of this document have an association to a [DataTypeMappingSet](#):

- [InternalBehavior](#), because it represents the interface between the software component's code and the RTE and all data types belonging to the particular component type have to be uniquely provided on implementation level.
- [ParameterSwComponentType](#), for the same reason (this component type doesn't have an [InternalBehavior](#)).
- [NvBlockDescriptor](#), because this meta-class also leads to generation of code from data types and is not associated to an [InternalBehavior](#).
- [CompositionSwComponentType](#), to support the definition of `ComSpecs` in the context of a [CompositionSwComponentType](#). Please note that this definition of a data type mapping is informal (i.e. it shall be taken as a hint for delegation [PortPrototypes](#) that are not yet referenced by a [DelegationSwConnector](#) or [PassThroughSwConnector](#)) and shall **not** be regarded as a binding contract towards the inner elements of the [CompositionSwComponentType](#).

]()

For more details about this aspect please refer to figure 5.62.

[TPS_SWCT_01193] Mappings between application and implementation types do not necessarily have to form a 1:1 relation [In general, it is not required that the sum of all mappings between `ApplicationDataType` and `ImplementationDataType` in a given system form a 1:1 relation. Depending on the use case and on the scope, 1:n as well as n:1 mappings are possible :

- Several `ApplicationDataTypes` may be mapped to the same `ImplementationDataType` in the scope of a system, an ECU, or even a single `InternalBehavior` of an atomic software component.

Of course, this requires that the different `ApplicationDataTypes` are used for different `DataPrototypes` and thus that the `DataPrototypes` are typed by them (and not by the `ImplementationDataTypes`). This allows to establish a more simple type system on the implementation level, than on the application model level.

- The same `ApplicationDataTypes` may be mapped to different `ImplementationDataTypes` for different ECUs. This scenario allows to choose the implementation data types according to the needs of specific ECUs.
- The same `ApplicationDataTypes` may be mapped to different `ImplementationDataTypes` even in the scope of a single ECU (more exactly speaking, a single RTE), but only for different `AtomicSwComponentTypes` (see [`constr_1004`]).

This improves the portability of software components which were developed independently or are ported between ECUs.

]()

[constr_1004] Mapping of `ApplicationDataTypes` in the scope of single `AtomicSwComponentTypes` [In the scope of `AtomicSwComponentType.internalBehavior.dataTypeMapping`, each `ApplicationDataType` shall be mapped to exactly one `ImplementationDataType` **at the time when the contract phase generation is executed.**]()

Figure 5.2: Compatibility of Data Types

[constr_1005] Compatibility of `ImplementationDataTypes` mapped to the same `ApplicationDataType` [It is required that `ImplementationDataTypes` which are taken for connecting corresponding elements of `PortInterfaces` and thus refer to compatible `ApplicationDataTypes` are also compatible among each other (so that RTE is able to cope with possible connections by converting the data accordingly) **at the time when the contract phase generation is executed.**]()

This constraint is visualized in figure 5.2.

[constr_1636] Mapping of data types that represent an `Optional Element Structure` [An `ApplicationRecordDataType` with at least one `element` where attribute `isOptional` is set to `true` shall only be mapped to an `ImplementationDataType` that fulfills the structural requirements to represent an `Optional Element Structure` (see [TPS_SWCT_01774]) **at the time when the contract phase generation is executed.**]()

5.2.3 Data Categories

An `AutosarDataType` is derived from `Identifiable`, thus having a `longName`, a `shortName`, a `category`, and several further attributes for administrative and documentation purposes (for details see [11]).

[TPS_SWCT_01238] Attribute `category` used in the context of `Autosar-DataType` [The `category` attribute is used to set constraints for the various properties which can be specified for an `AutosarDataType`. These properties are defined by aggregating the meta-class `SwDataDefProps` which contains several attributes and references.]()

Detailed explanations about the semantics of meta-class `SwDataDefProps` can be found in chapter 5.4.

This approach avoids a very deep and complicated inheritance tree which otherwise would be needed on the M2 level for `AutosarDataType`.

There is to some extent a redundancy between setting the `category` and defining the attributes of `AutosarDataType.swDataDefProps`. This redundancy is intended and allows to for a tool to rule out senseless configurations via simple rules.

In former version of this specification the categories were only used for calibration parameters. Due to several extensions the categories are now applicable for all use cases of the `AutosarDataType`.

An overview on all valid `categorys` defined for `AutosarDataType` is shown in [constr_1006].

Some `categorys` are also applied to sub-elements of the type system (column “Applicable to ...” in [constr_1006]). This is explained in more detail in the following sections.

Please note that the column “RTE + BSW” of [constr_1006] is only applicable for categories that are relevant either for ImplementationDataTypes and/or the aspect of measurement and calibration in McDataInstance.

[constr_1006] Applicable data categories, depending on specific model elements related to data definition properties [

Category	Applicable to ...											Use Case				Description	
	ApplicationArrayDataType	ApplicationRecordDataType	ApplicationPrimitiveDataType	ApplicationRecordElement	ApplicationArrayElement	ApplicationValueSpecification	ApplicationRuleBasedValueSpecification	ImplementationDataType	ImplementationDataTypeElement	SwSystemconst	McDataInstance	Calibration	Measurement	Communication Port Interfaces	RTE + BSW		
VALUE			x	x	x	x		x	x	x	x	x	x	x	x	Contains a single value.	
VAL_BLK			x	x	x	x					x	x		x		A value block defines values stored together within one calibration parameter object. It is similar to an value array but it stores the values by means of an axis instead (only important for calibration data handling).	
DATA_REFERENCE								x	x	x				x ³	x	Contains an address of another DataPrototype (whose type is given via SwDataDefProps.swPointerTargetProps).	
FUNCTION_REFERENCE								x	x	x					x	Contains an address of a function prototype (whose signature is given via SwDataDefProps.swPointerTargetProps.functionPointerSignature).	
TYPE_REFERENCE								x	x	x					x	x	The element is defined via reference to another data type (via SwDataDefProps.implementationDataType).
STRUCTURE	x			x	x			x	x		x	x	x	x	x	<p>Holds one or several further elements which can have different AutosarDataTypes.</p> <p>The underlying elements are defined in the same manner as normal data except for the association to SwAddrMethod: This has to be the same for all underlying elements.</p> <p>Corresponds to a Record if used in the application domain.</p>	
UNION								x	x		x	x	x	x	x	<p>Can hold values of different data types. It is similar to STRUCTURE except that all of its members start at the same location in memory.</p> <p>A UNION data prototype can contain only one of its elements at a time. The size of the UNION is at least the size of the largest member.</p> <p>Please find more information in [TPS_SWCT_01700].</p>	
ARRAY	x			x	x			x	x	x	x	x	x	x	x	An array of sub-elements which are of the same type.	

³[constr_1295] applies!

Category	Applicable to ...											Use Case				Description
	ApplicationArrayDataType	ApplicationRecordDataType	ApplicationPrimitiveDataType	ApplicationRecordElement	ApplicationArrayElement	ApplicationValueSpecification	ApplicationRuleBasedValueSpecification	ImplementationDataType	ImplementationDataElement	SwSystemConst	McDataInstance	Calibration	Measurement	Communication Port Interfaces	RTE + BSW	
BIT											x	x	x	x		One or several bits within a host variable, which are treated as an own data object.
HOST											x	x	x	x		A HOST data type is like a simple VALUE , but it is used for packed bit definition. That means it can host several BIT variables which have their own description and measurement access.
STRING			x	x	x	x					x	x	x	x		Contains a single value interpreted as a text string (note that it appears as a single value for the application domain; the internal representation can be an array).
BOOLEAN			x	x	x	x					x	x	x	x		Contains one boolean state. Depending on the CPU direct addressing of single bits may not be available. So a byte or a word can be used to store only one logical state.
COM_AXIS			x	x	x	x	x				x	x		x		An axis definition as separate calibration parameter which can be referenced by any CURVE , MAP , CUBOID , CUBE_4 , and CUBE_5 . The benefits by using a common axis is that it saves memory space; because it is stored only one time and can be used in multiple CURVES , MAPS , CUBOIDS , CUBE_4s , and CUBE_5s .
RES_AXIS			x	x	x	x	x				x	x		x		A RES_AXIS (rescale axis) is also a shared axis like COM_AXIS , the difference is that this kind of axis can be used for rescaling. Note that the RES_AXIS is by nature a CURVE which is used to implement a non linear scaling (rescale) of the axis. In addition to saving memory space via the shared usage like a COM_AXIS , it can compress a huge range to a non-linear distributed axis points thus retaining the required accuracy.
CURVE			x	x	x	x	x				x	x		x		Calibration parameter with one input value and one output value. That means output values can be defined depending on the input value. The granularity of implemented functionality can be changed by using different number of axis points. A CURVE has always one input axis and one output axis. The output axis is a characteristic of the curve and every time present but the input axis can be defined within the curve definition or separately.

Category	Applicable to ...												Use Case				Description
	ApplicationArrayDataType	ApplicationRecordDataType	ApplicationPrimitiveDataType	ApplicationRecordElement	ApplicationArrayElement	ApplicationValueSpecification	ApplicationRuleBasedValueSpecification	ImplementationDataType	ImplementationDataElement	SwSystemconst	McDataInstance	Calibration	Measurement	Communication Port Interfaces	RTE + BSW		
MAP			x	x	x	x	x				x	x		x		<p>Calibration parameter with two input values and one output value. That means output values can be defined depending on the input values.</p> <p>The granularity of implemented functionality can be changed by using different number of axis points for y- and x-axis. A MAP has always two input axes and one output axis.</p> <p>The output axis is a characteristic of the MAP and every time present but the input axes can be defined within the MAP definition or separately.</p>	
CUBOID			x	x	x	x	x				x	x		x		<p>Calibration parameter with three input values and one output value. That means output values can be defined depending on the input values.</p> <p>The granularity of implemented functionality can be changed by using different number of axis points for the input axes. A CUBOID has always three input axes and one output axis.</p> <p>The output axis is a characteristic of the CUBOID and every time present but the input axes can be defined within the CUBOID definition or separately.</p>	
CUBE_4			x	x	x	x	x				x	x		x		<p>Calibration parameter with four input values and one output value. That means output values can be defined depending on the input values.</p> <p>The granularity of implemented functionality can be changed by using different number of axis points for the input axes. A CUBE_4 has always four input axes and one output axis.</p> <p>The output axis is a characteristic of the CUBE_4 and every time present but the input axes can be defined within the CUBE_4 definition or separately.</p>	

Category	Applicable to ...	Use Case	Description
	ApplicationArrayDataType ApplicationRecordDataType ApplicationPrimitiveDataType ApplicationRecordElement ApplicationArrayElement ApplicationValueSpecification ApplicationRuleBasedValueSpecification ImplementationDataType ImplementationDataTypeElement SwSystemconst McDataInstance	Calibration Measurement Communication Port Interfaces RTE + BSW	
CUBE_5	x x x x x	x x x	<p>Calibration parameter with five input values and one output value. That means output values can be defined depending on the input values.</p> <p>The granularity of implemented functionality can be changed by using different number of axis points for the input axes. A CUBE_5 has always five input axes and one output axis.</p> <p>The output axis is a characteristic of the CUBE_5 and every time present but the input axes can be defined within the CUBE_5 definition or separately.</p>

This rule shall be imposed **at the time when the RTE is generated.**

]()

Please note further that the description of [SwServiceArg](#) is available in the TPS BSW Module Description Template [6].

Furthermore, the intersection of [TYPE_REFERENCE](#) and "Calibration" in [[constr_1006](#)] is empty because the type reference itself is definitively not relevant for measurement and calibration because at runtime the type reference has been resolved and at runtime, only "final" values of category, like [VALUE](#) or [STRUCTURE](#) are relevant.

The canonical way to provide the necessary information to derive an [McDataInstance](#) out of a [ParameterDataPrototype](#) is to let the [ParameterDataPrototype](#) be typed by an [ApplicationDataType](#) in the first place.

However, it is generally allowed (although not recommended) to define a [ParameterDataPrototype](#) that is typed by an [ImplementationDataType](#) as long as said "relevant information" about this [ParameterDataPrototype](#) is somehow provided at the time an [McDataInstance](#) is created from the [ParameterDataPrototype](#).

[TPS_SWCT_01239] default value for attribute [category](#) used in the context of [SwSystemconst](#) [The default value for the [category](#) of a [SwSystemconst](#) shall be [VALUE](#). This has to be applied if no explicit definition of the [category](#) can be found.]

()

5.2.4 Application Data Type

[TPS_SWCT_01240] Subclasses of **ApplicationDataType** [The abstract meta-class **ApplicationDataType** is further derived into an **ApplicationPrimitiveDataType** and an **ApplicationCompositeDataType** which are further explained in the following sub-chapters.] ([RS_SWCT_03216](#))

This aspect is further explained in Figure 5.3.

Figure 5.3: Basic Meta-Model for **ApplicationDataType**

]()

This list makes use of the `SwDataDefProps` and other meta-model elements which are explained in detail in the further sections of this chapter.

⁴don't care

⁵This is required by [TPS_SWCT_01179].

5.2.4.1 Application Primitive Data Types

5.2.4.1.1 Data Types for Single Values

In contrast to prior versions (R3.x) of the AUTOSAR standard, the primitive application data types on M2 level are no longer specified. Instead of this, the meta-class `ApplicationPrimitiveDataType` in combination with the attached `swDataDefProps` is used on the level of the M2 (meta-) model to specify the details on M1 modeling level.

[TPS_SWCT_01242] `category` characterizes the nature of a data type on application level [The `category` is used in addition to characterize the nature of a data type on application level.] (*RS_SWCT_03216*)

For example, the `IntegerType` as of AUTOSAR R3.x allows for specifying lower and upper ranges that constrain the applicable value interval. That aspect is still supported by this version of AUTOSAR, but the meta-model is different from the former approach. Especially it is no more considered of importance to specify that an `ApplicationPrimitiveDataType` is actually represented by “integer” numbers.

Figure 5.4 provides a sketch of how limits are defined now. The key feature is the aggregation of `SwDataDefProps` at `AutosarDataType`. The meta-class `SwDataDefProps` allows for creating a reference to a `DataConstr` that in turn aggregates a `DataConstrRule`.

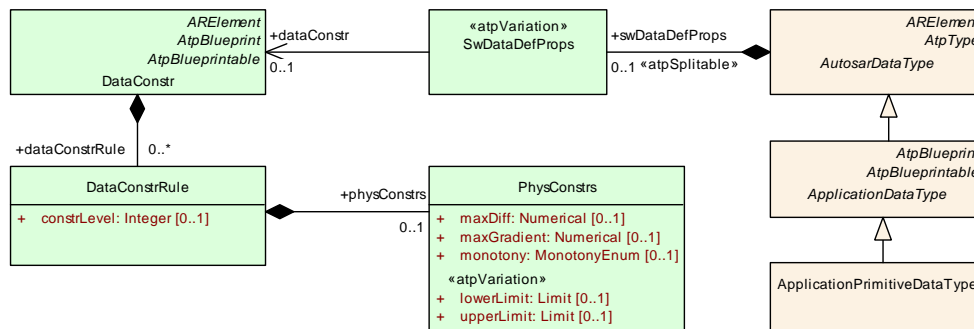

Figure 5.4: Specification of Physical Limits

The latter aggregates `PhysConstrs` and this meta-class finally owns two `Limits` in the roles `lowerLimit` and `upperLimit`.

Another example is shown in Figure 5.5. By making again use of `SwDataDefProps`, this figure shows how semantics in form of a `CompuMethod` and a `Unit` can be attached.

Also, an `initValue` can be defined which is used by the RTE in order to initialize values of `VariableDataPrototypes/ParameterDataPrototypes` defined locally in a software-component.

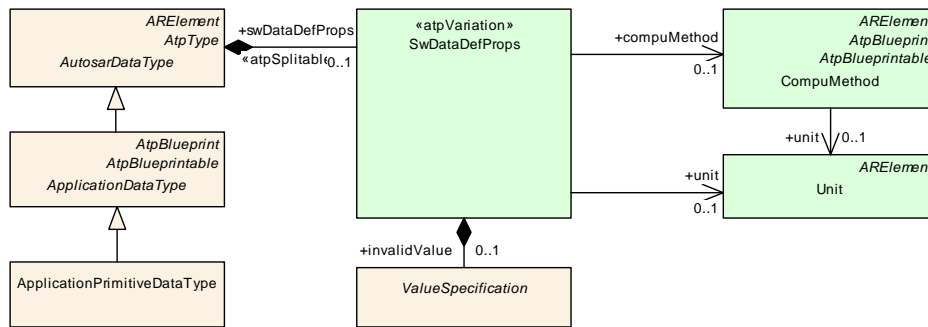

Figure 5.5: Some Properties of ApplicationPrimitiveDataTypes

Figure 5.6 (which is only applicable for linear and rational CompuMethods) illustrates the relationship between the data constraints for ApplicationDataType, CompuMethod, ImplementationDataType, BaseType for the case of an entirely linear or rational conversion.

Please note that the relation of CompuMethod to invalidValue is discussed in detail in section 5.4.2.

If an ApplicationPrimitiveDataType does not define dataConstr, then implicit constraints can be derived from physical meaning of the ApplicationDataType.

For example, if the data type represents a temperature the lower bound will not be able to exceed 0K.

For other physical meanings, it could be possible that the implicitly assumed limits go from $-\text{INF}$ to $+\text{INF}$.

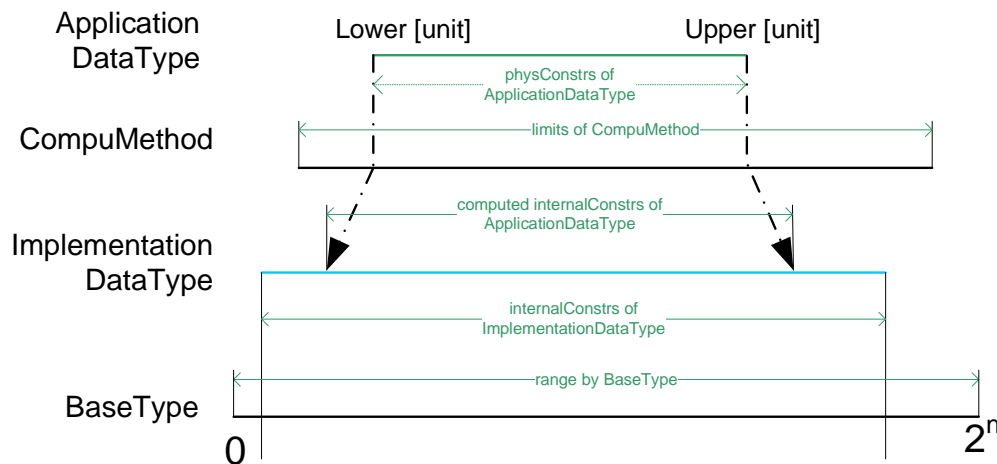

Figure 5.6: Value ranges for linear and rational CompuMethod

In order to avoid ambiguity regarding the values of limits it is **strongly recommended** defining a reasonable limit for ApplicationPrimitiveDataTypes.

[constr_2544] Limits need to be consistent [

- The limits of `ApplicationDataType` shall be inside the definition range of the `CompuMethod`

The `CompuMethod` needs to be applicable for limits of an `ApplicationDataType`. The reason is that the internal representation of the limits for the `ApplicationDataType` are calculated by applying the `CompuMethod`.

- The such defined internal limits of the `ApplicationDataType` shall be within or equal the `internalConstrs` of the mapped `ImplementationDataType`.
- The limits of the `ImplementationDataType` shall be within or equal to the limits defined by the size of the `BaseType`.

This rule shall be imposed **at the time when the contract phase generation is executed.**](/)

For a more detailed description of the properties that can be defined for data types (and data prototypes as well), see sections 5.4. The handling of `invalidValue` is explained in more detail in section 5.4.2.

[TPS_SWCT_01760] Defining the dimension of an `ApplicationPrimitiveDataType` of category `VAL_BLK` [An `ApplicationPrimitiveDataType` of category `VAL_BLK` that has only one dimension shall be described using the attribute `SwDataDefProps.swValueBlockSize`.

An `ApplicationPrimitiveDataType` of category `VAL_BLK` that has more than one dimension shall be described using the attribute `SwDataDefProps.swValueBlockSizeMult`].(*RS_SWCT_03216*)

[constr_1610] Existence of `SwDataDefProps.swValueBlockSize` and `SwDataDefProps.swValueBlockSizeMult` [Attributes `SwDataDefProps.swValueBlockSize` and `SwDataDefProps.swValueBlockSizeMult` shall not exist at the same time in the context of a given `SwDataDefProps`.

This rule shall be imposed **at the time when the contract phase generation is executed.**](/)

5.2.4.1.2 About Enumerations

[TPS_SWCT_01243] Definition of enumeration types [In the AUTOSAR meta-model, an enumeration is not implemented by means of an `ApplicationCompositeDataType`.

Instead, a discrete set of integer numbers can be used as a structural description for a single `ApplicationPrimitiveDataType` or an `ImplementationDataType` of category `VALUE` or `TYPE_REFERENCE` that boils down to an `ImplementationDataType` of category `VALUE`.

The mapping of the integer numbers to *labels* in the scope of the definition of an enumeration is considered part of the semantical definition via an attached *CompuMethod* rather than part of the structural description.](RS_SWCT_03216)

[TPS_SWCT_01562] Specification of values of an enumeration [For the specification of values of an enumeration on the basis of the labels defined in the applicable *CompuMethod* it is necessary to distinguish two approaches based on the used *AutosarDataType*:

- *ImplementationDataType*: as mentioned by [constr_1225], the definition of the labels of an enumeration shall only be done by using *TextValueSpecification*.
- *ApplicationPrimitiveDataType*: use the *ApplicationValueSpecification.swValueCont.swValuesPhys.vt* or *ApplicationRuleBasedValueSpecification.swValueCont.ruleBasedValues.arguments.vt*.

](RS_SWCT_03216)

The relevant meta-classes in the context of *SwDataDefProps* are sketched in Figure 5.7. This includes all meta-classes that may contribute to the definition of the symbol of a *CompuScale* in C code, see [TPS_SWCT_01431].

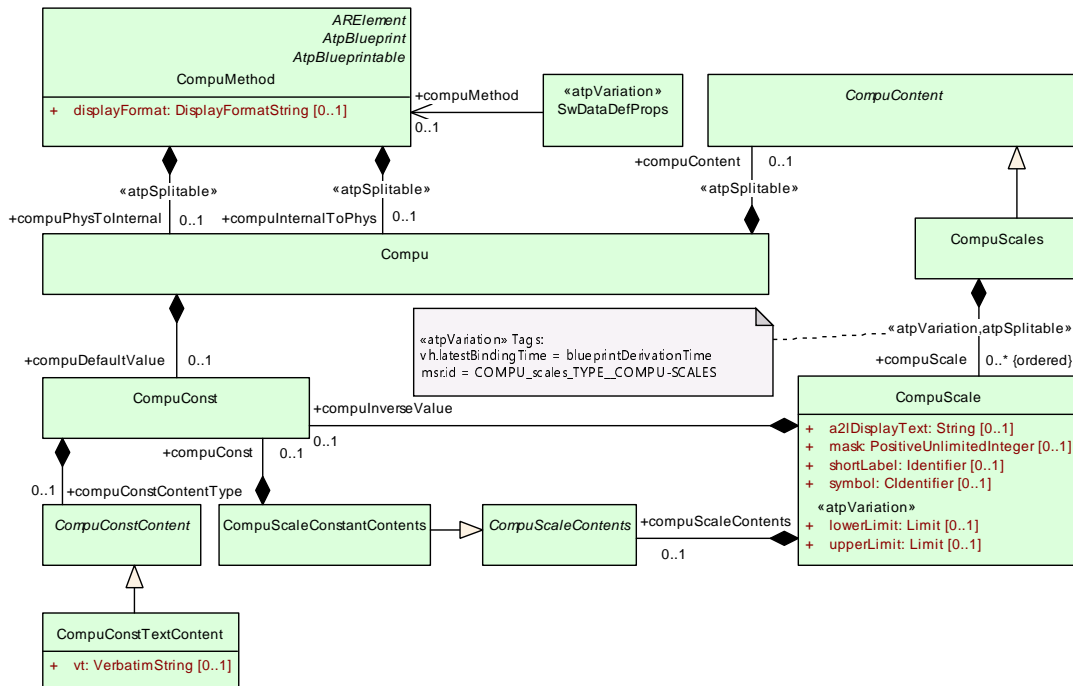

Figure 5.7: Relevant meta-classes for the specification of enumerations

An example of how an enumeration looks like in ARXML is contained in Appendix B.4.1.

5.2.4.1.3 Data Types for Calibration Parameters

[TPS_SWCT_01244] Data types for calibration parameters are also described as primitive types [Data types for calibration parameters are from the application perspective also described as primitive types. This is obvious, if they are simple values (`category VALUE`). Also, the `category STRING` is treated as a primitive type on application level.

Less obvious is the fact that `ApplicationDataTypes` of the categories `VAL_BLK`, `COM_AXIS`, `RES_AXIS`, `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, and `CUBE_5` are not described as composite data types (as far as the application level is concerned) although they admittedly possess some kind of internal structure.

In contrast to `ApplicationCompositeDataTypes`, they are **not** composed similarly of other `AutosarDataTypes`. Their substructure needs a special description in order to be compatible with existing calibration techniques.] ([RS_SWCT_03216](#))

[TPS_SWCT_01245] SwDataDefProps control the structure of calibration parameters [The substructure of these types is attached to the `SwDataDefProps`. By this means it is possible to define on the level of `DataPrototypes` or other artifacts, where the `SwDataDefProps` come into play.] ([RS_SWCT_03216](#))

For details on these part of the `SwDataDefProps` see chapters [5.4.4](#) and [5.5.6](#).

5.2.4.1.4 Data Types for Textual Strings

[constr_1093] Definition of textual strings [An `ApplicationPrimitiveDataType` of `category STRING` shall have a `swTextProps` which determines the `arraySizeSemantics` and `swMaxTextSize`.

This rule shall be imposed **at the time when the contract phase generation is executed**] ()

[TPS_SWCT_01488] ApplicationPrimitiveDataType shall be interpreted as a string of a particular encoding [To indicate that an `ApplicationPrimitiveDataType` shall be interpreted as a string of a particular encoding it shall reference `swDataDefProps.swTextProps.baseType` and the only attribute of the referenced `SwBaseType` relevant for this purpose is the `BaseTypeDirectDefinition.baseTypeEncoding`.] ()

[constr_1905] Existence of attribute SwTextProps.arraySizeSemantics [For each `SwTextProps`, attribute `arraySizeSemantics` shall exist **at the time when the contract phase generation is executed**.] ()

[constr_1906] Existence of attribute SwTextProps.swMaxTextSize [For each `SwTextProps`, attribute `swMaxTextSize` shall exist **at the time when the contract phase generation is executed**.] ()

[TPS_SWCT_01127] Byte array with variable size [SwTextProps can be used to define byte arrays of variable size.] (RS_SWCT_03182, RS_SWCT_03181)

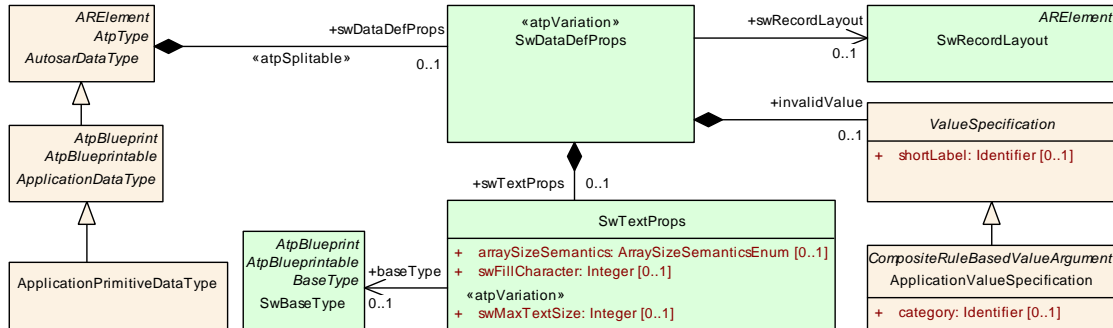

Figure 5.8: Specification of textual strings

[TPS_SWCT_01246] SwRecordLayout may also be required for A2L generation [A SwRecordLayout may also be required for the generation of A2L if the string is part of calibration data.] ()

As stated by [TPS_SWCT_01128], the definition of SwDataDefProps.swRecordLayout is considered mandatory anyway for ApplicationPrimitiveDataTypes of category STRING.

Class	SwTextProps			
Package	M2::MSR::DataDictionary::DataDefProperties			
Note	This meta-class expresses particular properties applicable to strings in variables or calibration parameters.			
Base	ARObject			
Aggregated by	SwDataDefProps.swTextProps			
Attribute	Type	Mult.	Kind	Note
arraySizeSemantics	ArraySizeSemanticsEnum	0..1	attr	This attribute controls the semantics of the arraysize for the array representing the string in an ImplementationDataType. It is there to support a safe conversion between ApplicationDatatype and ImplementationDatatype, even for variable length strings as required e.g. for Support of SAE J1939.
baseType	SwBaseType	0..1	ref	This is the base type of one character in the string. In particular this baseType denotes the intended encoding of the characters in the string on level of ApplicationDataType. Tags: xml.sequenceOffset=30
swFillCharacter	Integer	0..1	attr	Filler character for text parameter to pad up to the maximum length swMaxTextSize. The value will be interpreted according to the encoding specified in the associated base type of the data object, e.g. 0x30 (hex) represents the ASCII character zero as filler character and 0 (dec) represents an end of string as filler character. The usage of the fill character depends on the arraySizeSemantics. Tags: xml.sequenceOffset=40

Class	SwTextProps			
swMaxTextSize	Integer	0..1	attr	Specifies the maximum text size in characters. Note the size in bytes depends on the encoding in the corresponding baseType. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime xml.sequenceOffset=20

Table 5.7: SwTextProps

The following series of XML fragments exemplifies the definition of a data type for the representation of a textual string. First, the applicable `ApplicationPrimitiveDataType` is defined (see Figure 5.8).

Note that the `category` is set to the value `STRING`. Also, the `ApplicationPrimitiveDataType.swDataDefProps.swTextProps` indicate the width of the string and also define (by means of the reference to `baseType`) the encoding this string data type is supposed to utilize.

Note further that the fact that an `ApplicationDataType` directly references (across the implementation level) to a `SwBaseType` **represents an exception to the rule that `ApplicationDataType` should not be concerned about the lowest level of data type definition** in AUTOSAR.

If the bridging of the implementation level were accepted as a general pattern for the modeling of `ApplicationDataType` it would easily be possible to bypass the implementation level to some extent and this would render `ApplicationDataTypes` less versatile.

[TPS_SWCT_01128] `SwRecordLayout` needed for `ApplicationPrimitiveDataType` of category `STRING` [As mentioned in [TPS_SWCT_01179], an `ApplicationPrimitiveDataType` of category `STRING` is considered a `Compound Primitive Data Type`.

Therefore, it needs a reference to the definition of a `SwRecordLayout` that presets the approach for creating a matching `ImplementationDataType`.]()

An example for the usage of `SwRecordLayout` for the definition of a data type can be found in Appendix B.1.1.

[TPS_SWCT_01570] `DataTypeMap` is mandatory in the presence of `ApplicationPrimitiveDataType.swDataDefProps.swRecordLayout` [The definition of a `DataTypeMap` is mandatory even if an `ImplementationDataType` has been derived from an `ApplicationPrimitiveDataType` that defines a `SwRecordLayout`.]()

One motivation for the existence of [TPS_SWCT_01570] is that the integrator of an AUTOSAR ECU may rightfully decide to take a different `ImplementationDataType` other than the one that has been generated on the basis of the `SwRecordLayout`.

5.2.4.2 Application Composite Data Types

[TPS_SWCT_01247] **ApplicationArrayDataType** and **ApplicationRecordDataType** [The meta-classes `ApplicationArrayDataType` and `ApplicationRecordDataType` provide the means to define composite data types.

Such a composite data type is required if the application software wants to have access to the individual elements of the composite as well as to do operations with the whole composite, e.g. wants to communicate the complete record or array in a single transaction.

It is possible to use a combination of `ApplicationArrayDataType` and `ApplicationRecordDataType`, so that an `ApplicationArrayDataType` could be defined as `ApplicationRecordElement` of a `ApplicationRecordDataType` and in the same manner a `ApplicationRecordDataType` could be used as the base-type of an `ApplicationArrayDataType`. The creation of nested `ApplicationCompositeDataTypes` is also possible.] (RS_SWCT_03215, RS_SWCT_03216)

Details about meta-class `ApplicationRecordDataType` are depicted in Figure 5.9.

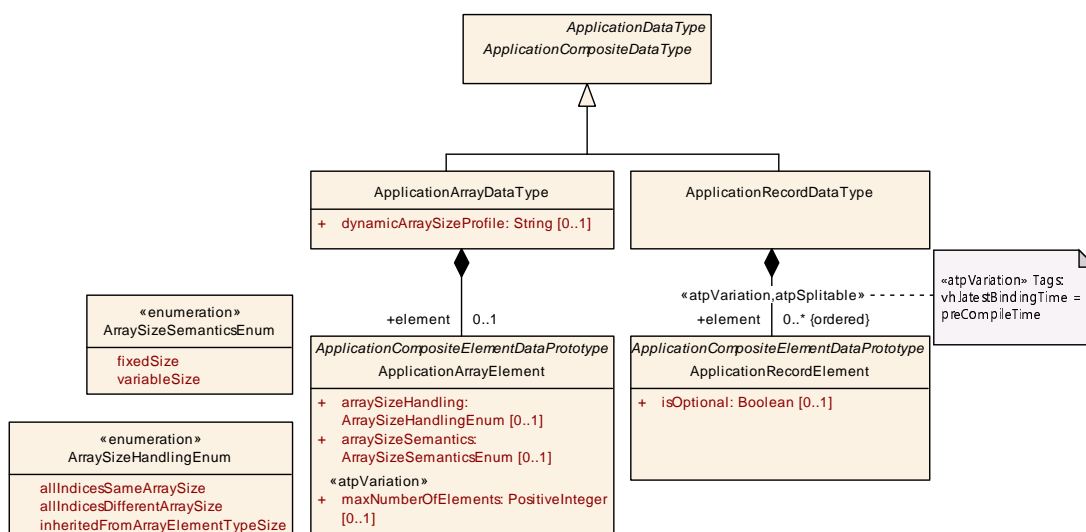

Figure 5.9: Summary of `ApplicationCompositeDataType`

5.2.4.2.1 ApplicationArrayDataType

[TPS_SWCT_01078] **Configurable array size** [The size of an `ApplicationArrayDataType` (in terms of the number of elements) is configured by means of the value of attribute `ApplicationArrayElement.numberOfElements`.

For the purpose of referring to an element of an `ApplicationArrayDataType` within a software-component description, the element's `index` runs from 0 to the value of `numberOfElements-1`.] (RS_SWCT_03144, RS_SWCT_03215)

Class	ApplicationArrayDataType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	An application data type which is an array, each element is of the same application data type. Tags: atp.recommendedPackage=ApplicationDataTypes			
Base	ARElement , ARObject , ApplicationCompositeDataType , ApplicationDataType , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpType , AutosarDataType , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
dynamicArraySizeProfile	String	0..1	attr	Specifies the profile which the array will follow if it is a variable size array.
element	ApplicationArrayElement	0..1	aggr	This association implements the concept of an array element. That is, in some cases it is necessary to be able to identify single array elements, e.g. as input values for an interpolation routine.

Table 5.8: ApplicationArrayDataType

[constr_1907] Existence of attribute [ApplicationArrayDataType.element](#) [For each [ApplicationArrayDataType](#), the aggregation of [ApplicationArrayElement](#) in the role `element` shall exist **at the time when the RTE is generated.**]()

Class	ApplicationArrayElement			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	Describes the properties of the elements of an application array data type.			
Base	ARObject , ApplicationCompositeElementDataPrototype , AtpFeature , AtpPrototype , DataPrototype , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	ApplicationArrayDataType.element , AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note
arraySizeHandling	ArraySizeHandlingEnum	0..1	attr	The way how the size of the array is handled.
arraySizeSemantics	ArraySizeSemanticsEnum	0..1	attr	This attribute controls how the information about the array size shall be interpreted.
indexDataType	ApplicationPrimitiveDataType	0..1	ref	This reference can be taken to assign a CompuMethod of category TEXTTABLE to the array. The texttable entries associate a textual value to an index number such that the element with that index number is represented by a symbolic name.
maxNumberOfElements	PositiveInteger	0..1	attr	The maximum number of elements that the array can contain. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime

Table 5.9: ApplicationArrayElement

Please note that the information about the number of elements of a specific [ApplicationArrayDataType](#) is not absolute but allows for further interpretation.

[TPS_SWCT_01076] Number of elements of a specific [ApplicationArrayDataType](#) might vary at run-time [That is, there are cases where the number of elements of a specific [ApplicationArrayDataType](#) might vary at run-time.

To be precise, the number of elements might vary between 0 and the value denoted by `maxNumberOfElements`.

For this purpose an additional attribute `arraySizeSemantics` is available that can be used to clarify the meaning of `maxNumberOfElements`.

For clarification, it might indeed happen that the actual number of elements in a specific `ApplicationArrayDataType` yields 0 simply because the respective `DataPrototype` is part of a higher-level protocol where under certain circumstances the `DataPrototype` of `ApplicationArrayDataType` is simply not required for expressing a given semantics. [\(RS_SWCT_03180, RS_SWCT_03181, RS_SWCT_03215, RS_SWCT_03144\)](#)

Please note that the ability to define the semantic meaning of `maxNumberOfElements` is not only limited to the application data type level. The same approach also applies for `ImplementationDataType`.

Enumeration	ArraySizeSemanticsEnum
Package	M2::AUTOSARTemplates::CommonStructure::ImplementationDataTypes
Note	This type controls how the information about the number of elements in an <code>ApplicationArrayDataType</code> is to be interpreted.
Aggregated by	ApplicationArrayElement.arraySizeSemantics , DiagnosticDataElement.arraySizeSemantics , ImplementationDataTypeElement.arraySizeSemantics , SwTextProps.arraySizeSemantics
Literal	Description
fixedSize	This means that the <code>ApplicationArrayDataType</code> will always have a fixed number of elements. Tags: <code>atp.EnumerationLiteralIndex=0</code>
variableSize	This implies that the actual number of elements in the <code>ApplicationArrayDataType</code> might vary at run-time. The value of <code>arraySize</code> represents the maximum number of elements in the array. Tags: <code>atp.EnumerationLiteralIndex=1</code>

Table 5.10: ArraySizeSemanticsEnum

[constr_1152] category of `ApplicationArrayElement` and `AutosarDataType` referenced in the role `type` shall be kept in sync [The value of `category` of an `ApplicationArrayElement` shall always be identical to the value of `category` of the `AutosarDataType` referenced by the `ApplicationArrayElement`.]()

Enumeration	ArraySizeHandlingEnum
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes
Note	This enumeration defines different ways to handle the sizes of variable size arrays.
Aggregated by	ApplicationArrayElement.arraySizeHandling , ImplementationDataTypeElement.arraySizeHandling
Literal	Description
allIndicesDifferent ArraySize	All elements of the variable size array may have different sizes. Tags: <code>atp.EnumerationLiteralIndex=0</code>
allIndicesSame ArraySize	All elements of the variable size array have the same size. Tags: <code>atp.EnumerationLiteralIndex=1</code>

Enumeration	ArraySizeHandlingEnum
inheritedFromArray ElementTypeSize	The size of all dimensions of the variable size array is determined by the size of the contained array element. Tags: atp.EnumerationLiteralIndex=2

Table 5.11: ArraySizeHandlingEnum

5.2.4.2.1.1 Variable Size Array

[TPS_SWCT_01604] Enable Size Indicator [To enable the RTE's ability to consider the number of valid elements inside a [Variable-Size Array Data Type](#) the [ApplicationArrayDataType.dynamicArraySizeProfile](#) of [ApplicationArrayDataType](#) and [ApplicationArrayElement.arraySizeHandling](#) shall be set.]([RS_SWCT_03181](#))

[TPS_SWCT_01601] Size Indicator shall be updated by software-component [If a software-component changes the number of valid elements in a variable size array, it shall also update the [Size Indicator](#) in the [ImplementationDataType](#).]([RS_SWCT_03181](#))

[TPS_SWCT_01602] Size Indicator shall be read by the software-component [If a software-component receives a variable size array, it shall use the [Size Indicator](#) in the [ImplementationDataType](#) to determine the number of valid elements in the array.]([RS_SWCT_03181](#))

[TPS_SWCT_01605] Semantics of ApplicationArrayElement.arraySizeHandling [The attribute [ApplicationArrayElement.arraySizeHandling](#) specifies how the size is determined in case of multi-dimensional variable size array.]([RS_SWCT_03181](#))

This allows to specify coherent relations between the sizes of the nested variable size arrays in case of multiple dimensions.

With a suitable [ImplementationDataType](#), it is possible to enable other software-components, RTE, and other BSW modules to make use of the [Size Indicator](#) and only transfer the valid data elements from the sender to the receiver.

[TPS_SWCT_01606] Internal structure of mapped ImplementationDataType [The attribute [dynamicArraySizeProfile](#) specifies which internal structure the [ImplementationDataType](#) that is mapped to the [ApplicationDataType](#) shall follow.]([RS_SWCT_03181](#))

[TPS_SWCT_01607] Profiles for internal structure of mapped ImplementationDataType [For the structure of the [ImplementationDataType](#) that is mapped to the [ApplicationDataType](#) the following profiles are defined for [dynamicArraySizeProfile](#): [VSA_LINEAR](#), [VSA_SQUARE](#), [VSA_RECTANGULAR](#), and [VSA_FULLY_FLEXIBLE](#).]([RS_SWCT_03181](#))

[TPS_SWCT_01608] Custom profiles for internal structure of mapped `ImplementationDataType` [Custom profiles can be added to `dynamicArraySizeProfile`. They shall have a company-specific prefix.]([RS_SWCT_03181](#))

As it is a general rule for the definition of custom profiles or values of `category`, the custom value should start with a company-specific prefix in order to avoid clashes with later extensions of the AUTOSAR standard.

`dynamicArraySizeProfile` is used to specify how the number of elements of the multiple dimensions of a variable size array correlate. They could be totally independent (`VSA_FULLY_FLEXIBLE`) on the one hand or each dimension has the same number of valid elements (`VSA_SQUARE`).

[TPS_SWCT_01623] Justification for the existence of attributes `ApplicationArrayType.dynamicArraySizeProfile` and `ApplicationArrayElement.arraySizeHandling` [At the first glance, the two attributes `ApplicationArrayType.dynamicArraySizeProfile` and `ApplicationArrayElement.arraySizeHandling` seem equivalent.

However, both are needed because they have to be used if multi dimensional variable size arrays have to be described. In this case, multiple combinations of sizes could occur which cannot be specified beforehand.]([RS_SWCT_03181](#))

The `ImplementationDataType` has to follow certain rules depending on the chosen profile. See chapter [5.2.5](#) for details.

[constr_1314] Profile `VSA_LINEAR` for `ApplicationArrayType` [If the `dynamicArraySizeProfile` of `ApplicationArrayType` is set to `VSA_LINEAR`, the contained `ApplicationArrayElement` shall fulfill **all** the following conditions **at the time when the contract phase generation is executed**:

- The attribute `ApplicationArrayElement.arraySizeSemantics` shall set to the value `variableSize`.
- The attribute `ApplicationArrayElement.maxNumberOfElements` shall be defined.
- The attribute `ApplicationArrayElement.arraySizeHandling` shall be set to the value `allIndicesSameArraySize`.
- The `ApplicationArrayElement` shall be typed by an `ApplicationDataType` that is not an `ApplicationArrayType` where the attribute `dynamicArraySizeProfile` exists.

]()

The part of [\[constr_1314\]](#) that demands that *the `ApplicationArrayElement` shall be typed by an `ApplicationDataType` that is not an `ApplicationArrayType` where the attribute `dynamicArraySizeProfile` exists* basically boils down to the simple explanation that the “leaf” data type of the `Variable-Size Array Data Type` can be anything but a `Variable-Size Array Data Type`.

[constr_1315] Profile VSA_SQUARE for ApplicationArrayType [If the `dynamicArraySizeProfile` of `ApplicationArrayType` is set to `VSA_SQUARE`, the contained `ApplicationArrayElement` shall fulfill **all** the following conditions :

- The attribute `ApplicationArrayElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ApplicationArrayElement.maxNumberOfElements` shall not be defined.
- The attribute `ApplicationArrayElement.arraySizeHandling` shall be set to the value `inheritedFromArrayElementTypeSize`.
- The `ApplicationArrayElement` shall be typed by an `ApplicationArrayType`.

The referred `ApplicationArrayType` shall refer over a chain (under consideration of the number of dimensions of the “root” `ApplicationArrayType`) of nested `ApplicationArrayTypes` with `ApplicationArrayElements` to an `ApplicationDataType` that is **not** an `ApplicationArrayType` where the attribute `dynamicArraySizeProfile` exists.

The last `ApplicationArrayType` in that chain shall have an `ApplicationArrayElement` that fulfills **all** the following conditions:

- The attribute `ApplicationArrayElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ApplicationArrayElement.maxNumberOfElements` shall be defined.
- The attribute `ApplicationArrayElement.arraySizeHandling` set to the value `allIndicesSameArraySize`.

All `ApplicationArrayTypes` before shall have an `ApplicationArrayElement` that fulfills **all** the following conditions:

- The attribute `ApplicationArrayElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ApplicationArrayElement.maxNumberOfElements` shall not be defined.
- The attribute `ApplicationArrayElement.arraySizeHandling` shall be set to the value `inheritedFromArrayElementTypeSize`.
- The `ApplicationArrayElement` shall be typed by an `ApplicationArrayType`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

The part of [constr_1315], [constr_1316], and [constr_1317] that demands that *the referred ApplicationArrayDataType shall refer over a chain (under consideration of the number of dimensions of the “root” ApplicationArrayDataType) of nested ApplicationArrayDataTypes with ApplicationArrayElements to an ApplicationDataType that is not an ApplicationArrayDataType where the attribute dynamicArraySizeProfile exists* basically boils down to the simple explanation that the “leaf” data type of the Variable-Size Array Data Type can be anything but a Variable-Size Array Data Type.

[constr_1316] Profile VSA_RECTANGULAR for ApplicationArrayDataType [If the dynamicArraySizeProfile of ApplicationArrayDataType is set to VSA_RECTANGULAR the contained ApplicationArrayElement shall fulfill **all** the following conditions :

- The attribute ApplicationArrayElement.arraySizeSemantics shall be set to the value variableSize.
- The attribute ApplicationArrayElement.maxNumberOfElements shall be defined.
- The attribute ApplicationArrayElement.arraySizeHandling shall be set to the value allIndicesSameArraySize.
- The ApplicationArrayElement shall be typed by an ApplicationArrayDataType.

The referred ApplicationArrayDataType shall refer over a chain (under consideration of the number of dimensions of the “root” ApplicationArrayDataType) of nested ApplicationArrayDataTypes with ApplicationArrayElements to an ApplicationDataType that is **not** an ApplicationArrayDataType where the attribute dynamicArraySizeProfile exists.

The last ApplicationArrayDataType in that chain shall have an ApplicationArrayElement that fulfills **all** the following conditions:

- The attribute ApplicationArrayElement.arraySizeSemantics shall be set to the value variableSize.
- The attribute ApplicationArrayElement.maxNumberOfElements shall be defined.
- The attribute ApplicationArrayElement.arraySizeHandling shall be set to the value allIndicesSameArraySize.

All ApplicationArrayDataTypes before shall have an ApplicationArrayElement that fulfills **all** the following conditions:

- The attribute ApplicationArrayElement.arraySizeSemantics shall set to the value variableSize
- The attribute ApplicationArrayElement.maxNumberOfElements shall be defined.

- The attribute `ApplicationArrayElement.arraySizeHandling` shall be set to the value `allIndicesSameArraySize`.
- The `ApplicationArrayElement` shall be typed by an `ApplicationArrayDataType`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]

[constr_1317] Profile VSA_FULLY_FLEXIBLE for ApplicationArrayDataType
[If the `dynamicArraySizeProfile` of `ApplicationArrayDataType` is set to `VSA_FULLY_FLEXIBLE`, the contained `ApplicationArrayElement` shall fulfill **all** the following conditions:

- The attribute `ApplicationArrayElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ApplicationArrayElement.maxNumberOfElements` shall be defined.
- The attribute `ApplicationArrayElement.arraySizeHandling` shall be set to the value `allIndicesDifferentArraySize`.
- The `ApplicationArrayElement` shall be typed by an `ApplicationArrayDataType`.

The referred `ApplicationArrayDataType` shall refer over a chain (under consideration of the number of dimensions of the “root” `ApplicationArrayDataType`) of nested `ApplicationArrayDataTypes` with `ApplicationArrayElements` to an `ApplicationDataType` that is **not** an `ApplicationArrayDataType` where the attribute `dynamicArraySizeProfile` exist.

The last `ApplicationArrayDataType` in that chain shall have an `ApplicationArrayElement` that fulfills **all** the following conditions:

- The attribute `ApplicationArrayElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ApplicationArrayElement.maxNumberOfElements` shall be defined.
- The attribute `ApplicationArrayElement.arraySizeHandling` shall be set to the value `allIndicesSameArraySize`.

All `ApplicationArrayDataTypes` before shall have an `ApplicationArrayElement` that fulfills **all** the following conditions:

- The attribute `ApplicationArrayElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ApplicationArrayElement.maxNumberOfElements` shall be defined.

- The attribute `ApplicationArrayElement.arraySizeHandling` shall be set to the value `allIndicesDifferentArraySize`.
- The `ApplicationArrayElement` shall be typed by an `ApplicationArrayDataType`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

For examples, see Appendix [B.1.3](#).

5.2.4.2.1.2 Multi-Dimensional Arrays

[TPS_SWCT_01256] Definition of multi-dimensional array data types [In order to describe multi dimensional arrays an `ApplicationArrayElement` references again another `ApplicationArrayDataType`. Hereby, one `ApplicationArrayDataType` per dimension is required.

This multiple dimensions do have a well-defined correlation to the individual dimensions of an `ImplementationDataType` of category `ARRAY` when the `ApplicationArrayDataType` is mapped to an `ImplementationDataType`.

The `ApplicationArrayElements` are mapping in the order of the `ApplicationArrayElement` to `ApplicationArrayDataType` references to `ImplementationDataTypeElements` in the order of first `ImplementationDataTypeElement` of the `ImplementationDataType` to leaf `ImplementationDataTypeElement`.

In other words the `ApplicationArrayElement` of the top-level `ApplicationArrayDataType` relates to the first `ImplementationDataTypeElement` of the `ImplementationDataType`.

The `ApplicationArrayElement` of the referenced `ApplicationArrayDataTypes` relates to the sub `ImplementationDataTypeElements` in the order of the `ApplicationArrayElement` to `ApplicationArrayDataType` references.] ([RS_SWCT_03215](#), [RS_SWCT_03216](#))

An example for the definition of a multi-dimensional array data type can be found in Appendix [B.1.5](#).

5.2.4.2.1.3 Index Data Type

The usage of an array represents an elegant way to group data with identical properties. This allows for an easy processing of the same functionality by iterating over the array elements.

From a functional point of view, however, each array element may have a distinct meaning that could be visible to the application software. To create this visibility, it is possible

to take advantage of an existing mechanism: `CompuMethods` of category `TEXTTABLE`.

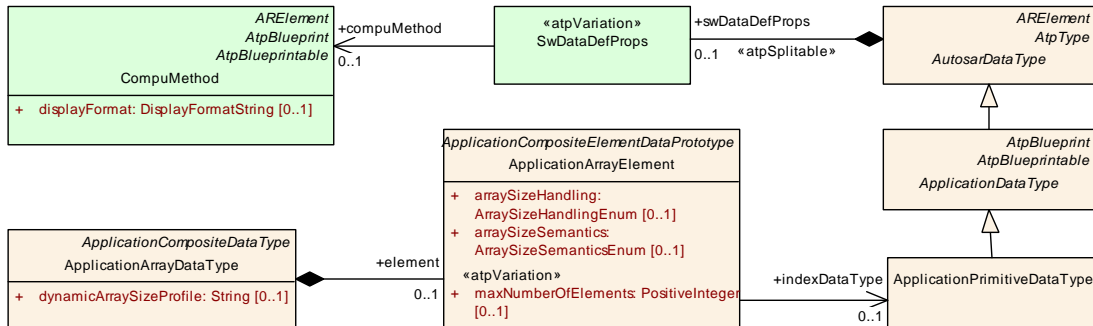

Figure 5.10: Modeling of the `ApplicationArrayElement.indexDataType`

[TPS_SWCT_01699] Usage of `ApplicationArrayElement.indexDataType` [The primary use case of the attribute `ApplicationArrayElement.indexDataType` is the creation of composite data type mappings or the description of measurement and calibration. Furthermore, the information could be used for documentation purposes.] (*RS_SWCT_03230*)

[constr_1438] `ApplicationArrayElement.indexDataType` needs to refer to a `CompuMethod` of category `TEXTTABLE` [The reference `ApplicationArrayElement.indexDataType` shall only point to an `ApplicationPrimitiveDataType` that in turn refers to a `CompuMethod` of category `TEXTTABLE`.

This rule shall be imposed **at the time when the contract phase generation is executed.**] ()

[constr_1440] Size of the `CompuMethod` of category `TEXTTABLE` referenced by `ApplicationArrayElement.indexDataType` [The interval defined by the `CompuScales` contained in the `CompuMethod` referenced by `ApplicationArrayElement.indexDataType` shall start at 0 and include all integer values until `ApplicationArrayElement.maxNumberOfElements - 1`.

This rule shall be imposed **at the time when the contract phase generation is executed.**] ()

[constr_1439] Requirements on `ApplicationArrayElement` if attribute `indexDataType` exists [If `ApplicationArrayElement.indexDataType` exists then the attribute `ApplicationArrayElement.arraySizeSemantics` shall be set to the value `fixedSize` and attribute `arraySizeHandling` shall not exist **at the time when the contract phase generation is executed.**] ()

An example for the definition of an `ApplicationArrayElement.indexDataType` can be found in Appendix B.1.2.

5.2.4.2.2 ApplicationRecordDataType

[TPS_SWCT_01249] **ApplicationRecordDataType** [A declaration of [ApplicationRecordDataType](#) describes a non-empty set of objects, each of which has a unique identifier with respect to the [ApplicationRecordDataType](#) and each has an own [ApplicationDataType](#).

The [shortName](#) of each [ApplicationRecordElement](#) within the scope of an [ApplicationRecordDataType](#) shall be unique.]([RS_SWCT_03216](#))

This means that, at runtime, the ApplicationRecordElement may or may not have a valid value and shall therefore be ignored.</p> <p>The underlying runtime software provides means to set the ApplicationRecordElement as not valid at the sending end of a communication and determine its validity at the receiving end.</p>

Table 5.13: ApplicationRecordElement

[TPS_SWCT_01771] Definition of optional elements on the level of `ApplicationDataType` [The modeling approach for the definition of optional elements on the level of `ApplicationDataType` is to set the attribute `ApplicationRecordElement.isOptional` to the value `true`.

If the attribute is not set or set to the value `false` then the respective `ApplicationRecordElement` **shall be considered mandatory.** (*RS_SWCT_03320*)

5.2.5 Implementation Data Type

5.2.5.1 Overview

[TPS_SWCT_01250] `ImplementationDataType` has been introduced to optimize the formal support for data type handling on the implementation level [The concept of an `ImplementationDataType` has been introduced to optimize the formal support for data type handling on the implementation level.

That is, an `ImplementationDataType` conceptually corresponds to the level of (C) source code. For example, `ImplementationDataTypes` have a direct impact on the contract (please find an explanation of this term in [2]) of a software-component and the RTE. (*RS_SWCT_03217*)

The allowed existence and multiplicity of all the attributes of `SwDataDefProps` and other properties depend on the `category` of the `ImplementationDataType`.

[constr_1178] Existence of attributes of `SwDataDefProps` in the context of `ImplementationDataType` [For the sake of removing possible sources of ambiguity, `SwDataDefProps` used in the context of `ImplementationDataType` can **only have one of**

- `baseType`
- `swPointerTargetProps`
- `implementationDataType`

at the time when the contract phase generation is executed. (*()*)

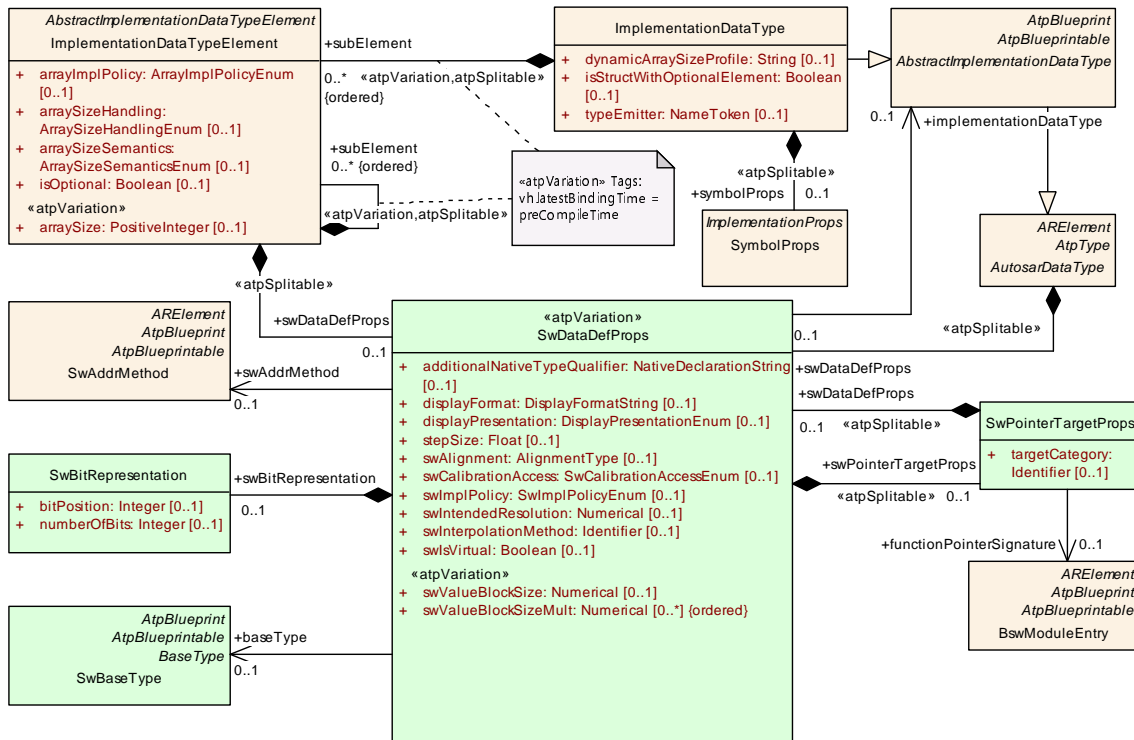

Figure 5.11: SwDataDefProps used in the context of ImplementationDataType

[TPS_SWCT_01251] Limited set of values for `category` are applicable for `ImplementationDataType` [Like any `AutosarDataType`, also the data types on implementation level are characterized by its `category` and its `SwDataDefProps`. For a given `category`, only a limited set of attributes of the `SwDataDefProps` makes sense.] (*RS_SWCT_03217*)

[constr_10373] `ImplementationDataType` of `category` `VALUE` shall not refer to `SwBaseType` of `category` `VOID` [An `ImplementationDataType` where attribute `category` is set to `VALUE` shall not reference (in the role `swDataDefProps.baseType`) a `SwBaseType` where attribute `category` is set to `VOID`.] ()

Rationale for the existence of [constr_10373]: The programming language C does not support a variable of type void:

```
void * MyVoidPtr /* works */

void MyVoidVar; /* does not work!*/
```

[constr_10434] Existence of attributes of `ImplementationDataType` depending on the `category` [

Attributes of ImplementationDataType	Attribute Existence per Category						
	VALUE	DATA_REFERENCE	FUNCTION_REFERENCE	TYPE_REFERENCE	STRUCTURE	UNION	ARRAY
<code>dynamicArraySizeProfile</code>							0..1
<code>isStructWithOptionalElement</code>					0..1

⁶don't care

⁷There is a use case for the definition of an `invalidValue` for `category ARRAY` and therefore `category STRUCTURE` is also supported for the sake of symmetry.

⁸This represents an exception such that it would make sense to use an entire `ArrayValueSpecification` as the `invalidValue` because a string semantically is more than just a bunch of characters in a row.

Attributes of SwDataDefProps	Root Element				Attribute Existence per Category

⌋()

[constr_1694] Allowed target of SwDataDefProps.implementationDataType
[The reference SwDataDefProps.implementationDataType shall only refer to an ImplementationDataType. Any other subclass of AbstractImplementationDataType is not supported as a reference target.]

This rule shall be applied **at the time when the contract phase generation is executed.**⌋()

This list makes use of the SwDataDefProps and other meta-model elements which are explained in detail in the further sections of this chapter.

Regulations regarding the applicable *categorys* for attribute ImplementationDataType.swDataDefProps.compuMethod can be found in [constr_1158] inside section 5.5.1.3.2.

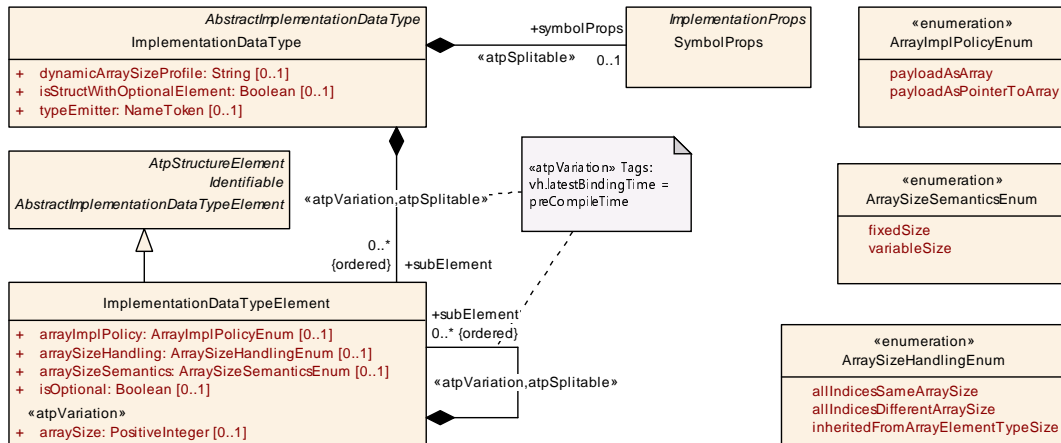

Figure 5.12: `ImplementationDataType` overview

[TPS_SWCT_01252] `ImplementationDataType` can express concepts not available on application level [As a consequence of the specific focus, it is possible to express concepts with an `ImplementationDataType` that are not supported on the application level, i.e. by `ApplicationDataType`:

- `ImplementationDataType` supports the definition of pointers
- It is possible to define “alias” names just as in a `typedef`
- It is possible to define nested `ImplementationDataTypes` but in contrast to the concept implemented for `ApplicationDataType` these implement a direct aggregation of sub-elements rather than applying the type-prototype pattern.

](RS_SWCT_03217)

The general structure of `ImplementationDataType` is sketched in Figure 5.12. If a specific `ImplementationDataType` is supposed to define a composite data type, the `ImplementationDataType` aggregates `ImplementationDataTypeElements`.

Table 5.17: ImplementationDataTypeElement

5.2.5.2 Modeling of Type Reference using Implementation Data Type

[TPS_SWCT_01441] **Nature of a TYPE_REFERENCE** [A type reference (formally represented by an [ImplementationDataType](#) of category TYPE_REFERENCE) implements a redirection to common [ImplementationDataTypes](#).]()

[TPS_SWCT_01442] **ImplementationDataType of category TYPE_REFERENCE does not define own properties** [As long as an [ImplementationDataType](#) of category TYPE_REFERENCE does not define own properties, the properties of the refined [ImplementationDataType](#) apply.]([RS_SWCT_03217](#))

[TPS_SWCT_01443] **ImplementationDataType of category TYPE_REFERENCE overwrites properties of refined ImplementationDataType** [If an implementation data types of category TYPE_REFERENCE defines own properties (e.g. [CompuMethod](#)), these properties overwrite the properties of the refined [ImplementationDataType](#).]([RS_SWCT_03217](#))

As explained by [[constr_1050](#)], Compatibility checks of [ImplementationDataType](#) require a prior resolution of possible type references, i.e. the compatibility shall be checked on the resolved [ImplementationDataType](#).

[constr_1383] Existence of CompuMethod and DataConstr for ImplementationDataTypes of category TYPE_REFERENCE [The existence of `ImplementationDataType.swDataDefProps.compuMethod` and `ImplementationDataType.swDataDefProps.dataConstr` for `ImplementationDataTypes` of category `TYPE_REFERENCE` is only allowed, if the respective `ImplementationDataType`, after all type references are resolved, ends up in an `ImplementationDataType` of category `VALUE`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Please note that, as a consequence of the existence of **[constr_1383]**, it is possible that the elements of a composite `ImplementationDataType` define individual `CompuMethods`. However, the definition of **one** `CompuMethod` that applies to the **entire** composite `ImplementationDataType` is not supported.

5.2.5.3 Modeling of Structure using Implementation Data Type

[constr_1106] Structure shall have at least one element [An `ImplementationDataType` or `ImplementationDataTypeElement` of category `STRUCTURE` shall own at least one `ImplementationDataTypeElement` **at the time when the contract phase generation is executed.**]()

5.2.5.3.1 Modeling of Optional Element Structure with ImplementationDataType

The definition of an `ImplementationDataType` that represents an `Optional Element Structure` shall not only rely on the existence of optional elements.

Also, the definition of the enclosing `ImplementationDataType` shall clearly signal the intention by means of the dedicated attribute `ImplementationDataType.isStructWithOptionalElement`.

[TPS_SWCT_01772] Semantics of attribute ImplementationDataType.isStructWithOptionalElement [If attribute `ImplementationDataType.isStructWithOptionalElement` is set to `true` then the `ImplementationDataType` advertises the intention to represent an `Optional Element Structure` such that the fulfillment of structural requirements for the existence of optional elements can be formally checked.

Again, this attribute represents a formal specification that optionality is intended as opposed to an `ImplementationDataType` that fulfills the structural requirements out of different motivations.](*RS_SWCT_03217, RS_SWCT_03320*)

[TPS_SWCT_01773] Definition of Optional Element Structure on the level of ImplementationDataType [The modeling approach for the definition of an `Optional Element Structure` on the level of `ImplementationDataType` is to set the attribute `ImplementationDataTypeElement.isOptional` to the value `true`.

If the attribute is not set or set to the value `false`, then the respective `ImplementationDataTypeElement` shall be considered mandatory.]([RS_SWCT_03217](#), [RS_SWCT_03320](#))

[constr_1637] Existence of `ImplementationDataTypeElement.isOptional` vs. `ImplementationDataType.isStructWithOptionalElement` [If one `ImplementationDataType.subElement` sets attribute `isOptional` to the value `true` then the enclosing `ImplementationDataType` shall also set attribute `isStructWithOptionalElement` to `true`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

In order to be able to generate a proper RTE API for the access to optional elements of data types in general it is necessary to impose structural requirements on the definition of `ImplementationDataType`.

In particular, it is necessary at runtime to store the information about the availability of a specific `ImplementationDataTypeElement` where attribute `isOptional` has been set to the value `true` in the context of an `ImplementationDataType` of category `STRUCTURE`.

An `ImplementationDataType` that represents an `Optional Element Structure` shall contain a special element which represents an *availability bitfield*.

This bitfield is implemented as an array of `uint8` and shall hold one bit for each optional element contained in the structured data type.

In particular, the applicable structural requirements for an `ImplementationDataType` that represents an `Optional Element Structure` are described in the following specification items.

[TPS_SWCT_01774] Modeling of `ImplementationDataType` with optional elements [

The following approach shall be taken to model an `ImplementationDataType` that represents an `Optional Element Structure`:

- The first `ImplementationDataTypeElement` of `ImplementationDataType` where attribute `isStructWithOptionalElement` is set to `true` shall have the `shortName` `availabilityBitfield`. [[constr_1638](#)] applies.
- This `ImplementationDataTypeElement` shall be of category `ARRAY`
- The `ImplementationDataTypeElement` shall set attribute `arraySizeSemantics` to the value `fixedSize`.
- The `ImplementationDataTypeElement` shall aggregate a further `ImplementationDataTypeElement` in the role `subElement` for which the following requirements apply:

- The `ImplementationDataTypeElement` shall be of category `TYPE_REFERENCE` that eventually refers to an `ImplementationDataType` that - one way or the other - implements an array of unsigned bytes, e.g. take the `Platform DataType` named `uint8` as the element type⁹.
- The `ImplementationDataTypeElement` shall set the value of attribute `arraySize` to `max(1,ceil(numberOfOptionalElements / 8))`.

](*RS_SWCT_03320*)

Please note that the `numberOfOptionalElements` mentioned in [*TPS_SWCT_01774*] is computed as the sum of all `subElements` for which the attribute `isOptional` is set to `true`.

This sum is only taken on the level of `subElements` for which the attribute `isOptional` is set to `true` and NOT on any further (logical) levels in the structure below.

[*TPS_SWCT_01881*] Scope of the `availabilityBitfield` [The bitfield shall only contain information of the availability of the direct child elements of the enclosing structure and not of elements of sub-structures.]()

Please find examples for the definition of optional elements and the `availabilityBitfield` in section [B.1.8](#).

[*constr_1638*] First `ImplementationDataTypeElement` of `ImplementationDataType` that represents an `Optional Element Structure` [The first `ImplementationDataTypeElement` of `ImplementationDataType` that represents an `Optional Element Structure`, i.e. the `availabilityBitfield` according to [*TPS_SWCT_01774*], shall not set attribute `isOptional` to `true` **at the time when the contract phase generation is executed.**]()

A further structural requirement applies.

[*constr_1639*] `ImplementationDataTypeElement` with attribute `isOptional` set to `True` [An `ImplementationDataTypeElement` where attribute `isOptional` is set to `True` shall set the value of attribute `category` to either of the following values:

- `VALUE`
- `TYPE_REFERENCE`

at the time when the contract phase generation is executed.]()

Instead, nested structures shall be created by modeling `ImplementationDataTypeElements` of category `TYPE_REFERENCE` that in turn refer to `ImplementationDataTypes` of category `STRUCTURE`.

Rationale: the existence of [*constr_1639*] simplifies the concept of the availability bitfield.

⁹this relation could be expressed in a more formal way. But it would be a very expansive formal way in an already complicated specification item. It is assumed that it is sufficient to convey the general idea.

The bitfield shall **only** contain information of the availability of the direct child elements and **not** of elements of sub-structures.

By using the `category TYPE_REFERENCE` it is assured that a separate `ImplementationDataType` of `category STRUCTURE` is generated for the sub-structure.

Since the AUTOSAR RTE provides the APIs to access the availability information on the basis of an `ImplementationDataType` of `category STRUCTURE`, the usage of anonymous structures with optional elements is not possible.

5.2.5.4 Modeling of Union using Implementation Data Type

[constr_1107] Union shall have at least one element [An `ImplementationDataType` or `ImplementationDataTypeElement` of `category UNION` shall own at least one `ImplementationDataTypeElement` **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01759] Use cases for unions [There are different use cases for the definition of a union data type:

1. The `DataPrototypes` derived from the union data type shall be transported over a communication network. For this purpose, it is necessary to apply a special modeling in the form of a wrapped union data type, as explained by [TPS_SWCT_01700].
2. The `DataPrototypes` created from the union data type are used internally within the same ECU, e.g. as a `PerInstanceMemory`, `romBlock`, or `ramBlock`. In this case the modeling of the union data type does not depend on specific constraints.

] (`RS_SWCT_03217`)

In summary, there are cases where unions can be used in `PortInterfaces`, but these are restricted to the fulfillment of certain conditions that are explained in [constr_1607].

[constr_1607] Only Wrapped Union Data Types in PortInterface [Within the scope of a `PortInterface` the usage of a Union data type is only supported

- for `Wrapped Union Data Types`.
- for a `PortInterface` that is used to type a `PortPrototype` that does not appear as a context in an `instanceRef` owned by a `DataMapping`. See also [constr_1441].

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

5.2.5.5 Modeling of Array using Implementation Data Type

5.2.5.5.1 Overview

[TPS_SWCT_01254] **ImplementationDataType with array semantics** [Of course, it is also possible to define an `ImplementationDataType` that provides array semantics.] (*RS_SWCT_03217*)

[TPS_SWCT_01006] **ImplementationDataType.subElement.arraySize shall be used to define the size of the array** [The primitive attribute `ImplementationDataType.subElement.arraySize` shall be used to define the size of the array.] (*RS_SWCT_03217*)

[TPS_SWCT_01007] **Semantics of array index** [For an `ImplementationDataType` that implements an array data type, the semantics of the array index is such that

- it shall start with the value 0
- it shall run to the value of `arraySize - 1`

] (*RS_SWCT_03217*)

[constr_1105] **Value of `arraySize`** [The value of the attribute `arraySize` of an `ImplementationDataTypeElement` owned by an `ImplementationDataType` or `ImplementationDataTypeElement` of category `ARRAY` shall be greater than 0 unless attribute `ImplementationDataTypeElement.arraySizeHandling` exists and is set to the value `inheritedFromArrayElementTypeSize`.

This rule shall be imposed **at the time when the contract phase generation is executed.**] ()

[TPS_SWCT_01478] **Array size is defined as an attribute of the `ImplementationDataTypeElement`** [Please note that the array size is **not** defined as an attribute of the `ImplementationDataType` which stands for the whole array.

It is actually defined as an attribute of the `ImplementationDataTypeElement` which is describing the array element (note that the same pattern is used in `ApplicationArrayDataType`).] (*RS_SWCT_03217*)

Consequently, if a “struct” element represents an array this specific struct-element is given by an `ImplementationDataTypeElement` of category `ARRAY` which in turn aggregates another `ImplementationDataTypeElement` of e.g. category `VALUE` representing the array element and containing the size.

[TPS_SWCT_01255] **Indicate whether the array is supposed to have a fixed size or whether the actual size might change during run-time** [It is also possible to indicate whether the array is supposed to have a fixed size or whether the actual size might change during run-time.] (*RS_SWCT_03217*)

[constr_1783] Existence of attribute `ImplementationDataTypeElement.arrayImplPolicy` [Attribute `ImplementationDataTypeElement.arrayImplPolicy` shall only exist **at the time when the contract phase generation is executed** if the enclosing `ImplementationDataType` or `ImplementationDataTypeElement` is of category `ARRAY`.]()

The usage of attribute `ImplementationDataTypeElement.arrayImplPolicy` does not have an impact on model semantics, i.e. it does not impose further conditions on the modeling of arrays.

The attribute merely influences the implementation of the respective array in the programming language binding in the form of generated C code.

Enumeration	ArrayImplPolicyEnum
Package	M2::AUTOSARTemplates::CommonStructure::ImplementationDataTypes
Note	This meta-class provides values to configure the implementation of the payload part of an array.
Aggregated by	<code>ImplementationDataTypeElement.arrayImplPolicy</code>
Literal	Description
payloadAsArray	This configuration demands the implementation of the payload as an array. Tags: atp.EnumerationLiteralIndex=0
payloadAsPointerTo Array	This configuration demands the implementation of the payload as a pointer to an array. Tags: atp.EnumerationLiteralIndex=1

Table 5.18: ArrayImplPolicyEnum

5.2.5.5.2 Modeling of Variable-Size Array using Implementation Data Type

In the same way as for `ApplicationDataTypes`, it is also possible to specify a `Size Indicator` of a variable size array which holds the number of valid elements of the array in the `ImplementationDataType`.

Please find more information about this topic in section 5.2.4.2.1.1.

[TPS_SWCT_01622] Modeling of a Variable-Size Array Data Type only with `ImplementationDataType` [The modeling of a `Variable-Size Array Data Type` does not require the existence of an `ApplicationCompositeDataType` and a `DataTypeMap`. A `Variable-Size Array Data Type` can be created by just setting up an `ImplementationDataType`.](*RS_SWCT_03217, RS_SWCT_03181*)

[TPS_SWCT_01610] Modeling of a Variable-Size Array Data Type with `Size Indicator` enabled [An `ImplementationDataType` with category `STRUCTURE` where the attribute `ImplementationDataType.dynamicArraySizeProfile` exists represents a `Variable-Size Array Data Type` with `Size Indicator` enabled.

For the sake of a proper definition of terminology, this `ImplementationDataType` shall be called the `VSA ImplementationDataType`.] ([RS_SWCT_03217](#), [RS_SWCT_03181](#))

[TPS_SWCT_01650] Structure of the `VSA ImplementationDataType` [The `VSA ImplementationDataType` shall consist of

- an `ImplementationDataTypeElement` representing the `Size Indicator` and
- an `ImplementationDataTypeElement` representing the `Payload` of the `Variable-Size Array Data Type`.

For the sake of a proper definition of terminology, these `ImplementationDataTypeElements` shall be called the `VSA Size Indicator ImplementationDataTypeElement` and the `VSA Payload ImplementationDataTypeElement` respectively.] ([RS_SWCT_03217](#), [RS_SWCT_03181](#))

[TPS_SWCT_01612] `arraySizeHandling` specifies how the size is determined [`arraySizeHandling` specifies how the size is determined in case of multi-dimensional variable size array.] ([RS_SWCT_03217](#), [RS_SWCT_03181](#))

The statement made by **[TPS_SWCT_01612]** allows the specification of coherency between the sizes of the nested variable size arrays in case of multiple dimensions.

[TPS_SWCT_01613] Internal structure of mapped `ImplementationDataType` [The attribute `dynamicArraySizeProfile` specifies which internal structure the `ImplementationDataType` shall follow.] ([RS_SWCT_03217](#), [RS_SWCT_03181](#))

[TPS_SWCT_01614] Profiles for internal structure of mapped `ImplementationDataType` [For the structure of the `ImplementationDataType` the following profiles are defined for `dynamicArraySizeProfile`: `VSA_LINEAR`, `VSA_SQUARE`, `VSA_RECTANGULAR` and `VSA_FULLY_FLEXIBLE`.] ([RS_SWCT_03217](#), [RS_SWCT_03181](#))

[TPS_SWCT_01615] Custom profiles for internal structure of mapped `ImplementationDataType` [Custom profiles can be added to `dynamicArraySizeProfile`. They shall have a company-specific prefix.] ([RS_SWCT_03217](#), [RS_SWCT_03181](#))

For reasons of readability and comprehensibility the following constraints focus on the payload of the `Variable-Size Array Data Type` only. For the `Size Indicator` additional individual constraints do apply.

[constr_1318] Profile `VSA_LINEAR` for `ImplementationDataType` [If the value of attribute `ImplementationDataType.dynamicArraySizeProfile` is set to `VSA_LINEAR`, the `ImplementationDataType` shall aggregate a `VSA Payload ImplementationDataTypeElement` that fulfills all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall not be defined.
- The attribute `ImplementationDataTypeElement.category` shall be set to `ARRAY`.

- The attribute `ImplementationDataTypeElement.arraySize` shall not be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall not be defined.

The VSA Payload `ImplementationDataTypeElement` shall immediately aggregate another `ImplementationDataTypeElement` that shall fulfill all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ImplementationDataTypeElement.arraySize` shall be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `allIndicesSameArraySize`.

This rule shall be imposed **at the time when the contract phase generation is executed.** `()`

[constr_1319] Profile VSA_SQUARE for ImplementationDataType [If the value of attribute `ImplementationDataType.dynamicArraySizeProfile` is set to `VSA_SQUARE`, the `ImplementationDataType` shall aggregate a VSA Payload `ImplementationDataTypeElement` that fulfills all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall not be defined.
- The attribute `ImplementationDataTypeElement.category` shall be set to the value `ARRAY`.
- The attribute `ImplementationDataTypeElement.arraySize` shall not be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall not be defined.

The VSA Payload `ImplementationDataTypeElement` shall immediately aggregate another `ImplementationDataTypeElement` (representing the first dimension) that shall fulfill all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ImplementationDataTypeElement.category` shall be set to the value `ARRAY`.
- The attribute `ImplementationDataTypeElement.arraySize` shall not be defined.

- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `inheritedFromArrayElementTypeSize`.

All **intermediate** `ImplementationDataTypeElements` in the aggregation chain that do not terminate the chain shall fulfill all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ImplementationDataTypeElement.category` shall be set to the value `ARRAY`.
- The attribute `ImplementationDataTypeElement.arraySize` shall not be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `inheritedFromArrayElementTypeSize`.

The **terminating** `ImplementationDataTypeElement` in the aggregation chain shall fulfill all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ImplementationDataTypeElement.arraySize` shall be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `allIndicesSameArraySize`.

This rule shall be imposed **at the time when the contract phase generation is executed.** `]()`

[constr_1320] Profile `VSA_RECTANGULAR` for `ImplementationDataType` [If the value of attribute `ImplementationDataType.dynamicArraySizeProfile` is set to `VSA_RECTANGULAR`, the `ImplementationDataType` shall aggregate a `VSA Payload ImplementationDataTypeElement` that fulfills all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall not be defined.
- The attribute `ImplementationDataTypeElement.category` shall be set to the value `ARRAY`.
- The attribute `ImplementationDataTypeElement.arraySize` shall not be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall not be defined.

The `VSA Payload ImplementationDataTypeElement` shall immediately aggregate another `ImplementationDataTypeElement` (representing the first dimension) that shall fulfill all the following conditions:

- The attribute `ImplementationDataTypeElement.category` shall be set to the value `ARRAY`.
- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ImplementationDataTypeElement.arraySize` shall be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `allIndicesSameArraySize`.

All **intermediate** `ImplementationDataTypeElements` in the aggregation chain that do not terminate the chain shall fulfill all the following conditions:

- The attribute `ImplementationDataTypeElement.category` shall be set to the value `ARRAY`.
- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ImplementationDataTypeElement.arraySize` shall be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `allIndicesSameArraySize`.

The **terminating** `ImplementationDataTypeElement` in the aggregation chain shall fulfill all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ImplementationDataTypeElement.arraySize` shall be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `allIndicesSameArraySize`.

This rule shall be imposed **at the time when the contract phase generation is executed.** |()

[constr_1321] Profile `VSA_FULLY_FLEXIBLE` for `ImplementationDataType` [If the value of attribute `ImplementationDataType.dynamicArraySizeProfile` is set to the value `VSA_FULLY_FLEXIBLE`, the `ImplementationDataType` shall aggregate a `VSA Payload ImplementationDataTypeElement` that fulfills all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall not be defined.
- The attribute `ImplementationDataTypeElement.category` shall be set to the value `ARRAY`.
- The attribute `ImplementationDataTypeElement.arraySize` shall not be defined
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall not be defined.

The `VSA Payload ImplementationDataTypeElement` shall immediately aggregate another `ImplementationDataTypeElement` (representing the first dimension) that shall fulfill all the following conditions:

- The attribute `ImplementationDataTypeElement.category` shall be set to `STRUCTURE`
- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ImplementationDataTypeElement.arraySize` shall be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `allIndicesDifferentArraySize`.

The `ImplementationDataTypeElement` shall aggregate another `ImplementationDataTypeElement` that fulfills the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall not be defined.
- The attribute `ImplementationDataTypeElement.category` shall be set to the value `ARRAY`.
- The attribute `ImplementationDataTypeElement.arraySize` shall not be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall not be defined.

The **aggregation chain is continued** by a (possible empty) sequence of a pair of `ImplementationDataTypeElements` with the following characteristics:

- The first `ImplementationDataTypeElement` in the pair shall fulfill all the following conditions:
 - The attribute `ImplementationDataTypeElement.category` shall be set to `STRUCTURE`.
 - The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.

- The attribute `ImplementationDataTypeElement.arraySize` shall be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `allIndicesDifferentArraySize`.
- The second `ImplementationDataTypeElement` in the pair shall fulfill all the following conditions:
 - The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall not be defined.
 - The attribute `ImplementationDataTypeElement.category` shall be set to the value `ARRAY`.
 - The attribute `ImplementationDataTypeElement.arraySize` shall not be defined.
 - The attribute `ImplementationDataTypeElement.arraySizeHandling` shall not be defined.

The **terminating** `ImplementationDataTypeElement` in the aggregation chain shall fulfill all the following conditions:

- The attribute `ImplementationDataTypeElement.arraySizeSemantics` shall be set to the value `variableSize`.
- The attribute `ImplementationDataTypeElement.arraySize` shall be defined.
- The attribute `ImplementationDataTypeElement.arraySizeHandling` shall be set to the value `allIndicesSameArraySize`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1396] Restriction for the value of attribute `category` for non-terminating `ImplementationDataTypeElements` taken to model a `Variable-Size Array Data Type` [The value of attribute `category` for non-terminating `ImplementationDataTypeElements` taken to model a `Variable-Size Array Data Type` shall **not** be set to `TYPE_REFERENCE` **at the time when the contract phase generation is executed.**]()

[constr_1322] Size Indicator for undefined `dynamicArraySizeProfile` [If the `ImplementationDataType.dynamicArraySizeProfile` does not exist but the `ImplementationDataType` is mapped to an `ApplicationArrayDataType` where the attribute `ApplicationArrayDataType.dynamicArraySizeProfile` exists, then the `ImplementationDataType` shall have the category `STRUCTURE`, representing a `Variable-Size Array Data Type` with `Size Indicator` enabled **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01617] Structure of an `ImplementationDataType` that represents a variable-sized array data type [The `ImplementationDataType` that represents a `Variable-Size Array Data Type` shall have the category `STRUCTURE` that has two `subElements`.

The role of the `subElements` with the definition of a `Variable-Size Array Data Type` is defined by [TPS_SWCT_01618], [TPS_SWCT_01619], [TPS_SWCT_01620], and [TPS_SWCT_01621].] (*RS_SWCT_03217, RS_SWCT_03181*)

[TPS_SWCT_01618] Size Indicator for `dynamicArraySizeProfile` set to `VSA_LINEAR`, `VSA_SQUARE`, or `VSA_FULLY_FLEXIBLE` [If an `ImplementationDataType` is mapped to an `ApplicationArrayDataType` which has the attribute `dynamicArraySizeProfile` set to the value `VSA_LINEAR`, `VSA_SQUARE` or `VSA_FULLY_FLEXIBLE`, the **first** `ImplementationDataType.subElement` shall be an integer large enough to hold the maximum number of valid elements of the variable size array (according to `maxNumberOfElements`).

This is the `Size Indicator` which holds the current number of valid elements of the variable size array.] (*RS_SWCT_03217, RS_SWCT_03181*)

[TPS_SWCT_01647] Size Indicator for `dynamicArraySizeProfile` set to `VSA_LINEAR`, `VSA_SQUARE`, or `VSA_FULLY_FLEXIBLE` if only `ImplementationDataType` is present [For each `ImplementationDataType` which has the attribute `dynamicArraySizeProfile` set to the value `VSA_LINEAR`, `VSA_SQUARE`, or `VSA_FULLY_FLEXIBLE`, the **first** `ImplementationDataType.subElement` shall be an integer large enough to hold the maximum number of valid elements of the variable size array (according to `arraySize`).

This is the `Size Indicator` which holds the current number of valid elements of the `Variable-Size Array Data Type`.] (*RS_SWCT_03217, RS_SWCT_03181*)

[TPS_SWCT_01619] Size Indicator for `dynamicArraySizeProfile` set to `VSA_RECTANGULAR` [If an `ImplementationDataType` is mapped to an `ApplicationArrayDataType` where the attribute `ApplicationArrayDataType.dynamicArraySizeProfile` exists and is set to the value `VSA_RECTANGULAR`, the **first** `ImplementationDataType.subElement` shall be a `ImplementationDataTypeElement` with the `category` set to `ARRAY` and the attribute `arraySize` set to a value equal to the number of the according dimension of the corresponding `ApplicationDataType`.] (*RS_SWCT_03217, RS_SWCT_03181*)

[TPS_SWCT_01648] Size Indicator for `dynamicArraySizeProfile` set to `VSA_RECTANGULAR` if only `ImplementationDataType` is present [For each `ImplementationDataType` where the attribute `ImplementationDataType.dynamicArraySizeProfile` exists and is set to the value `VSA_RECTANGULAR`, the **first** `ImplementationDataType.subElement` shall be a `ImplementationDataTypeElement` with the `category` set to `ARRAY` and the attribute `arraySize` set to a value equal to the size of the according dimension of the rectangular array.] (*RS_SWCT_03217, RS_SWCT_03181*)

[TPS_SWCT_01620] **Size Indicator for dynamicArraySizeProfile set to VSA_RECTANGULAR** [The elements of this `Size Indicator` array shall consist of integers large enough to hold the maximum number of valid elements (according to `maxNumberOfElements`).] (*RS_SWCT_03217, RS_SWCT_03181*)

This array holds the `Size Indicators` of all dimensions.

[TPS_SWCT_01621] **Payload for dynamicArraySizeProfile** [If an `ImplementationDataType` is mapped to an `ApplicationArrayDataType` where the attribute `dynamicArraySizeProfile` exists, the **second** `ImplementationDataType.subElement` shall be an array which can hold the data of the variable size array with all dimensions defined for the `ApplicationDataType`.

The `category` shall be set to `ARRAY` and `arraySize` shall be set to `maxNumberOfElements` of the corresponding `ApplicationArrayDataType`.] (*RS_SWCT_03217, RS_SWCT_03181*)

[TPS_SWCT_01649] **Payload for dynamicArraySizeProfile if only ImplementationDataType is present** [Each `ImplementationDataType` where the attribute `dynamicArraySizeProfile` exists shall aggregate a second `ImplementationDataType.subElement` with the `category` set to `ARRAY`.] (*RS_SWCT_03217, RS_SWCT_03181*)

Multiple Examples of the definition of variable-size arrays can be found in Appendix B.1.3.

An `ImplementationDataType` is also allowed to have `SwDataDefProps` (this feature is inherited from `AutosarDataType`), i.e. it can define various specific structural and semantical attributes. [*constr_1015*] shows which `SwDataDefProps` will be typically used here.

[TPS_SWCT_01257] **ImplementationDataType or the aggregated ImplementationDataTypeElements do not form closed sets** [An `ImplementationDataType` or the aggregated `ImplementationDataTypeElements` do not form closed sets but refer to further type definitions in one of four distinctive ways, depending on whether the type is implemented via a base type, a data or function pointer, or a reference to another implementation data type:

1. Reference to an underlying `SwBaseType` corresponds to `category VALUE`.
2. Reference to `BswModuleEntry` in `SwPointerTargetProps` corresponds to `category FUNCTION_REFERENCE`.
3. `SwDataDefProps` in `SwPointerTargetProps` corresponds to `category DATA_REFERENCE`.
4. Reference to another `ImplementationDataType` corresponds to `category TYPE_REFERENCE`.

] (*RS_SWCT_03217*)

At the end, all the “leaves” of the complete tree formed by these references shall end up in `SwBaseTypes`.

5.2.5.6 Modeling of Pointer using Implementation Data Type

[TPS_SWCT_01258] Definition of a pointer to data [The definition of a data pointer requires a special meta-class `SwPointerTargetProps` which aggregates another `SwDataDefProps`. This mechanism allows to describe the `category` and properties of the pointer object itself as well as the `category` and properties of its target data type.] (*RS_SWCT_03217*)

[constr_1177] Allowed `targetCategory` for `SwPointerTargetProps` [If the value of attribute `targetCategory` exists, then it shall be set to one of the following values:

- `TYPE_REFERENCE`
- `FUNCTION_REFERENCE`
- `VALUE` (only applicable if the `SwPointerTargetProps.swDataDefProps` refers to a `SwBaseType` where attribute `nativeDeclaration` is set to the value “void”)

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

As far as the AUTOSAR meta-model is concerned, a pointer to a pointer **could** in principle be implemented in two ways:

1. by defining an `ImplementationDataType` of category `DATA_REFERENCE` that aggregates `SwDataDefProps` in the role `swDataDefProps` that in turn aggregate `SwPointerTargetProps` in the role `swPointerTargetProps` with attribute `targetCategory` set to `TYPE_REFERENCE` that aggregates `SwDataDefProps` in the role `swDataDefProps` that references an `ImplementationDataType` of category `DATA_REFERENCE`.
2. by defining an `ImplementationDataType` of category `DATA_REFERENCE` that aggregates `SwDataDefProps` in the role `swDataDefProps` that in turn aggregate `SwPointerTargetProps` in the role `swPointerTargetProps` with attribute `targetCategory` set to `DATA_REFERENCE` (which is not allowed according to **[constr_1177]**) that in turn aggregates `SwDataDefProps` in the role `swDataDefProps` that aggregates `SwPointerTargetProps` in the role `swPointerTargetProps` that references an `ImplementationDataType` of category e.g. `VALUE`.

[constr_1254] Definition of a pointer to a pointer [AUTOSAR does **not** support the definition of a pointer to a pointer by defining an `ImplementationDataType`

of category `DATA_REFERENCE` that aggregates `SwDataDefProps` in the role `swDataDefProps` that in turn aggregate `SwPointerTargetProps` in the role `swPointerTargetProps` with attribute `targetCategory` set to `DATA_REFERENCE` that in turn aggregates `SwDataDefProps` in the role `swDataDefProps` that aggregates `SwPointerTargetProps` in the role `swPointerTargetProps` that references an `ImplementationDataType` of category e.g. `VALUE`.

This rule shall be imposed **at the time when the contract phase generation is executed.** `()`

For clarification, The AUTOSAR RTE does not support a definition of a pointer to a pointer by way of option 2 anyway. For all intents and purposes, `[constr_1254]` merely reflects this restriction on the level of AUTOSAR models.

Option 1 (which is also featured in Figure B.8) is the only viable way that is positively supported by the AUTOSAR RTE `[2]`.

[TPS_SWCT_01259] Definition of a pointer to a function [An `ImplementationDataType` or one of its sub-elements can also describe a function pointer. This completes its ability to declare all kinds of local data and of possible arguments used in library calls.

A function pointer is defined by the category `FUNCTION_REFERENCE` and the association `SwPointerTargetProps.functionPointerSignature` that refers to a `BswModuleEntry`. The latter essentially describes the signature of a function as explained in `[6]`. `(RS_SWCT_03217)`

Class	SwPointerTargetProps			
Package	M2::MSR::DataDictionary::DataDefProperties			
Note	This element defines, that the data object (which is specified by the aggregating element) contains a reference to another data object or to a function in the CPU code. This corresponds to a pointer in the C-language. The attributes of this element describe the category and the detailed properties of the target which is either a data description or a function signature.			
Base	<i>ARObject</i>

5.2.6 Base Type

5.2.6.1 Big Picture

From the terminology point of view, the definition of a base type as a “type” is slightly misleading in that it certainly has a type-nature, but does not necessarily represent a full-scale data type.

In the context of the software domain, this base type is not a self-contained level of definition of a data type. Instead, some of the attributes of a base type (represented by meta-class `SwBaseType`) provide “low-level”¹⁰ aspects to the definition of an `ImplementationDataType`.

Figure 5.14: Base Type

However, there are other corners of the AUTOSAR meta-model beyond the definition of data types and similar “low-level” information is required elsewhere as well, such that `SwBaseType` is consequently also used for the modeling of these aspects, for example:

- Definition of axes for maps and curves

¹⁰As in: close to the bare metal

- Definition of record layout
- Definition of signal properties on communication buses (see TPS System Template [10])
- Definition of properties of diagnostic telegrams (see TPS Diagnostic Extract Template [23])
- Definition of log and trace messages (see TPS Log and Trace Extract [24])
- Definition of properties relevant for measurement and calibration (see TPS Basic SoftwareModuleDescriptionTemplate [6])

[TPS_SWCT_01875] Usage of attributes of `BaseTypeDirectDefinition` depending on the area of applicability [

Attribute of meta-class <code>BaseTypeDirectDefinition</code>	<code>ImplementationDataType</code>	<code>SwTextProps</code>	<code>ComSpec</code>	<code>SwCalprmAxis</code>	<code>SwRecordLayoutV</code>	<code>SystemSignal</code>	<code>ISignal</code>	<code>DiagnosticDataElement</code>	<code>DltArgument</code>	<code>McDataInstance</code>
<code>baseTypeEncoding</code>	X	X		X	X	X	X	X	X	X
<code>baseTypeSize</code>	X		X	X	X		X	X	X	X
<code>byteOrder</code>	X		X	X	X			X	X	X
<code>memAlignment</code>	X			X	X					X
<code>nativeDeclaration</code>	X									

]()

The diversity of the areas of applicability (as hinted by the list in the previous paragraph) of `SwBaseType` is also reflected in the set of attributes that are relevant for each of the different areas of applicability, as indicated by [TPS_SWCT_01875].

Please note that in the context of using `SwBaseType` to define an `ImplementationDataType`, the attributes

- `byteOrder`
- `memAlignment`

are used only if the `ImplementationDataType` represents a Platform Type.

In this document, the description of the utilization of `SwBaseType` is focused on the areas of applicability that are in the scope of this document, i.e.

- Definition of data types
- Definition of base points for axes for maps and curves
- Definition of the values of a particular record layout group

- Definition of network representation in the scope of a ComSpec

[constr_1910] Existence of attribute `BaseType.baseTypeDefinition` [For each `BaseType` (which will be utilized in the form of `SwBaseType`), the aggregation in the role `baseTypeDefinition` shall exist **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01260] Applicability of `SwBaseType` for the definition of data types [`BaseType` is used to contribute low-level aspects to the definition of an `ImplementationDataType`. Consequently, the information carried by `SwBaseType` is used to generate the corresponding C-code typedefs in case the attribute `BaseTypeDirectDefinition.nativeDeclaration` exists at the “leaves” of data type definitions.]()

baseType Encoding	BaseTypeEncodingString	0..1	attr	This specifies, how an object of the current BaseType is encoded, e.g. in an ECU within a message sequence. Tags: xml.sequenceOffset=90

Class	BaseTypeDirectDefinition			
baseTypeSize	PositiveInteger	0..1	attr	Describes the length of the data type specified in the container in bits. Tags: xml.sequenceOffset=70
byteOrder	ByteOrderEnum	0..1	attr	This attribute specifies the byte order of the base type. Tags: xml.sequenceOffset=110
memAlignment	PositiveInteger	0..1	attr	This attribute describes the alignment of the memory object in bits. E.g. "8" specifies, that the object in question is aligned to a byte while "32" specifies that it is aligned four byte. If the value is set to "0" the meaning shall be interpreted as "unspecified". Tags: xml.sequenceOffset=100
native Declaration	NativeDeclarationString	0..1	attr	This attribute describes the declaration of such a base type in the native programming language, primarily in the Programming language C. This can then be used by a code generator to include the necessary declarations into a header file. For example BaseType with shortName: "MyUnsignedInt" native Declaration: "unsigned short" Results in typedef unsigned short MyUnsignedInt; If the attribute is not defined the referring Implementation DataTypes will not be generated as a typedef by RTE. If a nativeDeclaration type is given it shall fulfill the characteristic given by basetypeEncoding and baseType Size. This is required to ensure the consistent handling and interpretation by software components, RTE, COM and MCM systems. Tags: xml.sequenceOffset=120

Table 5.26: BaseType

The aggregation `BaseType.baseTypeDefinition` affects two abstract meta-classes and is therefore never used directly. However, in order to not break the semantics of the derived meta-classes `SwBaseType` and `BaseTypeDirectDefinition` a constraint is still required.

5.2.6.2 Category

[constr_1011] category of SwBaseType [For the attribute `SwBaseType.category` only the values `FIXED_LENGTH` and `VOID` are supported **at the time when the contract phase generation is executed.**]()

[constr_1422] Value of category is VOID [If the value of the attribute `SwBaseType.category` is set to `VOID` then the attribute `baseTypeSize` and `baseTypeEncoding` shall not exist **at the time when the contract phase generation is executed.**]()

[constr_1012] Value of category is FIXED_LENGTH [If the value of the attribute `SwBaseType.category` is set to `FIXED_LENGTH` then the attribute `baseTypeSize` shall be filled with content **at the time when the contract phase generation is executed.**]()

5.2.6.3 Native Declaration

[constr_1010] If nativeDeclaration does not exist [If `nativeDeclaration` does not exist in the `SwBaseType`, it is required that the `shortName` (e.g. “uint8”) of the corresponding `ImplementationDataType` is equal to a name of one of the Platform or Standard Types predefined in AUTOSAR code.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

The consequence of **[constr_1010]** is that if the `nativeDeclaration` does not exist the RTE generator will **not** consider the `ImplementationDataType` for the generation of data type definitions.

Still, the compiler will positively be able to resolve the data type because it can fall back to the data type definitions contained in the header file for platform and standard data types that has to be included by regulation of the AUTOSAR standard.

Please note that `nativeDeclaration` shall yield a valid C data type symbol, whether this is done by a `typedef` or a by using the symbol¹¹ of an integral data type is principally all the same.

Of course, using the symbol of an integral data type as the value of `nativeDeclaration` increases the odds that the enclosing `SwBaseType` can be used independently of the availability of the definition of a `typedef` that may or may not be available in a given context.

[TPS_SWCT_01563] Applicable values for `nativeDeclaration` [For the purpose of avoiding portability issues the value `nativeDeclaration` should only consist of the symbol of an integral C data type.]()

For more information on this refer to [25].

5.2.6.4 Base Type Size

[TPS_SWCT_01444] Size of `SwBaseType` is specified in bits [The value of attribute `BaseTypeDirectDefinition.baseTypeSize` is specified in bits.]()

The value of attribute `baseTypeSize` in the context of the definition of an `ImplementationDataType` where attribute `category` is set to the value `ARRAY` is modeled as part of the `ImplementationDataTypeElement`.

Because the value of `baseTypeSize` is defined in the context of the `SwDataDef-Props` referenced by the `ImplementationDataTypeElement`, it should be clear that this value is **not supposed to determine the size of the entire array in bits**. Instead, it is clearly dedicated to specify the **size of a primitive element of the array in bits**.

An example definition of `ImplementationDataType` where attribute `category` is set to the value `ARRAY` and the corresponding `SwBaseType` can be found in Appendix B.1.7.

The attribute `baseTypeEncoding` specifies how the values of the base type are encoded.

[TPS_SWCT_01861] Specification of `baseTypeSize` in the context of an `ImplementationDataType` where attribute `category` is set to `ARRAY` [In the context of the definition of an `ImplementationDataType`, where attribute `category` is set to `ARRAY`, the conditions for the definition of `baseTypeSize` depends on the nature of the `ImplementationDataTypeElement`:

¹¹Note that the symbol does not necessarily have to consist of a single token, i.e. for all intents and purposes (for example) `unsigned char` is also considered the symbol of an integral C data type.

- If the `ImplementationDataTypeElement` represents a primitive data type (i.e. `category` is set to `VALUE` or to `TYPE_REFERENCE` where eventually an `ImplementationDataType` of `category VALUE` is referenced): The value of attribute `baseTypeSize` that is defined in the context of the definition of an `ImplementationDataType` where attribute `category` is set to `ARRAY` applies to the **size of an element of the array data type**.
- If the `ImplementationDataTypeElement` represents a composite data object (i.e. the `ImplementationDataTypeElement` that represents the element of the array has attribute `category` set to `STRUCTURE` or `ARRAY`), then attribute `baseTypeSize` shall only be used on deeper levels of the hierarchy.
- If the `ImplementationDataTypeElement` is typed a composite data type (i.e. the `ImplementationDataTypeElement` that represents the element of the array has attribute `category` set to `TYPE_REFERENCE`, where eventually an `ImplementationDataType` of `category STRUCTURE` or `ARRAY` is referenced), then the definition of attribute `baseTypeSize` is delegated to deeper levels of the referenced `ImplementationDataType`.

]()

Please note that the understanding specified in [TPS_SWCT_01861] is also helpful in terms of model economics. If the value were supposed to define the size of the entire array, it would typically be necessary to create a lot of additional `SwBaseTypes` for this purpose.

The fact that the value is meant per element means that it is possible to re-use an `SwBaseType` that most likely already exists (because it is very likely that the code that accesses the array also needs to deal with the element data type anyway).

5.2.6.5 Base Type Encoding

The attribute `baseTypeEncoding` specifies how the values of the base type are encoded.

[TPS_SWCT_01845] Supported value encodings for `SwBaseType` [The supported values for attribute `BaseTypeDirectDefinition.baseTypeEncoding` are:

- 1C: One's complement
- 2C: Two's complement
- BCD-P: Packed Binary Coded Decimals
- BCD-UP: Unpacked Binary Coded Decimals
- DSP-FRACTIONAL: Digital Signal Processor
- SM: Sign Magnitude
- IEEE754: floating-point numbers

- ISO-8859-1: single-byte coded character
- ISO-8859-2: single-byte coded character
- WINDOWS-1252: single-byte coded character
- UTF-8: UCS Transformation Format 8
- UTF-16: Character encoding for Unicode *code points* based on 16 bit *code units* [14]
- UCS-2: Universal Character Set 2
- NONE: Unsigned Integer
- VOID: corresponds to a void in C. The encoding is not formally specified here.
- BOOLEAN: This represents an unsigned integer to be interpreted as boolean. The value shall be interpreted as `true` if the value of the unsigned integer is 1 and it shall be interpreted as `false` if the value of the unsigned integer is 0.

A `CompuMethod` shall be referenced by the corresponding `AutosarDataType` that implements the common sense behind the boolean concept, i.e. define a `TEXTTABLE` with two `CompuScales`: e.g. `true -> 1, false -> 0`.

]()

Please note that restrictions apply to the usage of some values of attribute `BaseType-DirectDefinition.baseTypeEncoding`, as documented in [constr_10383].

At least for the usage of `SwBaseType` in the context of software, there is an obvious relation between the definition of the `baseTypeSize` and the `baseTypeEncoding` such that there is a minimum value that needs to be defined for the definition of the `baseTypeSize` for certain values of `baseTypeEncoding`, see [TPS_SWCT_01876].

Please note that it is still possible to use objects that are larger than required for storing information that occupies only a part of the data object.

Example 5.1

It would be possible to put UTF-8-encoded information into a 64-bit wide data object. But in this case, only 8 bit of the 64-bit object would actually be usable. The rest is wasted.

A motivation for such a choice may be that the underlying hardware is faster or maybe only capable of word-based addressing and therefore the storing of the UTF-8 information in just a single 8-bit-wide data object might not be possible.

In other words, using a 64-bit data object to host information encoded as UTF-8 does not mean that the object is filled with UTF-8 information, thereby forming some sort of an array of UTF-8-encoded information.

In AUTOSAR, an array has to be defined as an array data type, i.e. `ApplicationArrayDataType` or `ImplementationDataType` where attribute `category` is set to the value `ARRAY`.

[TPS_SWCT_01876] Minimum value of `baseTypeSize` for a given `baseTypeEncoding` [

WINDOWS-1252	8
UTF-8	8
UTF-16	16
UCS-2	16
NONE	8
VOID	
BOOLEAN	8

]()

5.2.6.6 Byte Order and Memory Alignment

[TPS_SWCT_01262] `memAlignment` and `byteOrder` are platform-specific [The value of attributes `BaseTypeDirectDefinition.memAlignment` and `BaseTypeDirectDefinition.byteOrder` is platform-specific and therefore should be set only in use cases where this is really needed.

These attributes shall be considered as optional.

If a `SwBaseType` is platform-specific then also the `ImplementationDataType` and software-component descriptions build on top of it become platform-specific.]()

However, there are use cases for `SwBaseType` where this does not matter: especially the calibration support format which is generated in ECU-specific scope (and also contains `SwBaseType`, see [6]) could well be platform-specific.

Further regulations apply for the case that the value `UTF-16` is used for setting the attribute `BaseTypeDirectDefinition.baseTypeEncoding`:

[constr_1398] Existence of attributes of `BaseTypeDirectDefinition` [If the value of attribute `BaseTypeDirectDefinition.baseTypeEncoding` is set to `UTF-16` then the attribute `BaseTypeDirectDefinition.byteOrder` shall exist.

The only allowed values of `BaseTypeDirectDefinition.byteOrder` in this case are `mostSignificantByteFirst` and `mostSignificantByteLast`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

There is already predefined terminology (see [14]) existing that describes the two possible cases of byte orientation in a `UTF-16`-encoded string. The connection to this terminology is defined by [TPS_SWCT_01651] and [TPS_SWCT_01652].

<i>Enumeration</i>	<i>ByteOrderEnum</i>
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes
Note	When more than one byte is stored in the memory the order of those bytes may differ depending on the architecture of the processing unit. If the least significant byte is stored at the lowest address, this architecture is called little endian and otherwise it is called big endian. ByteOrder is very important in case of communication between different PUs or ECUs.
Aggregated by	ApSomeipTransformationProps.byteOrder, <code>BaseTypeDirectDefinition.byteOrder</code> , DiagnosticCommonProps.defaultEndianness, ISignalToIPduMapping.packingByteOrder, MultiplexedIPdu.selectorFieldByteOrder, PduToFrameMapping.packingByteOrder, SegmentPosition.segmentByteOrder, SOMEIPTransformationDescription.byteOrder, <code>System.containerIPduHeaderByteOrder</code>
Literal	Description
mostSignificantByteFirst	Most significant byte shall come at the lowest address (also known as BigEndian or as Motorola-Format) Tags: atp.EnumerationLiteralIndex=0
mostSignificantByteLast	Most significant byte shall come highest address (also known as LittleEndian or as Intel-Format) Tags: atp.EnumerationLiteralIndex=1
opaque	For opaque data endianness conversion has to be configured to Opaque. See AUTOSAR COM Specification for more details. Tags: atp.EnumerationLiteralIndex=2

Table 5.27: ByteOrderEnum

[TPS_SWCT_01651] UTF-16BE [If the value of attribute `BaseTypeDirectDefinition.baseTypeEncoding` is set to `UTF-16` and the attribute `BaseTypeDirectDefinition.byteOrder` in this case are `mostSignificantByteFirst` then the `SwBaseType` corresponds to the definition of `UTF-16BE` according to the Unicode standard [14].]()

[TPS_SWCT_01652] UTF-16LE [If the value of attribute `BaseTypeDirectDefinition.baseTypeEncoding` is set to `UTF-16` and the attribute `BaseTypeDirectDefinition.byteOrder` in this case are `mostSignificantByteLast` then the `SwBaseType` corresponds to the definition of `UTF-16LE` according to the Unicode standard [14].]()

A further question that needs clarification is the usage of the so-called `Byte Order Mark` which allows (at run-time) for determining the actual byte order directly from the payload of a Unicode string.

As AUTOSAR has means to formally and comprehensively define the byte-order of any given `DataPrototype` that can hold a string at run time, it is **not** necessary to support a further instrument that takes care of the same purpose.

[TPS_SWCT_01653] UTF-16-encoded strings are not allowed to start with a BOM [If the value of attribute `BaseTypeDirectDefinition.baseTypeEncoding` is set to `UTF-16` then the value of a `DataPrototype` (which is effectively representing a string) is not allowed to start with a `Byte Order Mark (BOM)`.]()

Please note that [\[TPS_SWCT_01653\]](#) removes a possible redundancy in the definition and execution of `UTF-16`-encoded strings.

The redundancy is not only regarded unnecessary but also **potentially dangerous** because it is not possible to check whether the definition is consistent with the execution at configuration time.

From the formal point of view, [\[TPS_SWCT_01653\]](#) does not represent an actual constraint although it is formulated as such.

However, an AUTOSAR tool would not be able to properly check the condition at configuration time and therefore this rule is published as a specification item.

5.2.7 Data Type Terminology

There are uses of data types that on the one hand need a handy term (because this kind of data type is used a lot) but on the other hand cannot easily be expressed in simple terms of meta-model elements (like `ApplicationDataType`).

Therefore, it is not an option to fully describe the characteristics of these kinds of data types precisely every time one of these is used. A definition of terminology is supposed to associate the mentioned kinds of data types with the term under which their use shall be paraphrased.

5.2.7.1 Primitive Type

In some cases it is necessary to constrain that applicability of data types to primitive C data types. It would be possible to describe the characteristics of eligible `Autosar-DataTypes` at every single place in an AUTOSAR specification where this specific limitation applies.

However, this may end up in lengthy and potentially inconsistent descriptions at different places within AUTOSAR specifications. Therefore, this chapter provides a canonical definition of a primitive data type that can be referred to from other places.

[TPS_SWCT_01564] Non-recursive definition of a primitive data type [An `AutosarDataType` is considered a primitive data type if the following conditions apply:

- it is an `ApplicationPrimitiveDataType` of `category VALUE` or `BOOLEAN`

- it is an [ImplementationDataType](#) of category [VALUE](#)

]([RS_SWCT_03216](#), [RS_SWCT_03217](#))

[TPS_SWCT_01565] Recursive definition of a primitive data type [An [Autosar-DataType](#) is considered a primitive data type if the following conditions apply:

- it is an [AutosarDataType](#) according to [[TPS_SWCT_01564](#)]
- it is an [AutosarDataType](#) of category [TYPE_REFERENCE](#) that, after all type-references have been resolved, boils down an [AutosarDataType](#) according to [[TPS_SWCT_01564](#)].

]([RS_SWCT_03216](#), [RS_SWCT_03217](#))

5.2.7.2 Compound Primitive Data Type

[TPS_SWCT_01179] Compound Primitive Data Type [For clarification, a “compound primitive data type” is an [ApplicationPrimitiveDataType](#) of category [STRING](#), [CURVE](#), [MAP](#), [CUBOID](#), [CUBE_4](#), [CUBE_5](#), [COM_AXIS](#), [RES_AXIS](#), and [VAL_BLK](#).

This implies the existence of a [swRecordLayout](#) owned by the [swDataDefProps](#) of the [ApplicationPrimitiveDataType](#) that defines the mapping to a corresponding [ImplementationDataType](#).

The main characteristic of the “compound primitive data type” is that with respect to the application data type layer its data type is considered a primitive data type but when it comes to the implementation data type layer the type is implemented as a composite data type according to the applicable [SwRecordLayout](#).]([RS_SWCT_03216](#))

Please note that the main reason for the emphasis of “primitive” in the term [Compound Primitive Data Type](#) is that the user of a [Compound Primitive Data Type](#) accesses an object typed by a [Compound Primitive Data Type](#) only via an **interpolation method that returns a data object typed by a primitive data type**.

Properties of a [Compound Primitive Data Type](#) with respect to the definition of an [invalidValue](#) are described in section [5.4.2](#).

Please note that a [Compound Primitive Data Type](#) is typically created with a “measurement and calibration mindset” that focuses on two aspects:

- data semantics
- memory layout

This is one of the reasons why the [SwRecordLayout](#) is referenced by (and thereby becoming an integral part of the definition of) the [ApplicationDataType](#).

5.2.7.3 Integral Primitive Type

The `SenderReceiverToSignalMapping` (see [10]) allows for the integral mapping of a piece of data to a single `SystemSignal`. The specification of AUTOSAR COM [22] imposes certain requirements on the characteristics of data that apply for the integral mapping.

[TPS_SWCT_01477] Integral Primitive Types [Data types that qualify for being used in the context of a `SenderReceiverToSignalMapping` shall be called Integral Primitive Types.] (*RS_SWCT_03218*)

[constr_1229] category of ImplementationDataType boils down to VALUE [An `ImplementationDataType` qualifies as an `Integral Primitive Type` if and only if either

- its `category` is `VALUE` or `TYPE_REFERENCE` that eventually boils down to `VALUE` or
- its `category` is `ARRAY` and it has only one `subElement` and one of the following conditions applies:
 - `subElement.category` is set to `VALUE` or `TYPE_REFERENCE` that eventually boils down to `VALUE` and the `subElement` refers to a `SwBaseType` where `baseTypeSize` is set to the value 8 and the `baseTypeEncoding` is set to `NONE`.
 - `subElement.category` is set to `TYPE_REFERENCE` and the `swDataDefProps.implementationDataType` literally represents the `Platform Data Type` named “uint8”.
 - `subElement.category` is set to `TYPE_REFERENCE` and the attribute `swDataDefProps.implementationDataType.shortName` is set to “uint8” and `swDataDefProps.baseType.baseTypeDefinition.nativeDeclaration` does not exist.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1230] ApplicationDataType that qualifies for Integral Primitive Type [An `ApplicationDataType` qualifies as an `Integral Primitive Type` if and only if all the following conditions apply:

- `ApplicationDataType.category` is set to `BOOLEAN`, `VALUE`, `STRING`, or `ARRAY`
- in the applicable scope a `DataTypeMap` is available that refers to the given `ApplicationDataType`
- the found `DataTypeMap` refers to an `ImplementationDataType` that fulfills the requirements of [constr_1229]

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

5.2.7.4 Variable-Size Array Data Type

The definition of and further explanation regarding the term `Variable-Size Array Data Type` can be found in chapter 2.7.

5.2.7.5 Wrapped Union Data Type

There are use cases for sending a `DataPrototype` that is effectively typed by a **union** data type over a communication network. In this case, however, it is necessary to not only send the `DataPrototype` itself but add an information about the applicable member of the union as a form of “meta-data” to the transmission.

By this means the sender can identify the applicable member of the union and the receiver can accordingly access the proper union element.

It is the nature of union data types that executable code shall **symmetrically** access the union, i.e. the member that was written needs to be read, the usage of a union as a “type converter” is heavily frowned upon (because it causes unspecified behavior from ISO-C:99 [26] point of view) and shall be discouraged by AUTOSAR.

Thus, AUTOSAR needs to take this condition into account and define a specific modeling for the handling of union data types.

[TPS_SWCT_01700] Definition of unions that can be transmitted over a communication network [If it is intended to send a data object typed by a union data type over a communication bus then a specific modeling is required for this purpose.

- The union data type shall never be used as such, it shall always be enclosed in an `ImplementationDataType` of category `STRUCTURE` that aggregates exactly two `ImplementationDataTypeElements`:
 - The **first** `ImplementationDataTypeElement` shall be used to identify the applicable element of the actual union data type.

The `shortName` of this element shall be set to “**memberSelector**”, it shall be of category `VALUE`, or of category `TYPE_REFERENCE` that finally boils down to category `VALUE`.

Furthermore, it shall refer to a `SwBaseType` with attribute `baseTypeEncoding` set to `NONE` and attribute `baseTypeSize` set to the value 8, 16, or 32.

This `ImplementationDataTypeElement` shall be called the `Member Selector`.

- The **second** `ImplementationDataTypeElement` shall be of `category UNION`, it represents the actual union “payload”.
- The purpose of the `Member Selector` is to identify the element of the union data type that applies for a given access to the union.

If the value of the `Member Selector` is set to 1 then the first `subElement` of the `ImplementationDataType` of `category UNION` is applicable.

If the value of the `Member Selector` is set to 2 then the second `subElement` is applicable and so on.

- The value of the `Member Selector` shall range between **the value 1** and the number of `subElements` of the `ImplementationDataTypeElement` of `category UNION`. Once again, the index counting is 1-based!
- Obviously, the actual data type used to hold the `Member Selector` shall be capable of storing a value that corresponds to the number of `subElements` of the `ImplementationDataTypeElement` of `category UNION`.
- Constraint [constr_1441] applies.

]([RS_SWCT_03217](#))

[TPS_SWCT_01701] Wrapped Union Data Type [Data types that fulfill the requirements of [TPS_SWCT_01700] shall be called `Wrapped Union Data Types`.]([RS_SWCT_03217](#))

[constr_1442] `category TYPE_REFERENCE` shall not be used for modeling the “payload” of a `Wrapped Union Data Type` [For the modeling of the “payload” part of a `Wrapped Union Data Type` it shall not be possible **at the time when the contract phase generation is executed** to use an `ImplementationDataTypeElement` of `category TYPE_REFERENCE` that finally (i.e. after all possible indirections are resolved) boils down to `category UNION`.]()

The definition of the `Wrapped Union Data Type` represents the **canonical way** of how union data types shall be used in AUTOSAR on the application and communication level. Consequentially, the usage of the `category` value `UNION` is effectively limited to an `ImplementationDataTypeElement`.

[constr_1444] Limited applicability of `Wrapped Union Data Type` [There is no support **at the time when the contract phase generation is executed** for the usage of `Wrapped Union Data Type` in `PortInterfaceMappings`, and `Diagnostics`.]()

For the time being, AUTOSAR restricts the initialization of a union data type to the first member of the union data type, see [constr_1445].

A simplified example for the definition of a `Wrapped Union Data Type` can be found in Appendix [B.1.4](#).

One obvious consequence of this restriction is that for any given [ValueSpecification](#) taken to initialize a [Wrapped Union Data Type](#) the value of the [Member Selector](#) is **strictly** locked to 1.

[constr_1445] Initialization of the [Member Selector](#) of a [Wrapped Union Data Type](#) [The `initValue` for the [Member Selector](#) shall **never be set to any value other than 1**.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Another aspect of the initialization of a [Wrapped Union Data Type](#) is that the “payload” part cannot be treated as a composite data type unless the first element of the “payload” part is typed by a composite data type.

In other words, it is not possible to initialize the first [subElement](#) of an [ImplementationDataTypeElement](#) of category UNION. It is only possible to assign an initial value to the “payload” part itself.

[TPS_SWCT_01702] Initialization of the “payload” of a [Wrapped Union Data Type](#) [The `initValue` for the [ImplementationDataTypeElement](#) of category UNION shall be assigned to the [ImplementationDataTypeElement](#) of category UNION but it shall reflect the structure of the first [subElement](#) of the [ImplementationDataTypeElement](#) of category UNION.] ([RS_SWCT_03217](#))

In other words, if the first [subElement](#) of the [ImplementationDataTypeElement](#) of category UNION is of a primitive type then a [NumericalValueSpecification](#) shall be used to initialize the [ImplementationDataTypeElement](#) of category UNION.

If the [subElement](#) is typed by a composite data type then a [CompositeValueSpecification](#) shall be used to initialize the [ImplementationDataTypeElement](#) of category UNION.

To summarize the initialization issue, a [Wrapped Union Data Type](#) is modeled as a structure of two elements and requires a [RecordValueSpecification](#) that in turn aggregates two [ValueSpecifications](#), one for the [Member Selector](#) that shall have no other value than 1, and one for the “payload”.

The structure of the second [ValueSpecification](#) depends on the data type used for the first element of the “payload”.

5.2.7.6 Optional Element Structure

As already mentioned in section 2.8, there are use cases for structured data types that contain optional elements that may or may not exist at a given time.

These data types require a specific modeling on both the level of [ApplicationDataType](#) and the level of [ImplementationDataType](#).

[TPS_SWCT_01775] Structured data types with optional elements [A structured data type that contains at least one optional element shall be called an `Optional Element Structure`.] ([RS_SWCT_03320](#))

On the level of `ApplicationDataType`, the existence of optional elements is signaled by setting the attribute `ApplicationRecordElement.isOptional` to `true`. For more details, please refer to section [5.2.4.2.2](#).

The description of how an `Optional Element Structure` shall be modeled using `ImplementationDataType` can be found in section [5.2.5.3.1](#).

5.2.7.7 Compu Scale Literal

The `CompuMethod` applied to an `ApplicationDataType` may include *discrete point ranges*.

This means that a numerical value (on the implementation side) is associated with a textual value on the physical side. The value on the physical side can have different meanings, depending on the context in which it is used.

The already identified contexts are:

- the usage as a so-called `CompuScale Code Symbolic Name`, as defined by [\[TPS_SWCT_01569\]](#) or
- the usage as a so-called `CompuScale Value Symbolic Name`, as defined by [\[TPS_SWCT_01696\]](#) or
- the usage as a `CompuScale.a2lDisplayText`, as defined in section [5.5.1.4](#).

And because it is sometimes cumbersome to subsume all the applicable contexts in a description, it is considered useful to define a technical term that acts as a "base-class" for all the meanings in the different contexts.

This technical term is defined as `Compu Scale Literal`. This means that wherever the term `Compu Scale Literal` is used, any of the quoted contexts could apply.

5.3 Data Prototypes

5.3.1 Overview

[TPS_SWCT_01264] Data prototypes implement a role of a data type [Generally speaking, a data prototype represents the implementation of a role of a data type within the definition of another data type, e.g. a "typed" data object declared within a software component or a port interface.

This means formally that it has an is-of-type relation to a data type and is usually aggregated by another element, e.g. the internal behavior or a port interface.] ()

In the meta-model, various kinds of data prototypes are derived from the abstract `DataPrototype` as shown in figure 5.15.

The reason for the introduction of this hierarchy was the distinction between `AutosarDataPrototype` (which can be used for the application and implementation types as well) and `ApplicationCompositeElementDataPrototype` (which is restricted to be used within the application types).

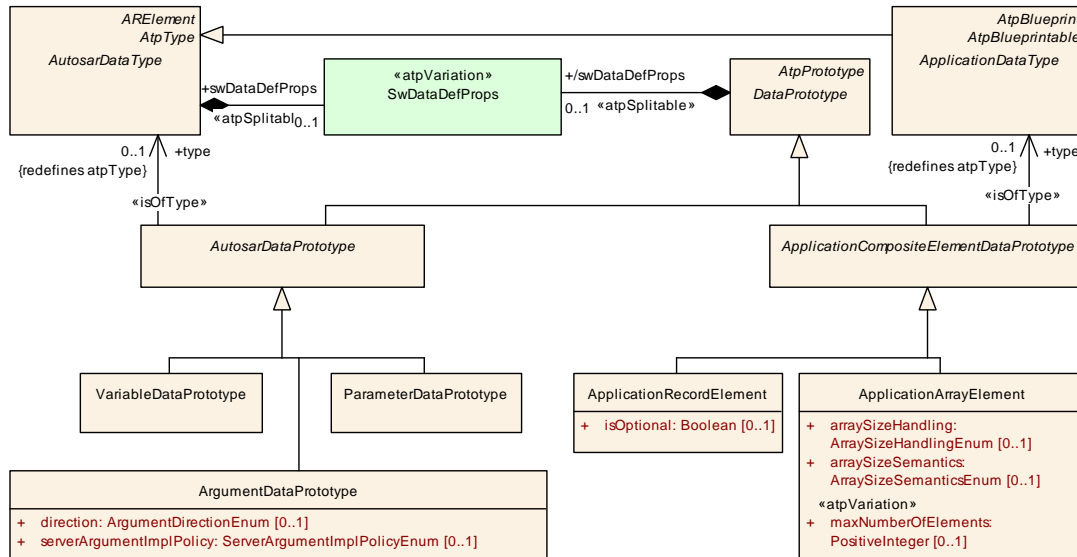

Figure 5.15: Data Prototypes Overview

Because these `DataPrototypes` are modeled as own meta-classes it is possible to define own attributes for them (on M2) which (in the M1 model) could extend or constrain the attribute values already set via the corresponding data type.

[TPS_SWCT_01265] DataPrototype aggregates an own set of SwDataDefProps
 [This mechanism is used here in the way that `DataPrototype` aggregates an own set of `SwDataDefProps`. Thus, each kind of `DataPrototype` has the ability to extend or even overwrite the `SwDataDefProps` already defined by its `ApplicationDataType` or `ImplementationDataType`.

This mechanism, if carefully applied, allows for a better reuse of data types because they can be kept free of the properties which vary according to the context or are defined in later project phases.] ()

initValue	ValueSpecification	0..1	aggr	Specifies initial value(s) of the ParameterDataPrototype

Table 5.32: ParameterDataPrototype

[TPS_SWCT_01267] **DataPrototype** can be aggregated in different roles [Note that even though the meta-classes `VariableDataPrototype` and `ParameterDataPrototype` already express specific use cases of the underlying data type the same `DataPrototype` can still be aggregated in different roles, e.g. in the `SwcInternalBehavior` to express different methods how to access it.]()

An example is the aggregation of `VariableDataPrototype` by `SwcInternalBehavior` in the roles of either `implicitInterRunnableVariable` or `explicitInterRunnableVariable`. Find more information concerning these use cases in chapter 7.

[TPS_SWCT_01268] **Definition of initValue for a VariableDataPrototype or a ParameterDataPrototype** [It is possible to assign an `initValue` for both a `VariableDataPrototype` and a `ParameterDataPrototype`.]()

This aspect is sketched in Figure 5.16.

[TPS_SWCT_01269] **In PortInterfaces, initial values defined for DataPrototypes are ignored** [These `initValues` have no meaning for `DataPrototypes`

within `PortInterfaces` because in this case a more specific definition of initial values via the so-called `ComSpec` is required. `()`

For more information, please refer to chapter 4.5.

Figure 5.16: Initial value for `AutosarDataPrototypes`

Find more information about the interpretation of `initValue` in section 5.7.

[constr_1416] Existence of `ApplicationArrayElement.maxNumberOfElements` [The attribute `ApplicationArrayElement.maxNumberOfElements` shall exist **at the time when the contract phase generation is executed** for all `ApplicationArrayElements` defined in the scope of an `ApplicationArrayDataType` where the attribute `ApplicationArrayDataType.dynamicArraySizeProfile` does not exist. `()`

This means that for fixed-size array data types the attribute `ApplicationArrayElement.maxNumberOfElements` shall be defined for every dimension of the fixed-size array data.

5.3.2 Data Constraints for DataPrototypes typed by Array DataTypes

There are cases where it should be possible to reference different `DataConstrs` from `DataPrototypes` of category `ARRAY` typed by either an `ApplicationArrayDataType` or an `ImplementationDataType` of category `ARRAY`.

For example, consider a predefined `AutosarDataType` of category `ARRAY` with `uint8` elements, but without the definition of `DataConstrs`.

This `AutosarDataType` is instantiated several times by means of the existence of `DataPrototypes` of category `ARRAY`.

Each of the derived `DataPrototypes` of category `ARRAY` may have individual upper and lower limits which apply to all elements, e.g. one `DataPrototype` has a range of `0..3` while another has a range of `0..7` for all elements.

This use case occurs, for example, when communicating array-data with different ranges over the network.

The motivation to specify the `DataConstr` at the `DataPrototype` of category `ARRAY` is:

- Make explicit that all derived `DataPrototypes` are based on the same `AutosarDataType`.
- Reduce the number of `AutosarDataTypes` in the model and in the code.
- Specify the `DataConstrs` only once where needed.

- Make explicit that all array elements have the same `DataConstrs`.

The same motivation also applies to the `SwDataDefProps.displayFormat` and `SwDataDefProps.stepSize` attributes of `DataPrototypes` of category `ARRAY`.

AUTOSAR supports this use case under the following conditions:

[constr_1407] Definition of `SwDataDefProps.dataConstr` depending on the capabilities of the data type [The definition of a `SwDataDefProps.dataConstr` according to [constr_1288] and [constr_1289] is only supported for a `DataPrototype` of category `ARRAY` if the corresponding `ApplicationArrayDataType` or `ImplementationDataType` of category `ARRAY` also supports the specification of a `SwDataDefProps.dataConstr`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

The prioritization of `SwDataDefProps.dataConstr` for a `DataPrototype` of category `ARRAY` follows the spirit given in [constr_1015] for the inheritance of `DataPrototypes` from `AutosarDataTypes`.

[TPS_SWCT_01796] Prioritization of `SwDataDefProps.dataConstr` for a `DataPrototype` of category `ARRAY` [A `SwDataDefProps.dataConstr` specified for a `DataPrototype` of category `ARRAY` refines the `SwDataDefProps.dataConstr` specified at the corresponding `ApplicationArrayDataType` or `ImplementationDataType` of category `ARRAY`.]()

[constr_1408] Definition of `SwDataDefProps.displayFormat` depending on the capabilities of the data type [The definition of a `SwDataDefProps.displayFormat` according to [constr_1288] and [constr_1289] is only supported for a `DataPrototype` of category `ARRAY` if the corresponding `ApplicationArrayDataType` or `ImplementationDataType` of category `ARRAY` also supports the specification of a `SwDataDefProps.displayFormat`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

The prioritization of `SwDataDefProps.displayFormat` for a `DataPrototype` of category `ARRAY` follows the spirit given in [constr_1015] for the inheritance of `DataPrototypes` from `AutosarDataTypes`.

[TPS_SWCT_01797] Prioritization of `SwDataDefProps.displayFormat` for a `DataPrototype` of category `ARRAY` [A `SwDataDefProps.displayFormat` specified for a `DataPrototype` of category `ARRAY` refines the `SwDataDefProps.displayFormat` specified at the corresponding `ApplicationArrayDataType` or `ImplementationDataType` of category `ARRAY`.]()

[constr_1413] Definition of `SwDataDefProps.stepSize` depending on the capabilities of the data type [The definition of a `SwDataDefProps.stepSize` according to [constr_1288] and [constr_1289] is only supported for a `DataPrototype` of

category ARRAY if the corresponding `ApplicationArrayDataType` or `ImplementationDataType` of category ARRAY also supports the specification of a `SwDataDefProps.stepSize`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

The prioritization of `SwDataDefProps.stepSize` for a `DataPrototype` of category ARRAY follows the spirit given in [constr_1015] for the inheritance of `DataPrototypes` from `AutosarDataTypes`.

[TPS_SWCT_01798] Prioritization of `SwDataDefProps.stepSize` for a `DataPrototype` of category ARRAY [A `SwDataDefProps.stepSize` specified for a `DataPrototype` of category ARRAY refines the `SwDataDefProps.stepSize` specified at the corresponding `ApplicationArrayDataType` or `ImplementationDataType` of category ARRAY.]()

[constr_1409] Definition of `SwDataDefProps.dataConstr` depending on the capabilities of the element data type [The definition of a `SwDataDefProps.dataConstr` according to [constr_1007] and [constr_1009] is only supported for an `ApplicationArrayDataType` or an `ImplementationDataType` of category ARRAY if the aggregated `ApplicationArrayDataType.element` or `ImplementationDataType.subElement` also supports the specification of a `SwDataDefProps.dataConstr`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1718] Inheritance of `SwDataDefProps.dataConstr` from an array data type to the array elements [A `SwDataDefProps.dataConstr` specified for an `ApplicationArrayDataType` or `ImplementationDataType` of category ARRAY applies to all array leaf elements represented by (potentially multiple levels of) `ApplicationArrayDataType.element` or `ImplementationDataType.subElement`.

In this case, the `ApplicationArrayDataType.element` or `ImplementationDataType.subElement` shall not have an own `SwDataDefProps.dataConstr`. This also applies for multi-dimensional array data types.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1410] Definition of `SwDataDefProps.displayFormat` depending on the capabilities of the element data type [The definition of a `SwDataDefProps.displayFormat` according to [constr_1007] and [constr_1009] is only supported for an `ApplicationArrayDataType` or an `ImplementationDataType` of category ARRAY if the aggregated `ApplicationArrayDataType.element` or `ImplementationDataType.subElement` also supports the specification of a `SwDataDefProps.displayFormat`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1719] Inheritance of `SwDataDefProps.displayFormat` from an array data type to the array elements [A `SwDataDefProps.displayFormat` specified for an `ApplicationArrayDataType` or `ImplementationDataType` of category `ARRAY` applies to all array leaf elements represented by (potentially multiple levels of) `ApplicationArrayDataType.element` or `ImplementationDataType.subElement`.

In this case, the `ApplicationArrayDataType.element` or `ImplementationDataType.subElement` shall not have an own `SwDataDefProps.displayFormat`. This also applies for multi-dimensional array data types.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1414] Definition of `SwDataDefProps.stepSize` depending on the capabilities of the element data type [The definition of a `SwDataDefProps.stepSize` according to [constr_1007] and [constr_1009] is only supported for an `ApplicationArrayDataType` or an `ImplementationDataType` of category `ARRAY` if the aggregated `ApplicationArrayDataType.element` or `ImplementationDataType.subElement` also supports the specification of a `SwDataDefProps.stepSize`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1720] Inheritance of `SwDataDefProps.stepSize` from an array data type to the array elements [A `SwDataDefProps.stepSize` specified for an `ApplicationArrayDataType` or `ImplementationDataType` of category `ARRAY` applies to all array leaf elements represented by (potentially multiple levels of) `ApplicationArrayDataType.element` or `ImplementationDataType.subElement`.

In this case, the `ApplicationArrayDataType.element` or `ImplementationDataType.subElement` shall not have an own `SwDataDefProps.stepSize`. This also applies for multi-dimensional array data types.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

5.3.3 Reference to Data Prototypes

This chapter explains the various patterns for referencing `DataPrototypes`.

[TPS_SWCT_01446] References to a `DataPrototype` may or may not imply the necessity for using an `instanceRef` [As references to a `DataPrototype` may or may not imply the necessity for using an `instanceRef` this would mean that in some places the meta-model would have to implement both variants depending on the

use case. To avoid this, AUTOSAR defines a unified reference implementation for [VariableDataPrototypes](#) and [ParameterDataPrototypes](#).¹()

5.3.3.1 AUTOSAR Variable Ref

[TPS_SWCT_01270] [AutosarVariableRef](#) [With the advent of [AutosarVariableRef](#) it is possible to implement a uniform reference to a [VariableDataPrototype](#) that covers all foreseen use cases:

- Reference to a [localVariable](#), no [AtpInstanceRef](#) required.
- Reference to an [autosarVariable](#) (which involves an [AtpInstanceRef](#)).
- Reference to the internal structure of a [VariableDataPrototype](#) implemented using a composite [ImplementationDataType](#).

¹()

Class	AutosarVariableRef			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::DataElements			
Note	<p>This class represents a reference to a variable within AUTOSAR which can be one of the following use cases:</p> <p>localVariable:</p> <ul style="list-style-type: none"> • localVariable which is used as whole (e.g. InterRunnableVariable, inputValue for curve) <p>autosarVariable:</p> <ul style="list-style-type: none"> • a variable provided via Port which is used as whole (e.g. dataAccesspoints) • an element inside of a composite local variable typed by ApplicationDatatype (e.g. inputValue for a curve) • an element inside of a composite variable provided via Port and typed by ApplicationDatatype (e.g. inputValue for a curve) <p>autosarVariableInImplDatatype:</p> <ul style="list-style-type: none"> • an element inside of a composite local variable typed by ImplementationDatatype (e.g. nvramData mapping) • an element inside of a composite variable provided via Port and typed by ImplementationDatatype (e.g. inputValue for a curve) 			
Base	<i>ARObject</i>			
Aggregated by	InstantiationDataDefProps.variableInstance , NvBlockDataMapping.nvRamBlockElement , NvBlockDataMapping.readNvData , NvBlockDataMapping.writtenNvData , NvBlockDataMapping.writtenReadNvData , RoleBasedDataAssignment.usedDataElement , SwVariableRefProxy.autosarVariable , VariableAccess.accessedVariable			
Attribute	Type	Mult.	Kind	Note
autosarVariable	DataPrototype	0..1	iref	<p>This references a variable which is provided by a port and/or which is part of a CompositeDataType.</p> <p>InstanceRef implemented by: VariableInAtomicSWCTypeInstanceRef</p>
autosarVariableInImplDatatype	ArVariableInImplementationDataInstanceRef	0..1	aggr	<p>This is used if the target variable is inside of variableData Prototype typed by an ImplementationDataType.</p>

Class	AutosarVariableRef			
localVariable	VariableDataPrototype	0..1	ref	This reference is used if the variable is local to the current component. It would also be possible to use the instance reference here. Such an instance ref would not have a contextElement, since the current instance is the context. But the local instance is a special case which may provide further optimization. Therefore an explicit reference is provided for this case.

Table 5.33: AutosarVariableRef

Figure 5.17: Implementation of AutosarVariableRef

Rules for the modeling and semantics of an [AtpInstanceRef](#) are defined in [11].

[constr_2536] Target of an autosarVariable in AutosarVariableRef shall refer to a variable [The target of `autosarVariable` (which in fact is an instance ref) in `AutosarVariableRef` shall either be or be nested in `VariableDataPrototype`. This means that the target shall either be a `VariableDataPrototype` or an `ApplicationCompositeElementDataPrototype` that in turn is owned by a `VariableDataPrototype`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

5.3.3.2 AUTOSAR Parameter Ref

[TPS_SWCT_01271] AutosarParameterRef [With the advent of `AutosarParameterRef`, it is possible to implement a uniform reference to a `ParameterDataPrototype` that covers all foreseen use cases:

- Reference to a `localParameter`, no `AtpInstanceRef` required.
- Reference to an `autosarParameter` (which involves an `AtpInstanceRef`).

]()

Please note that there is a very limited amount of use-cases available where the `AutosarParameterRef` can (with the active consent of the AUTOSAR standard) reference a `VariableDataPrototype`.

[constr_1173] Applicability of AutosarParameterRef referencing a VariableDataPrototype [A reference from `AutosarParameterRef` to `VariableDataPrototype` is **only** applicable if the `AutosarParameterRef` is used in the

context of `SwAxisGrouped` at the time when the contract phase generation is executed.]()

For example, the use case referenced in [constr_1173] applies if it is required to store a grouped axis in a variable in order to adapt the axis during run-time of the ECU by a dedicated algorithm. Note that in all cases where [constr_1173] does not apply [constr_2535] shall be fulfilled.

Class	AutosarParameterRef			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::DataElements			
Note	<p>This class represents a reference to a parameter within AUTOSAR which can be one of the following use cases:</p> <p>localParameter:</p> <ul style="list-style-type: none"> localParameter which is used as whole (e.g. sharedAxis for curve) <p>autosarVariable:</p> <ul style="list-style-type: none"> a parameter provided via PortPrototype which is used as whole (e.g. parameterAccess) an element inside of a composite local parameter typed by ApplicationDatatype (e.g. sharedAxis for a curve) an element inside of a composite parameter provided via Port and typed by ApplicationDatatype (e.g. sharedAxis for a curve) <p>autosarParameterInImplDatatype:</p> <ul style="list-style-type: none"> an element inside of a composite local parameter typed by ImplementationDatatype an element inside of a composite parameter provided via PortPrototype and typed by ImplementationDatatype 			
Base	ARObject			
Aggregated by	InstantiationDataDefProps.parameterInstance , ParameterAccess.accessedParameter , RoleBasedDataAssignment.usedParameterElement , SwCalprmRefProxy.arParameter			
Attribute	Type	Mult.	Kind	Note
autosarParameter	DataPrototype	0..1	iref	<p>This instance reference is used if the calibration parameter is either imported via a port or is part of a composite data structure.</p> <p>InstanceRef implemented by: ParameterInAtomicSWCTypeInstanceRef</p>
localParameter	DataPrototype	0..1	ref	<p>In the majority of cases this reference goes to ParameterDataPrototypes rather than VariableDataPrototypes. Pointing the reference to a VariableDataPrototype is limited to special use cases, e.g. if the AutosarParameterRef is used in the context of an SwAxisGrouped.</p> <p>This reference is used if the arParameter is local to the current component.</p> <p>Of course, it would technically also be feasible to use an InstanceRef for this case. However, the InstanceRef would not have a contextElement (because the current instance is the context).</p> <p>Hence, the local instance is a special case which may provide further optimization. Therefore an explicit reference is provided for this case.</p>

Table 5.34: AutosarParameterRef

[constr_2535] Target of an `autosarParameter` in `AutosarParameterRef` shall refer to a parameter [Except for the specifically described cases where [constr_1173], applies the target of `autosarParameter` (which in fact is an instance ref) in `AutosarParameterRef` shall either be or be nested in `ParameterDataPrototype`.

This means that the target shall either be a [ParameterDataPrototype](#) or an [ApplicationCompositeElementDataPrototype](#) that in turn is owned by a [ParameterDataPrototype](#).

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

5.3.3.3 Modeling Approach

The attribute [Ref.index](#) shall be used whenever a model element that represents an array is referenced in a scalar context, i.e. when the reference is supposed to identify a specific array element.

Primitive	Ref			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes			
Note	<p>This primitive denotes a name based reference. For detailed syntax see the <code>xsd.pattern</code>.</p> <ul style="list-style-type: none"> • first slash (relative or absolute reference) [optional] • Identifier [required] • a sequence of slashes and Identifiers [optional] <p>This primitive is used by the meta-model tools to create the references.</p> <p>Tags: <code>xml.xsd.customType=REF</code> <code>xml.xsd.pattern=/?[a-zA-Z][a-zA-Z0-9_]{0,127}/([a-zA-Z][a-zA-Z0-9_]{0,127})*</code> <code>xml.xsd.type=string</code></p>			
Attribute	Type	Mult.	Kind	Note
base	Identifier	0..1	attr	<p>This attribute reflects the base to be used for this reference.</p> <p>Tags: <code>xml.attribute=true</code></p>
blueprintValue	String	0..1	attr	<p>This represents a description that documents how the value shall be defined when deriving objects from the blueprint.</p> <p>Tags: <code>atp.Status=draft</code> <code>xml.attribute=true</code></p>
index	PositiveInteger	0..1	attr	<p>This attribute supports the use case to point on specific elements in an array. This is in particular required if arrays are used to implement particular data objects.</p> <p>The counting of array indices starts with the value 0, i.e. the index of the first array element is 0.</p> <p>Tags: <code>xml.attribute=true</code></p>

Table 5.35: Ref

A very typical example for such a situation is the access to an element of an [ApplicationArrayDataType](#) by means of a reference to [ApplicationArrayElement](#) in which the index attribute is used.

The usage of the [index](#) attribute does not make sense if the context of the access is already scalar, e.g. accessing an [ApplicationRecordElement](#) in the context of an [ApplicationRecordDataType](#), the usage of the attribute [index](#) in a context that is already scalar by nature would also be misleading and is therefore prohibited.

[constr_1161] Applicability of the attribute **Ref.index** [The usage of attribute **Ref.index** is limited to references to the following meta-classes:

- [ApplicationArrayElement](#)
- Sub-classes of [AbstractImplementationDataTypeElement](#).

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

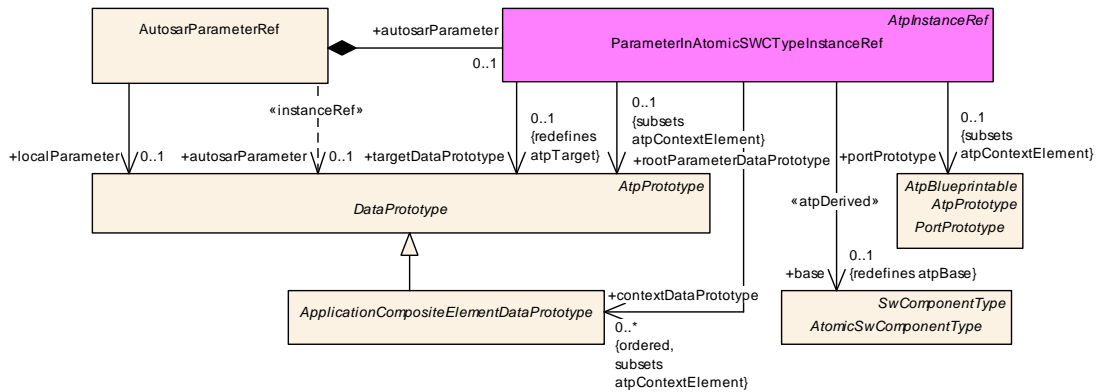

Figure 5.18: Implementation of the InstanceRef for AutosarParameterRef

Class	ParameterInAtomicSWCTypeInstanceRef			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::DataElements::InstanceRefs Usage			
Note	This class implements an instance reference which can be applied for variables as well as for parameters.			
Base	ARObject, AtpInstanceRef			
Aggregated by	AutosarParameterRef.autosarParameter			
Attribute	Type	Mult.	Kind	Note

rootParameter DataPrototype	DataPrototype	0..1	ref	This represents the entry point for references into a CompositeData Type. Tags: xml.sequenceOffset=30
targetData Prototype	DataPrototype	0..1	ref	This is the target parameter element. Note that this must be nested in ParameterDataPrototype. The target must be one of ParameterDataPrototype, Application CompositeElementDataPrototype. Tags: xml.sequenceOffset=50

Table 5.36: ParameterInAtomicSWCTypeInstanceRef

Note: If the target of the **AtpInstanceRef** is an **AutosarDataPrototype** then the **rootVariableDataPrototype** shall not exist.

The implementation of the `AtpInstanceRefs` for `AutosarVariableRef` and `AutosarParameterRef` probably needs some clarification regarding the references to `DataPrototypes`.

[TPS_SWCT_01374] Implementation of `AutosarParameterRef` [The reference to `rootParameterDataPrototype` is **not** redundant. It is required for identifying the `autosarParameter` itself in a `ParameterInterface` for the case that the `targetDataPrototype` is an `ApplicationCompositeElementDataPrototype`.]()

As explained before, the implementation of `AutosarParameterRef` in a specific case is subject to [\[constr_1173\]](#).

[constr_1608] Existence of `rootParameterDataPrototype` [The reference `rootParameterDataPrototype` shall exist **at the time when the contract phase generation is executed** if and only if

- `AutosarDataType` of the `autosarParameter` is a composite data type and
- `targetDataPrototype` refers to a `DataPrototype` inside the `rootParameterDataPrototype`.

]()

Note: If the target of the `AtpInstanceRef` is an `AutosarDataPrototype` then the `rootParameterDataPrototype` shall not exist.

[TPS_SWCT_01375] Implementation of `AutosarVariableRef` [The reference to `rootVariableDataPrototype` is **not** redundant. It is required for identifying the `autosarVariable` itself in a `SenderReceiverInterface` or `NvDataInterface` for the case that the `targetDataPrototype` is an `ApplicationCompositeElementDataPrototype`.]()

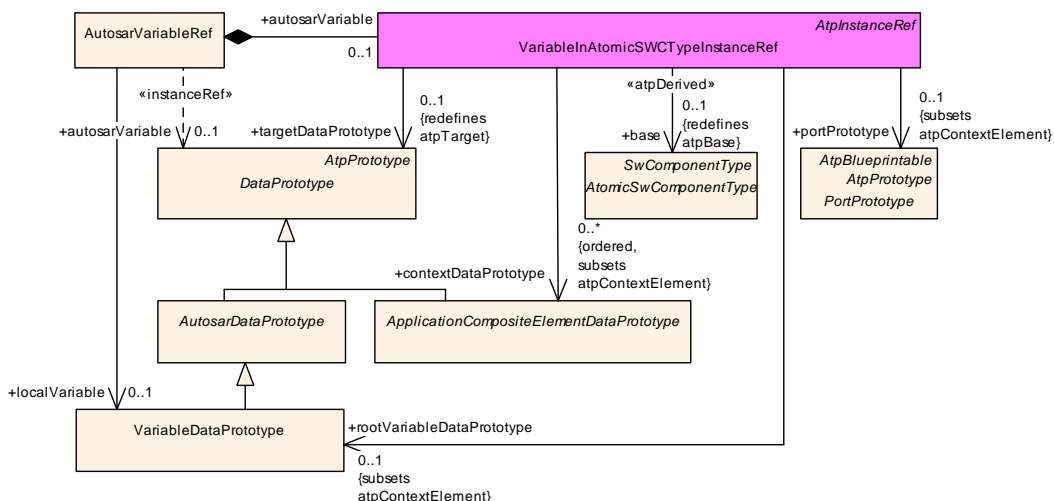

Figure 5.19: Implementation of the InstanceRef for `AutosarVariableRef`

[constr_1609] Existence of `rootVariableDataPrototype` [The reference `rootVariableDataPrototype` shall exist **at the time when the contract phase generation is executed** if and only if

- the `AutosarDataType` of the `autosarVariable` is a composite data type and
- the `targetDataPrototype` refers to a `DataPrototype` inside the `rootVariableDataPrototype`.

]()

5.3.3.4 Access into VariableDataPrototype typed by an Implementation-DataType

The meta-class `ArVariableInImplementationDataInstanceRef`, despite the name, has formally no relationship to `AtpInstanceRef`. Therefore, the following definition applies:

[TPS_SWCT_01681] Context path in `ArVariableInImplementationDataInstanceRef` [The references in the roles

- `portPrototype`
- `rootVariableDataPrototype`
- ordered collection of `contextDataPrototype`
- `targetDataPrototype`

constitute the path leading from the root to the specified inner instance of a `dataElement` inside a `VariableDataPrototype` typed by an `Implementation-DataType`.]()

This relation is also depicted in Figure 5.20.

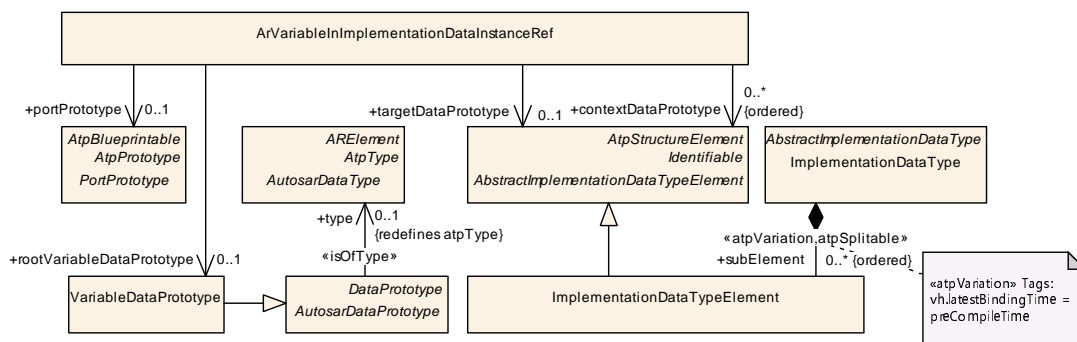

Figure 5.20: Implementation of `ArVariableInImplementationDataInstanceRef`

[constr_1423] Completeness of references `ArVariableInImplementationDataInstanceRef.contextDataPrototype` [The reference `ArVariableInImplementationDataInstanceRef.contextDataPrototype` shall be defined for

- each *leaf* (i.e. the end of a chain of aggregating elements) `ImplementationDataTypeElement` of category `TYPE_REFERENCE` in a chain of referencing `ImplementationDataTypes` which is not the `targetDataPrototype`

- and each `ImplementationDataTypeElement` owned by an `ImplementationDataType` or `ImplementationDataTypeElement` of category `ARRAY` in a chain of referencing `ImplementationDataTypes`

starting from the `ImplementationDataTypes` of the `rootVariableDataPrototype` down to the leaf `ImplementationDataTypeElement` which is typed (directly or indirectly via `ImplementationDataType` of category `TYPE_REFERENCE`) by the `ImplementationDataType` of the `targetDataPrototype`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1424] Existence of `ArVariableInImplementationDataInstanceRef`.
`contextDataPrototype` [The attribute `ArVariableInImplementationDataInstanceRef.contextDataPrototype` shall only exist **at the time when the contract phase generation is executed** for an `ImplementationDataTypeElement` category `TYPE_REFERENCE` or `ARRAY`.]()

Technically, it would be possible to avoid the context for a one-dimensional array in the hierarchy. The context is still required because then the rule for the existence of contexts becomes much simpler.

An example that demonstrates the necessity for the existence of `ArVariableInImplementationDataInstanceRef` can be found in Appendix [B.1.9](#).

Class	ArVariableInImplementationDataInstanceRef			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::DataElements			
Note	<p>This class represents the ability to navigate into a data element inside of an <code>VariableDataPrototype</code> which is typed by an <code>ImplementationDatatype</code>.</p> <p>Note that it shall not be used if the target is the <code>VariableDataPrototype</code> itself (e.g. if its a primitive).</p> <p>Note that this class follows the pattern of an <code>InstanceRef</code> but is not implemented based on the abstract classes because the <code>ImplementationDataType</code> isn't either, especially because <code>ImplementationDataTypeElement</code> isn't derived from <code>AtpPrototype</code>.</p>

5.4 Properties of Data Definitions

5.4.1 Overview

As it has already been shown in the previous chapters, various properties and associations can be attached to the definition of data types as well as prototypes. These are described by the meta-class `SwDataDefProps` which covers all properties of a particular data object under various aspects.

In general, the properties specified within `SwDataDefProps` may apply to all kind of data declared within the software-component template and within the basic software module description template as well, e.g. component local data, data used for communication, data used for measurement as well as for calibration.

However, there are constraints for the attributes depending on the role of the data:

The usage of `SwDataDefProps` in the context of the `ComSpec networkRepresentation` (which is configurable in several roles and different contexts) implements a "fork" in the dependency graph that is coded into [\[constr_1015\]](#) and this "fork" should not have an impact on elements on the left of the `ComSpec networkRepresentation` column.

[\[constr_1015\]](#) Prioritization of `SwDataDefProps` [

Attributes of SwDataDefProps	Usage For			Place of Setting

This rule shall be imposed **at the time when the contract phase generation is executed.**

]()

Please note that empty table cells in [constr_1015] represent not-applicable settings. The following legend applies for the non-empty table cells:

¹⁴swIntendedResolution is used only in an early phase of the definition of data types, namely in the context of the definition of so-called blueprints. To that extent, swIntendedResolution represents a non-binding requirement that shall later be considered for the definition of an appropriate CompuMethod.

- D Define** the attribute independent of settings to the left.
- A Add** Only applicable for the case that an attribute has an upper multiplicity greater than 1: if the attribute is defined on the left, then any additional definition of the attribute adds to the already existing collection. If the attribute is not defined on the left, then the attribute can be defined.
- I Inherit** the definition from the left for usage in the scope of this element.
- M** Attribute is **meaningless** in the scope of this element. Tools shall ignore such an attribute without a warning.
- C** This means that the left element constrains right element.
- AI** If the attribute is already defined on the left then the attribute is not redefined but adds implementation-related information.

Example 5.2

An `ApplicationDataType` of category `BOOLEAN` supports the definition of an own `CompuMethod` to define the semantics of e.g. (ON, OFF) or (HIGH, LOW) or (PASSED, FAILED) **as long as the number of values match and matching pairs of values on application level and implementation level exist**. In contrast, the corresponding `ImplementationDataType` uses (true, false) as the applicable literals in any of the above mentioned cases.

- S** Create a “Self-contained” artifact based on the left.

Example 5.3

A `CompuMethod` defined in the context of a `System` of category `ECU_EXTRACT` is copied into the separate artifact for the `McSupportData` and references need to be updated to the copy.

Use case: Provide a `McDataGenerator` with a single, self-contained file to do its job.

Some property names contain the term “variable” or “calprm”, this comes from historical¹⁵ reasons and can be taken as some hint where the property most likely applies to.

The usage of the “/” in the table rows mentioning the content of `swCalprmAxisSet`, `swCalprmAxis`, in particular `SwAxisGrouped.swCalprmRef` and `SwAxisGrouped.sharedAxisType` resp. `SwAxisIndividual.swVariableRef`, `SwAxisIndividual.unit`, and `SwAxisIndividual.inputVariableType` represents a “shortcut” that glosses over a specific aspect of the modeling of `SwCalprmAxis` that is visible in

¹⁵In the beginning of ASAM and MSR, measurements and calibration parameters (characteristics) were separated and the properties were merged over time.

the model but does not appear in the AUTOSAR XML schema, see Figure 5.22 (which contains all the meta-classes and roles mentioned in the table entries).

In particular, the "shortcut" affects the existence of meta-class `SwCalprmAxisTypeProps` and its aggregation in the role `SwCalprmAxis.swCalprmAxisTypeProps`. As depicted in Figure 5.22, `SwCalprmAxisTypeProps` acts as an abstract base class to both `SwAxisGrouped` and `SwAxisIndividual`.

In ARXML files that conform to the AUTOSAR XML schema, however, both `SwAxisGrouped` and `SwAxisIndividual` appear as direct child elements of `SwCalprmAxis`.

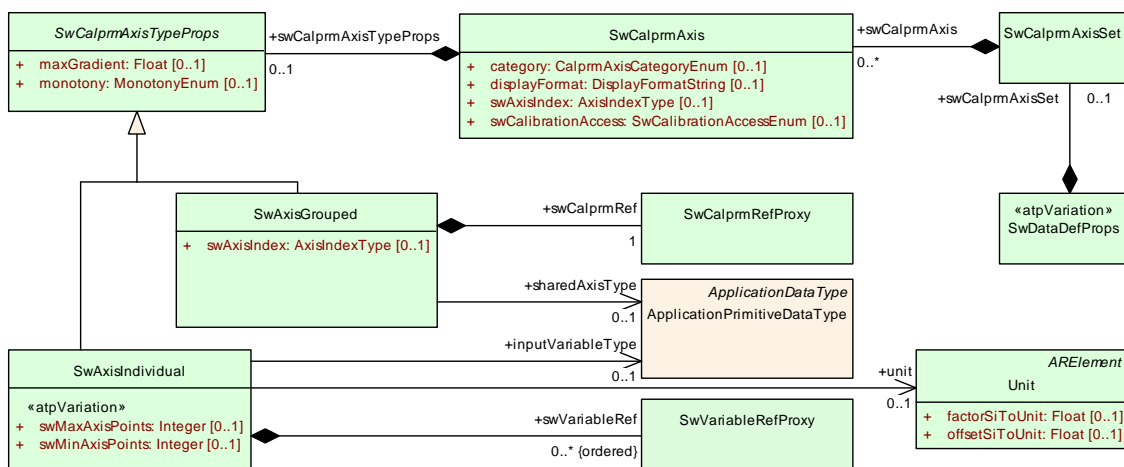

Figure 5.22: Modeling of `SwAxisGrouped` and `SwAxisIndividual`

This difference between meta-model and AUTOSAR XML schema is explained by the existence of a set of tags at the aggregation `SwCalprmAxis.swCalprmAxisTypeProps`. The details of how these tags impact the schema generation are explained in the *TPS XML Schema Production Rules* [27].

To summarize, the "shortcut" in the table rows simply approximates the situation in ARXML instead of reflecting the actual modeling in the AUTOSAR meta-model.

[constr_1244] DataPrototypes used in application software shall not be typed by C enums [A `ImplementationDataType` that is used to type a `DataPrototype` owned by an `AtomicSwComponentType` shall not set `swDataDefProps.additionalNativeTypeQualifier` to `enum` at the time when the contract phase generation is executed.]()

[TPS_SWCT_01272] Semantics of swComparisonVariable [Please note that `swComparisonVariables` shall be displayed in the MCD system on the ordinate in a curve.

By showing the input value and the comparison value the calibration engineer can see if the current working point is above or below a curve providing thresholds. For example, in a curve specifying a temperature-depending gear shift threshold engine speed the engine speed can be shown as "comparisonVariable".

These variables can be used to display the value of a variable on the value axis of a calibration parameter (characteristic), that is currently displayed in the MCD-System.

The purpose is to compare the appropriate result from the calibration parameter in question, with a value being calculated or taken from a sensor (the comparison variable).

The sole purpose of this comparison-variable is therefore to serve the calibration process.]()

Class	<<atpVariation>> SwDataDefProps			
Package	M2::MSR::DataDictionary::DataDefProperties			
Note	<p>This class is a collection of properties relevant for data objects under various aspects. One could consider this class as a "pattern of inheritance by aggregation". The properties can be applied to all objects of all classes in which SwDataDefProps is aggregated.</p> <p>Note that not all of the attributes or associated elements are useful all of the time. Hence, the process definition (e.g. expressed with an OCL or a Document Control Instance MSR-DCI) has the task of implementing limitations.</p> <p>SwDataDefProps covers various aspects:</p> <ul style="list-style-type: none"> • Structure of the data element for calibration use cases: is it a single value, a curve, or a map, but also the recordLayouts which specify how such elements are mapped/converted to the DataTypes in the programming language (or in AUTOSAR). This is mainly expressed by properties like swRecordLayout and swCalprmAxisSet • Implementation aspects, mainly expressed by swImplPolicy, swVariableAccessImplPolicy, swAddr Method, swPointerTargetProps, baseType, implementationDataType and additionalNativeTypeQualifier • Access policy for the MCD system, mainly expressed by swCalibrationAccess • Semantics of the data element, mainly expressed by compuMethod and/or unit, dataConstr, invalid Value • Code generation policy provided by swRecordLayout <p>Tags: vh.latestBindingTime=codeGenerationTime</p>			
Base	ARObject			
Aggregated by	AutosarDataType.swDataDefProps , CompositeNetworkRepresentation.networkRepresentation , DataPrototype.swDataDefProps , DataPrototypeTransformationProps.networkRepresentationProps , DiagnosticDataElement.swDataDefProps , DiagnosticEnvDataElementCondition.swDataDefProps , DltArgument.networkRepresentation , FlatInstanceDescriptor.swDataDefProps , ImplementationDataTypeElement.swDataDefProps , InstantiationDataDefProps.swDataDefProps , ISignal.networkRepresentationProps , McDataInstance.resultingProperties , ParameterAccess.swDataDefProps , PerInstanceMemory.swDataDefProps , ReceiverComSpec.networkRepresentation , SenderComSpec.networkRepresentation , SomeipDataPrototypeTransformationProps.networkRepresentation , SwPointerTargetProps.swDataDefProps , SwServiceArg.swDataDefProps , SwSystemconst.swDataDefProps , SystemSignal.physicalProps			
Attribute	Type	Mult.	Kind	Note
additionalNativeTypeQualifier	NativeDeclarationString	0..1	attr	<p>This attribute is used to declare native qualifiers of the programming language which can neither be deduced from the baseType (e.g. because the data object describes a pointer) nor from other more abstract attributes. Examples are qualifiers like "volatile", "strict" or "enum" of the C-language. All such declarations have to be put into one string.</p> <p>Tags: xml.sequenceOffset=235</p>

Class	<<atpVariation>> SwDataDefProps			
annotation	Annotation	*	aggr	This aggregation allows to add annotations (yellow pads ...) related to the current data object. Tags: xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=20 xml.typeElement=false xml.typeWrapperElement=false
baseType	SwBaseType	0..1	ref	Base type associated with the containing data object. Tags: xml.sequenceOffset=50
compuMethod	CompuMethod	0..1	ref	Computation method associated with the semantics of this data object. Tags: xml.sequenceOffset=180
dataConstr	DataConstr	0..1	ref	Data constraint for this data object. Tags: xml.sequenceOffset=190
displayFormat	DisplayFormatString	0..1	attr	This property describes how a number is to be rendered e.g. in documents or in a measurement and calibration system. Tags: xml.sequenceOffset=210
display Presentation	DisplayPresentation Enum	0..1	attr	This attribute controls the presentation of the related data for measurement and calibration tools.
implementation DataType	AbstractImplementation DataType	0..1	ref	This association denotes the ImplementationDataType of a data declaration via its aggregated SwDataDefProps. It is used whenever a data declaration is not directly referring to a base type. Especially <ul style="list-style-type: none"> • redefinition of an ImplementationDataType via a "typedef" to another ImplementationDatatype • the target type of a pointer (see SwPointerTarget Props), if it does not refer to a base type directly • the data type of an array or record element within an ImplementationDataType, if it does not refer to a base type directly • the data type of an SwServiceArg, if it does not refer to a base type directly Tags: xml.sequenceOffset=215
invalidValue	ValueSpecification	0..1	aggr	Optional value to express invalidity of the actual data element. Tags: xml.sequenceOffset=255
stepSize	Float	0..1	attr	This attribute can be used to define a value which is added to or subtracted from the value of a DataPrototype when using up/down keys while calibrating.
swAddrMethod	SwAddrMethod	0..1	ref	Addressing method related to this data object. Via an association to the same SwAddrMethod it can be specified that several DataPrototypes shall be located in the same memory without already specifying the memory section itself. Tags: xml.sequenceOffset=30

Class	<<atpVariation>> SwDataDefProps			
swAlignment	AlignmentType	0..1	attr	The attribute describes the intended typical alignment of the DataPrototype. If the attribute is not defined the alignment is determined by the swBaseType size and the memoryAllocationKeywordPolicy of the referenced Sw AddrMethod. Tags: xml.sequenceOffset=33
swBit Representation	SwBitRepresentation	0..1	aggr	Description of the binary representation in case of a bit variable. Tags: xml.sequenceOffset=60
swCalibration Access	SwCalibrationAccess Enum	0..1	attr	Specifies the read or write access by MCD tools for this data object. Tags: xml.sequenceOffset=70
swCalprmAxis Set	SwCalprmAxisSet	0..1	aggr	This specifies the properties of the axes in case of a curve or map etc. This is mainly applicable to calibration parameters. Tags: xml.sequenceOffset=90
swComparison Variable	SwVariableRefProxy	*	aggr	Variables used for comparison in an MCD process. Tags: xml.sequenceOffset=170 xml.typeElement=false
swData Dependency	SwDataDependency	0..1	aggr	Describes how the value of the data object has to be calculated from the value of another data object (by the MCD system). Tags: xml.sequenceOffset=200
swHostVariable	SwVariableRefProxy	0..1	aggr	Contains a reference to a variable which serves as a host-variable for a bit variable. Only applicable to bit objects. Tags: xml.sequenceOffset=220 xml.typeElement=false
swImplPolicy	SwImplPolicyEnum	0..1	attr	Implementation policy for this data object. Tags: xml.sequenceOffset=230
swIntended Resolution	Numerical	0..1	attr	The purpose of this element is to describe the requested quantization of data objects early on in the design process. The resolution ultimately occurs via the conversion formula present (compuMethod), which specifies the transition from the physical world to the standardized world (and vice-versa) (here, "the slope per bit" is present implicitly in the conversion formula). In the case of a development phase without a fixed conversion formula, a pre-specification can occur through swIntendedResolution. The resolution is specified in the physical domain according to the property "unit". Tags: xml.sequenceOffset=240
swInterpolation Method	Identifier	0..1	attr	This is a keyword identifying the mathematical method to be applied for interpolation. The keyword needs to be related to the interpolation routine which needs to be invoked. Tags: xml.sequenceOffset=250

Class	<<atpVariation>> SwDataDefProps			
swIsVirtual	Boolean	0..1	attr	This element distinguishes virtual objects. Virtual objects do not appear in the memory, their derivation is much more dependent on other objects and hence they shall have a swDataDependency . Tags: xml.sequenceOffset=260
swPointerTarget Props	SwPointerTargetProps	0..1	aggr	Specifies that the containing data object is a pointer to another data object. Note: This atpSplittable property has no atp.Splitkey due to atpVariation (PropertySetPattern). Stereotypes: atpSplittable Tags: xml.sequenceOffset=280
swRecord Layout	SwRecordLayout	0..1	ref	Record layout for this data object. Tags: xml.sequenceOffset=290
swRefresh Timing	MultidimensionalTime	0..1	aggr	This element specifies the frequency in which the object involved shall be or is called or calculated. This timing can be collected from the task in which write access processes to the variable run. But this cannot be done by the MCD system. So this attribute can be used in an early phase to express the desired refresh timing and later on to specify the real refresh timing. Tags: xml.sequenceOffset=300
swTextProps	SwTextProps	0..1	aggr	the specific properties if the data object is a text object. Tags: xml.sequenceOffset=120
swValueBlock Size	Numerical	0..1	attr	This represents the size of a Value Block Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime xml.sequenceOffset=80
swValueBlock SizeMult (ordered)	Numerical	*	attr	This attribute is used to specify the dimensions of a value block (VAL_BLK) for the case that that value block has more than one dimension. The dimensions given in this attribute are ordered such that the first entry represents the first dimension, the second entry represents the second dimension, and so on. For one-dimensional value blocks the attribute swValueBlockSize shall be used and this attribute shall not exist. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime
unit	Unit	0..1	ref	Physical unit associated with the semantics of this data object. This attribute applies if no compuMethod is specified. If both units (this as well as via compuMethod) are specified the units shall be compatible. Tags: xml.sequenceOffset=350
valueAxisData Type	ApplicationPrimitive DataType	0..1	ref	The referenced ApplicationPrimitiveDataType represents the primitive data type of the value axis within a compound primitive (e.g. curve, map). It supersedes CompuMethod, Unit, and BaseType. Tags: xml.sequenceOffset=355

Aggregated by	ModeDeclarationGroupPrototype.swCalibrationAccess , SwCalprmAxis.swCalibrationAccess , SwDataDefProps.swCalibrationAccess
Literal	Description
notAccessible	The element will not be accessible via MCD tools, i.e. will not appear in the ASAP file. Tags: atp.EnumerationLiteralIndex=0
readOnly	The element will only appear as read-only in an ASAP file. Tags: atp.EnumerationLiteralIndex=1
readWrite	The element will appear in the ASAP file with both read and write access. Tags: atp.EnumerationLiteralIndex=2

Table 5.44: SwCalibrationAccessEnum

[TPS_SWCT_01273] Precedence rules for the application of [SwDataDefProps](#) [[SwDataDefProps](#) can be specified on various levels, from type over prototype to instantiation, finally data access and calibration support after RTE generation. In general, properties specified on prototype level override the ones specified on type level.

More formally, the precedence of such properties is:

1. attributes of [SwDataDefProps](#) defined on [ApplicationDataType](#) which may be overwritten by
2. attributes of [SwDataDefProps](#) defined on [ImplementationDataType](#) which may be overwritten by
3. attributes of [SwDataDefProps](#) defined on [DataPrototype](#) which may be overwritten by
4. attributes of [SwDataDefProps](#) defined on [InstantiationDataDefProps](#) which may be overwritten by
5. attributes of [SwDataDefProps](#) defined on [ParameterAccess](#) respectively [Argument](#) which may be overwritten by
6. attributes of [SwDataDefProps](#) defined on [FlatInstanceDescriptor](#) which may be overwritten by
7. attributes of [SwDataDefProps](#) defined on [McDataInstance](#)

]()

Note that details about applicable attributes of [SwDataDefProps](#) can be found in [[constr_1015](#)].

[TPS_SWCT_01274] [SwDataDefProps](#) used to support calibration and measurement [The last item in the list of use cases contained in [[TPS_SWCT_01273](#)] denotes that [SwDataDefProps](#) are also used as part of [McSupportData](#) which is a direct input to the generation of measurement and calibration configuration formats (so-called A2L-files).

This use case is further explained in [6]. Since these data are generated by the RTE, they will use a copy of the properties according to the precedence given above.

However, even in this use case which comes after RTE generation it is possible that properties relevant for the MCD system are added which had been undefined so far.

This for example, applies to the attribute `swRefreshTiming` which denotes a timing information relevant for the measurement system; this information may be set rather late in the process chain.]()

Obviously such an override is not applicable in all cases. In particular, the properties covering the structure shall not be redefined on `DataPrototype`. Implementation policy, semantics and code generation policy may be changed under consideration of compatibility rules.

Access policy for the MCD system is the most likely subject to be redefined on the `DataPrototype` of even on an instantiation level.

Section 5.4.3 describes how `SwDataDefProps` are used for measuring purposes while Section 5.4.4 describes the construction of characteristics based on the combination of `SwDataDefProps` with `DataPrototypes`.

Section 2.2.2 describes in which context calibration parameters can be defined. Finally, sections 2.2.3, 7.5.4, and 5.5.5 show how calibration parameters are used in `RunnableEntity` and show the link to an actual ECU implementation.

Enumeration	SwImplPolicyEnum
Package	M2::MSR::DataDictionary::DataDefProperties
Note	Specifies the implementation strategy with respect to consistency mechanisms of variables.
Aggregated by	BswInternalTriggeringPoint.swImplPolicy , InternalTriggeringPoint.swImplPolicy , SwDataDefProps.swImplPolicy , Trigger.swImplPolicy
Literal	Description
const	forced implementation such that the running software within the ECU shall not modify it. For example implemented with the "const" modifier in C. This can be applied for parameters (not for those in NVRAM) as well as argument data prototypes. Tags: atp.EnumerationLiteralIndex=0
fixed	This data element is fixed. In particular this indicates, that it might also be implemented e.g. as in place data, (#DEFINE). Tags: atp.EnumerationLiteralIndex=1
measurementPoint	The data element is created for measurement purposes only. The data element is never read directly within the ECU software. In contrast to a "standard" data element in an unconnected provide port is, this unconnection is guaranteed for measurementPoint data elements. Tags: atp.EnumerationLiteralIndex=2
queued	The content of the data element is queued and the data element has 'event' semantics, i.e. data elements are stored in a queue and all data elements are processed in 'first in first out' order. The queuing is intended to be implemented by RTE Generator. This value is not applicable for parameters. Tags: atp.EnumerationLiteralIndex=3
standard	This is applicable for all kinds of data elements. For variable data prototypes the 'last is best' semantics applies. For parameter there is no specific implementation directive. Tags: atp.EnumerationLiteralIndex=4

Table 5.45: SwImplPolicyEnum

[TPS_SWCT_02000] **Default value for attribute swImplPolicy** [If the attribute **swImplPolicy** is not explicitly set at any of the locations listed in “Place of Setting” for **SwDataDefProps**, the default value **standard** applies.]()

Please note that the locations listed in “Place of Setting” for **SwDataDefProps** are described in [\[constr_1015\]](#).

5.4.2 Invalid Value

The diagram [5.5](#) shows that in addition to the semantics defined through the **computeMethod** (explained below in chapter [5.5.1](#)), also an **invalidValue** can be specified. This is a requirement of the VFB [\[3\]](#), allowing expressing which specific value is used to indicate invalidation.

Figure 5.24: Invalid value

The relation of the definition of an `invalidValue` to a `CompuMethod` (see section 5.5.1) is illustrated in Figures 5.25, 5.26, and 5.27.

Figure 5.25 depicts the possibility that the `invalidValue` can be defined (with different consequences, see [TPS_SWCT_01834] and [TPS_SWCT_01835]) **inside** or **outside** of the boundaries of the corresponding `CompuMethod`.

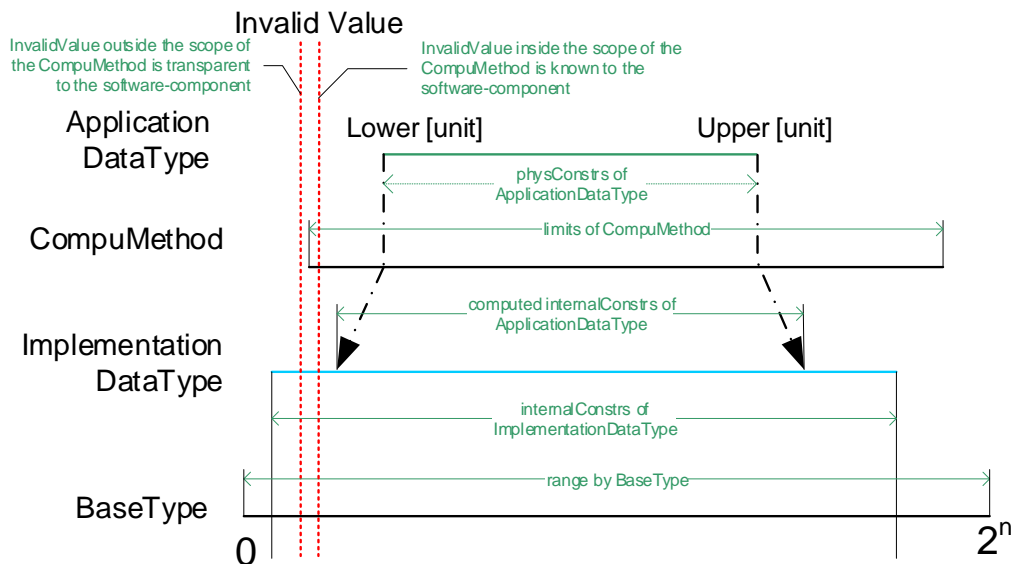

Figure 5.25: Value ranges and invalid values for linear and rational `CompuMethod`

Figure 5.26 and Figure 5.27 depict a similar situation for the case of mixed `CompuMethods` where the `invalidValue` is defined in the discrete part of a `CompuMethod`.

Figure 5.26 sketches a case where a `CompuMethod` has a linear and a discrete part and the `invalidValue` is defined by means of one value that is defined in the discrete part of the `CompuMethod`.

As mentioned by [TPS_SWCT_01834], the `invalidValue` shall be defined in the physical domain in this case. In other words, the `invalidValue` shall be defined by a symbol according to [TPS_SWCT_01432].

As a consequence of the definition of an `invalidValue` **inside**, the scope of a mixed `CompuMethod` the `invalidValue` is visible to the software-component.

Figure 5.26: Value ranges and invalid values with discrete `invalidValue` defined inside the scope of the `CompuMethod`

Figure 5.27, on the other hand, sketches a case where a `CompuMethod` has a linear and a discrete part and the `invalidValue` is not within the defined linear interval and not defined by means of one value out of the discrete part of the `CompuMethod`.

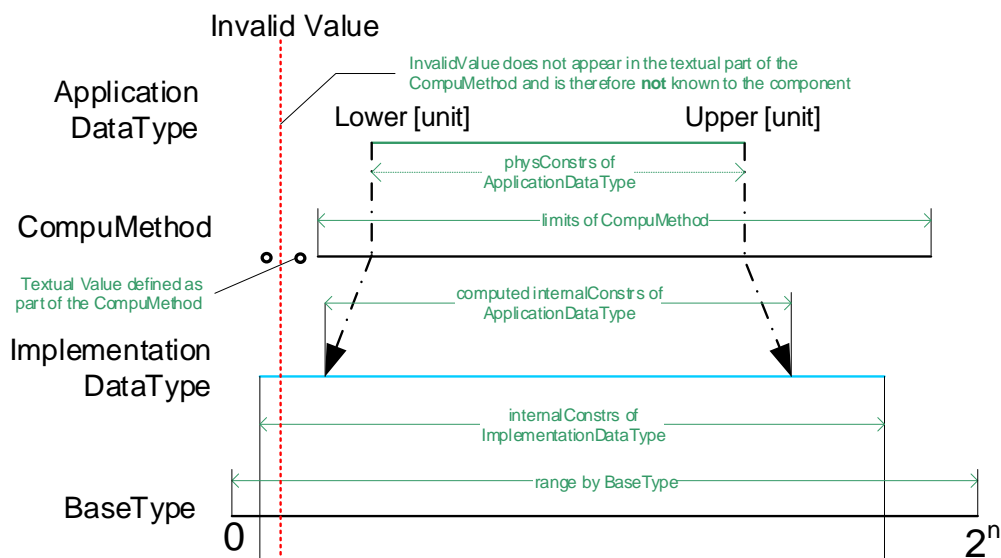

Figure 5.27: Value ranges and invalid values with discrete `invalidValue` defined outside the scope of the `CompuMethod`

As mentioned by [TPS_SWCT_01835], the `invalidValue` shall be defined in the internal domain in this case. In other words, the `invalidValue` shall be defined by a `NumericalValueSpecification`.

As a consequence of the definition of an `invalidValue` **outside** the scope of a mixed `CompuMethod`, the `invalidValue` is invisible (and therefore not accessible) to the software-component.

The conclusions of the illustrations in Figures 5.25, 5.26, and 5.27 are summarized in the following list:

- [TPS_SWCT_01432] **`invalidValue` outside limits of `compuMethod` requires processing by RTE** [If the value of attribute `invalidValue` is outside the range limits defined by the `compuMethod`, it is invisible (unknown, transparent) to the communicating software-components. In this case, the processing of the `invalidValue` is done by the RTE.

The sender has to use the invalidation API of the RTE. The receiving software-component can either use the data receive status, or the `DataReceiveErrorEvent` respectively `DataReceivedEvent` to decide about the validity of the received data.

Alternatively, the receiving software-component can be designed so that it relies on the reception of an `initValue` as a default value in case of data invalidation.]
()

[TPS_SWCT_01835] **`invalidValue` is outside the scope of the `compuMethod`** [If the value of the `invalidValue` of an `ApplicationPrimitiveDataType` of category VALUE is supposed to be **outside** the scope of the applicable `CompuMethod`, a `NumericalValueSpecification` (that provides a value in the internal representation) shall be used to describe the `invalidValue` of the `ApplicationPrimitiveDataType`.] (RS_SWCT_03216)

Because of the existence of [TPS_SWCT_01834] and [TPS_SWCT_01835], the definition of the `invalidValue` is fully specified and therefore [constr_1221] does not apply to this case.

- [TPS_SWCT_01434] **`invalidValue` is inside the limits of the `compuMethod`, handled by software-components** [If the `invalidValue` is inside the range limits defined by the `compuMethod`, it is visible (known) to the communicating software-components. In this case, the software-components can directly read and write the value.

This is in particular the case, if the sender and receiver are calculating a checksum over a larger data structure to implement an end-to-end communication protection.

To ensure the integrity of the checksums, it is required to set invalid values by the sending component directly, and to receive invalid values unchanged.] ()

[TPS_SWCT_01834] `invalidValue` is inside the scope of the `compuMethod`
[If the value of the `invalidValue` of an `ApplicationPrimitiveDataType` of category `VALUE` is supposed to be **inside** the scope of the applicable `CompuMethod`, an `ApplicationValueSpecification` shall be used to describe the `invalidValue` of the `ApplicationPrimitiveDataType`.] (*RS_SWCT_03216*)

[TPS_SWCT_01834] means that the value of the `ApplicationValueSpecification` shall be within the bounds defined by `swDataDefProps.compuMethod.compuPhysToInternal.compuContent.compuScale.lowerLimit` or `upperLimit` or the inverse case that is based on the bounds defined by `swDataDefProps.compuMethod.compuInternalToPhys.compuContent.compuScale.lowerLimit` or `upperLimit`.

[TPS_SWCT_01436] Different receivers require different handling of data invalidation [It is possible that in case of 1:n communication different receivers requiring a different handling of data invalidation depending on the criticality of its functionality. For instance, one receiver applies the checksum based end to end communication protection and another receiver relies on the substitution of invalid values by `invalidValues`.] ()

The handling of `invalidValue` for `ApplicationPrimitiveDataType` of category `STRING` is defined by **[constr_1242]**.

A typical use case for putting the `invalidValue` inside the boundaries of the applicable `CompuMethod` is a composite data type that contains the values of all individual wheel speeds. If one of the sensors fails and starts to send `invalidValue` it would probably not make sense to consider the whole composite data element invalid.

It may very likely still be possible to make sense of the remaining intact wheel speed values and carry on with whatever business the receiving software-component has with that data.

From this perspective, it would obviously be OK for the sending software-component to actively send the `invalidValue` that is then processed as a “regular” value without applying additional semantics by the RTE/Com.

[TPS_SWCT_01646] Sending `invalidValue` without invalidation applied by RTE/Com [For intentionally sending `invalidValue` without invalidation applied by RTE/Com the `SenderReceiverInterface.invalidationPolicy.handleInvalid` shall be set to the value `HandleInvalidEnum.dontInvalidate`.] ()

[constr_1390] Restriction to the value of `SenderReceiverInterface.invalidationPolicy.handleInvalid` [If the value of `SenderReceiverInterface.invalidationPolicy.handleInvalid` is set to any value other than `HandleInvalidEnum.dontInvalidate` then the `invalidValue` shall not be within the interval defined by the `CompuMethod` of the applicable `dataElement` **at the time when the contract phase generation is executed**.] ()

Please note that `ApplicationPrimitiveDataTypes` of category `VALUE` in principle can have an `invalidValue` provided by a `NumericalValueSpecification` because the value of the attribute `invalidValue` can be **outside the range** of the applicable `CompuMethod` (see [TPS_SWCT_01432]).

[TPS_SWCT_01437] `invalidValue` can also be specified without setting a `compuMethod` [An `invalidValue` can also be specified without setting a `compuMethod`.]()

Figure 5.25 illustrates the relationship between `ApplicationDataType`, `CompuMethod`, `ImplementationDataType`, `invalidValue`, `BaseType`.

[constr_2545] `invalidValue` shall fit in the specified ranges [The `invalidValue` shall be in the range of the `ImplementationDataType` **at the time when the contract phase generation is executed**.]()

Please note that the `invalidValue` is a `ValueSpecification`. Of course, it would technically be possible to use any subclass of `ValueSpecification` at this place.

[constr_1016] Restriction of `invalidValue` for `ImplementationDataType` and `ImplementationDataTypeElement` [`invalidValue` for `ImplementationDataType` and `ImplementationDataTypeElement` is restricted to be either a compatible `NumericalValueSpecification`, `TextValueSpecification` (caution, [constr_1284] applies) or a `ConstantReference` that in turn points to a compatible `ValueSpecification`.

This rule shall be imposed **at the time when the contract phase generation is executed**.]()

[constr_1384] Definition of `invalidValue` for `DataPrototype` typed by `ApplicationPrimitiveDataType` of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, `CUBE_5`, `COM_AXIS`, `RES_AXIS`, and `VAL_BLK` [An `invalidValue` shall not be specified for a `DataPrototype` typed by `ApplicationPrimitiveDataType` of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, `CUBE_5`, `COM_AXIS`, `RES_AXIS`, and `VAL_BLK` **at the time when the contract phase generation is executed**.]()

Rationale for [constr_1384]: there is no use case for sending a `DataPrototype` typed by `ApplicationPrimitiveDataType` of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, `CUBE_5`, `COM_AXIS`, `RES_AXIS`, and `VAL_BLK` over a communication bus.

[TPS_SWCT_01486] `ApplicationPrimitiveDataType` of category `STRING` may have `invalidValue` [The only kind of `Compound Primitive Data Type` that is allowed to define an `invalidValue` is an `ApplicationPrimitiveDataType` of category `STRING`.](RS_SWCT_03216)

[constr_1241] `Compound Primitive Data Types` and `invalidValue` [`Compound Primitive Data Types` that have set the value of `category` other than `STRING` shall **not** define `invalidValue` **at the time when the contract phase generation is executed**.]()

[constr_1242] Restriction of `invalidValue` for `ApplicationPrimitiveDataType` of category `STRING` [`invalidValue` for `ApplicationPrimitiveDataType` of category `STRING` (**[constr_1241]** applies) is restricted to be either a compatible `ApplicationValueSpecification` or a `ConstantReference` that in turn points to a compatible `ApplicationValueSpecification` **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01487] Correspondence of `invalidValue` for `ApplicationPrimitiveDataType` and `ImplementationDataType` [The `invalidValue` specified on the level of an `ApplicationPrimitiveDataType` shall correspond to the `invalidValue` specified on the level of a compatible `ImplementationDataType`. The terms “corresponds” boils down to:

- `category VALUE` or `BOOLEAN`: application of `CompuMethod`
- `category STRING`: the definition of a constant value for a string data type is explained in section "Specification of values for Strings". There is no formal support defined to check that the values of `invalidValue` really correspond to each other.

]()

[constr_10196] Definition of `invalidValue` for `DataPrototype` is typed by an `ImplementationDataType` that references a `CompuMethod` of category `TEXTTABLE` or `BITFIELD_TEXTTABLE` [If an `invalidValue` is defined for a `DataPrototype` that is typed by an `ImplementationDataType` that references or inherits (see **[constr_1015]**) a `CompuMethod` of category `TEXTTABLE` or `BITFIELD_TEXTTABLE`, the applicable `ValueSpecification` shall be a `TextValueSpecification` **if** the value fits into the intervals defined by the `CompuMethod`.

In this case the value provided shall match to one of the applicable text values (`vt`, `shortLabel`, `symbol`) defined by the applicable `CompuScales`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Please note that several attributes of meta-class `CompuScale` can be taken to describe the actual value. It is therefore necessary to clarify what happens if several of these attributes exist within the context of one `CompuScale`. This clarification can be found in **[TPS_SWCT_01696]**.

The consequence of the existence of **[constr_10196]** is that a `NumericalValueSpecification` can be used for the definition of an `invalidValue` for a `DataPrototype` that is typed by an `ImplementationDataType` that references a `CompuMethod` of category `TEXTTABLE` or `BITFIELD_TEXTTABLE` if the `invalidValue` is **not** supposed to be represented by the `CompuMethod`.

[constr_1302] Restriction of data invalidation [Data invalidation is only applicable for one of the following cases applicable on the **receiving** side:

1. `VariableDataPrototypes` typed by either an `ApplicationPrimitiveDataType` or an `ImplementationDataType` of category `VALUE` or `TYPE_REFERENCE` that boils down to category `VALUE` that have defined an `invalidValue`.
2. `VariableDataPrototypes` typed by either an `ApplicationCompositeDataType` or an `ImplementationDataType` of category `STRUCTURE`, or `ARRAY` or of category `TYPE_REFERENCE` that boils down to category `STRUCTURE`, or `ARRAY` that have **at least one** primitive element with an `invalidValue`.

This rule shall be imposed **at the time when the contract phase generation is executed.** |()

Please note that [constr_1302], in general, leaves room for the definition of an `invalidValue` for a `DataPrototype` typed by a `Wrapped Union Data Type` because it demands the existence of a primitive element that has an `invalidValue`. In the case of a `Wrapped Union Data Type`, the primitive element could be the `Member Selector`, and thus [constr_1302] would technically be fulfilled.

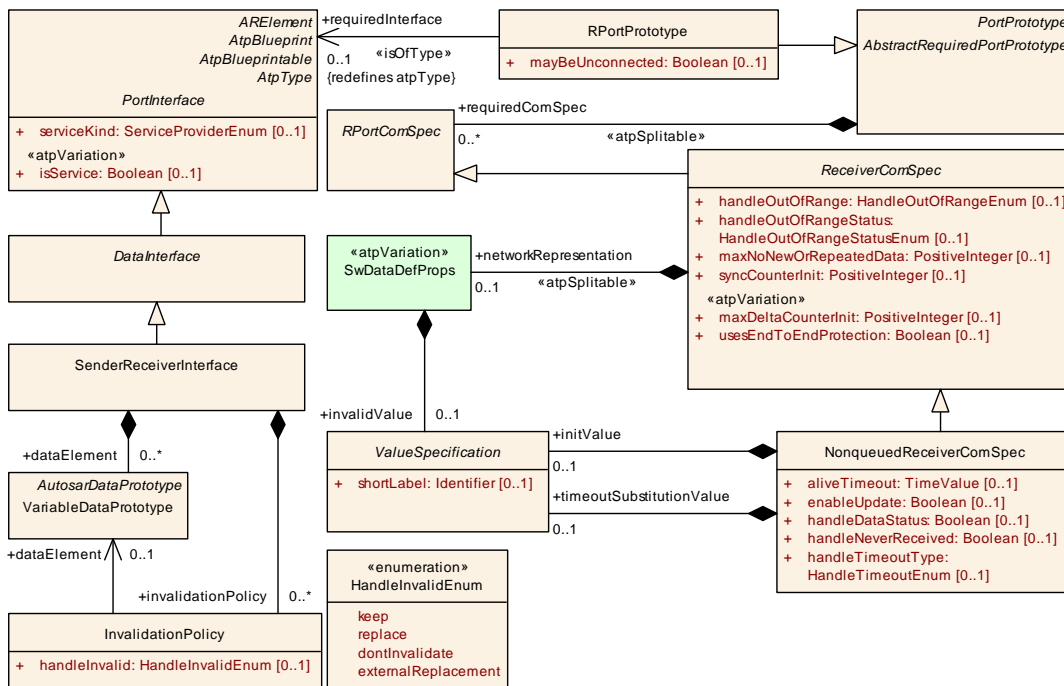

Figure 5.28: Relationships required to consider the `invalidValue`

On the one hand, it does not make sense to just define an `invalidValue` for the `Member Selector` from the semantic point of view. On the other hand, the actual payload may not even have an `invalidValue` according to [constr_1009] or [constr_1288], respectively.

In order to simplify the situation and make a clear statement, [constr_1446] has been defined.

[constr_1446] No definition of `invalidValue` for a `Wrapped Union Data Type`
[The definition of an `invalidValue` for a `DataPrototype` typed by a `Wrapped`

Union Data Type is not supported **at the time when the contract phase generation is executed.**]()

[constr_1140] Combination of `invalidValue` with the attribute `handleInvalid` [The combination of setting the attribute `handleInvalid` of the meta-class `InvalidationPolicy` owned by `SenderReceiverInterface` to value `replace` **and** of setting the value of the attribute `initValue` owned by a corresponding `NonqueuedReceiverComSpec` effectively to the value of the `invalidValue` (owned by a corresponding `SwDataDefProps`) is not supported **at the time when the contract phase generation is executed.**]()

The term “corresponding” (as utilized in [constr_1140]) refers to the fact that information regarding the fulfillment of [constr_1140] is factually distributed over different areas of the meta-model. For clarification, the following relationship should be considered:

The `SenderReceiverInterface` defines how to deal with an invalid value by means of the attribute `handleInvalid` on the basis of individual `dataElements`. The `SenderReceiverInterface` is taken for typing a `RPortPrototype` that in turn owns a `ReceiverComSpec`. [constr_1140] applies if the particular `ReceiverComSpec` is actually a `NonqueuedReceiverComSpec` that refers to the same `dataElement`.

In this case the `invalidValue` owned by the `SwDataDefProps` that in turn is owned by the respective `dataElement` is relevant for the fulfillment of [constr_1140]. The “big picture” of this relationship is sketched in Figure 5.28.

[constr_1219] Invalidation depends on the value of `swImplPolicy` [If the value of `swImplPolicy` of a `SenderReceiverInterface.dataElement` is set to the value `SwImplPolicyEnum.queued`, then the enclosing `SenderReceiverInterface` shall not aggregate in the role `invalidationPolicy` an `InvalidationPolicy`

- that references the `dataElement` and
- where the value of `InvalidationPolicy.handleInvalid` is set to anything else than `HandleInvalidEnum.dontInvalidate`

at the time when the contract phase generation is executed.]()

[constr_1282] Restriction concerning the usage of `RuleBasedValueSpecification` or a `ReferenceValueSpecification` for the specification of an `invalidValue` [The aggregation of a `RuleBasedValueSpecification` or a `ReferenceValueSpecification` for the definition of a `ApplicationPrimitiveDataType.swDataDefProps.invalidValue` is not supported **at the time when the contract phase generation is executed.**]()

5.4.3 Properties for Measurement

In embedded automotive software design, measurement means access to memory locations in an ECU and transferring its contents to the measurement & calibration system.

While in classical software design, variables abstract the memory locations in the code, AUTOSAR provides for this purpose the `DataPrototype` with its various specializations:

- `VariableDataPrototype` of a `SenderReceiverInterface` or `NvDataInterface` used in a `PortPrototype` (of a `SwComponentPrototype`), to capture sender-receiver and non-volatile data communication between `SwComponentPrototypes`
- `ArgumentDataPrototype` of a `ClientServerOperation` in a `ClientServerInterface` to capture client-server communication between `SwComponentPrototypes`.
- `VariableDataPrototype` in the context of an `SwcInternalBehavior` to
 - capture communication between `RunnableEntities` within a `SwComponentPrototype`
 - handle data in a non-volatile memory block
 - provide pure software component internal memory which has to be accessible for an MCD system

[TPS_SWCT_01440] Measurement is not limited to primitive objects [The ability of being measured is not restricted to primitive data (`category VALUE`) but can also be applied to composite data (`category STRUCTURE` or `ARRAY`).]()

The following semantical and structural features from `SwDataDefProps` are relevant (among other purposes) for the measurement system:

- `swCalibrationAccess`
- `swImplPolicy`
- `compuMethod`
- `unit` (if not specified by `compuMethod`)
- `baseType`

[TPS_SWCT_01130] Measurement and calibration access to model elements is defined by `swCalibrationAccess` [The ability to be accessed by e.g. a calibration tool is given by setting the `swCalibrationAccess` attribute.]([RS_SWCT_03152](#))

The valid settings of `swCalibrationAccess` are regulated by [[constr_1017](#)].

[constr_1017] Supported combinations of `swImplPolicy` and `swCalibrationAccess` [

<code>swImplPolicy</code>	<code>swCalibrationAccess</code>		
	<code>notAccessible</code>	<code>readOnly</code>	<code>readWrite</code>
<code>fixed</code>	yes	not supported	not supported
<code>const</code>	yes	yes	not supported
<code>standard</code>	yes	yes	yes
<code>queued</code>	yes	not supported	not supported
<code>measurementPoint</code>	not supported	yes	not supported

This rule shall be imposed **at the time when the contract phase generation is executed.**

]()

[TPS_SWCT_01559] Default value for attribute `SwDataDefProps.swCalibrationAccess` [The default value for the attribute `SwDataDefProps.swCalibrationAccess` is `SwCalibrationAccessEnum.notAccessible`.]()

[constr_1018] `dataElement` with `swImplPolicy` set to `measurementPoint` shall not be referenced by a `VariableAccess` aggregated by `RunnableEntity` in the role `dataReadAccess` [Due to the nature of `dataElements` characterized by setting the `swImplPolicy` to `measurementPoint`, such `dataElements` shall not be referenced by a `VariableAccess` aggregated by `RunnableEntity` in the role `dataReadAccess` **at the time when the contract phase generation is executed.**]()

5.4.4 Properties of Curves and Maps

A characteristic table is defined by setting the `category` of the corresponding `AutosarDataType` or `DataPrototype` to `CURVE` respectively `MAP`, `CUBOID`, `CUBE_4`, and `CUBE_5`.

Its `SwDataDefProps` determine an axis description. The type of the functional values is given by the attached `SwBaseType` and the `CompuMethod`.

The axis description itself is defined by the meta-model element `SwCalprmAxisSet` aggregating the appropriate number of `SwCalprmAxisTypeProps`.

This is the base class for a so called “individual axis” (formalized by meta-class `SwAxisIndividual`) or a “grouped axis” (formalized by meta-class `SwAxisGrouped`).

The latter is used to share axis points by several characteristic tables. Figure 5.29 shows an overview on the relevant meta-model elements.

The type of the functional values is given by the attached `SwBaseType` and the `CompuMethod` or by the referenced `ApplicationDataType`.

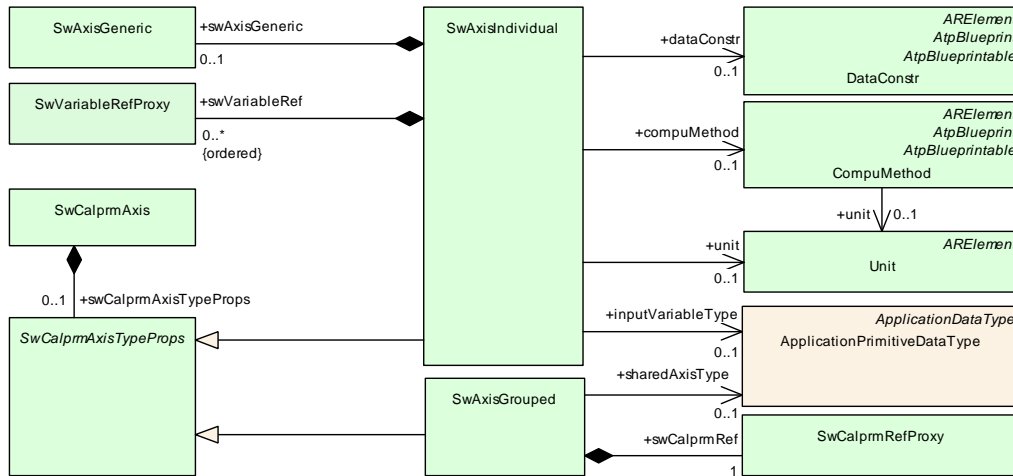

Figure 5.29: Overview on the Meta-Model for Axis Description

If an [ApplicationDataType](#) is referenced (via [valueAxisDataType](#)) this supersedes [CompuMethod](#), [Unit](#), and [BaseType](#) if these are defined in parallel.

Figure 5.30: Overview on a Generic Axis

Figure 5.31 shows how an individual axis is represented by the meta-model. The corresponding M1 Model is illustrated in Figure 5.32.

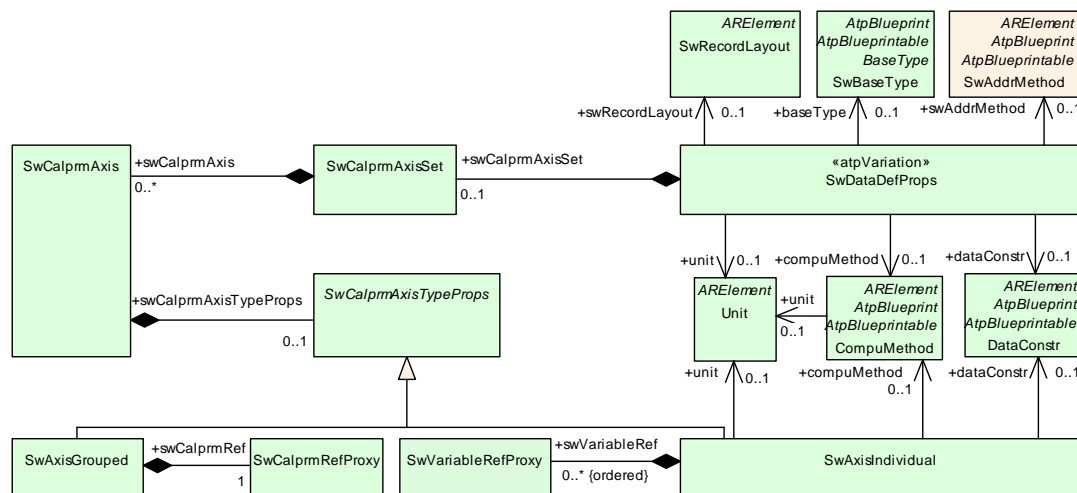

Figure 5.31: Meta-Model Elements used for a Curve

The [SwAxisIndividual](#) references value-models to account the minimum and the maximum number of axis values as well as the number of axis points.

Hence, the size of the structure to hold the functional values is determined by the number of axis values for all axes. The type of the axis values is determined when the

type of the referenced input value (`swVariableRef`) has been set. For further details see section 5.4.5.

[TPS_SWCT_01107] `swMinAxisPoints` and `swMaxAxisPoints` represent variation points [The value of attributes `swMinAxisPoints` and `swMaxAxisPoints` is subject to variant handling.] (*RS_SWCT_03148*)

Attribute	Type	Mult.	Kind	Note
sharedAxisType	ApplicationPrimitiveDataType	0..1	ref	This is the datatype of the calibration parameter providing the shared axis.
swAxisIndex	AxisIndexType	0..1	attr	Describes which axis of the referenced calibration parameter provides the values for the group axis. The index satisfies the following convention: <ul style="list-style-type: none"> • 0 = value axis. in this case, the interpolation result of the referenced parameter is used as a base point index. • The index should only be specified if the parameter under swCalprm contains more than one axis. It is standard practice for the axis index of parameters with more than one axis, to be set to 1, if data has not been assigned to swAxisIndex. Tags: xml.sequenceOffset=20
swCalprmRef	SwCalprmRefProxy	1	aggr	This property specifies the calibration parameter which serves as the input axis. In AUTOSAR, the type of the referenced Calibration parameter shall be compatible to the type specified by sharedAxisType. <p>Please note that the multiplicity of this aggregation cannot be set to 0..1 based on the non-mainstream schema generation instructions defined at the aggregation.</p> However, the multiplicity has to be factually considered 0..1 (i.e. a SwAxisGrouped that does not aggregate the role swCalprmRef is still valid according to the XML schema, depending on the use case documented in [constr_1015]). Tags: xml.roleElement=false xml.roleWrapperElement=false xml.sequenceOffset=30 xml.typeElement=false xml.typeWrapperElement=false

Table 5.55: SwAxisGrouped

5.4.4.1 Specification of grouped Axes

Please note that [SwAxisGrouped](#) has a dual nature in that it is used to

- define the data type of the shared axis (see Figure [5.33](#))
- identify the specific [DataPrototype](#) that implements a shared axis in the context of a specific access to the enclosing curve (see Figure [5.34](#))

Figure [5.33](#) depicts the usage of [SwAxisGrouped](#) for the definition of an [ApplicationPrimitiveDataType](#) that implements a curve.

It is worth noticing that [ApplicationPrimitiveDataType](#) appears in two different roles in the diagram:

- The definition of the `ApplicationPrimitiveDataType` of the curve itself is depicted in the upper part of the diagram.
- The selection of the `ApplicationPrimitiveDataType` that represents the grouped axis is depicted in the lower part of the diagram.

The modeling depicted in Figure 5.33 can be further clarified by an example model that is reduced to the minimum content to exemplify the use case. Here, the role of the usage of `SwAxisGrouped` is to define the data type of the curve itself and of a shared axis:

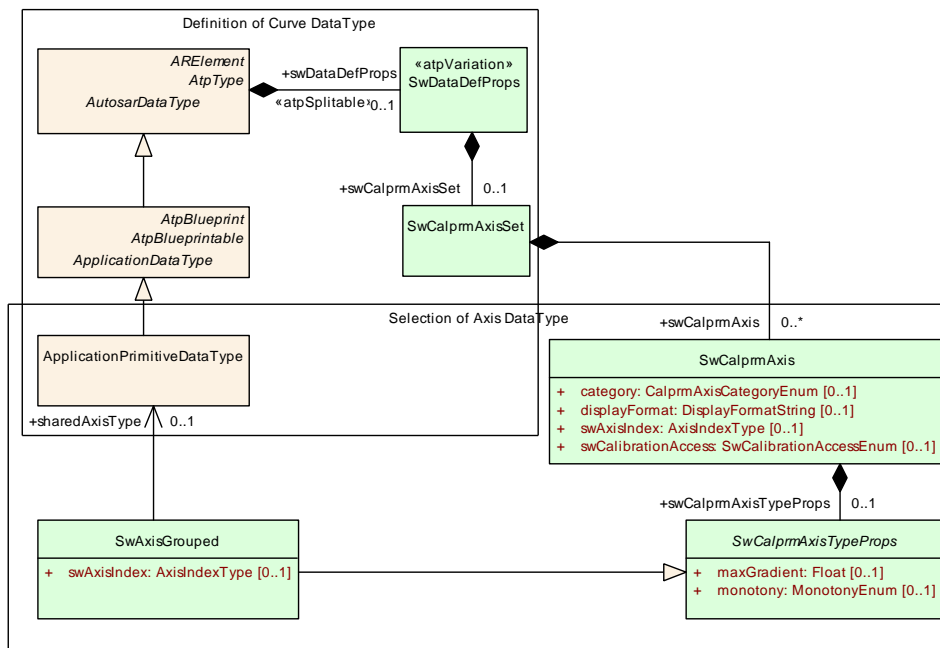

Figure 5.33: Definition of an `ApplicationPrimitiveDataType` that implements a curve

Listing 5.1: Usage of `SwAxisGrouped` to define the data type of a shared axis

Figure 5.34 depicts the usage of `SwAxisGrouped` in the context of a `ParameterAccess` (which, in the case of a curve, typically results in the call of an interpolation method for the respective curve and the specific axis that is supposed to be used in the interpolation).

Also in this case, the diagram depicts two distinct (yet related) aspects:

- In the upper part of the diagram, the definition of the access to the `DataPrototype` that represents the specific curve inside the enclosing `SwComponentPrototype` is modeled by means of the `ParameterAccess.accessedParameter`.
- In the lower part of the diagram, the identification of the `DataPrototype` that represents the grouped axis inside the enclosing `SwComponentPrototype` is modeled by means of the `SwAxisGrouped.swCalprmRef.arParameter`.

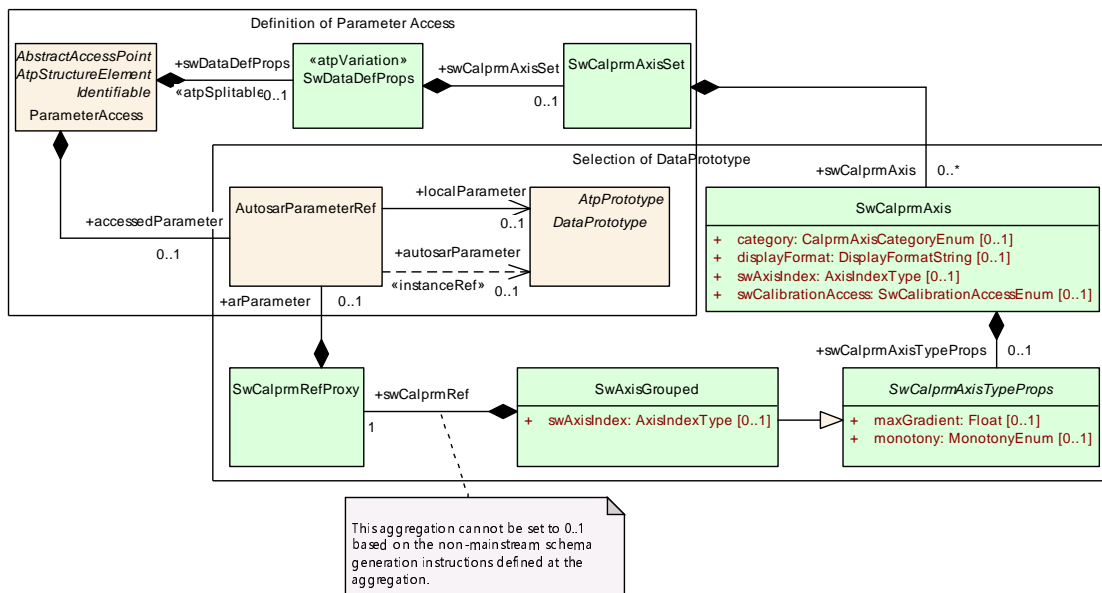

Figure 5.34: Usage of `SwAxisGrouped` in the context of a `ParameterAccess`

Please note that the multiplicity of aggregation `SwAxisGrouped.swCalprmRef` cannot be set to 0..1 based on the *non-mainstream schema generation instructions*¹⁶ defined at the aggregation.

However, the multiplicity factually has to be considered 0..1 (i.e. a `SwAxisGrouped` that does not aggregate the role `swCalprmRef` is still valid according to the XML schema, depending on the use case documented in [constr_1015]).

¹⁶The details are explained in the description of the schema generation control tags `xml.roleElement` and `xml.roleWrapperElement`, as well as `xml.typeElement` and `xml.typeWrapperElement` in the document TPS XML Schema Production Rules [27].

The following bare-bones model listing exemplifies the usage of `SwAxisGrouped` in the context of a `ParameterAccess` where a specific local parameter is identified to take the role of the shared axis in the specific access to the curve.

Listing 5.2: Usage of `SwAxisGrouped` in the context of a `ParameterAccess`

[constr_10096] Shared axis shall not be a fixed axis [An `ApplicationPrimitiveDataType` of category `COM_AXIS` shall not contain the definition of an `SwCalprmAxis` of category `FIX_AXIS`.

This rule shall be imposed **at the time when the contract phase generation is executed**()

Rationale for the existence of [constr_10096]: the definition of a grouped axis that is implemented by a fixed axis is not supported by the A2L [15] standard.

5.4.4.2 Specification of fix Axes

In most cases the axes of a curve or map are accessible to a calibration software and it is possible to calibrate axes points and their corresponding values.

There are cases, however, where axes are intentionally declared as fix and where no intention exists to change the properties of the axis ever¹⁷.

These axes are also known as fix axes. The support for the creation of fix axes in the meta-model is based upon the usage of `SwAxisGeneric` as depicted in Figure 5.30.

[TPS_SWCT_01747] Value of `category` for fix axis [A fix axis shall be modeled as an `SwCalprmAxis` with attribute `category` set to the value `FIX_AXIS`.]()

[TPS_SWCT_01748] Sub-categories of fix axes [There are different sub-categories of fix axes:

- Fix axis where the distance between axis points can be computed according to a standardized algorithm.

In this case, fix axes of arbitrary length can be described by feeding three arguments defined in the context of the axis description into the axis algorithm.

Consequently, the memory footprint of different fix axis of this `category` is literally identical, independently of the number of axis points.

The following variations exist:

- **Subcategory `PAR`**, i.e. `category = FIX_AXIS_PAR`: the axis is created out of a *starting value* and a *shift* that creates further axis points as using a power-of-two algorithm. The details can be found in [15].
- **Subcategory `PAR_DIST`**, i.e. `category = FIX_AXIS_PAR_DIST`: the axis is created out of a *starting value* and an *offset* that adds further axis points with the distance given by offset. The details can be found in [15].
- Fix axis where the axis points are defined as a list of values directly in the axis definition. This variety boils down to
 - **Subcategory `PAR_LIST`**, i.e. `category = FIX_AXIS_PAR_LIST`: the axis is created out of a list of numerical values that represent the axis points. The details can be found in [15].

¹⁷Typically, a calibration software does not have the ability to manipulate (or even inspect) the axis' properties by inspecting the ECU's memory.

These values of `category` shall be used for `SwAxisType`.`]()`

As mentioned before, the modeling of a fix axis is based upon the definition of the `SwAxisGeneric`. But this statement by itself is not yet sufficient to unambiguously clarify the details of the modeling.

For this purpose, it is necessary to provide further information about the specifics of the roles `SwAxisGeneric.swAxisType` and `SwAxisGeneric.swGenericAxisParam`.

[TPS_SWCT_01749] Semantics of `SwAxisGeneric.swAxisType` in the definition of a fix axis [The role `SwAxisGeneric.swAxisType` specifies the `category` of the fix axis according to `[TPS_SWCT_01748]`.`]()`

[TPS_SWCT_01750] Semantics of `SwAxisGeneric.swGenericAxisParam` in the definition of a fix axis [The role `SwAxisGeneric.swGenericAxisParam` provides the actual numeric values for the definition of the axis.

The semantics of a provided numerical value is clarified by the attribute `SwGenericAxisParamType.category` where meta-class `SwGenericAxisParamType` is referenced in the role `swGenericAxisParamType`.`]()`

Please note that the standardized values and multiplicities within the model of an `SwAxisGeneric` are defined in accordance with `[TPS_SWCT_01479]` and `[TPS_SWCT_01480]`.

[constr_1544] Standardized values and multiplicities for the modeling of `SwAxisGeneric` for the definition of a fix axis [

<code>category</code> of <code>swAxisType</code>	<code>category</code> of <code>SwGenericAxisParamType</code>	Multiplicity of <code>swGenericAxisParam</code>	Multiplicity of <code>vf</code>
<code>FIX_AXIS_PAR</code>	<code>OFFSET</code>	1	1
	<code>SHIFT</code>	1	1
<code>FIX_AXIS_PAR_DIST</code>	<code>OFFSET</code>	1	1
	<code>DISTANCE</code>	1	1
<code>FIX_AXIS_PAR_LIST</code>	<code>LIST</code>	1	1..*

This rule shall be imposed **at the time when the contract phase generation is executed**.

`]()`

Please note that the axis points and values of a fix axis are defined in the definition of the fix axis itself and therefore any initial value assigned to a fix axis would be ignored anyway.

This might lead to confusion such that the initial value does not make it into the software. In order to avoid such confusion AUTOSAR **does not support the definition of an initial value for a fix axis**.

This regulation is reflected in the existence of `[constr_1545]`.

[constr_1545] No initialization for fix axis [An `ApplicationValueSpecification` taken to initialize an `ApplicationPrimitiveDataType` that contains a fix axis shall not contain initial values for the axis index of the fix axis inside the `ApplicationPrimitiveDataType` **at the time when the contract phase generation is executed.**]()

Please note that the calibration software may still have access to axis points and values of the fix axis if these properties are specified in an A2L file.

For this purpose `McDataInstance` needs to be set up properly. The details are explained in [6].

Examples of the definition of a fix axis can be found in Appendix B.2.5.

5.4.5 Setting an Axis Input Value

When an interpolation routine is called, an input value has to be provided to find the appropriate axis entry in the implementation of a `RunnableEntity`. However, this input value cannot be arbitrarily chosen but only be selected from available `VariableDataPrototype` assigned to it.

Attributes (e.g. `displayFormat`, `swCalibrationAccess`) of a shared axis can be defined in the context of the definition of the `ApplicationPrimitiveDataType` of category `COM_AXIS` for the shared axis.

The same ability to define attributes¹⁸ is also required for the definition of an "embedded" `stdAxis`.

There are several possible ways of how the required attributes can be defined, e.g. by means of the existence of the reference in the role `inputVariableType` if `SwCalprmAxis.swCalprmAxisTypeProps` yields an `SwAxisIndividual`, see [TPS_SWCT_01865].

Please note that the modeling of `SwCalprmAxis` and `SwAxisIndividual`, as mentioned in [TPS_SWCT_01865] and [TPS_SWCT_01866], is depicted in Figure 5.22.

[TPS_SWCT_01865] Definition of attributes for an "embedded" axis if reference `inputVariableType` exists [If `SwCalprmAxis.swCalprmAxisTypeProps` yields an `SwAxisIndividual` and if the reference in the role `SwAxisIndividual.inputVariableType` exists, then the definition of attributes (e.g. `displayFormat`, `swCalibrationAccess`) of an `SwCalprmAxis` of category `stdAxis` can be done via the `SwDataDefProps` attached to the `ApplicationPrimitiveDataType` referenced in the role `SwCalprmAxis.swCalprmAxisTypeProps.inputVariableType`.]()

¹⁸Some attributes, like `CompuMethod` or `DataConstr` of an "embedded" axis can be directly defined on the basis of the `SwAxisIndividual`, but those are just individual shortcuts.

[TPS_SWCT_01866] Definition of attributes for an "embedded" axis if reference `inputVariableType` does not exist [If `SwCalprmAxis.swCalprmAxisTypeProps` yields an `SwAxisIndividual` and if the reference in the role `SwAxisIndividual.inputVariableType` does not exist, then the attributes can be taken from the `AutosarDataTypes` of `DataPrototypes` referenced from a `swVariableRef` that is aggregated by an `SwAxisIndividual`, that in turn is obtained in the role `swCalprmAxisTypeProps` from an enclosing `SwCalprmAxis`.

In this case, the respective attributes have to be compatible in all `AutosarDataTypes` used to type `DataPrototypes` referenced from within the role `SwAxisIndividual.swVariableRef`.]()

This leaves the consideration of compatibility between the `DataPrototype(s)` referenced by means of `SwAxisIndividual.swVariableRef` and the actual axis specification to the following attributes:

- `SwAxisIndividual.dataConstr`
- `SwAxisIndividual.compuMethod`
- `SwAxisIndividual.unit`

[TPS_SWCT_01676] Preferred approach to checking the compatibility of input value and axis [The compatibility in terms of data type between the description of an `SwAxisIndividual` and the `DataPrototype(s)` used as an input variable to the respective interpolation routine shall preferably be checked alternatively between

- the `ApplicationPrimitiveDataType(s)` of `DataPrototype(s)` referenced by means of `SwAxisIndividual.swVariableRef` (the provider in terms of compatibility)
- the `ApplicationPrimitiveDataType` referenced by means of `SwAxisIndividual.inputVariableType` (The requester in terms of compatibility).

For compatibility, the `compuMethod` of `SwAxisIndividual.swVariableRef` and the `ApplicationPrimitiveDataType` referenced by means of `SwAxisIndividual.inputVariableType` shall not be considered.]()

Rationale: in many cases the input variable is defined by a float data type to take benefit from the precision in computations. But the axis data type is an integer data type to save memory. In this situation, a requirement for compatible `compuMethods` would exclude the described scenario.

The implementation of the software-component shall make sure that the float value is properly converted and rescaled to an integer data type compatible to the axis data type.

[TPS_SWCT_01677] Fall-back approach to checking the compatibility of input value and axis [If the reference `SwAxisIndividual.inputVariableType` does not exist then the compatibility in terms of data type between the description of an `SwAxisIndividual` and the `DataPrototype(s)` used as an input variable to the respective interpolation routine shall be checked on the basis of the following references:

- `SwAxisIndividual.dataConstr`
- `SwAxisIndividual.unit`

respectively

- `SwAxisIndividual.dataConstr`
- `SwAxisIndividual.compuMethod.unit`

against their respective counterparts in the `ApplicationPrimitiveDataTypes` of the `DataPrototype(s)` referenced by means of `SwAxisIndividual.swVariableRef.()`

[constr_1420] Existence of `SwAxisIndividual.inputVariableType` [If the reference `SwAxisIndividual.inputVariableType` does not exist then either:

- `SwAxisIndividual.dataConstr`
- `SwAxisIndividual.unit`

or

- `SwAxisIndividual.dataConstr`
- `SwAxisIndividual.compuMethod.unit`

shall exist **at the time when the contract phase generation is executed.**]

The constraint is necessary for the generation of the respective specification of the axis in A2L.

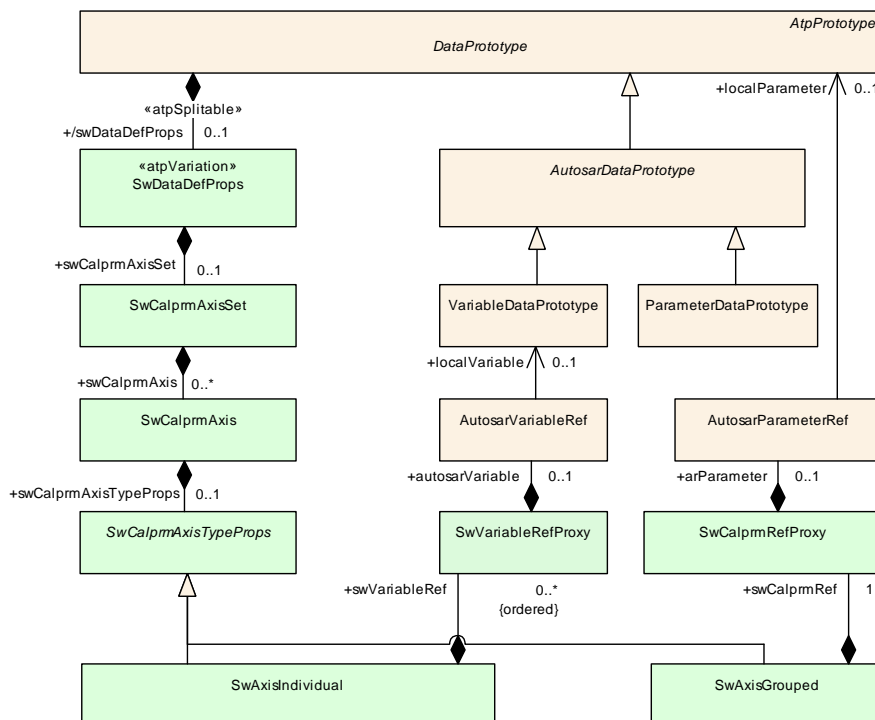

Figure 5.35: Extended Axis Elements and Input Variable Reference

Every `ParameterDataPrototype` then allows to specify zero or more input values (being type compatible to `inputVariableType`) in its axis description.

This means that at the specification time of an `SwcInternalBehavior`, a list of input values has to be specified where the implementer of a `RunnableEntity` can choose of. The input values are `DataPrototype` entities either being

- a `VariableDataPrototype` in a `SenderReceiverInterface` or `NvDataInterface` of a `PortPrototype`, of the `AtomicSwComponentType` where the `SwcInternalBehavior` is associated to, or an `ArgumentDataPrototype` in a `ClientServerOperation` of a `ClientServerInterface` in a `PortPrototype` of the `AtomicSwComponentType` where the `InternalBehavior` is associated to, or
- a `VariableDataPrototype` within the `SwcInternalBehavior`.

To achieve this, `SwAxisIndividual` is aggregating a `SwVariableRefProxy`.

Originally, MSRSW uses a `AutosarVariableRef` to set the input value of an axis appropriately. In AUTOSAR, this has been extended by first introducing a `SwVariableRefProxy`.

Note that this is a specific use case for the role `SwVariableRefProxy.autosarVariable`.

Note further that the use cases for the existence of the attributes `SwVariableRefProxy.autosarVariable` and `SwVariableRefProxy.mcDataInstanceVar` are entirely disjoint and therefore the simultaneous existence of these two attributes would not make any sense at all.

Therefore, `[constr_1382]` has been introduced to clarify this aspect.

[constr_1382] Mutually exclusive existence of attributes `SwVariableRefProxy.autosarVariable` vs. `SwVariableRefProxy.mcDataInstanceVar` [In any given AUTOSAR model, the aggregations `SwVariableRefProxy.autosarVariable` and `SwVariableRefProxy.mcDataInstanceVar` shall never exist at the same time **at the time when the contract phase generation is executed.**]

As shown in Figure 5.35, this approach is also used to represent a `AutosarVariableRef` in all roles, e.g. the result of an interpolation routine applied to an axis, the input value determination, a list of dependent parameters, and `swDataDependency`.

With the means of `ApplicationArrayDataTypes` it's possible to define `DataPrototypes` holding an n-dimensional array of Compound Primitive Data Types of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, `CUBE_5`, `COM_AXIS`, or `RES_AXIS`.

For those `DataPrototypes` input values for the axes should be described to enable a display of the working point in the MCD system.

Thereby, typically the whole array of the contained axes is either associated with an array of variables or with a single value. In the case of arrays typically the n-th axis is combined with the n-th input value.

[constr_1425] Definition of `swCalprmAxisSet.swCalprmAxis` / `SwAxisIndividual.swVariableRef` depending on the capabilities of the data type [The definition of a `swCalprmAxisSet.swCalprmAxis` / `SwAxisIndividual.swVariableRef` in the context of an `InstantiationDataDefProps` or a `ParameterAccess` is only supported for a `DataPrototype` of category `ARRAY` if the data type of the `ApplicationArrayElement` also supports the specification of a `swCalprmAxisSet.swCalprmAxis` / `SwAxisIndividual.swVariableRef` according to [\[constr_1289\]](#)].

Thereby, multiple `ApplicationArrayDataTypes` might be nested to express multiple array dimensions. This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01683] Specification of an array of input variable for an array of axes [For `DataPrototypes` typed by an array of elements of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, `CUBE_5`, `COM_AXIS`, or `RES_AXIS` the applied `InstantiationDataDefProps` or `ParameterAccess` may reference a `VariableDataPrototype` typed by an `ApplicationArrayDataType` with the means of `SwAxisIndividual.swVariableRef.autosarVariable`.

This expresses the semantic that the nth element in the axis array uses the nth value in the input variable array for the specific `SwAxisGrouped.swAxisIndex`.]()

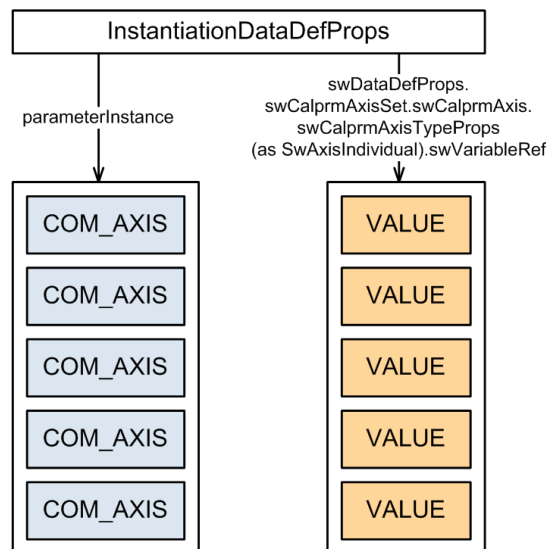

Figure 5.36: The nth `COM_AXIS` in the array of `COM_AXIS`s uses the nth `VALUE` in the array of `VALUE`s as working point.

Please note that in this case the two associated arrays needs to have same number of dimensions and sizes of the dimensions.

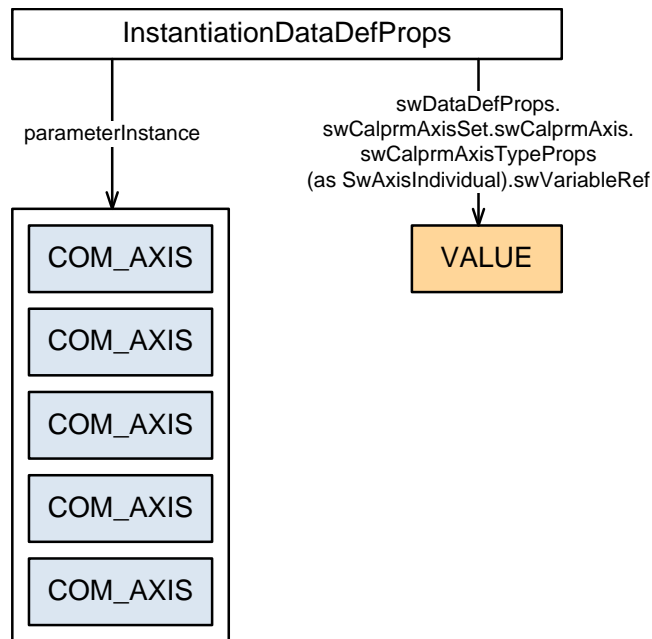

Figure 5.37: Each **COM_AXIS** in the array of **COM_AXIS**s uses the identical **VALUE** as working point.

[constr_1426] Consistency of array sizes for axes and input variable array [The number of array dimension defined by `ApplicationArrayDataTypes` and the values of the `maxNumberOfElements` attributes for the array of elements of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, `CUBE_5`, `COM_AXIS`, or `RES_AXIS` shall be **identical** to the number of array dimension and according value of the `maxNumberOfElements` of the `VariableDataPrototype` referenced by `SwAxisIndividual.swVariableRef.autosarVariable`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01684] Specification of a single input variable for an array of axes [For `DataPrototypes` typed by an array of elements of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, `CUBE_5`, `COM_AXIS`, or `RES_AXIS` the applied `InstantiationDataDefProps` or `ParameterAccess` may reference a `VariableDataPrototype` typed by an `ApplicationPrimitiveDataType` with the means of `SwAxisIndividual.swVariableRef.autosarVariable`.

This expresses the semantic that each element in the axis array uses the identical input variable for the specific `SwAxisGrouped.swAxisIndex`.]()

5.4.6 Setting a Group Axis

Grouped curves share the same axis definition. In MSRSW, this is shown by referencing the `SwCalprm`, representing an individual curve, from a `SwAxisGrouped`.

Note that this does not describe which axis shall be taken from a reference `swCalprmRef` acting as a shared axis. This would be done in `SwAxisGrouped.swAxisIndex`.

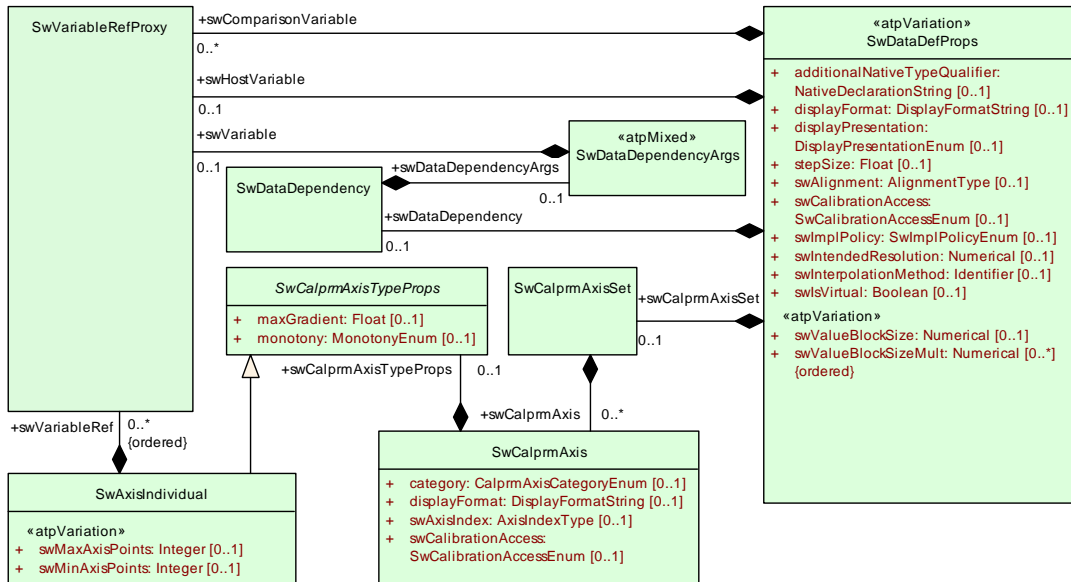

Figure 5.38: Applying Proxy Variable Reference Mechanism

AUTOSAR applies a similar proxy approach for parameters as for the variables. Therefore, an `SwCalprmRefProxy` has been introduced in MSRSW, and is aggregated by the `SwAxisGrouped` element.

The `SwCalprmRefProxy` aggregates an `AutosarParameterRef` providing an association to a `ParameterDataPrototype`, representing a curve with an axis. When defining the data-type of a parameter, the type of the shared axis is defined in `sharedAxisType`.

[constr_1020] ParameterDataPrototype needs to be of compatible data type as referenced in sharedAxisType [Finally, the `ParameterDataPrototype` assigned in `swCalprmRef` shall be typed by data type compatible to `sharedAxisType` at the time when the contract phase generation is executed.]()

The AUTOSAR-style is shown in the upper left part of Figure 5.35, while in the upper middle the MSRSW style is shown, referencing the `SwCalprm`.

Table 5.57: SwVariableRefProxy

Figure 5.40: Proxy reference classes

The basic patterns for referencing [DataPrototypes](#) are explained in section 5.3.3. In the context of this chapter it is worth to remark that the definition of access to calibration parameters is implemented in the context of a [RunnableEntity](#) (see Figure 7.3).

[TPS_SWCT_01846] Use InstantiationDataDefProps to facilitate the definition of access to calibration parameters [As the definition of a calibration parameter may involve the definition of several axes the necessity to provide this amount of information might become cumbersome and (to some extent) redundant and difficult to maintain if the same calibration parameter is accessed from within several

`RunnableEntities`. In other words: in this case it would be necessary to repeat the more or less complex set of information for each `RunnableEntity`.

To avoid this unnecessary level of complexity for the definition of access to calibration parameters, it is possible to define the access to the calibration parameter on the level of `InstantiationDataDefProps` which have been defined to facilitate this kind of re-use.]()

For more information please refer to section 7.5.4. This ability is also documented in [constr_1015].

With the means of `ApplicationArrayDataTypes` its possible to define `DataPrototypes` holding an n-dimensional array of Compound Primitive Data Types of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, and `CUBE_5`.

For those `DataPrototypes`, group axis/axes needs to be defined in case `SwAxisIndividuals` are not used for all `SwCalprmAxis` definitions.

Thereby, typically the whole array of elements of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, and `CUBE_5` is either associated with an array of group axes or alternatively with a single group axis.

In the case of arrays typically the nth `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, and `CUBE_5` is combined with the nth `COM_AXIS` or `RES_AXIS`.

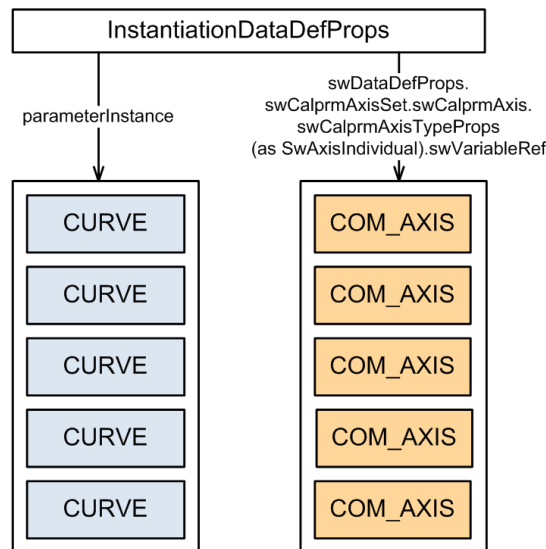

Figure 5.41: The nth `CURVE` in the array of `CURVES` relates to the nth `COM_AXIS` in the array of `COM_AXIS`S

[constr_1427] Definition of `swCalprmAxisSet.swCalprmAxis / SwAxisGrouped.swCalprmRef` depending on the capabilities of the data type [The definition of a `swCalprmAxisSet.swCalprmAxis / SwAxisGrouped.swCalprmRef` in the context of an `InstantiationDataDefProps` or a `ParameterAccess` is only supported

for a `DataPrototype` of category `ARRAY` if the data type of the `ApplicationArrayElement` also supports the specification of a `swCalprmAxisSet.swCalprmAxis/SwAxisGrouped.swCalprmRef` according to [\[constr_1289\]](#).

Thereby, multiple `ApplicationArrayDataTypes` might be nested to express multiple array dimensions. This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01685] Specification of an array of group axes for an array of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, or `CUBE_5` [For `DataPrototypes` typed by an array of elements of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, or `CUBE_5` the applied `InstantiationDataDefProps` or `ParameterAccess` may reference a `DataPrototype` typed by an `ApplicationArrayDataType` with the means of `SwAxisGrouped.swCalprmRef.arParameter`.

This expresses the semantic that the n^{th} element in the `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, or `CUBE_5` array uses the n^{th} group axis in the `COM_AXIS` or `RES_AXIS` array for the specific `SwAxisGrouped.swAxisIndex`.]()

Please note that in this case the two associated arrays needs to have same number of dimensions and sizes of the dimensions.

[constr_1428] Consistency of array sizes for arrays of elements of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, or `CUBE_5` arrays and used group axes arrays [The number of array dimension defined by `ApplicationArrayDataTypes` and the values of attribute `maxNumberOfElements` attributes for the array of elements of category `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, or `CUBE_5` needs to be identical to the number of array dimension and according value of the `maxNumberOfElements` of the `DataPrototype` referenced by `SwAxisGrouped.swCalprmRef.arParameter` **at the time when the contract phase generation is executed.**]()

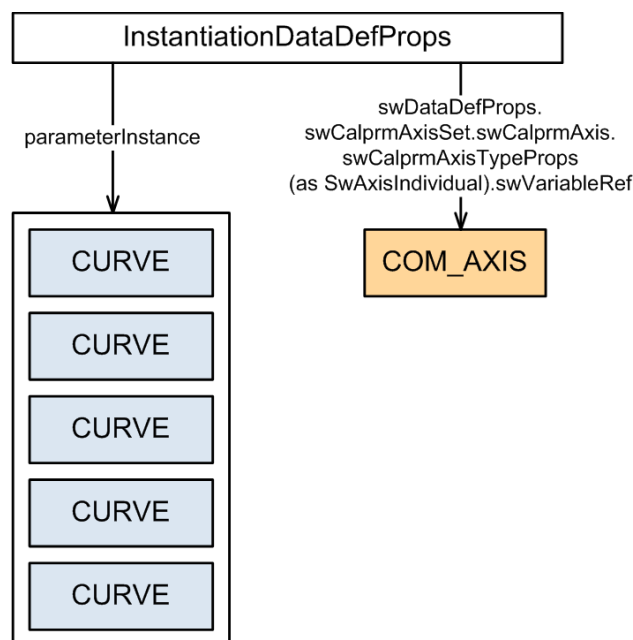

Figure 5.42: Each `MAP` in the array of `CURVES` uses the identical `COM_AXIS`

[TPS_SWCT_01686] Specification of a single group axis for an array of elements of **category** [CURVE](#), [MAP](#), [CUBOID](#), [CUBE_4](#), or [CUBE_5](#) [For [DataPrototypes](#) typed by an array of elements of [category](#) [CURVE](#), [MAP](#), [CUBOID](#), [CUBE_4](#), or [CUBE_5](#) the applied [InstantiationDataDefProps](#) or [ParameterAccess](#) may reference a [DataPrototype](#) typed by a [ApplicationPrimitiveDataTypes](#) of category [COM_AXIS](#) or [RES_AXIS](#) with the means of [SwAxisGrouped.swCalprmRef.arParameter](#).

This expresses the semantic that each element in the [CURVE](#), [MAP](#), [CUBOID](#), [CUBE_4](#), or [CUBE_5](#) array uses the identical [COM_AXIS](#) or [RES_AXIS](#) for the specific [SwAxisGrouped.swAxisIndex](#).|()

5.4.7 Specifying Data Dependencies

[SwDataDependency](#) allows dependent data elements to be specified. For example, other [ParameterDataPrototypes](#) can be combined into one [ParameterDataPrototype](#) whose consistent value is automatically derived by the measurement and calibration system. Upon adjusting one of the parameters, the dependent parameter is then also automatically adjusted according to the chosen formula.

Consider for example a rectangular triangle with a hypotenuse of length 1, where the length of the other sides are the parameters A and B. When adjusting parameter A, the parameter B has to be adjusted accordingly to $B = \sqrt{1 - A * A}$. Also, other parameters might depend on B, e.g. $B_AREA = B * B$ or $TRIANGULAR_AREA = (A * B)/2$. This example is shown in listing [B.12](#).

A dependent parameter should not be adjustable by itself. The only way to influence its value is through the adjustment of a parameter it depends on.

An exemplary definition of a data dependency can be found in section [B.2.1](#).

Class	SwDataDependency

Table 5.60: CompuGenericMath

5.4.8 Precedence of data properties with respect to data elements, axis elements, computation methods, units

There are similar attributes defined in `SwDataDefProps` as well as in `SwCalprmAxis` as well as in `CompuMethod`. Therefore, we need to define which attribute value wins in the overall process from SWC-Description to MC-Support to ASAM-A2L.

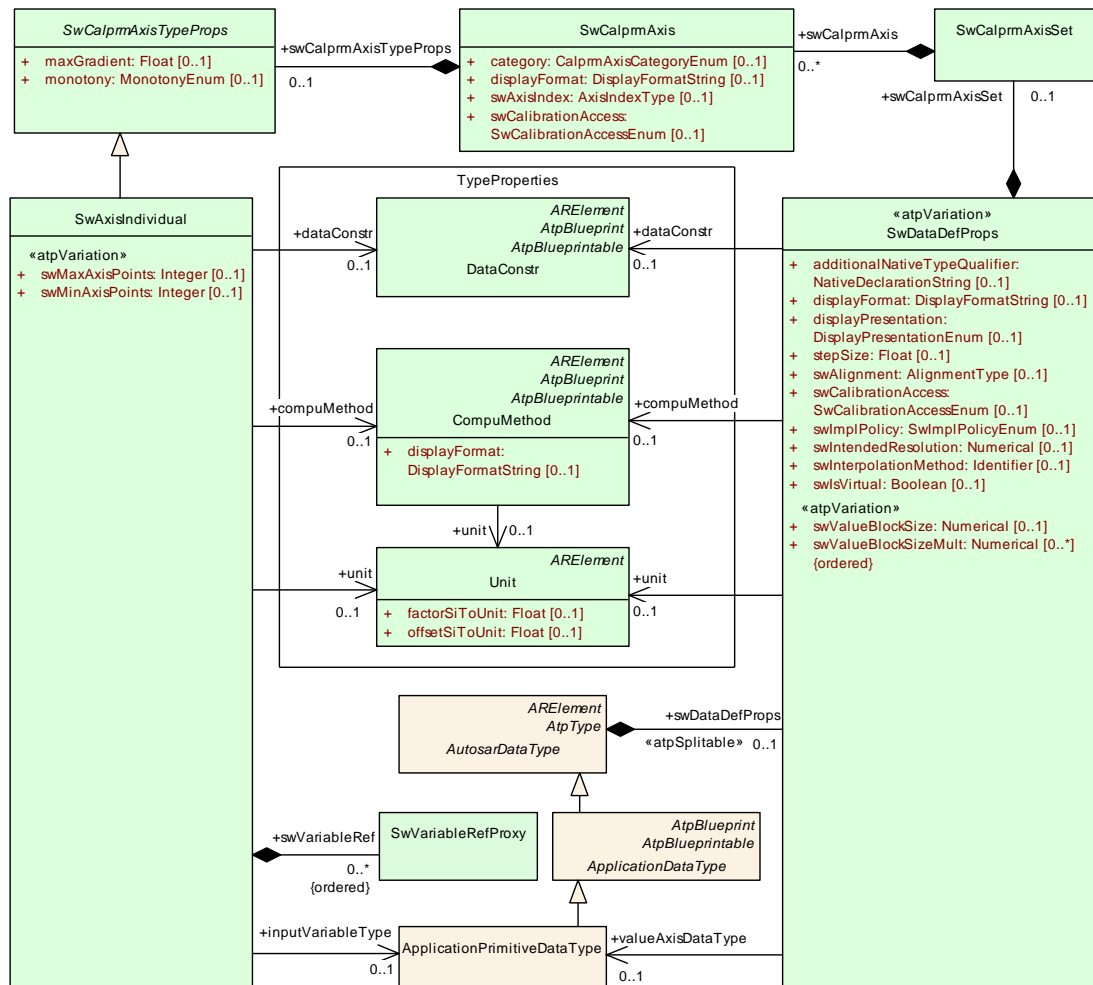

Figure 5.43: Various Attributes in the Context of `SwDataDefProps`

[TPS_SWCT_01496] General precedence rule for attributes of `SwDataDefProps`
 [The general precedence rule is that

- `SwDataDefProps` wins over `valueAxisDataType` (exception: `compuMethod` and `unit`).
- `SwDataDefProps` wins over `compuMethod`.
- `SwDataDefProps` wins over `swCalprmAxisSet`.
- `SwDataDefProps.swCalprmAxisSet` wins over `swCalprmAxisSet.swCalprmAxis.swCalprmAxisTypeProps.compuMethod` or `SwAxisIndividual.inputVariableType`.

- `SwAxisIndividual.inputVariableType` wins over `SwAxisIndividual.compuMethod`, `SwAxisIndividual.unit`, but **not** over `SwAxisIndividual.dataConstr`.

]()

Figure 5.43 illustrates the fact that some attributes in `SwDataDefProps` can also be expressed in sub-elements respectively in referenced elements.

The following examples illustrate particular cases (the highest precedence comes first):

- **[TPS_SWCT_01497] Precedence of the unit of value axis** [For the usage of `unit` of value axis the following precedence rule is defined:
 - `SwDataDefProps.valueAxisDataType.swDataDefProps.unit`
 - `SwDataDefProps.valueAxisDataType.swDataDefProps.compuMethod.unit`
 - `SwDataDefProps.unit`
 - `SwDataDefProps.compuMethod.unit`

]()

[constr_2550] Units of value axis shall be consistent [The units specified in the context of value axis shall be the same, even if there is a precedence rule.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

In particular, `[constr_2550]` reflects the fact that a `Unit` may be specified in different phases of the development process but finally need to be consistent.

- **[TPS_SWCT_01498] Precedence of the DataConstr of value axis** [For the usage of `DataConstr` of value axis the following precedence rule is defined:
 - `SwDataDefProps.dataConstr`
 - `SwDataDefProps.valueAxisDataType.swDataDefProps.dataConstr`

]()

[constr_2548] Data constraint of value axis shall match [The values compliant to `SwDataDefProps.dataConstr` shall also be compliant to `SwDataDefProps.valueAxisDataType.swDataDefProps.dataConstr`.

In other words `SwDataDefProps.dataConstr` win over but are not allowed to relax `SwDataDefProps.valueAxisDataType.swDataDefProps.dataConstr` but are not allowed.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

- **[TPS_SWCT_01499] Precedence of the `CompuMethod` of value axis** [For the usage of `CompuMethod` of value axis the following precedence rule is defined:

- `SwDataDefProps.valueAxisDataType.swDataDefProps.compuMethod`
- `SwDataDefProps.compuMethod`

]()

- **[TPS_SWCT_01500] Precedence of the display format of value axis** [For the usage of display format of value axis the following precedence rule is defined:

- `SwDataDefProps.displayFormat`
- `SwDataDefProps.valueAxisDataType.swDataDefProps.displayFormat`
- `SwDataDefProps.valueAxisDataType.swDataDefProps.compuMethod.displayFormat`
- `SwDataDefProps.compuMethod.displayFormat`

]()

Note that this deviates from the general rule since `displayFormat` is not an essential property. The last item in the list above is the consequence of the fact that if there is a `valueAxisDataType` it supersedes the `compuMethod`

- **[TPS_SWCT_01501] Precedence of the calibration access of value axis** [For the usage of calibration access of value axis the following precedence rule is defined:

- `SwDataDefProps.swCalibrationAccess`
- `SwDataDefProps.valueAxisDataType.swDataDefProps.swCalibrationAccess`

]()

Note that this deviates from the general rule since `swCalibrationAccess` is not such an essential property.

- **[TPS_SWCT_01502] Precedence of the `Unit` of the input axis** [For the usage of `Unit` of the input axis the following precedence rule is defined:

- `SwAxisIndividual.unit`
- `SwAxisIndividual.compuMethod.unit`
- `SwAxisIndividual.inputVariableType.swDataDefProps.unit`
- `SwAxisIndividual.swVariableRef.autosarVariable.autosarVariable.type.swDataDefProps.compuMethod.unit`

- `SwAxisIndividual.swVariableRef.autosarVariable.autosarVariable.type.swDataDefProps.unit`

}]()

[constr_2549] Units of input axis shall be consistent [The units specified in the context of an input axis shall be compatible, even if there is a precedence rule.

This rule shall be imposed **at the time when the contract phase generation is executed.**}]()

[constr_2549] reflects the fact that `unit` may be specified in different phases of the development process but finally need to be consistent.

- **[TPS_SWCT_01503] Precedence of the `DataConstr` of the input axis** [For the usage of `DataConstr` of the input axis the following precedence rule is defined:

- `SwAxisIndividual.dataConstr`
- `SwAxisIndividual.inputVariableType.swDataDefProps.dataConstr`
- `SwAxisIndividual.swVariableRef.type.swDataDefProps.dataConstr`

}]()

Please note that the attribute `SwAxisIndividual.inputVariableType.swDataDefProps.dataConstr` represents the input value, not the axis itself. For this reason, there is no specific constraint defined that the `dataConstr` needs to fulfill.

- **[TPS_SWCT_01504] Precedence of the display format of the input axis** [For the usage of display format of the input axis the following precedence rule is defined:

- `SwCalprmAxis.displayFormat`
- `SwCalprmAxis.swCalprmAxisTypeProps.compuMethod.displayFormat`
- `SwCalprmAxis.swCalprmAxisTypeProps.inputVariableType.swDataDefProps.displayFormat`
- `SwCalprmAxis.swCalprmAxisTypeProps.inputVariableType.swDataDefProps.compuMethod.displayFormat`
- `SwCalprmAxis.swCalprmAxisTypeProps.swVariableRef.type.swDataDefProps.displayFormat`
- `SwCalprmAxis.swCalprmAxisTypeProps.swVariableRef.type.swDataDefProps.compuMethod.displayFormat`

}]()

Please note that `SwAxisIndividual.inputVariableType.swDataDefProps.dataConstr` represent the input value and not the axis itself. For this reason there is no specific constraint that `displayFormat` needs to match.

- **[TPS_SWCT_01505]** lists possible combinations of values of `SwCalibrationAccessEnum` for outer and inner elements of a complex data type and the (in the column "result") indicates value of `SwCalibrationAccessEnum` applicable for this specific combination¹⁹.
- **[TPS_SWCT_01506] Precedence of the calibration access of input axis** [For the usage of calibration access of input axis the following precedence rule is defined:
 - `SwDataDefProps.swCalibrationAccess`
 - `SwCalprmAxis.swCalibrationAccess`

}]()

Note that the `swCalibrationAccess` defined on a Compound Primitive Data Type (see **[TPS_SWCT_01179]**) reflects the entire curve or map.

Therefore, if the entire curve or map cannot be accessed by the measurement calibration diagnostic system (MCD-System), the axis can also not be accessed. On the other hand it might be that access is granted for the value axis only but not for the axis points.

[TPS_SWCT_01505] Precedence of calibration access along structural hierarchies in complex types [

5.5 Elements used in Properties of Data Definitions

This section describes further elements which are attached to `SwDataDefProps` via associations.

¹⁹For technical reasons, **[TPS_SWCT_01505]** cannot be placed directly in the itemized list.

5.5.1 Computation Methods

[TPS_SWCT_01276] Computation methods [An important part of semantics is the specification of a so-called computation method which specifies the conversion between the physical and the internal representation of data. This usually makes sense only for primitive data types.] ()

An [ApplicationCompositeDataType](#) cannot be given a particular semantic meaning as a whole but it is obviously possible to specify the semantics of all or a part of the contained elements, i.e. the [ApplicationPrimitiveDataTypes](#).

Class	CompuMethod			
Package	M2::MSR::AsamHdo::ComputationMethod			
Note	<p>This meta-class represents the ability to express the relationship between a physical value and the mathematical representation.</p> <p>Note that this is still independent of the technical implementation in data types. It only specifies the formula how the internal value corresponds to its physical pendant.</p> <p>Tags: atp.recommendedPackage=CompuMethods</p>			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note

compuPhysToInternal	Compu	0..1	aggr	<p>This represents the computation from physical values to the internal values.</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=compuPhysToInternal xml.sequenceOffset=90</p>
displayFormat	DisplayFormatString	0..1	attr	<p>This property specifies, how the physical value shall be displayed e.g. in documents or measurement and calibration tools.</p> <p>Tags: xml.sequenceOffset=20</p>
unit	Unit	0..1	ref	<p>This is the physical unit of the Physical values for which the CompuMethod applies.</p> <p>Tags: xml.sequenceOffset=30</p>

Table 5.61: CompuMethod

This meta-class [CompuMethod](#) was actually taken from the ASAM standard's *harmonized data objects*. This is also indicated by the green color of the meta-classes in the diagram.

Some [categorys](#) of [CompuMethod](#) cannot be successfully converted to A2L [15] because A2L does not provide an equivalent semantics that comes close to the respective AUTOSAR semantics.

A prominent example for such a case is a [CompuMethod](#) of category [BITFIELD_TEXTTABLE](#).

[constr_1142] **category of CompuMethod shall not be extended** [In contrast to the general rule that `category` can be extended by user-specific values it is **not allowed** to extend the meaning of the attribute `category` of meta-class `CompuMethod` **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01277] **Computation methods are used for the conversion of *internal* values into their *physical* representation and vice versa** [`CompuMethods` are used for the conversion of *internal* values into their *physical* representation and vice versa. The direction of the conversion depends on the origin of the value to be converted:

- If the value is provided by the ECU, then the conversion direction is from *internal* to *physical*.
- If a *physical* value is provided by the tester, it is converted to an *internal* value before being sent to the ECU.

]()

[TPS_SWCT_01548] **Limits of a CompuMethod** [In case `CompuScale.lowerLimit` and `CompuScale.upperLimit` are used to constrain the applicable range of the conversion of a `CompuMethod`, they logically represent the limiting values **before** the conversion is applied.]()

In other words, the limits are applied on the source end of the conversion rather than to the result that comes out at the other end of the conversion.

This is obviously a lot safer than the opposite approach where a given physical/internal value would first be converted to its internal/physical equivalent and then, after the conversion is finished there would be (as a second step) the obligation to check whether the result of the conversion is actually valid in terms of the applicable limits.

As hinted by [TPS_SWCT_01548], the definition of valid intervals is done **by means of specifying the valid intervals as opposed to specifying the invalid intervals**. This observation is also valid for uses of `CompuMethod` outside the scope of this document.

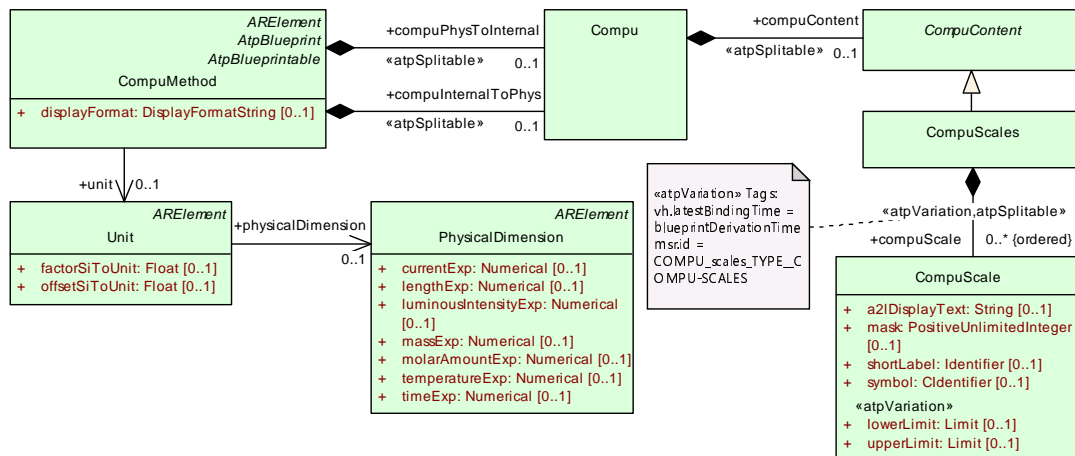

Figure 5.44: A `CompuMethod` and its attributes define data semantics

[TPS_SWCT_01278] CompuMethods can also be used to assign symbolic names to internal values [CompuMethods can also be used to assign symbolic names to internal values (like an enumeration in C) or to ranges of internal values or to single bits (like a bitfield in C).

This is also considered as a conversion between internal numbers and a semantical representation.]()

Actually, the preferred conversion direction depends on the use case.

In the following, the internal-to-physical conversion direction is used as the default. Usually a CompuMethod is defined for one conversion direction only even if it is used in both directions.

For simple functions like identical (1:1 conversion) or linear functions this is sufficient because the inverse function can be derived quite easily from the defined function. In this case also the limits for the reverse direction can be gained by applying the forward function to the forward limits.

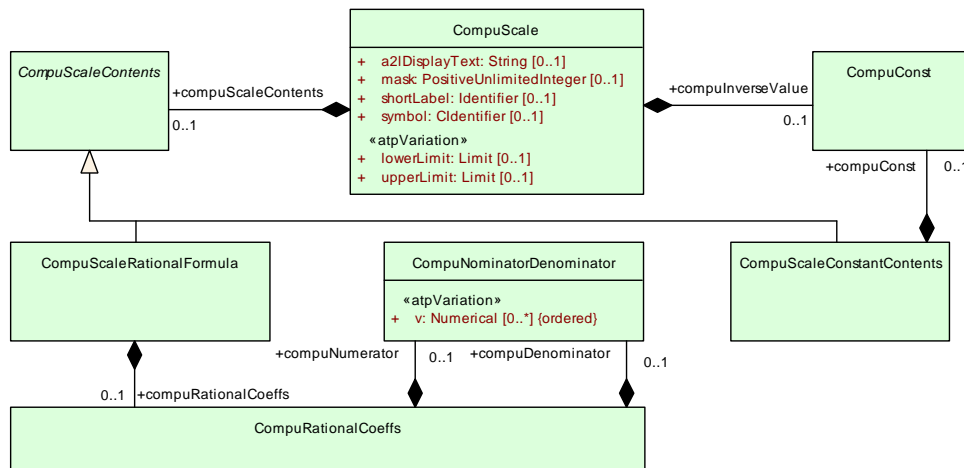

Figure 5.45: A CompuScale and its attributes define data semantics

For more complex functions (e.g. rational functions) it is usually not possible to compute the inverse function automatically. More seriously, the inversion yields ambiguous results if the function is not monotonic. To deal with such possible ambiguities directly, an inverse value can be provided explicitly for the function or for each of its parts respectively.

[constr_1022] Limits shall be defined for each direction of CompuMethod [In case that both domains are specified in the CompuMethod both shall have explicitly defined limits **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01280] CompuMethod applied to values outside of its limits [If a CompuMethod is applied to values outside its limits, it is up to the MCD-tool (Measurement, Calibration, Diagnostic tool) to indicate this to the user. In this case the CompuMethod shall not be applied at all.]()

[constr_1175] Depending on its `category`, `CompuMethod` shall refer to a `unit` [As a `CompuMethod` specifies the conversion between the physical world and the numerical values, it shall refer to a `unit` unless the `CompuMethod`'s `category` is one of `TEXTTABLE`, `BITFIELD_TEXTTABLE`, or `IDENTICAL`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[**constr_1175**] does *not* imply that `CompuMethods` where the `category` is one of `TEXTTABLE`, `BITFIELD_TEXTTABLE`, or `IDENTICAL` are not *allowed* to refer to a `unit`. They may still refer to a `unit`, but according to [**constr_1175**] this relation is not *mandated*.

A further implication is that the `unit` itself may not have a dimension, i.e. all exponents of SI units are 0.

Figure 5.44 sketches a conceptual overview of `CompuMethod`. It consists of the following attributes:

- **[TPS_SWCT_01281] `Unit` associated with a `PhysicalDimension`** [A `unit` (described in next section) can be associated with a `PhysicalDimension`.]()

Note that quantities like “%” are not derived from SI units. However, they have a meaning in the physical world and need to be represented in form of data types. Therefore, a `CompuMethod` also applies in those cases.

- **[TPS_SWCT_01430] Conversion specification from internal to physical values as well as the reverse conversion** [A conversion specification from internal to physical values, as well as the reverse conversion. Both of them in turn consist of an abstract `CompuContent`. Derived classes allow the specification of a conversion formula in two different ways.]()

[constr_1024] Stepwise definition of `CompuMethods` [In a bound model, the intervals (i.e. determined by attributes `CompuScale.lowerLimit` and `CompuScale.upperLimit`) defined by `CompuScales` used in the context of a given `CompuMethod` of all values of `category` except `BITFIELD_TEXTTABLE` shall **not** overlap.

For `CompuMethods` of `category` `BITFIELD_TEXTTABLE`, the combination of the interval created by attributes `CompuScale.upperLimit`, `CompuScale.lowerLimit` and `CompuScale.mask` shall be unique in the context of the enclosing `CompuMethod`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

The possible values of attribute `CompuMethod.category`, along with a description of the respective semantics, are listed in [**TPS_SWCT_01877**].

[TPS_SWCT_01667] Avoidance of overlapping of directly adjacent intervals within `CompuMethods` [Intervals of a given `CompuMethod` may be **located directly adjacent** to each other.

This means that the `upperLimit` of one `CompuScale` has the same numerical value as the `lowerLimit` of another `CompuScale` defined within the context of the `CompuMethod`.

In this case, it is necessary to properly set the attribute `CompuScale.lowerLimit.intervalType` or `CompuScale.upperLimit.intervalType` in order to avoid an overlapping.

Specifically, one of the interval boundaries shall be set to `intervalType.open` in order to avoid an overlapping.]()

- **[TPS_SWCT_01282] Number of intervals in which a given conversion applies** [`CompuScales` is a number of intervals (called `CompuScale`) within which a certain conversion applies. The respective interval is given in terms of upper and lower limit.

Within each `CompuScale` we have the abstract `CompuScaleContents`. To deal with possible ambiguities directly, an inverse value can be provided explicitly for that particular scale (`compuInverseValue`).]()

Please note that limits are explained in more detail in chapter 5.2.4.1.

- As the diagram shows, `CompuScaleContents` is an abstract meta-class. A number of derived meta-classes allow the specification of a conversion formula in a variety of ways, including:
 - mapping the whole interval to a constant (`CompuConst`)
 - providing rational coefficients of the conversion formula (`CompuRationalCoeffs`)
- **[TPS_SWCT_01283] Rational function** [The rational function is specified as rational coefficients for the numerator (`compuNumerator`) and the denominator (`compuDenominator`). `CompuNominatorDenominator` can have as many V elements as needed for the rational function.

The sequence of the values V carries the information for the exponents, that means the first V is the coefficient for x_0 , the second V is the coefficient for x_1 , etc. With this sequence the values of the exponents can be entirely represented.]()

[constr_1025] Avoid division by zero in rational formula [The rational formula shall not yield any division by zero **at the time when the contract phase generation is executed**.]()

[TPS_SWCT_01284] `CompuScale` might require a representation in the generated RTE C code [A `CompuScale` might require a representation in the generated RTE C code. For this purpose it is necessary to identify a property that controls how to symbol used for the `CompuScale` in the C code is created.

The symbol itself can be created out of different sources according to a standardized precedence schema.]()

[TPS_SWCT_01569] Definition of CompuScale Code Symbolic Name [In C code, a `CompuScale` is represented by an identifier that is, as far as AUTOSAR modeling is concerned, called a `CompuScale Code Symbolic Name`.

The `CompuScale Code Symbolic Name` may be taken from `CompuScale.symbol`, `CompuConstTextContent.vt`, or `CompuScale.shortLabel`. The details are explained in [\[TPS_SWCT_01431\]](#).]()

[TPS_SWCT_01431] Finding the symbol for the representation of a `CompuScale` with a point-range in C code [In general, the value of the attributes `symbol`, `vt`, and `shortLabel` can be taken as the source for naming the symbol that represents the `CompuScale` in the C code.

The following rule applies (lower values indicate higher priority) for all `CompuScales` with a point-range:

1. Take the value of `symbol` if this attribute exists.
2. Take the value of `vt` if it makes a valid C identifier.
3. Take the value of `shortLabel` if it exists.

Fail if none of the possible options apply.

]()

[TPS_SWCT_01695] Relation between `ValueSpecification` and the definition of `CompuScales` [In order to find a match between the content of a `ValueSpecification` and a `CompuScale` the content of the `ValueSpecification` shall be checked against the `CompuScale Value Symbolic Names` according to [\[TPS_SWCT_01696\]](#).

If no matching `CompuScale Value Symbolic Names` can be found then the `ValueSpecification` shall be considered unusable in the context of the `CompuMethod` that is subject to [\[constr_1146\]](#).]()

[TPS_SWCT_01696] `CompuScale Value Symbolic Name` [The value of the `CompuScale Value Symbolic Name` of a given `CompuScale` shall be obtained by taking the values of the following attributes according to the following priority (lower values indicate higher priority):

1. Take the value of `symbol` if this attribute exists.
2. Take the value of `vt` if this attribute exists.
3. Take the value of `shortLabel` if it exists.

]()

Just to be sure, the (obvious) difference between a `CompuScale Value Symbolic Name` and a `CompuScale Code Symbolic Name` is that the former is not required to pass as a valid C identifier.

[constr_1434] CompuScales shall not have identical CompuScale Value Symbolic Names [In a CompuMethod that is subject to [constr_1146], no two CompuScales shall have identical CompuScale Value Symbolic Names (according to [TPS_SWCT_01696]) **at the time when the contract phase generation is executed.**]()

[constr_1146] Applicability of a symbol for a CompuScale in C code [The `symbol` attribute shall only be provided for CompuScales where the `category` of the enclosing CompuMethod is one of the following:

- TEXTTABLE
- SCALE_LINEAR_AND_TEXTTABLE
- SCALE_RATIONAL_AND_TEXTTABLE
- BITFIELD_TEXTTABLE

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Table 5.75: CompuNominatorDenominator

Please note that the values of coefficients within a rational formula are **not restricted** to integer values. It is possible to use floating-point values as well.

The values of exponents **cannot be set arbitrarily** but are implicitly defined by the appearance of coefficients in [CompuNominatorDenominator.v](#), i.e. the first value in the ordered list of [CompuNominatorDenominator.v](#) represents the exponent 0, the second [CompuNominatorDenominator.v](#) represents the exponent 1, and so on.

5.5.1.1 Category Values in the context of a CompuMethod

For a detailed description of [CompuMethods](#), please refer to the *ASAM MCD 2 Harmonized Data Objects* [28].

[TPS_SWCT_01877] contains a definition of possible values for the attribute [category](#).

[constr_1134] Allowed structure of TEXTTABLE [The existence of [physConstrs](#) is not allowed and [compuInternalToPhys](#) shall exist with [compuScales](#) consisting of [upperLimit](#) and [lowerLimit](#) **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01877] Description of supported **categorys** of **CompuMethods** [

ASAM Category	Meaning	Specific properties
IDENTICAL	This CompuMethod just hands over the internal value with an optional unit.	Only the base elements are allowed and unit , physConstrs and internalConstrs are optional. This is the simplest type of a CompuMethod .
LINEAR	A linear conversion can be performed in two steps: The internal value is multiplied with a factor; after that, an offset is added to the result of the multiplication.	Exactly one CompuScale , with two v in compuNumerator and one v in compuDenominator .
SCALE_LINEAR	Used for a piecewise linear conversion.	More than one compuScale can be defined. Additionally there have to be the upperLimit and lowerLimit elements which define the region of validity for the linear function. The boundaries of the regions shall not overlap.
SCALE_LINEAR_AND_TEXTTABLE	Used for piecewise definition of one or more linear and several texttable scales.	Properties depend on the used scale function. For details see definition of SCALE_LINEAR and TEXTTABLE . The scales shall each provide lowerLimit and upperLimit definitions.
RAT_FUNC	The rational function type is similar to the linear type without the restrictions for the compuNumerator s and compuDenominator s.	It can have as many v elements as needed for the rational function. The sequence of the values v carries the information for the exponents, that means the first v is the coefficient for x_0 , the second v is the coefficient for x_1 , etc. With this sequence the values of the exponents can be entirely represented. A rational function is only applicable for conversions in the direction that it is defined for, i.e. the automatic calculation of the inverse function is not supported by the MCD system.
SCALE_RAT_FUNC	Used for piecewise defined rational conversion.	
SCALE_RATIONAL_AND_TEXTTABLE	Used for piecewise definition of one rational and several texttable scales.	Properties depend on the used scale function. For details see definition of SCALE_RAT_FUNC and TEXTTABLE . The scales shall each provide lowerLimit and upperLimit definitions.
TEXTTABLE	The type TEXTTABLE is used for transformations of the internal value into textual elements.	The result is placed in the Compu Scale Literal . The compuDefaultValue is optional. If the reverse calculation is needed then for each scale the compuInverseValue can be used to define the reverse calculation result. If no inverse value is explicitly defined then the smallest possible value of the scale will be used as result of the reverse calculation. [constr_1134] applies!
TAB_NOINTP	Similar to TEXTTABLE , but for numerical values.	The values per scale are defined in CompuConst .
BITFIELD_TEXTTABLE	Similar to TEXTTABLE but for bit fields.	BITFIELD_TEXTTABLE is derived from TEXTTABLE . The main difference is that TEXTTABLE results to a single value while BITFIELD_TEXTTABLE results to a concatenated value set. In difference to all the other computational methods every CompuScale will be applied including the bit mask specified in mask . Therefore it is allowed for this type of CompuMethod , that CompuScales overlap. To calculate the string reverse to a value, the string has to be split and the according value for each substring has to be summed up. The sum is finally transmitted. The processing has to be done in order of the CompuScale elements. [constr_1135] applies!

]()

[constr_1135] Limit of `vt` in `BITFIELD_TEXTTABLE` [The separator for splitting the string representing the value is “|” and is therefore forbidden to appear in `vt` at the time when the contract phase generation is executed.]()

5.5.1.2 Applicability of Attributes in the context of a `CompuMethod`

This section summarizes the applicability of `CompuMethod` in terms of which attributes of `CompuMethod` and related meta-classes (e.g. `CompuScale`, `CompuConst`) shall be used depending on the nature of the `CompuMethod`, expressed by means of the value of attribute `category`.

[constr_1375] Existence of attributes of `CompuMethod` and related meta-classes depending on the value of the `category` [

	Attribute Existence per Category

This rule shall be imposed at the time when the contract phase generation is executed.

]()

For clarification, the first two rows of the table contained in [constr_1375] define the applicability of the immediate attributes of meta-class `CompuMethod`, the remainder of the table then goes into further detail regarding the usage of the attributes of related meta-classes (e.g. `CompuScale`, `CompuConst`).

Please note that annotations apply to the individual cell values. These annotations are formulated by means of a numerical value in parentheses, e.g. (1).

The following legend applies to the cells in the table contained in [constr_1375]:

D Define the attribute.

empty cell Attribute is **not applicable** for usage in the scope of this element.

O Optionally define the attribute.

In addition to the primary cell legend the following annotations apply to the cells in the table contained in [constr_1375]:

- (1) In this case **either** `compuPhysToInternal` **or** `compuInternalToPhys` shall be defined.
- (2) In this case both `compuPhysToInternal` and `compuInternalToPhys` shall be defined unless `compuInverseValue` exists (see [TPS_SWCT_01282]). In other words, if the explicit definition of a `compuInverseValue` exists then there is no need to define conversions from internal to physical **and** vice versa.
- (3) Not applicable for `CompuScales` where attribute `compuScaleContents.compuConst` exists.
- (4) Limits shall be defined according to [constr_1022].
- (5) Restrictions on the structure of the `CompuMethod` according to [constr_1134] apply.
- (6) Specify an output value for a conversion formula if the value to be converted yields outside the plausibility limit (for more information, please refer to the class table of `Compu`).
- (7) Restricted applicability for the attribute `CompuScale.symbol`, see [constr_1146].
- (8) Mandatory for `CompuConst`; enforced for `CompuRationalCoeffs`.

5.5.1.3 CompuMethod and AutosarDataType

This chapter clarifies the applicability of `CompuMethod` for the relevant concrete subclasses of `AutosarDataType`.

5.5.1.3.1 CompuMethod and ApplicationDataType

For `ApplicationDataType`, there are (see [constr_1007]) a number values of `category` that allow for the definition of a `ApplicationDataType.swDataDefProps.compuMethod`.

[constr_1634] visualizes the allowed combinations of `ApplicationDataType.category` vs. `CompuMethod.category`.

The rows of the table contained in [constr_1634] represent values of `category` for `ApplicationDataType` that are cleared for the definition of a `CompuMethod` according to [constr_1007].

The columns of the table contained in [constr_1634] represent values of `category` for `CompuMethod`.

[constr_1634] Allowed combinations of `ApplicationDataType.category` vs. `CompuMethod.category`

	IDENTICAL	LINEAR	SCALE_LINEAR	SCALE_LINEAR_AND_TEXTTABLE	RAT_FUNC	SCALE_RATIONAL_AND_TEXTTABLE	TEXTTABLE	TAB_NOINTP	BITFIELD_TEXTTABLE

CUBE_4	X	X	X	X	X	X	X	X	X
CUBE_5	X	X	X	X	X	X	X	X	X

This rule shall be imposed **at the time when the contract phase generation is executed.**

]()

5.5.1.3.2 CompuMethod and ImplementationDataType

For `ImplementationDataType`, there are (see [constr_1009]) only two values of `category` that allow for the definition of a `ImplementationDataType.swDataDefProps.compuMethod`: `TEXTTABLE` and `BITFIELD_TEXTTABLE`.

The rows of the table contained in [constr_1158] represent values of `category` for `ImplementationDataType` that are cleared for the definition of a `CompuMethod` according to [constr_1009].

The columns of the table contained in [constr_1158] represent values of `category` for `CompuMethod`.

This rule shall be imposed **at the time when the contract phase generation is executed.**

)]()

5.5.1.4 CompuMethod and A2L

Attribute `CompuScale.a2lDisplayText` does not contribute to the semantics of the AUTOSAR model, it is just a convenience shortcut to support the conversion of an AUTOSAR `CompuMethod` to an A2L `COMPU_VTAB`.

In the interest of calibration and measurement engineers who will later have to work with the A2L content created from an AUTOSAR model, it is strongly recommended that all eligible²⁰ `CompuMethods` should define respective values of `CompuScale.a2lDisplayText`.

However, this specification can hardly provide any binding rules for the case that an eligible `CompuMethod` does not contain `CompuScale.a2lDisplayText`.

If there were an intention within AUTOSAR to strongly control how the display text in a generated A2L file should look like, then [TPS_SWCT_01878] would be formulated as

²⁰`CompuMethods` with "point range interval" that can be converted into a `COMPU_VTAB` in A2L, i.e. `CompuMethods` of `category` `TEXTTABLE` and `BITFIELD_TEXTTABLE`

a constraint (as opposed to a spec item) that requires the existence of `CompuScale.a2lDisplayText` where applicable.

[TPS_SWCT_01878] Applicability of attribute `CompuScale.a2lDisplayText`
[Attribute `CompuScale.a2lDisplayText` only makes sense in the context of a `CompuMethod` where attribute `category` has one of the values

- `TEXTTABLE`
- `BITFIELD_TEXTTABLE`

and only if the values of

- `CompuScale.lowerLimit`
- `CompuScale.upperLimit`

are identical. Otherwise the value of `CompuScale.a2lDisplayText` shall be ignored.](/)

5.5.2 Physical Dimensions

[TPS_SWCT_01285] Physical dimension [Another important part of the semantics associated with a data type is its physical dimension. Units are used to augment the value with additional information like *m/s* or *liter*. This is necessary for a correct interpretation of the physical value for input and output processes.

The conversion of values into other units like *km/h* into *miles/h* is also possible. Therefore, the unit involves information about its physical dimensions.](/)

[TPS_SWCT_01056] Physical dimension [The substructure of physical dimensions defines all used quantities in the SI-System²¹ (e.g. velocity as length/time corresponds to m/s).]([RS_SWCT_02100](#))

[TPS_SWCT_01059] Exponent for each of the seven fundamental dimensions [For basing a new unit directly upon SI units an exponent for each of the seven fundamental dimensions and its corresponding SI unit needs to be specified.]([RS_SWCT_02100](#))

[TPS_SWCT_01737] Default values for physical exponents [The default value of attributes `currentExp`, `lengthExp`, `luminousIntensityExp`, `massExp`, `molarAmountExp`, `temperatureExp`, `timeExp` is 0.]([RS_SWCT_02100](#))

[TPS_SWCT_01060] Negative exponents [Negative exponents are allowed.]([RS_SWCT_02100](#))

Table 5.76: PhysicalDimension

AUTOSAR provides the ability to map two [PhysicalDimensions](#) onto each other with the implication that the two mapped [PhysicalDimensions](#) shall be considered compatible.

As explained by [[constr_1053](#)], the only degree of freedom regarding the compatibility of [PhysicalDimensions](#) is the value of the [shortName](#).

In other words, by means of the definition of a [PhysicalDimensionMapping](#) it is possible to declare that two [PhysicalDimensions](#) with exactly the same values of the exponent attributes just are considered as a match even if they have different [shortNames](#).

This declaration of support for the assessment of compatibility is not done on a global scope, but in the context of a [CompositionSwComponentType](#), by means of the reference in the role [CompositionSwComponentType.physicalDimensionMapping](#).

The main use case for the definition of `PhysicalDimensions` with exactly the same values of the exponent attributes and different `shortNames` is to increase the chances for integrating model content from different contributors that each define their own set of `PhysicalDimension`.

Figure 5.46: Modeling of `PhysicalDimensionMapping`

`PhysicalDimensionMappings` are aggregated in form of `PhysicalDimensionMappingSets`. This allows for gathering semantically related `PhysicalDimensionMappings` into the same `PhysicalDimensionMappingSet`.

[TPS_SWCT_01058] **UnitGroup** [The `UnitGroups` determine if such a conversion is appropriate.](RS_SWCT_02100)

Figure 5.47 depicts the concept how units are defined.

For a detailed description of these elements please refer to the [28]. Standard units are already predefined for AUTOSAR in form of a description file.

[TPS_SWCT_01736] **Default values for `Unit.physicalDimension`** [If a `Unit` does not define the attribute `Unit.physicalDimension`, the default `PhysicalDimension` with the `shortName` `NoDimension` applies where all physical exponents are set to 0.](RS_SWCT_02100)

Figure 5.47: Definition of SI based units

Note that quantities like "%" are not derived from SI units and therefore have no association to a physical dimension.

An exemplary definition of a `Unit` can be found in section B.2.2.

[constr_1026] **Compatibility of Units** [If a `SwDataDefProps` references a `Unit` and the `SwDataDefProps` has a reference to either of/or both

- a `CompuMethod` that in turn references a `Unit`
- a `DataConstr` that in turn references a `Unit`

then the `Units` referenced from

- `SwDataDefProps`
- `SwDataDefProps.compuMethod`
- `SwDataDefProps.dataConstr`

shall be compatible **at the time when the contract phase generation is executed.**](/)

Please note that for the sake of model consistency, it is also possible to define a meaningless `Unit` for all the pieces of data that conceptually do not really have a `Unit` attached to them (e.g. `ApplicationPrimitiveDataTypes` of category `BOOLEAN`).

By looking at the model, it becomes clear that the subject of whether to assign a `Unit` has been given a thought and the lack of a `Unit` is not simply the result of an oversight. For example, the AUTOSAR General Blueprints [29] define the `Unit NoUnit` for exactly this purpose.

[constr_1255] ApplicationPrimitiveDataTypes of category BOOLEAN and STRING [If a `Unit` is referenced from within `SwDataDefProps` and/or `PhysConstrs` owned by an `ApplicationPrimitiveDataTypes` of category `BOOLEAN` and `STRING` it is required that this `Unit` represents a meaningless unit, i.e. the referenced `physicalDimension` shall not define any exponent value other than 0 at the time when the contract phase generation is executed.]()

[TPS_SWCT_01068] Units can be grouped with the help of UnitGroup [Units can be grouped with the help of `UnitGroup`. This grouping is intended as a logical grouping which allows for example an MCD (Measurement Calibration Diagnostic) device to present different unit systems to the user such that he can choose the most appropriate one.] (*RS_SWCT_02100*)

Figure 5.48: Relation of SwComponentType to UnitGroup

Class	UnitGroup			
Package	M2::MSR::AsamHdo::Units			
Note	<p>This meta-class represents the ability to specify a logical grouping of units. The category denotes the unit system that the referenced units are associated to.</p> <p>In this way, e.g. country-specific unit systems (CATEGORY="COUNTRY") can be defined as well as specific unit systems for certain application domains.</p> <p>In the same way a group of equivalent units, can be defined which are used in different countries, by setting CATEGORY="EQUIV_UNITS". KmPerHour and MilesPerHour could such be combined to one group named "vehicle_speed". The unit MeterPerSec would not belong to this group because it is normally not used for vehicle speed. But all of the mentioned units could be combined to one group named "speed".</p> <p>Note that the UnitGroup does not ensure the physical compliance of the units. This is maintained by the physical dimension.</p> <p>Tags: atp.recommendedPackage=UnitGroups</p>

Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
unit	<code>Unit</code>	*	ref	This represents one particular unit in the UnitGroup. Tags: xml.sequenceOffset=20

Table 5.81: UnitGroup

The association from `SwComponentType` to `UnitGroup` (beside the obvious use case to allow for the specification of `unitGroups` relevant for the enclosing `SwComponentType` in particular) is supposed to support the identification of `UnitGroups` relevant for the enclosing `System`. This aspect facilitates the creation of ASAM MCD2 files for a concrete ECU.

According to [28] the following three values for `category`s are recommended in the context of `UnitGroup`:

- `COUNTRY` collects units which are common in a particular country, denoted by the `shortName` / `longName` of the `UnitGroup`
- `CALCULATION` refers to specific units intended for the creation of data types. In this `category` of `UnitGroup`, several `Units` may refer to the same `PhysicalDimension` as well as to different `PhysicalDimension`.
- `EQUIV_UNITS` define a group of equivalent units, which are used for example in different countries.

Additional values for `category` may be mutually agreed between the stakeholders.

In the example shown in Figure 5.49, `Units` are classified by country and use.

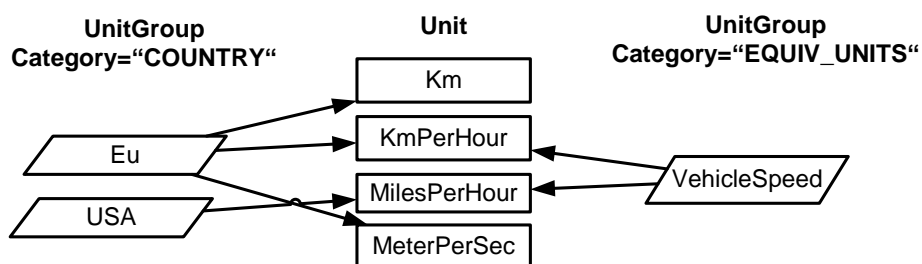

Figure 5.49: Example for units and unit groups

Assume "MilesPerHour" should be converted to a European unit: Based on the `physicalDimension` a conversion to "MeterPerSec" as well as "KmPerHour" is possible. In this case "KmPerHour" is preferred because "MilesPerHour" and "KmPerHour" are both members of the `UnitGroup` named "VehicleSpeed".

In contrast to this, "MeterPerSec" is not considered as appropriate for "VehicleSpeed" in this specific example.

[TPS_SWCT_01061] Conversion of units [If a unit has to be converted according to the chosen country code, the `physicalDimension` of both units shall be the same. If another unit shares the same `UnitGroup` with a `category` of `EQUIV_UNITS` it is preferred as target of the conversion.] ([RS_SWCT_02100](#))

5.5.4 Data Constraints

Section 5.2.4.1 already shows an example on how to define constraints for the physical range of a data type, see Figure 5.4.

[TPS_SWCT_01286] DataConstr [In general, the meta-class `DataConstr` can be aggregated (via `SwDataDefProps.dataConstr`) to define various constraints for the possible values of a data type. This includes limits for the physical and internal range, as well as special constraints (`monotony`) for the setup of axis definition.]()

Figure 5.50 and the following class tables show the meta-classes involved in the definition of constraints.

A more detailed documentation of these meta-classes can be found in [28]. As refinement of these definitions, the following values apply for `constrLevel`:

[constr_2561] Application of DataConstrRule.constrLevel [`DataConstrRule.constrLevel` is limited to

- 0:** This represents so called “hard limits”. They shall always be specified.
- 1:** This represents so called “soft limits”. Soft limits may be violated after confirmation by the user of an MCD-System.

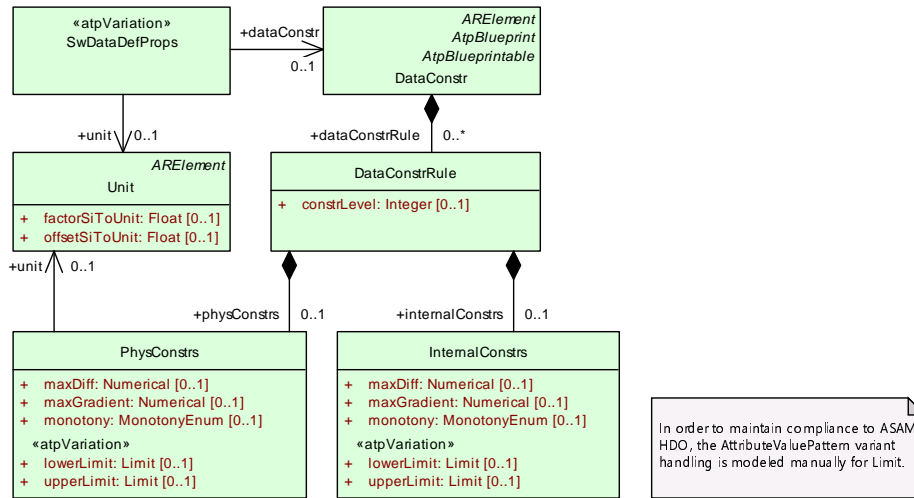

This rule applies **at the time when the contract phase generation is executed**. Other values may exist, but the semantics is outside the AUTOSAR scope.

]()

[TPS_SWCT_01287] Standard limits and extended limits in the ASAM-MCD2 (ASAP2) specification [The ASAM-MCD2 (ASAP2) specification [15] defines standard limits and extended limits. If extended limits exist, the standard limits may be violated upon user confirmation. Note that in consequence, of this definition, the following approach applies for A2L generation:

- If only one `DataConstrRule` with `constrLevel` set to **0** is specified, it represents the standard limits in A2L. No extended limits are generated.
- If two `DataConstrRule` exist, then:
 - the one with `constrLevel` set to **0** represents to the extended limits
 - the one with `constrLevel` set to **1** represents to the standard limits

Note that even if this is somehow counter-intuitive (since the one with `constrLevel` set to 0 changes its role), it matches the best to the definitions in ASAM-MCD2.]()

In order to maintain compliance to ASAM HDO, the AttributeValuePattern variant handling is modeled manually for Limit.

Enumeration	MonotonyEnum
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes
Note	This enumerator denotes the values for specification of monotony for e.g. curves.
Aggregated by	InternalConstrs.monotony , PhysConstrs.monotony , SwCalprmAxisTypeProps.monotony
Literal	Description
decreasing	This indicates that the related curve needs to be monotony decreasing. Tags: atp.EnumerationLiteralIndex=0
increasing	This indicates that the related curve needs to be monotony increasing. Tags: atp.EnumerationLiteralIndex=1
monotonous	This indicates that the values shall be monotonously decreasing or increasing, depending on the trend set by the first values of the series. Tags: atp.EnumerationLiteralIndex=2
noMonotony	This indicates that the related curve needs not to be monotony. Tags: atp.EnumerationLiteralIndex=3
strictlyDecreasing	This indicates that the related curve needs to be strictly monotony decreasing. Tags: atp.EnumerationLiteralIndex=4
strictlyIncreasing	This indicates that the related curve needs to be strictly monotony increasing. Tags: atp.EnumerationLiteralIndex=5
strictMonotonous	This indicates that the values shall be strict monotonously decreasing or increasing, depending on the trend set by the first values of the series. Tags: atp.EnumerationLiteralIndex=6

Table 5.87: MonotonyEnum

[TPS_SWCT_01288] Interpretation of [PhysConstrs](#) and [InternalConstrs](#) by tools [[DataConstr](#) is an [ARElement](#) which can be reused by several data type specifications. Especially an [ImplementationDataType](#) and an [ApplicationDataType](#) which are mapped to each other, can refer to the same constraints, or they can define their own constraints.

To avoid conflicts, in both cases [PhysConstrs](#) shall be interpreted by tools only with respect to application data types while [InternalConstrs](#) shall be interpreted only with respect to implementation data types.

If only [PhysConstrs](#) are provided to [ApplicationDataTypes](#) the [CompuMethod](#) can be used to compute the [InternalConstrs.](#)]()

[TPS_SWCT_01289] Semantics of [Limit](#) [Technically, a [Limit](#) specifies a boundary of the interval of valid values for a given context (i.e. a data type). Please note that the boundary might or might not be part of the interval itself, i.e. the interval might be open or closed. From the formal point of view, the range represents all real numbers defined by:

$$\begin{aligned}
 \text{range} &= \{x \in \mathbb{R} \mid \text{lowerLimit.value} < x < \text{upperLimit.value}\} \\
 &\cup \{\text{lowerLimit.value} \mid \text{lowerLimit.intervalType} == \text{"CLOSED"}\} \\
 &\cup \{\text{upperLimit.value} \mid \text{upperLimit.intervalType} == \text{"CLOSED"}\}
 \end{aligned}$$

]()

Please note that `Limit` inherits from `AbstractNumericalVariationPoint`. This means it is a number which may be subject to variability. For this reason, it is not possible to constrain the content already in the xml schema.

[constr_1191] Value of `Limit` shall yield a numerical value [After all variability is bound, the content obtained from a limit shall yield a numerical value **at the time when the RTE is generated.**]()

Nevertheless, it is not possible to distinguish on this level between float and integer values. Consequently, **[constr_1191]** will not take the burden from an AUTOSAR tool to decide whether the value provided as a limit actually makes sense in any of the given contexts.

open	The area is limited by the value given. The value itself is not included. Tags: atp.EnumerationLiteralIndex=2

Table 5.88: IntervalTypeEnum

5.5.4.1 Physical Limits

Physical limits can be given at various places in the AUTOSAR Meta-Model, e.g. in context of `ApplicationDataTypes`, `DataPrototypes` but also without the usage of the type-prototype-pattern in `Compound Primitive Data Types` (e.g `SwAxisIndividual.dataConstr`).

Nevertheless, the usage of `PhysConstrs` requires a `CompuMethod` for the calculation of the numerical limits, which cannot be applied for textual conversions. For this reason following definition applies:

[TPS_SWCT_01761] Physical limits of pure textual conversions [It is not possible to define the lower or upper limit of a set of textual labels. Therefore, it is not possible

to define limits for an object that can only take elements of a set of textual labels as the value.]()

Please note, as a consequence of [TPS_SWCT_01761] for data defined by means of a `CompuMethod` of `category TEXTTABLE` or `BITFIELD_TEXTTABLE` and additionally a `DataConstr` with a `dataConstrRule.physConstrs` the given `physConstrs` has no meaning.

[TPS_SWCT_01762] Physical limits of mixed textual conversions [The definition of the physical limits of a piece of data described by a `CompuMethod` of `category SCALE_LINEAR_AND_TEXTTABLE` and `SCALE_RATIONAL_AND_TEXTTABLE` can only be specified for the **linear** or **rational** part.

In addition, the defined textual labels can be used for the conversion.]()

For clarification, [TPS_SWCT_01761] and [TPS_SWCT_01762] do not limit the usage of `DataConstr.dataConstrRule.internalConstrs` which may define further and even tighter constraints on implementation level.

Those `internalConstrs` might be even given in context of a `Compound Primitive Data Type` (for example, in the context of an `SwAxisIndividual.inputVariableType` (see [TPS_SWCT_01865]) or `SwAxisIndividual.dataConstr`).

5.5.5 Addressing Methods

In an ECU there might be various methods to access a particular object (e.g. measurement or calibration parameter) according to a given address. This variety might come from different kind of memory (near, far, ...) but also from indirections which are introduced by the compiler.

[TPS_SWCT_01290] SwAddrMethod [In order to allow a measurement and calibration system to access such objects `SwAddrMethods` are specified. Another purpose of this feature is to support the definition of abstract memory sections, i.e. to specify which variables shall be put together in the same sections in case of generated code (especially for data allocated by the RTE).

`SwAddrMethod` will be used to group data, for example, to cover the fact that sometimes it is required that one or more calibration parameters out of the overall collection of calibration parameters of a `SwComponentPrototype` respectively an AUTOSAR software component shall be placed in another memory location than the other parameters of the `SwComponentPrototype` respectively the AUTOSAR software component.]()

[TPS_SWCT_01291] Association of MemorySection with SwAddrMethod [In `Implementation` the particular `MemorySection` is associated with the `SwAddrMethod`. This association indicates that all objects of the associated addressing method shall be placed in the given memory section.]()

[constr_10424] Reference from [MemorySection](#) to [ExecutableEntity](#) [Each [ExecutableEntity](#) shall only be referenced by exactly one [MemorySection](#) at the time when the contract phase generation is executed.]()

Class	MemorySection			
Package	M2::AUTOSARTemplates::CommonStructure::ResourceConsumption::MemorySectionUsage			
Note	<p>Provides a description of an abstract memory section used in the Implementation for code or data. It shall be declared by the Implementation Description of the module or component, which actually allocates the memory in its code. This means in case of data prototypes which are allocated by the RTE, that the generated Implementation Description of the RTE shall contain the corresponding MemorySections.</p> <p>The attribute "symbol" (if symbol is missing: "shortName") defines the module or component specific section name used in the code. For details see the document "Specification of Memory Mapping". Typically the section name is build according the pattern:</p> <p><SwAddrMethod shortName>[_<further specialization nominator>][_<alignment>]</p> <p>where</p> <ul style="list-style-type: none"> • [<SwAddrMethod shortName>] is the shortName of the referenced SwAddrMethod • [<further specialization nominator>] is an optional infix to indicate the specialization in the case that several MemorySections for different purpose of the same Implementation Description referring to the same or equally named SwAddrMethods. • [<alignment>] is the alignment attributes value and is only applicable in the case that the memory AllocationKeywordPolicy value of the referenced SwAddrMethod is set to addrMethodShortNameAnd Alignment <p>MemorySection used to Implement the code of RunnableEntitis and BswSchedulableEntitis shall have a symbol (if missing: shortName) identical to the referred SwAddrMethod to conform to the generated RTE header files.</p> <p>In addition to the section name described above, a prefix is used in the corresponding macro code in order to define a name space. This prefix is by default given by the shortName of the BswModule Description resp. the SwComponentType. It can be superseded by the prefix attribute.</p>			
Base	<i>ARObject</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>			
Aggregated by	ResourceConsumption.memorySection			
Attribute	Type	Mult.	Kind	Note
alignment	AlignmentType	0..1	attr	The attribute describes the typical alignment of objects within this memory section.
executableEntity	ExecutableEntity	*	ref	Reference to the ExecutableEntitis located in this section. This allows to locate different Executable Entities in different sections even if the associated Sw Addrmethod is the same. This is applicable to code sections only.
option	Identifier	*	attr	<p>The service (in AUTOSAR: BswModuleEntry) is implemented in a way that it either resolves to aninline function or to a standard function depending on conditions set at a later point in time.</p> <p>The following two values are standardized (to be used for code sections only and exclusively to each other):</p> <ul style="list-style-type: none"> • INLINE - The code section is declared with the keyword "inline". • LOCAL_INLINE - The code section is declared with the keyword "static inline". <p>In both cases (INLINE and LOCAL_INLINE) the inline expansion depends on the compiler. Depending on this, the code section either corresponds to an actual section in memory or is put into the section of the caller.</p>

Class	MemorySection			
prefix	SectionNamePrefix	0..1	ref	The prefix used to set the memory section's namespace in the code. The existence of a prefix element supersedes rules for a default prefix (such as the Bsw ModuleDescription's shortName). This allows the user to define several name spaces for memory sections within the scope of one module, cluster or SWC.
size	PositiveInteger	0..1	attr	The size in bytes of the section.
swAddrmethod	SwAddrMethod	0..1	ref	<p>This association indicates that this module specific (abstract) memory section is part of an overall SwAddr Method, referred by the upstream declarations (e.g. calibration parameters, data element prototypes, code entities) which share a common addressing strategy. This can be evaluated for the ECU configuration of the build support.</p> <p>This association shall always be declared by the Implementation description of the module or component, which allocates the memory in its code. This means in case of data prototypes which are allocated by the RTE, that the software components only declare the grouping of its data prototypes to SwAddrMethods, and the generated Implementation Description of the RTE actually sets up this association.</p>
symbol	Identifier	0..1	attr	Defines the section name as explained in the main description. By using this attribute for code generation (instead of the shortName) it is possible to define several different MemorySections having the same name - e.g. symbol = CODE - but using different sectionName Prefixes.

Table 5.89: MemorySection

Attribute	Type	Mult.	Kind	Note
memory Allocation KeywordPolicy	MemoryAllocationKeywordPolicyType	0..1	attr	Enumeration to specify the name pattern of the Memory Allocation Keyword.
option	Identifier	*	attr	This attribute introduces the ability to specify further intended properties of the MemorySection in with the related objects shall be placed. These properties are handled as to be selected. The intended options are mentioned in the list. In the Memory Mapping configuration, this option list is used to determine an appropriate MemMapAddressingModeSet .

Class	SwAddrMethod			
section Initialization Policy	SectionInitialization PolicyType	0..1	attr	Specifies the expected initialization of the variables (inclusive those which are implementing VariableData Prototypes). Therefore this is an implementation constraint for initialization code of BSW modules (especially RTE) as well as the start-up code which initializes the memory segment to which the AutosarData Prototypes referring to the SwAddrMethod's are later on mapped. If the attribute is not defined it has the identical semantic as the attribute value "INIT"
sectionType	MemorySectionType	0..1	attr	Defines the type of memory sections which can be associated with this addressing method.

Table 5.92: SwAddrMethod

[TPS_SWCT_01456] Predefined values for [MemorySection.option](#) and [SwAddrMethod.option](#) [The following values of [MemorySection.option](#) and [SwAddrMethod.option](#) are predefined by AUTOSAR:

resetSafe This corresponds to variables of ECU-functions which values shall endure a ECU reset.

protected This corresponds to variables, constants, and code which shall not be accessible and modifiable from the outside without a security mechanism.

offline This corresponds to calibration parameters which shall not be modifiable during ECU operation.

coreGlobal This corresponds to variables, constants, and code which have to be accessible by any core in case of multi-core ECUs.

coreLocal This corresponds to variables, constants, and code which have to be accessible by one core in case of multi-core ECUs.

nvData This corresponds to variables of ECU-functions which shall be stored in non-volatile data. This option is applicable for memory used as a `RAM Block` managed by the NvM.

safetyQM This corresponds to variables, constants, and code without any safety integrity level and therefore having a QM rating.

safetyAsilA This corresponds to variables, constants, and code with the safety integrity level A.

safetyAsilB This corresponds to variables, constants, and code with the safety integrity level B.

safetyAsilC This corresponds to variables, constants, and code with the safety integrity level C.

safetyAsilD This corresponds to variables, constants, and code with the safety integrity level D.

configClassPreBuild This corresponds to config data which is assigned at pre-compile or link time.

configClassPostBuild This corresponds to config data which is assigned at post-build time.

]()

Obviously, the multiplicity of both the attribute `MemorySection.option` and `SwAddrMethod.option` allows for the appearance of more than one value. For example, a combination of the values `resetSafe`, `protected`, and `safetyAsilC` makes perfect sense on a particular list and can be used to express a meaning that combines the semantics of both values with each other.

However, this combination of values is not arbitrarily possible. It is therefore necessary to formulate a constraint that regulates the appearance of the safety-related values mentioned in [TPS_SWCT_01456].

In other words, it would not make any sense to attribute a given memory object with two different ASIL [30] values appearing on the same list.

If these values were combined on a particular list, the intended semantics would be ambiguous and could not clearly be determined. Therefore, [constr_1311] applies.

[constr_1311] Appearance of safety-related possible values of `MemorySection.option` or `SwAddrMethod.option` [Any given collection of values stored in the attributes `MemorySection.option` or `SwAddrMethod.option` according to [TPS_SWCT_01456] shall at most include a single value out of the following list **at the time when the RTE is generated:**

- `safetyQM`
- `safetyAsilA`
- `safetyAsilB`
- `safetyAsilC`
- `safetyAsilD`

]()

[constr_1381] Appearance of core-related possible values of `MemorySection.option` or `SwAddrMethod.option` [Any given collection of values stored in the attributes `MemorySection.option` or `SwAddrMethod.option` according to [TPS_SWCT_01456] shall at most include a single value out of the following list **at the time when the RTE is generated:**

- `coreGlobal`
- `coreLocal`

]()

[TPS_SWCT_01294] **Missing SwDataDefProps.swAddrMethod** [If the association SwDataDefProps.swAddrMethod is missing the object can be placed anywhere without restriction, e.g. using a default behavior of the RTE generator. Contradicting specifications (e.g. two different component types request different associations for one particular SwAddrMethod) shall be flagged as an error.] ()

Figure 5.52 illustrates the usage of SwAddrMethod in the context of a DataPrototype.

[TPS_SWCT_01292] **Usage of SwAddrMethod in the context of a DataPrototype** [The software component which defines the DataPrototype will in general not be the same to which the Implementation that actually contains the description of the MemorySection belongs.

The reason for this is that the resources for data allocated by the RTE will be described in the Implementation of the RTE. The indirection via SwAddrMethod makes this possible.] ()

[TPS_SWCT_01293] **RTE Generator has to derive the Memory Allocation Keyword** [Please note that the RTE Generator has to derive the Memory Allocation Keyword used for RunnableEntities and BswSchedulableEntities from the shortName of the SwAddrMethod only because the alignment defined in MemorySection is not known at contract phase.] ()

[constr_2034] **SwAddrMethod referenced by RunnableEntities, BswCalledEntities, or BswSchedulableEntities** [RunnableEntities, BswCalledEntities, and BswSchedulableEntities shall not reference a SwAddrMethod which attribute memoryAllocationKeywordPolicy is set to addrMethodShortNameAndAlignment at the time when the RTE is generated.] ()

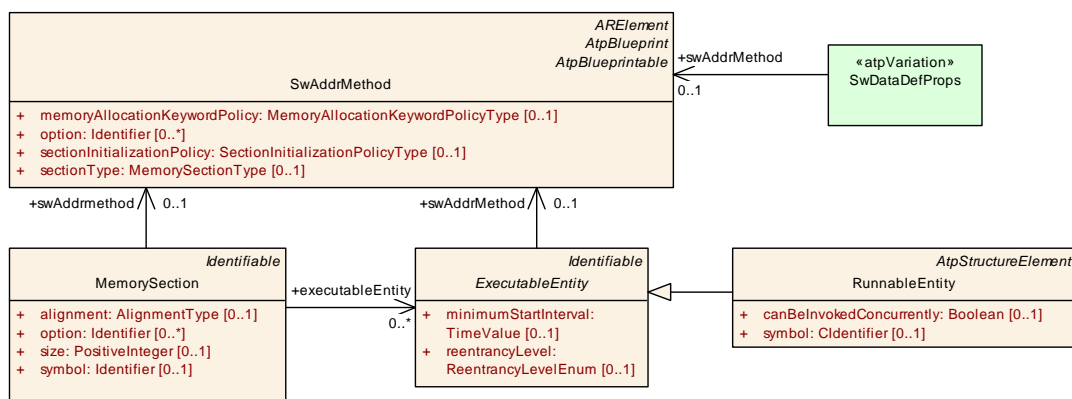

Figure 5.51: SwAddrMethod

[constr_1402] Applicability of core-related possible values of `MemorySection.option` or `SwAddrMethod.option` related to `SwAddrMethod.sectionInitializationPolicy` [If the attribute `SwAddrMethod.option` or `MemorySection.option` is set to `coreLocal` then the attribute `SwAddrMethod.sectionInitializationPolicy` of the same `SwAddrMethod` respectively the `MemorySection.swAddrMethod` shall be either set to `INIT` or `CLEARED` **at the time when the RTE is generated.**]()

The purpose of [constr_1402] is a reduction of the complexity of memory layouts and reduce the amount of memory gaps due to allocation restrictions.

Primitive	SectionInitializationPolicyType
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes
Note	<p>SectionInitializationPolicyType describes the intended initialization of MemorySections. The following values are standardized in AUTOSAR Methodology:</p> <ul style="list-style-type: none"> • INIT: To be used for (explicitly or not explicitly) initialized variables. • CLEARED: To be used for not explicitly initialized variables. • POWER-ON-CLEARED: To be used for variables that are not explicitly initialized (cleared) during normal start-up. Instead these are cleared only after power on reset. <p>Please note that the values are defined similar to the representation of enumeration types in the XML schema to ensure backward compatibility.</p> <p>Tags: xml.xsd.customType=SECTION-INITIALIZATION-POLICY-TYPE xml.xsd.type=NMTOKEN</p>

Table 5.93: SectionInitializationPolicyType

[constr_10068] Standardized values for `SectionInitializationPolicyType` [The following values for `SectionInitializationPolicyType` are reserved by the AUTOSAR standard:

INIT To be used for (explicitly or not explicitly) initialized variables.

CLEARED To be used for not explicitly initialized variables.

POWER-ON-CLEARED To be used for variables that are not explicitly initialized (cleared) during normal start-up. Instead these are cleared only after power on reset.

This rule shall be imposed **at the time when the RTE is generated.**]()

Please note that custom values of `SectionInitializationPolicyType` are currently not supported.

Enumeration	MemorySectionType
Package	M2::MSR::DataDictionary::AuxillaryObjects
Note	Enumeration to specify the essential nature of the data which can be allocated in a common memory class by the means of the AUTOSAR Memory Mapping.
Aggregated by	<code>SwAddrMethod.sectionType</code>
Literal	Description

Enumeration	MemorySectionType
calibrationVariables	This memory section is reserved for "virtual variables" that are computed by an MCD system during a measurement session but do not exist in the ECU memory. Tags: atp.EnumerationLiteralIndex=2
calprm	To be used for calibratable constants of ECU-functions. Tags: atp.EnumerationLiteralIndex=3
code	To be used for mapping code to application block, boot block, external flash etc. Tags: atp.EnumerationLiteralIndex=4
configData	Constants with attributes that show that they reside in one segment for module configuration. Tags: atp.EnumerationLiteralIndex=5
const	To be used for global or static constants. Tags: atp.EnumerationLiteralIndex=6
excludeFromFlash	This memory section is reserved for "virtual parameters" that are taken for computing the values of so-called dependent parameter of an MCD system. Dependent Parameters that are not at the same time "virtual parameters" are allocated in the ECU memory. Virtual parameters, on the other hand, are not allocated in the ECU memory. Virtual parameters exist in the ECU Hex file for the purpose of being considered (for computing the values of dependent parameters) during an offline-calibration session. Tags: atp.EnumerationLiteralIndex=7
var	To be used for global or static variables. The expected initialization is specified with the attribute sectionInitializationPolicy. Tags: atp.EnumerationLiteralIndex=9

Table 5.94: MemorySectionType

Enumeration	MemoryAllocationKeywordPolicyType

For more information on the specification of a [MemorySection](#) refer to [6].

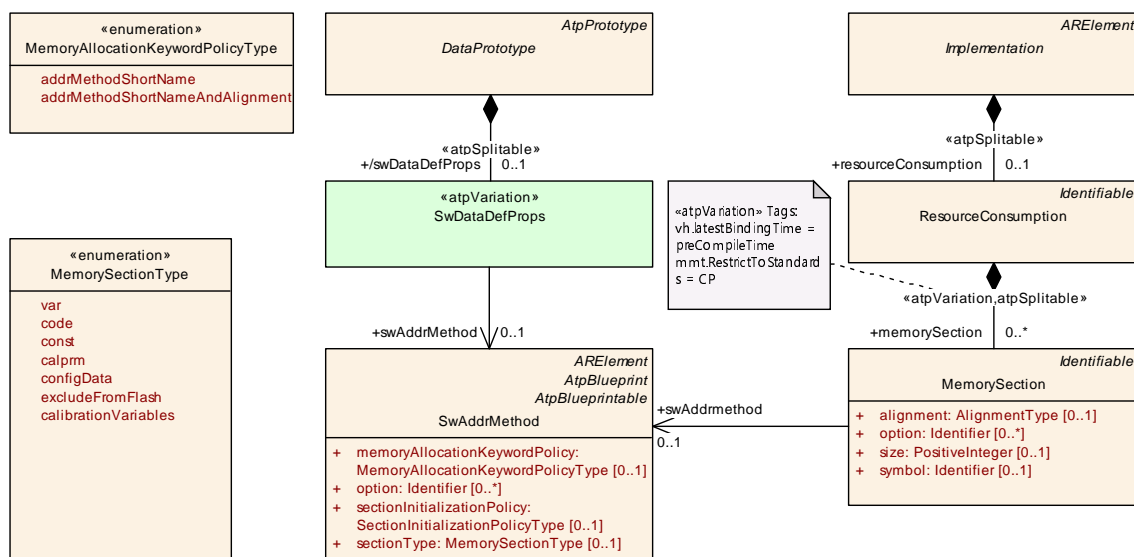

Figure 5.52: Assigning an address method to a memory section

5.5.6 Record Layouts

[TPS_SWCT_01295] [SwRecordLayout](#) [The [SwRecordLayout](#) describes how data is serialized in the memory of an ECU. This information is important with respect to the following aspects:

- to inform a measurement and calibration system how the data is serialized in the memory of an ECU
- to make sure that the software development results in the intended data structures
- to identify the proper interpolation routines

Via the [SwDataDefProps](#), a record-layout can be associated to a data entity. If the very same serialization approach is used for multiple [ApplicationDataTypes](#) all of

these may refer to the same `SwRecordLayout` even if the size of the data is different.] ([RS_SWCT_03215](#))

5.5.6.1 Specifying Record Layouts

As mentioned above, the purpose of record layout is to specify how an object (e.g. a calibration parameter) is serialized in memory of an ECU. The canonical approach for this is to define nested groups (`SwRecordLayoutGroup`).

These groups indicate the structure of the corresponding `Implementation-DataType`. The serialization is then executed by iterating over the axes of a curve, a map, or iterating along a string.

The contents of such a record layout group (`SwRecordLayoutGroupContent`) is a mixture of (thus nested) groups and values (`SwRecordLayoutV`).

These values refer to particular properties of the object (e.g. value, count, ...). By application of this pattern, the serialization of any complex object can be specified.

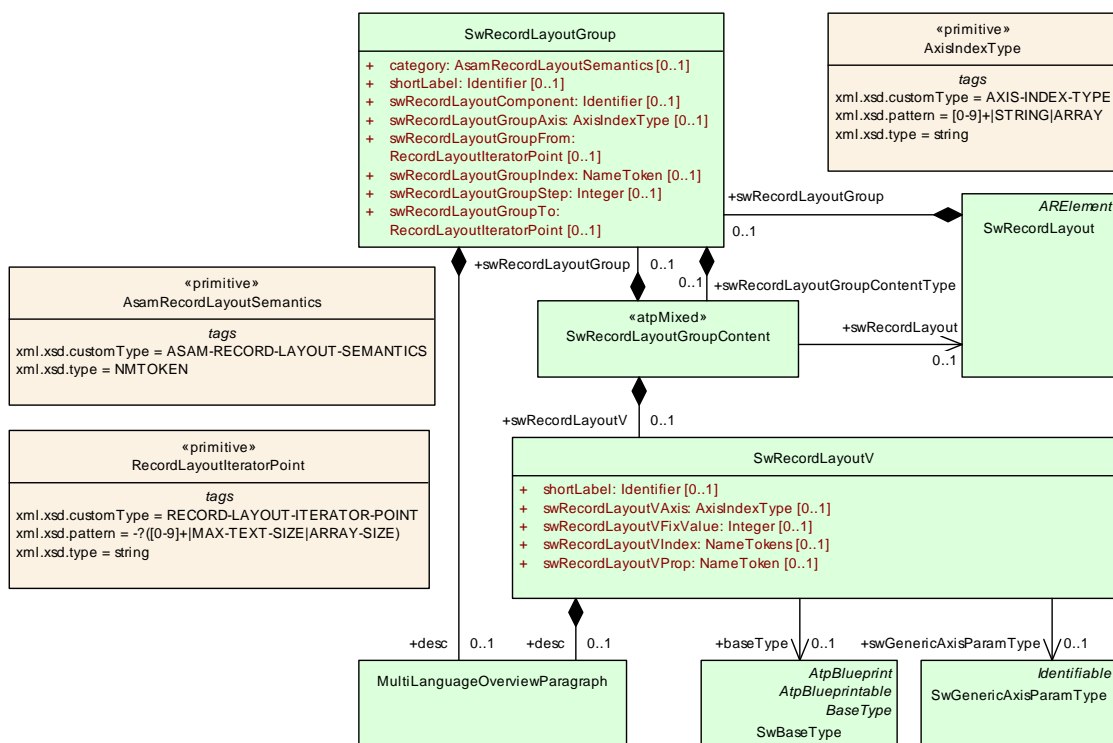

Figure 5.53: Specification of a record layout

Class	SwRecordLayout			
Package	M2::MSR::DataDictionary::RecordLayout			
Note	<p>Defines how the data objects (variables, calibration parameters etc.) are to be stored in the ECU memory. Class	SwRecordLayoutV			
swRecordLayoutVAxis	AxisIndexType	0..1	attr	<p>This attribute gives the index of the axis of which values that are stored in the record. swRecordVIndex refers to the symbolic names of the iterators for which the axis value shall be stored in the record.</p> <p>In case of nested iterators (mainly for multidimensional objects) the iterator names are specified as whitespace-separated names.</p> <p>These symbolic names relate to swRecordLayoutGroup Index. The iterators are processed from left to right in such a manner that they symbolize the loop index from the outside to the inside.</p> <p>It is considered an error if more components are specified than axes exist in the related ApplicationDataType.</p> <p>Tags: xml.sequenceOffset=40</p>
swRecordLayoutVFixValue	Integer	0..1	attr	<p>This attribute specifies the filler character for the current record layout, in the form of hex digits. It is also used to specify the fix value for e.g. FIXRIGHTDIFF.</p> <p>Tags: xml.sequenceOffset=80</p>
swRecordLayoutVIndex	NameTokens	0..1	attr	<p>The symbolic value for iteration, or the symbolic values separated by whitespaces, refer to the symbolic values given in swRecordLayoutGroupIndex .</p> <p>The iterators are processed from left to right, in such a manner that they symbolize the loop index from the outside to the inside.</p> <p>It is considered an error if the record layout is referenced by an entity which has less number of axes than index names referenced here.</p> <p>Tags: xml.sequenceOffset=60</p>
swRecordLayoutVProp	NameToken	0..1	attr	<p>This attribute describes the kind of values to be stored. More details see below. The standardized values foreseen for this attribute are defined in [TPS_SWCT_01489].</p> <p>Tags: xml.sequenceOffset=50</p>

Table 5.98: SwRecordLayoutV

Class	SwRecordLayoutGroup			
Package	M2::MSR::DataDictionary::RecordLayout			
Note	Specifies how a record layout is set up. Using SwRecordLayoutGroup it recursively models iterations through axis values. The subelement swRecordLayoutGroupContentType may reference other Sw RecordLayouts, SwRecordLayoutVs and SwRecordLayoutGroups for the modeled record layout.			
Base	AObject			
Aggregated by	SwRecordLayout.swRecordLayoutGroup , SwRecordLayoutGroupContent.swRecordLayoutGroup			
Attribute	Type	Mult.	Kind	Note

Class	SwRecordLayoutGroup			
category	AsamRecordLayoutSemantics	0..1	attr	<p>This attribute denotes the semantics in particular in terms of the corresponding A2L-Keyword. This is to support the mapping of the more general record layouts in AUTOSAR/MSR to the specific A2I keywords.</p> <p>It is possible to express the specific semantics of A2I recordlayout keywords in swRecordlayoutGroup but not always vice versa. Therefore the mapping is provided in this optional attribute.</p> <p>Tags: xml.sequenceOffset=5</p>
desc	MultiLanguageOverviewParagraph	0..1	aggr	<p>This aggregation allows a brief description about the particular record layout group which can help to identify the entry. In-depth documentation should be added to the introduction of the surrounding record layout.</p> <p>Tags: xml.sequenceOffset=20</p>
shortLabel	Identifier	0..1	attr	<p>This attribute specifies a name which can be used e.g. when ECU code is generated from the record layout group.</p> <p>Tags: xml.sequenceOffset=3</p>
swGenericAxisParamType	SwGenericAxisParamType	0..1	ref	<p>This association allows to specify record layout groups to iterate over generic axis parameters. For example, if the generic axis parameter is an array, the record layout group will iterate over this array.</p> <p>Obviously, the axis referred to by swRecordLayoutGroup Axis shall be a generic axis in which the referenced Sw GenericAxisType is aggregated.</p> <p>Tags: xml.sequenceOffset=50</p>
swRecordLayoutComponent	Identifier	0..1	attr	<p>This attribute is used to denote the component to which the group in question applies. Thus, the record layout supports structured objects.</p> <p>This secures independence from the sequence of components, because they can be referred to via name.</p> <p>Tags: xml.sequenceOffset=90</p>
swRecordLayoutGroupAxis	AxisIndexType	0..1	attr	<p>This attribute specifies the iteration axis number for a Sw RecordLayoutGroup. The current record layout group then refers exactly to the axis with this number. This means that the values are taken by iterating along the thus referenced axis.</p> <p>Tags: xml.sequenceOffset=30</p>
swRecordLayoutGroupContentType	SwRecordLayoutGroupContent	0..1	aggr	<p>This is the contents of the recordLayout which is produced for every step of iteration.</p> <p>Tags: xml.roleElement=false xml.roleWrapperElement=false xml.sequenceOffset=100 xml.typeElement=false xml.typeWrapperElement=false</p>
swRecordLayoutGroupFrom	RecordLayoutIteratorPoint	0..1	attr	<p>This attribute specifies the iterator index for the point in the axis from which a record layout group is commenced.</p> <p>Negative values are also possible, i.e. the value -4 counts from the fourth value from the end. If this property is missing, the iteration starts with '1'.</p> <p>Tags: xml.sequenceOffset=60</p>

Class	SwRecordLayoutGroup			
swRecordLayoutGroupIndex	NameToken	0..1	attr	This attribute attributes a symbolic name to the iterator of the superimposed record layout group. This can be referenced as a loop index in contained SwRecordLayoutV elements. Tags: xml.sequenceOffset=40
swRecordLayoutGroupStep	Integer	0..1	attr	This attribute specifies the step width for the iterator index that is used for the current record layout group. Note that negative values are also possible, in case of the starting point is higher than the endpoint. If the property is missing, the step width is "1". Tags: xml.sequenceOffset=80
swRecordLayoutGroupTo	RecordLayoutIteratorPoint	0..1	attr	This attribute specifies the end point for the iteration. Negative values are also possible, i.e. the value -4 counts up to the fourth value from the end. If this property is not there, the iteration ends at "-1" which is the last element. Note that depending on the arraySizeSemantics of SwTextProps the iteration ends at the value specified in swMaxTextSize. Tags: xml.sequenceOffset=70

Table 5.99: SwRecordLayoutGroup

Class	<<atpMixed>> SwRecordLayoutGroupContent			
Package	M2::MSR::DataDictionary::RecordLayout			
Note	This is the contents of a RecordLayout which is inserted for every iteration. Note that since this is atp Mixed, multiple properties can be inserted for each iteration.			
Base	ARObject			
Aggregated by	SwRecordLayoutGroup.swRecordLayoutGroupContentType			
Attribute	Type	Mult.	Kind	Note
swRecordLayout	SwRecordLayout	0..1	ref	This association allows to support reusable "sub"-record layouts. In particular, the contents of the referenced record layout shall be used as if the record layout group in the referenced record layout was aggregated in the current record layout group. So, semantically it would be equivalent to replace the particular association with an aggregation of the swRecordLayoutGroup of the referenced SwRecordLayout. Tags: xml.sequenceOffset=110
swRecordLayoutGroup	SwRecordLayoutGroup	0..1	aggr	This aggregation provides support for nested iterations. For example, if a map is to be handled, then we might have two nested SwRecordLayoutGroups, one for the x-axis and one for the y-axis. The inner iteration runs faster. Tags: xml.sequenceOffset=130
swRecordLayoutV	SwRecordLayoutV	0..1	aggr	Particular Value specification for this record layout group. Tags: xml.sequenceOffset=120

Table 5.100: SwRecordLayoutGroupContent

For [CURVE](#), [MAP](#), etc. the iteration shall be performed along the input axis.

Primitive	AxisIndexType
Package	M2::MSR::DataDictionary::RecordLayout
Note	<p>This meta-class specifies an axis in a curve/map data object. The index satisfies the following convention:</p> <ul style="list-style-type: none"> • 0 output "axis" • 1 input axis 1 (X input axis e.g. of a CURVE) • 2 input axis 2 (Y input axis e.g. of a MAP) • 3 input axis 3 (Z input axis e.g. of a CUBOID) • 4 input axis 3 (Z4 input axis e.g. of a CUBE_4) • 5 input axis 3 (Z5 input axis e.g. of a CUBE_5) • 6..9 etc. <p>The output "axis" provides access to the output value of the parameter. Note that this access is usually performed via an index according to the input axis.</p> <p>In addition to this, the Values STRING and ARRAY support specific iterations.</p> <p>Tags: xml.xsd.customType=AXIS-INDEX-TYPE xml.xsd.pattern=[0-9]+ STRING ARRAY xml.xsd.type=string</p>

Table 5.101: AxisIndexType

Primitive	RecordLayoutIteratorPoint
Package	M2::MSR::DataDictionary::RecordLayout
Note	<p>This meta-class denotes a start / endpoint for the iteration of a SwRecordLayoutGroup. It can be an integer or one of the keywords MAX-TEXT-SIZE ARRAY-SIZE. Note that negative numbers are counted backwards. Therefore e.g. -1 refers to the last value.</p> <p>Tags: xml.xsd.customType=RECORD-LAYOUT-ITERATOR-POINT xml.xsd.pattern=-?([0-9]+ MAX-TEXT-SIZE ARRAY-SIZE) xml.xsd.type=string</p>

Table 5.102: RecordLayoutIteratorPoint

[TPS_SWCT_01489] Description of standardized values of [SwRecordLayoutV](#). [swRecordLayoutVProp](#) [

Property	Description
VALUE	The value of the axis for the current iterator point. This is e.g. the particular point on an input-axis, but also the particular character in a string.
COUNT	The amount of values of the axis.
LEFTDIFF	The difference to the previous axis point.
RIGHTDIFF	The difference to the next axis point.
DIST	The distance value of this axis in case of a fixed axis with distance specification.
SHIFT	The shift value of this axis in case of a fixed axis with shift/offset.
OFFSET	The offset value of this axis in case of a fixed axis with shift/offset.
FILL	Fill with the hex value specified as contents of swRecordLayoutVFixValue .
RESERVED	Position shall be ignored by MCD tools.
IDENTIFIER	An "identifier" is deposited at the position.
FIXLEFTDIFF	Difference between this and a fixed left-hand value specified in swRecordLayoutVFixValue .
FIXRIGHTDIFF	Difference between this and a fixed right-hand value specified in swRecordLayoutVFixValue .

]| ([RS_SWCT_03215](#))

Figure 5.54 and Figure 5.55 illustrate most of these properties.

Figure 5.54: Values for swRecordLayoutVProp for individual axis

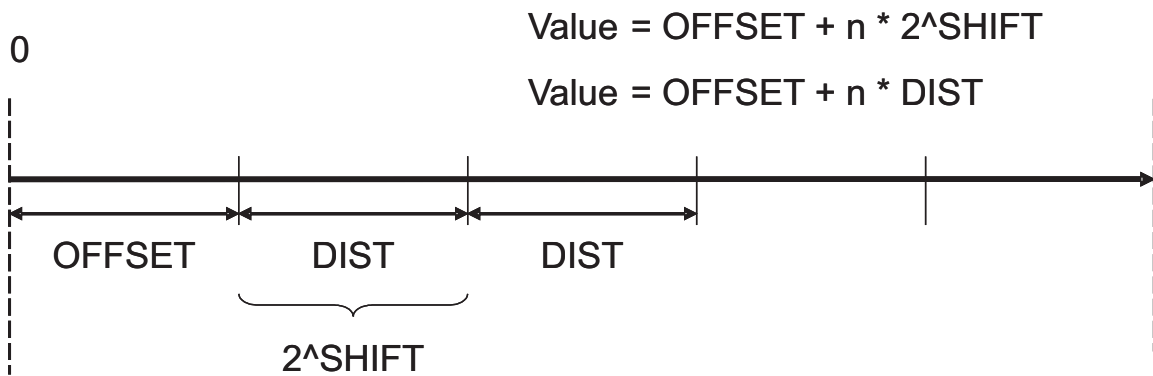

Figure 5.55: Values for swRecordLayoutVProp for fixed axis

[TPS_SWCT_01296] Different approaches of ASAM MCD-2MC and AUTOSAR with respect to [SwRecordLayout](#) [ASAM MCD-2D specification (also known as A2L, or ASAP) uses keywords in record layouts where MSR/AUTOSAR uses the more generic approach specified here.

It may happen that this generic approach cannot always be safely mapped to the A2L keywords. Therefore, [SwRecordLayoutGroup.category](#) can assist the conversion to the current A2L format. |(RS_SWCT_03215)

Primitive	AsamRecordLayoutSemantics
Package	M2::MSR::DataDictionary::RecordLayout
Note	<p>This meta-class is used to denote the semantics in particular in terms of the corresponding A2L-Keyword. This is to support the mapping of the more general record layouts in AUTOSAR/MSR to the specific A2L keywords.</p> <p>It is possible to express the specific semantics of A2L RecordLayout keywords in SwRecordlayoutGroup but not always vice versa. Therefore the mapping is provided in this optional attribute.</p> <p>It is specified as NMTOKEN to reduce the direct dependency of ASAM an AUTOSAR standards.</p> <p>Tags: xml.xsd.customType=ASAM-RECORD-LAYOUT-SEMANTICS xml.xsd.type=NMTOKEN</p>

Table 5.103: AsamRecordLayoutSemantics

The values of `SwRecordLayoutGroup.category` can, for example, be taken from the ASAM MCD 2D specification provided in [15]. Examples are:

- INDEX_INCR
- INDEX_DECR
- COLUMN_DIR
- ROW_DIR
- ALTERNATE_WITH_X
- ALTERNATE_WITH_Y
- ALTERNATE_CURVES

Note that there are keywords in A2L bound to a calibration parameter which in MSR/AUTOSAR are represented by the `SwRecordLayout` (DEPOSIT etc.).

Section B.2.4 presents an exemplary definition of a record layout of a curve.

5.5.6.2 RecordLayouts and DataTypes

[TPS_SWCT_01837] **Types for record layouts** [Because `ParameterDataPrototypes` have a `<<isOfType>>`-relation to `ApplicationDataTypes` or `ImplementationDataTypes`, the related data types shall properly match to the details as specified in `swDataDefProps`.] (*RS_SWCT_03215*)

This is exemplified in figure 5.56.

Figure 5.56: Dependency of AutosarDataTypes and SwRecordLayouts

[TPS_SWCT_01297] Compliance of **ApplicationDataTypes** or **ImplementationDataTypes** to **swDataDefProps** [In order to maintain this compliance the following options exist:

- Manually create **ImplementationDataTypes** from corresponding **ApplicationDataTypes** and the referenced **SwRecordLayouts**
- Automatically create **ImplementationDataTypes** according to the existing definition of **SwRecordLayouts**. This could be performed by a model transformation according to the algorithm shown below.

]()

[TPS_SWCT_01298] **Computing SwRecordLayout from ImplementationDataTypes is not possible** [Note that computing **SwRecordLayouts** from **ImplementationDataTypes** is not really possible because the particular semantics of the components is not available (**swRecordLayoutVProp**).] (**RS_SWCT_03215**)

The algorithm to generate the desired data types is illustrated in the following two diagrams.

We create an **ImplementationDataType** for each **ApplicationDataType**. Figure 5.57 illustrates how to map the details.

Figure 5.57: algorithm to map the details of an application data type to the corresponding implementation data type according to the record layout

Please note that the refinement of the sub element happens according to the approach sketched in figure 5.58.

[TPS_SWCT_01299] **Relation of swRecordLayoutGroup to subElement** [For each **swRecordLayoutGroup** an appropriate **subElement** shall be created.

The algorithm shall be recursively applied to the newly created **ImplementationDataTypeElements**. As the record layout groups are nested, this recursion yields the complete structure in the **ImplementationDataType**.] (**RS_SWCT_03215**)

Example definitions of record layouts can be found in Appendix B.2.3.

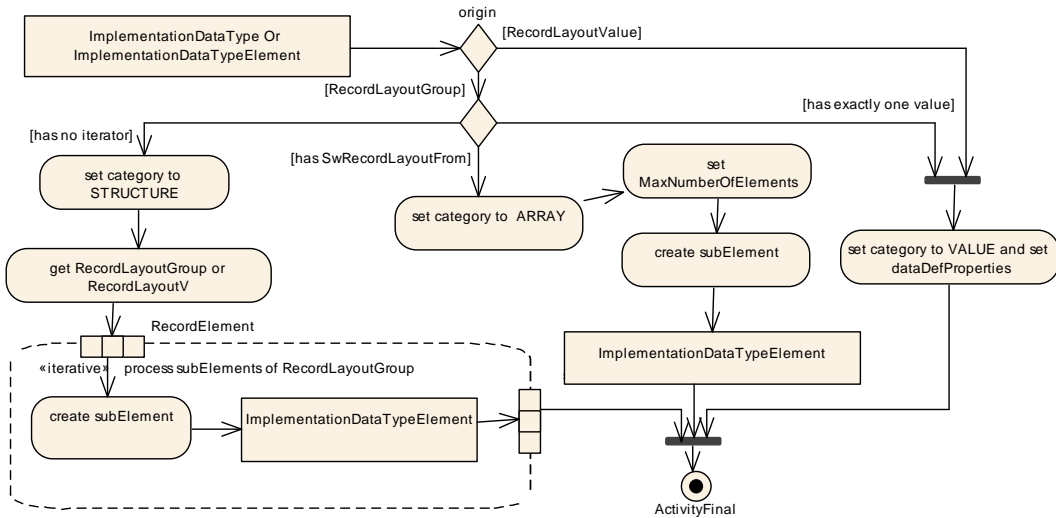

Figure 5.58: refining subElements

5.5.6.3 Record Layouts and Interpolation Routines

[TPS_SWCT_01300] Relationship between record layouts and interpolation routines [The relationship between record layouts and interpolation routines can be specified in [InterpolationRoutineMappingSet](#).

The interpolation routine is represented as [BswModuleEntry](#) and implements a particular interpolation method which is denoted in the value of [InterpolationRoutine.shortLabel](#).

The intended interpolation method is denoted in the value of attribute [SwDataDefProps.swInterpolationMethod.](#) ([RS_SWCT_03215](#))

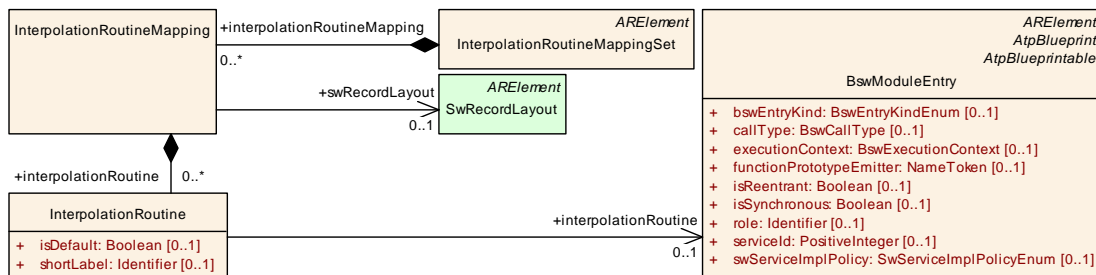

Figure 5.59: Mapping of Record Layouts and Interpolation Routines

Class	InterpolationRoutineMappingSet
Package	M2::AUTOSARTemplates::SWComponentTemplate::MeasurementAndCalibration::InterpolationRoutineMappingSet
Note	This meta-class specifies a set of interpolation routine mappings. Tags: atp.recommendedPackage=InterpolationRoutineMappingSets

Base	ARObject			
Aggregated by	InterpolationRoutineMapping.interpolationRoutine			
Attribute	Type	Mult.	Kind	Note
interpolation Routine	BswModuleEntry	0..1	ref	This specifies a BswModuleEntry which implements the current interpolation method for the given record layout. Tags: xml.sequenceOffset=30
isDefault	Boolean	0..1	attr	This attribute specifies whether the enclosing InterpolationRoutine is considered the default in the context (defined by the System Template) of a given collection InterpolationRoutineMapping that owns the enclosing InterpolationRoutine. Tags: xml.sequenceOffset=20

Class	InterpolationRoutine			
shortLabel	Identifier	0..1	attr	This is the name of the interpolation method which is implemented by the referenced bswModuleEntry. It corresponds to swInterpolationMethod in SwDataDef Props. Tags: xml.sequenceOffset=10

Table 5.106: InterpolationRoutine

5.5.7 Display Presentation

[TPS_SWCT_01756] Semantics of [SwDataDefProps.displayPresentation](#)

[The attribute [SwDataDefProps.displayPresentation](#) is used to control the presentation of data within measurement and calibration tools.

When such a tool displays a series of measurement values its useful to indicate to the displaying tool whether the series of measurement values can be seen as a continuous graph or as a set of discrete values, i.e. step-wise.

For instance, a continuous graph is appropriate for the case that the values do not bounce arbitrarily within one measurement cycle, e.g. a temperature variable.]()

On the other hand, a discrete handling is correct if each value of the measured variable has a distinct meaning and therefore may arbitrarily change within one measurement cycle, e.g. a state variable.

Another use case is the indication of how an ECU utilizes a [DataPrototype](#) of [category CURVE](#), [MAP](#), or [CUBOID](#) to determine a single value out of one or several working points in axis.

This can be either done via interpolation between the sampling points on each axis or without interpolation by taking the nearest sampling point.

The first option requires the continuous representation for the determined value in the displaying tool whereas the second option expects a discrete handling of the determined value.

[constr_1592] Definition of [SwDataDefProps.displayPresentation](#) depending on the capabilities of the data type [The definition of a [SwDataDefProps.displayPresentation](#) according to [constr_1288] and [constr_1289] shall only be applied for a [DataPrototype](#) of [category ARRAY](#) if the corresponding [ApplicationArrayDataType](#) or [ImplementationDataType](#) of [category ARRAY](#) supports the specification of a [SwDataDefProps.displayPresentation](#).

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1602] Definition of [SwDataDefProps.displayPresentation](#) depending on the capabilities of the element [The definition of a [SwDataDefProps](#).

`displayPresentation` according to [\[constr_1007\]](#) and [\[constr_1009\]](#) is only supported for an `ApplicationArrayDataType` or an `ImplementationDataType` of category `ARRAY` if the aggregated `ApplicationArrayDataType.element` or `ImplementationDataType.subElement` also supports the specification of a `SwDataDefProps.displayPresentation`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01757] Not-applicable scenario for `presentationContinuous` [If the semantics of the `DataPrototype` is described by means of a `CompuMethod` of category `TEXTTABLE`, `BITFIELD_TEXTTABLE` or `TAB_NOINTP` the option to set attribute `displayPresentation` is meaningless because the step-wise change of data is an intrinsic property of the data object.]()

[TPS_SWCT_01758] Applicable value range of `SwDataDefProps.displayPresentation` [If the semantics of a `DataPrototype` is described by means of a `CompuMethod` of category `IDENTICAL`, `LINEAR`, `RAT_FUNC` the attribute `SwDataDefProps.displayPresentation` describes the presentation of data for the complete value range.

If the semantics of a `DataPrototype` is described by means of a `CompuMethod` of category `SCALE_LINEAR_AND_TEXTTABLE` or `SCALE_RATIONAL_AND_TEXTTABLE` the attribute `SwDataDefProps.displayPresentation` describes the presentation of data only for the value range outside the `TEXTTABLE` values.]()

Enumeration	DisplayPresentationEnum
Package	M2::MSR::DataDictionary::DataDefProperties
Note	This meta-class represents the ability to provide values for controlling the presentation of data within measurement and calibration tools.
Aggregated by	SwDataDefProps.displayPresentation
Literal	Description
presentation Continuous	The presentation of data shall form a continuous graph between data points. Tags: atp.EnumerationLiteralIndex=0
presentation Discrete	The presentation of data shall be step-shaped between data points. Tags: atp.EnumerationLiteralIndex=1

Table 5.107: DisplayPresentationEnum

5.6 Specification of Constant Values

5.6.1 Overview

[TPS_SWCT_01177] Assignment of constant values [Constant values can be assigned to a meta-class by aggregating the meta-class `ValueSpecification`. This aggregation can be used in two ways:

1. by referencing to a reusable [ConstantSpecification](#) which contains another [ValueSpecification](#)
2. or through an inline aggregation of a value specification of various kind.

|(RS_SWCT_03175)

Class	ConstantSpecification

Table 5.115: ReferenceValueSpecification

[constr_1921] Existence of ReferenceValueSpecification.referenceValue
 [For each ReferenceValueSpecification, attribute referenceValue shall exist at the time when the contract phase generation is executed.]()

Figure 5.60 shows the specialized subclasses of ValueSpecification which allow defining values for different use cases.

[TPS_SWCT_01178] Specialized subclasses of ValueSpecification [The use case for specialized subclasses of ValueSpecification are:

- Reference to a constant (which is actually a reusable value specification) by means of a ConstantReference.
- TextValueSpecification
- NumericalValueSpecification
- ArrayValueSpecification
- RecordValueSpecification
- ApplicationValueSpecification: this shall (see [constr_10439]) be used to specify the value of Compound Primitive Data Types (see [TPS_SWCT_01179]) such as curves and maps. It is also possible to use this in general (e.g. for a primitive calibration value) for the specification of a value of a DataPrototype typed by an ApplicationDataType.

Note that ApplicationValueSpecification is modeled along the example of ASAM CDF (for more information please refer to [31]).

- Reference to a DataPrototype: this can be used to describe initial values for pointer variables in the basic software. One use case is the exchange of data descriptions used to access calibration data for software emulation methods (see [6] for details).

- [ApplicationRuleBasedValueSpecification](#), inside an [ArrayValueSpecification](#), see [[constr_1779](#)].
- [NumericalRuleBasedValueSpecification](#), inside an [ArrayValueSpecification](#), see [[constr_1779](#)].
- [CompositeRuleBasedValueSpecification](#), inside an [ArrayValueSpecification](#), see [[constr_1779](#)].

]([RS_SWCT_03175](#))

It's important to understand that although the name of the meta-class [TextValueSpecification](#) suggests that it is the preferred way for the definition of an [invalidValue](#) or [initValue](#) of a [VariableDataPrototype/ParameterDataPrototype](#) typed by an [ApplicationPrimitiveDataType](#) of category [STRING](#) the [TextValueSpecification](#) actually has a different purpose (as defined by [[constr_1284](#)]).

[constr_1284] Limitation of the use of [TextValueSpecification](#) [[TextValueSpecification](#) shall **only** be used in the context of an [AutosarDataType](#) that references a [CompuMethod](#) in the role [ImplementationDataType.swDataDef-Props.compuMethod](#) of category [TEXTTABLE](#) and [BITFIELD_TEXTTABLE](#).

This rule shall be imposed **at the time when the contract phase generation is executed.**]([\(\)](#))

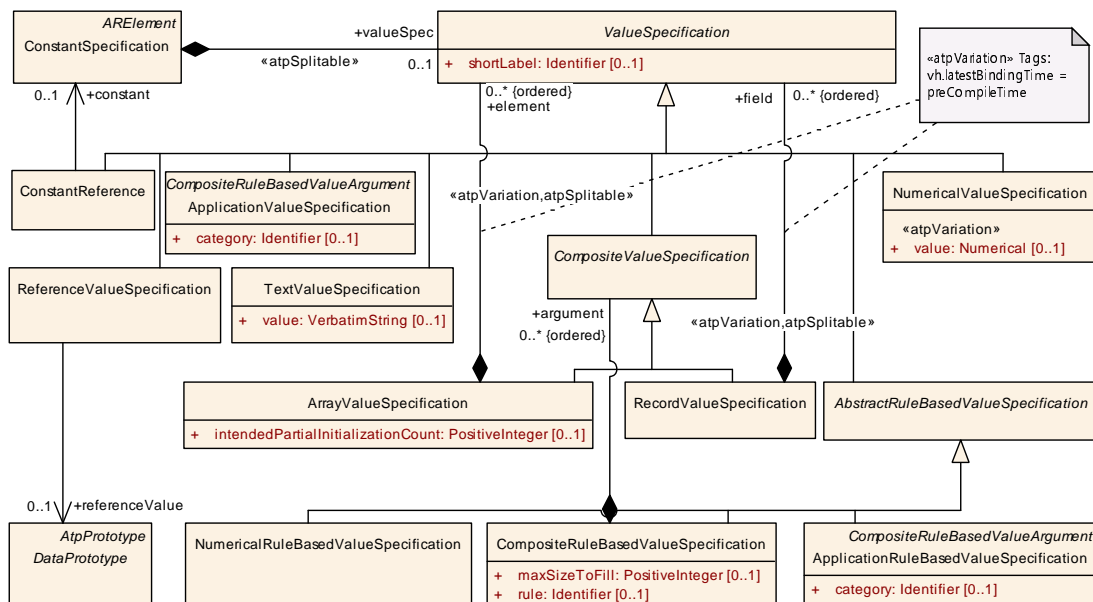

Figure 5.60: Summary of [ValueSpecification](#)

In other words, the purpose of [TextValueSpecification](#) is to define the labels that correspond to enumeration values.

The constraints [[constr_1225](#)] and [[constr_1284](#)] correspond to each other such that [[constr_1225](#)] demands the usage of [TextValueSpecification](#) for the definition of

labels for enumeration values while [constr_1284] says that the definition of labels for enumeration values is the only use case for `TextValueSpecification`.

Note that `ValueSpecification` does not inherit from any data type. This would cause a redundancy²² in the meta-model since the intended data type of a given `ValueSpecification` is already determined by the context in which it is aggregated.

Nonetheless, the intended data type imposes a certain constraint on the content of a `ValueSpecification`:

[TPS_SWCT_01838] `ValueSpecification` shall fit into data type [An instance of `ValueSpecification` which is used to assign a value to a software object typed by an `AutosarDataType` shall fit into this `AutosarDataType` without losing information.]()

For example, it is not allowed to assign the numerical value “1.5” as initial value to a data prototype typed by an `ImplementationDataType` which has an integer base type.

[constr_1271] `RecordValueSpecification.fields` shall be identical to the number of `ApplicationRecordDataType.elements` [The initialization of a `DataPrototype` typed by an `ApplicationRecordDataType` by means of a `RecordValueSpecification` shall exactly match the structure of the `ApplicationRecordDataType`.

For this means, it is required that the number of `RecordValueSpecification.fields` shall be identical to the number of `ApplicationRecordDataType.elements`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1272] `RecordValueSpecification.fields` shall be identical to the number of `subElements` of `ImplementationDataType` of category `STRUCTURE` [The initialization of an `DataPrototype` typed by an `ImplementationDataType` of category `STRUCTURE` by means of a `RecordValueSpecification` shall exactly match the structure of the `ImplementationDataType` of category `STRUCTURE`.

For this means, it is required that the number of `RecordValueSpecification.fields` shall be identical to the number of `ImplementationDataType.subElements`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

²²For example, “1” can be taken as a constant value for many data types. If the `ValueSpecification` were instead referring to a specific `AutosarDataType` it would be necessary to define a “1” for every single `AutosarDataType` this value is supposed to be used in combination with.

If the corresponding [ApplicationRecordElement](#) is typed by an [ApplicationRecordDataType](#) then the comparison of structural compliance between [ApplicationRecordDataType](#) and [ValueSpecification](#) shall continue beyond the encountered [NotAvailableValueSpecification](#).

Class	NotAvailableValueSpecification			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	This meta-class provides the ability to specify a ValueSpecification to state that the respective element is not available. This ability is needed to support the existence of ApplicationRecordElements where attribute <code>isOptional</code> is set to the value <code>true</code> .

defaultPattern	PositiveInteger	0..1	attr	The content of this attribute shall be used to initialize gaps in the memory occupied by a structured data type in the case that an NotAvailableValueSpecification is used. Note that this pattern is only applied during initialization!

Table 5.116: NotAvailableValueSpecification

For deeply nested composite data types (including [ImplementationDataTypes](#) created in response to the existence of a [Compound Primitive Data Type](#)) [[constr_1271](#)], [[constr_1272](#)], and [[constr_1273](#)] shall be applied recursively according to the nature of the given nesting levels. For the “leaf” elements [[TPS_SWCT_01838](#)] applies.

Please find more information about the creation of rule-based [ValueSpecifications](#) in section [5.6.9](#).

5.6.2 Reference to Constant

Note the specific meaning of [ConstantReference](#): it passes the definition of the value on to a [ConstantSpecification](#) that is defined as part of an [AUTOSAR ARPackage](#).

Class	ConstantReference
Package	M2::AUTOSARTemplates::CommonStructure::Constants
Note	Instead of defining this value inline, a constant is referenced.
Base	ARObject , ValueSpecification

Class	ConstantReference			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element, CalibrationParameterValue.applInitValue, CalibrationParameterValue.implInitValue, ConstantSpecification.valueSpec, CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.timeoutSubstitutionValue, NonqueuedReceiverComSpec.initValue, NonqueuedReceiverComSpec.timeoutSubstitutionValue, NonqueuedSenderComSpec.initValue, NvProvideComSpec.ramBlockInitValue, NvProvideComSpec.romBlockInitValue, NvRequireComSpec.initValue, ParameterDataPrototype.initValue, ParameterProvideComSpec.initValue, ParameterRequireComSpec.initValue, PersistencyDataRequiredComSpec.initValue, PersistencyKeyValuePair.initValue, PortDefinedArgumentValue.value, PortPrototypeBlueprintInitValue.value, RecordValueSpecification.field, SomeipEventDeployment.eventReceptionDefaultValue, StateManagementCompareCondition.compareValue, SwDataDefProps.invalidValue, VariableDataPrototype.initValue			
Attribute	Type	Mult.	Kind	Note
constant	ConstantSpecification	0..1	ref	The referenced constant.

Table 5.117: ConstantReference

[constr_1930] Existence of ConstantReference.constant [For each ConstantReference, attribute constant shall exist **at the time when the contract phase generation is executed.**]()

5.6.3 Constant Specification Mapping

[TPS_SWCT_01186] ConstantSpecificationMapping [The ConstantSpecificationMapping is used to associate

- a ValueSpecification owned by the ConstantSpecification referenced in the role implConstant (defined in the *implementation domain*) with
- a corresponding ValueSpecification owned by the ConstantSpecification referenced in the role applConstant (defined in the *application domain*).

]()

The existence of a ConstantSpecificationMapping is required only in specific situations. One possible such situation for the application of a ConstantSpecificationMapping could be in the context of the definition of a SwRecordLayout, where the structure of the "physical" ConstantSpecification may be dramatically different from the structure of the mapped "internal" ConstantSpecification.

In other words, the existence of a ConstantSpecificationMapping is typically **more about data structure than data value.**

Please note that the formal definition of how a "ConstantSpecification defined in the *application domain*" looks like is not exactly straight-forward. Obvious candidates are ApplicationValueSpecification or ApplicationRuleBasedValueSpecification, but this is not the end of it.

Figure 5.61: Constant Mapping

It is also necessary to extend this definition to composite `ValueSpecifications`, e.g. A `RecordValueSpecification` where all "leaf" child elements are either `ApplicationValueSpecification` or `ApplicationRuleBasedValueSpecification`.

Again, this is just one possible way to define a qualifying `ConstantSpecification`, resp. the aggregated `ValueSpecification`.

In fact, there are plenty of ways to define a "`ConstantSpecification` defined in the *application domain*". The criteria are summarized in [TPS_SWCT_01871].

[TPS_SWCT_01871] Definition of a `ConstantSpecification` in the *application domain* [A `ConstantSpecification` qualifies as being defined in the *application domain* if its aggregated `valueSpec` fulfills one of the following criteria:

- The `ValueSpecification` is an `ApplicationValueSpecification`.
- The `ValueSpecification` is an `ApplicationRuleBasedValueSpecification`.
- The `ValueSpecification` is a `RecordValueSpecification` where the fields recursively (i.e. via arbitrary aggregation levels of further `CompositeValueSpecifications` or `CompositeRuleBasedValueSpecifications`) boil down to `ApplicationValueSpecifications` or `ApplicationRuleBasedValueSpecifications`.
- The `ValueSpecification` is an `ArrayValueSpecification` where the element recursively (i.e. via arbitrary aggregation levels of further `CompositeValueSpecifications` or `CompositeRuleBasedValueSpecifications`) boil down to `ApplicationValueSpecifications` or `ApplicationRuleBasedValueSpecifications`.
- The `ValueSpecification` is a `CompositeRuleBasedValueSpecification` where the arguments fulfill one of the above criteria.
- The `ValueSpecification` is a `ConstantReference` where the referenced constant fulfills one of the above criteria.

]()

Please note that the formal definition of how a "`ConstantSpecification` defined in the *implementation domain*" looks like is not exactly straight-forward. Obvious candidates are `NumericalValueSpecification` or `TextValueSpecification`, but this is not the end of it. It is also necessary to extend this definition to composite `ValueSpecifications`, e.g. a `RecordValueSpecification` where all "leaf" child

elements are either `NumericalValueSpecification` or `TextValueSpecification`.

Again, this is just one possible way to define a qualifying `ConstantSpecification`, resp. the aggregated `ValueSpecification`.

in fact, there are plenty of ways to define a "`ConstantSpecification` defined in the *implementation domain*". The criteria are summarized in [TPS_SWCT_01872].

[TPS_SWCT_01872] Definition of a `ValueSpecification` in the *implementation domain* [A `ValueSpecification` qualifies as being defined in the *implementation domain* if it fulfills one of the following criteria:

- The `ValueSpecification` is a `NumericalValueSpecification`.
- The `ValueSpecification` is a `TextValueSpecification`.
- The `ValueSpecification` is a `RecordValueSpecification` where the `fields` recursively (i.e. via arbitrary aggregation levels of further `CompositeValueSpecifications` or `CompositeRuleBasedValueSpecifications`) boil down to `NumericalValueSpecifications` or `TextValueSpecifications`.
- The `ValueSpecification` is an `ArrayValueSpecification` where the `element` recursively (i.e. via arbitrary aggregation levels of further `CompositeValueSpecifications` or `CompositeRuleBasedValueSpecifications`) boil down to `NumericalValueSpecifications` or `TextValueSpecifications`.

5.6.4 Values for Variable-Size Array

Variable-size data types have the ability to change the number of valid elements at run-time. However, in many situations it is necessary to define an [ArrayValueSpecification](#) for such a data type.

An [ArrayValueSpecification](#) that can be used for a *variable-size array* data type needs to be able to handle the following cases:

- Full initialization of the entire array-data type. This case is identical to the creation of a [ArrayValueSpecification](#) for a fixed-size array data type.
- Provision of values for the **first n elements** of the *variable-size array*. This case is also known as *partial initialization*.
- Creation of an empty [ArrayValueSpecification](#), i.e. an [ArrayValueSpecification](#) carries the semantics of intentionally initializing 0 elements of a *variable-size array*. Note the semantical difference between not initializing at all and intentionally initializing 0 elements of the *variable-size array*.

All the described cases shall be supported by AUTOSAR. As already described, the existence of an [ArrayValueSpecification](#) with the full number of elements is identical to the fixed size case. The "empty" case could be seen as a subset of the partial initialization.

The partial initialization of *variable-size arrays* has two facets:

[TPS_SWCT_01793] Initialization of a *variable-size array* typed by an [ImplementationDataType](#) [A *variable-size array* that is modeled by means of an [ImplementationDataType](#) is actually existing as a structure consisting of a *size indicator* and an *array that carries the payload*.

Therefore, the *partial initialization* shall be implemented by explicitly initializing the *size indicator* to a value between 0 and the applicable `ImplementationDataTypeElement.arraySize` and provide the corresponding number of `ValueSpecifications` for the *payload*.|(RS_SWCT_03175, RS_SWCT_03181)

[TPS_SWCT_01794] Initialization of a *variable-size array* typed by an `ApplicationArrayType` [A *variable-size array* that is modeled by means of an `ApplicationArrayType` where attribute `arraySizeSemantics` is set to `variableSize` does not contain any size-indicator element and therefore requires a different approach for *partial initialization*.

For this purpose, `ArrayValueSpecification.intendedPartialInitializationCount` shall be used for the specification of the number of elements that shall be initialized. |(RS_SWCT_03175, RS_SWCT_03181)

The applicability of attribute `ArrayValueSpecification.intendedPartialInitializationCount` is limited to the use case of initializing a *variable-size array* typed by an `ApplicationArrayType`. AUTOSAR does not foresee any other use case for this attribute.

[constr_1712] Existence of attribute `ArrayValueSpecification.intendedPartialInitializationCount` [An `ArrayValueSpecification` where attribute `intendedPartialInitializationCount` exists shall only be applied for the initialization of an `ApplicationArrayType` where attribute `arraySizeSemantics` is set to `variableSize`.

This rule shall be imposed **at the time when the contract phase generation is executed**.|()

[constr_1273] Rules for the initialization of `ApplicationArrayType` by means of `ArrayValueSpecification` [The following rules apply for the initialization of a `DataPrototype` typed by an `ApplicationArrayType` by means of an `ArrayValueSpecification`:

- If the attribute `ApplicationArrayType.element.arraySizeSemantics` is set to **fixedSize** then the `ArrayValueSpecification` shall exactly match the structure of the `ApplicationArrayType`.

This means that the number of `ArrayValueSpecification.elements` shall be identical to the value of `ApplicationArrayType.element.maxNumberOfElements`.

- If the attribute `ApplicationArrayType.element.arraySizeSemantics` is set to **variableSize** and the `ArrayValueSpecification` **does not define** attribute `intendedPartialInitializationCount` then `ArrayValueSpecification` shall **exactly** match the structure of the `ApplicationArrayType`.

This means that the number of `ArrayValueSpecification.elements` shall be identical to the value of `ApplicationArrayType.element.maxNumberOfElements`.

- If the attribute `ApplicationArrayDataType.element.arraySizeSemantics` is set to `variableSize` and the `ArrayValueSpecification` specifies a value for attribute `intendedPartialInitializationCount` then `ArrayValueSpecification` shall contain **exactly** `intendedPartialInitializationCount` elements.

This includes the case that the value of `intendedPartialInitializationCount` is set to 0 (i.e. "empty" initialization) and the case that the `intendedPartialInitializationCount` is set to the value of the respective `ApplicationArrayElement.maxNumberOfElements` (i.e. "full" initialization).

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1274] Rules for the initialization of array-shaped `ImplementationDataType` with a fixed size by means of `ArrayValueSpecification` [The following rule applies for the initialization of a `DataPrototype` typed by an `ImplementationDataType` of category ARRAY where attribute `ImplementationDataType.subElement.arraySizeSemantics` is set to `fixedSize` by means of an `ArrayValueSpecification`: the `ArrayValueSpecification` shall exactly match the structure of the `ImplementationDataType`.

This means that the number of `ArrayValueSpecification.elements` shall be identical to the value of `ImplementationDataType.subElement.arraySize`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Please note that the initialization of an `ImplementationDataType` that represents a *variable-size array* is clarified in [TPS_SWCT_01793].

More details can be found in section 5.6.9.

5.6.5 Values for Compound Primitive Data Types

[TPS_SWCT_01180] Maximum possible size of Compound Primitive Data Type [Note that if the size of the Compound Primitive Data Type (see [TPS_SWCT_01179]) (curve/map) is defined using an `AttributeValueVariationPoint` (in other words `swMaxAxisPoints`, `swValueBlockSize`, `swValueBlockSizeMult` dependent on the value of `SwSystemconst`) the `initValue` shall provide the maximum possible amount of values.](RS_SWCT_03216)

In this case it is the responsibility of model author to ensure that the size of the specified `initValues` matches the range of the involved system constants.

[TPS_SWCT_01839] Size of Compound Primitive Data Type is variant [For Compound Primitive Data Types (see [TPS_SWCT_01179]) where the size is subject to variation the size of the specified `initValues` shall match the range of the involved `SwSystemconst`.](RS_SWCT_03216, RS_SWCT_03148)

Class	SwSystemconst			
Package	M2::MSR::DataDictionary::SystemConstant			
Note	This element defines a system constant which serves an input to select a particular variation point. In particular a system constant serves as an operand of the binding function (swSyscond) in a Variation point. Note that the binding process can only happen if a value was assigned to to the referenced system constants. Tags: atp.recommendedPackage=SwSystemconst

swDataDef Props	SwDataDefProps	0..1	aggr	This denotes the data definition properties of the system constant. This supports to express the limits and optionally a conversion within the internal to physical values by a compu method. Stereotypes: atp.Splitable Tags: atp.Splitkey=swDataDefProps xml.sequenceOffset=40

Table 5.120: SwSystemconst

[TPS_SWCT_01181] Bound model specifies a primitive which is smaller than the maximum defined by the range of the involved SwSystemconst [The processing tools shall take the lower part of the `initValues` in case the bound model specifies a primitive which is smaller than the maximum defined by the range of the involved `SwSystemconst`.] ([RS_SWCT_03216](#), [RS_SWCT_03148](#))

The consequences of [\[TPS_SWCT_01181\]](#) are exemplified by [Figure 5.63](#).

[constr_2050] Mandatory information of a SwAxisCont [If the attribute `swAxisCont` is defined for an `ApplicationValueSpecification` the `SwAxisCont` shall define one `swAxisIndex` value and one `swArraysizes` value per dimension, even in the case when the owning `ApplicationValueSpecification` defines only the content of a single dimensional object like a CURVE.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_2051] Mandatory information of a SwValueCont [If the attribute `swValueCont` is defined for an `ApplicationValueSpecification` the `SwValueCont` shall always define the attribute `swArraysizes` if the `ApplicationValueSpecification` is of category CURVE, MAP, CUBOID, CUBE_4, CUBE_5, COM_AXIS, RES_AXIS, or VAL_BLK.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

In the context of one `ApplicationValueSpecification`, the number of elements of attribute `swValueCont.swArraysizes` depends on the value of `ApplicationValueSpecification.category`.

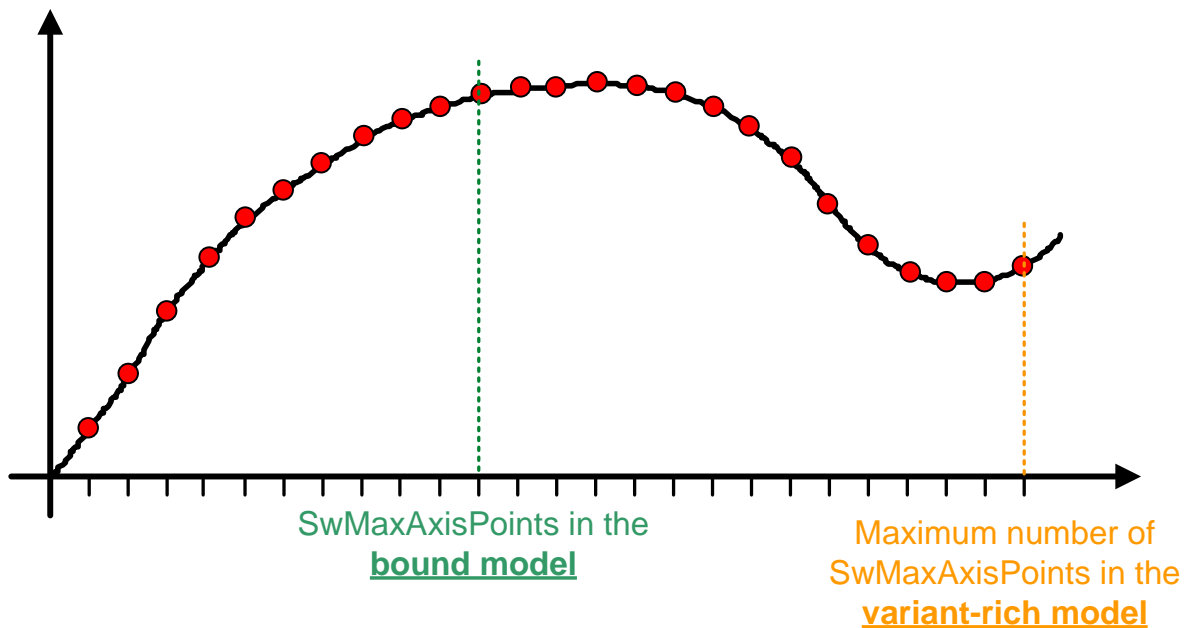

Figure 5.63: Explanation of `swMaxAxisPoints`

It is unfortunately not possible to bind the number of elements in `swValueCont.swArraysizes` for one of the following reasons:

- Not all axes might be considered in the definition of the `ApplicationValueSpecification`. If one or more of the applicable axes are group axes, then these are omitted in the definition of the `ApplicationValueSpecification`.

Due to the nature of a `COM_AXIS`, it is initialized separately by means of a dedicated `ApplicationValueSpecification`.

- The `ApplicationValueSpecification` may set attribute `category` to the values `COM_AXIS` or `RES_AXIS` and therefore supposed to be applied to the initialization of a shared axis itself.
- For `ApplicationValueSpecification` where attribute `category` is set to `VAL_BLK`, no axes are defined at all.

Therefore, the number of elements of `ApplicationValueSpecification.swValueCont.swArraysizes` depends on the value of attribute `ApplicationValueSpecification.category`, see [\[constr_10502\]](#).

swArraysSize	ValueList	0..1	aggr	This attribute defines the size of each dimension for compound primitives CURVE, MAP, CUBOID, CUBE_4, CUBE_5, COM_AXIS, RES_AXIS, VAL_BLK. For each dimension one value has to be defined, e.g. one in case of COM_AXIS and two or more in case of MAP. Tags: xml.sequenceOffset=40
swValuesPhys	SwValues	0..1	aggr	swValuesPhys represents the values in the physical domain. Tags: xml.sequenceOffset=50
unit	Unit	0..1	ref	This represents the physical unit of the provided values. Tags: xml.sequenceOffset=20
unitDisplay Name	SingleLanguageUnit Names	0..1	aggr	This specifies how the physical units of the current value set shall be displayed in documents or in user interfaces of tools. Tags: xml.sequenceOffset=30

Table 5.121: SwValueCont

[constr_10502] Number of elements of ApplicationValueSpecification.swValueCont.swArraysSize vs. ApplicationValueSpecification.category
|

Value of category	Number of values in swValueCont.swArraysSize
CURVE	1
MAP	2
CUBOID	3
CUBE_4	4
CUBE_5	5
COM_AXIS	1
RES_AXIS	1
VAL_BLK	1..*

This rule shall be imposed **at the time when the ValueSpecification is applied.**

|()

[TPS_SWCT_01882] Ordering of elements within ApplicationValueSpecification.swValueCont.swValuesPhys [The order of elements in ApplicationValueSpecification.swValueCont.swValuesPhys should be aligned with the memory layout for both the ROW_DIR and the COLUMN_DIR case. Of course, the order in swValuesPhys can be defined so that both cases can be properly supported.

But it shall be possible, just by looking at the `ApplicationValueSpecification`, to understand whether the `ApplicationValueSpecification` was created for the `ROW_DIR` or for the `COLUMN_DIR` case:

ROW_DIR The order of values in `swValueCont.swArraysize` is identical to the values of `swAxisCont.swArraysize`, as defined by the respective `swAxisIndex`.

This means, for example, if the array size of the x-axis is 4 and the array-size of the y-axis is 3, then the values within `swValueCont.swArraysize` would be 4 and 3 (in this order).

COLUMN_DIR The order of values in `swValueCont.swArraysize` is the reverse of the values of `swAxisCont.swArraysize`, as defined by the respective `swAxisIndex`.

This means, for example, if the array size of the x-axis is 4 and the array-size of the y-axis is 3, then the values within `swValueCont.swArraysize` would be 3 and 4 (in this order).

The modeling of `ApplicationValueSpecification.swAxisCont` is 100% identical for both cases. The only difference shows up in the modeling of `ApplicationValueSpecification.swValueCont.()`

If the `Compound Primitive Data Type` to which an `ApplicationValueSpecification` where attribute `category` is set to `MAP`, `CUBOID`, `CUBE_4`, or `CUBE_5` is known in advance, then rules can be defined for the relation between the value of `ApplicationValueSpecification.swValueCont.swArraysize` and the definition of `ApplicationPrimitiveDataType.swDataDefProps.swCalprmAxisSet`.

[constr_10503] ApplicationValueSpecification where attribute category is set to MAP, CUBOID, CUBE_4, or CUBE_5 and ROW_DIR SwRecordLayout [In the context of an `ApplicationValueSpecification` where attribute `category` is set to `MAP`, `CUBOID`, `CUBE_4`, or `CUBE_5` that is applied to a `DataPrototype` typed by an `ApplicationPrimitiveDataType` where the `swDataDefProps.swRecordLayout` refers to a `SwRecordLayout` with a `ROW_DIR` approach, the value of `ApplicationValueSpecification.swValueCont.swArraysize.v[i]` (i.e., counting up from the first element of `swArraysize.v`) shall be identical to the number of axis points of the respective `SwCalprmAxisSet.swCalprmAxis` where attribute `swAxisIndex` is set to `i`:

- If the respective `SwCalprmAxis` is a `SwAxisGrouped`, then the number of axis points shall be retrieved from the attribute `subElement.arraySize` of the `ImplementationDataType` that is referenced by a `DataTypeMap` that also references the `ApplicationDataType` referenced in the role `SwAxisGrouped.sharedAxisType`.
- If the respective `SwCalprmAxis` is a `SwAxisIndividual`, the number of axis points is identical to the value of attribute `SwAxisIndividual.swMaxAxisPoints`.

This rule shall be imposed **at the time when the ValueSpecification is applied**()

Rationale for the existence of [constr_10503]: the order of the values provided in `ApplicationValueSpecification.swValueCont.swValuesPhys` shall be such that it follows the memory layout.

If this is confirmed, then the configuration of the corresponding `SwRecordLayout` is relevant and the order in which elements are put into `SwValueCont.swValuesPhys` would indeed entirely be defined by the order of elements collected in the role `ApplicationValueSpecification.swValueCont.swArraysizes`.

Please find an example for the observation made by [constr_10503] in section B.3.6.1.

[constr_10504] ApplicationValueSpecification where attribute category is set to VAL_BLK and ApplicationPrimitiveDataType.swDataDefProps.swValueBlockSizeMult exists for ROW_DIR SwRecordLayout [If the attribute `ApplicationPrimitiveDataType.swDataDefProps.swValueBlockSizeMult` exists, then the value of `ApplicationValueSpecification.swValueCont.swArraysizes` can be identical to the value of `ApplicationPrimitiveDataType.swDataDefProps.swValueBlockSizeMult` if the referenced `ApplicationPrimitiveDataType.swDataDefProps.swRecordLayout` defines a row-first `ROW_DIR` layout **at the time when the ValueSpecification is applied.**]()

[constr_10505] ApplicationValueSpecification where attribute category is set to MAP, CUBOID, CUBE_4, or CUBE_5 and COLUMN_DIR SwRecordLayout [In the context of an `ApplicationValueSpecification` where attribute `category` is set to `MAP`, `CUBOID`, `CUBE_4`, or `CUBE_5` that is applied to a `DataPrototype` typed by an `ApplicationPrimitiveDataType` where the `swDataDefProps.swRecordLayout` refers to a `SwRecordLayout` with a `COLUMN_DIR` approach, the value of `ApplicationValueSpecification.swValueCont.swArraysizes.v[-i]` (i.e., counting down from the last element of `swArraysizes.v`) shall be identical to the number of axis points of the respective `SwCalprmAxisSet.swCalprmAxis` where attribute `swAxisIndex` is set to i :

- If the respective `SwCalprmAxis` is a `SwAxisGrouped`, then the number of axis points shall be retrieved from the attribute `subElement.arraySize` of the `ImplementationDataType` that is referenced by a `DataTypeMap` that also references the `ApplicationDataType` referenced in the role `SwAxisGrouped.sharedAxisType`.
- If the respective `SwCalprmAxis` is a `SwAxisIndividual`, the number of axis points is identical to the value of attribute `SwAxisIndividual.swMaxAxisPoints`.

This rule shall be imposed **at the time when the ValueSpecification is applied**()

Rationale for the existence of [constr_10505]: the order of the values provided in `ApplicationValueSpecification.swValueCont.swValuesPhys` shall be such that it follows the memory layout.

If this is confirmed, then the configuration of the corresponding `SwRecordLayout` is relevant and the order in which elements are put into `swValuesPhys` would indeed entirely be defined by the order of elements collected in the role `ApplicationValueSpecification.swValueCont.swArraysizes`.

Please find an example for the observation made by [constr_10505] in section B.3.6.2.

[constr_10506] ApplicationValueSpecification where attribute category is set to VAL_BLK and ApplicationPrimitiveDataType.swDataDefProps.swValueBlockSizeMult exists for COLUMN_DIR SwRecordLayout [If the attribute `ApplicationPrimitiveDataType.swDataDefProps.swValueBlockSizeMult` exists, then the value of `ApplicationValueSpecification.swValueCont.swArraysizes` can be taken over from the reversed values of `ApplicationPrimitiveDataType.swDataDefProps.swValueBlockSizeMult` if the referenced `ApplicationPrimitiveDataType.swDataDefProps.swRecordLayout` defines a column-first `COLUMN_DIR` layout **at the time when the ValueSpecification is applied.**]()

If the `Compound Primitive Data Type` to which an `ApplicationValueSpecification` where attribute `category` is set to `VAL_BLK` is known in advance, then rules can be defined for the relation between the value of `swValueCont.swArraysizes` and `ApplicationPrimitiveDataType.swDataDefProps.swValueBlockSize` or `swDataDefProps.swValueBlockSizeMult`.

[constr_10507] ApplicationValueSpecification where attribute category is set to VAL_BLK and ApplicationPrimitiveDataType.swDataDefProps.swValueBlockSize exists [If the attribute `ApplicationPrimitiveDataType.swDataDefProps.swValueBlockSize` exists, then the value of `ApplicationValueSpecification.swValueCont.swArraysizes` shall contain a single `v` and the value of `v` shall be identical to the value of attribute `swValueBlockSize` **at the time when the ValueSpecification is applied.**]()

Please note that for multidimensional `Compound Primitive Data Types` (e.g. `MAP`) it is necessary to know the dimensions in order to be able to process the `SwValues`. [constr_2050] and [constr_2051] shall support a consistent handling of single and multidimensional `Compound Primitive Data Types`.

[constr_2052] Values of swArraysizes and the number of values provided by swValuesPhys shall be consistent. [`swValuesPhys` shall define as many values as the attribute `swArraysizes` (if this attribute exists) defines.

In other words, in the bound model the number of descendants (`v`, or `vf`, or `vt`, or `vtf`) shall be identical to the number of elements of the related `DataPrototype` typed by an `ApplicationPrimitiveDataType`.

If several `swArraysizes` values are provided, the values have to be multiplied in order to get the total number of `swValuesPhys` values.

This rule shall be imposed **at the time when the contract phase generation is executed.** |()

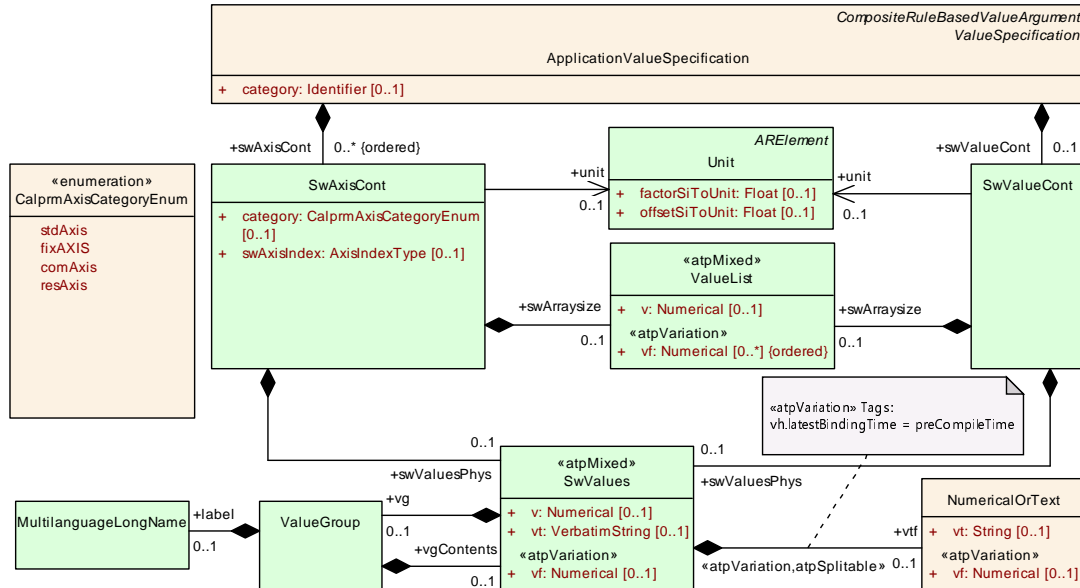

Figure 5.64: Definition of an ApplicationValueSpecification

Please note that in the case of an **Compound Primitive Data Types**, typically the attribute `swValuesPhys` defines more than one value. [constr_2051] and [constr_2052] shall enable a consistent handling of the `swValuesPhys` values regardless how many dimensions the related **Compound Primitive Data Type** defines.

If the **ApplicationValueSpecification** defines values for a **Compound Primitive Data Type** with more than one input axis, the existence of the attribute `swArraysizes` becomes mandatory to ensure the correct processing of the `swValuesPhys` values independent of the existence of `SwValues.vg`.

[TPS_SWCT_02001] Values of SwAxisCont with the category COM_AXIS, RES_AXIS are for display only [In case of **ApplicationValueSpecifications** of category MAP, CUBOID, CUBE_4, CUBE_5, and CURVE it is possible that the `SwAxisCont` of axes can be omitted if the axis is of category COM_AXIS or RES_AXIS.

If `SwAxisCont` values exists in such cases for the axes these are for display purpose only because the related `DataPrototype` of the MAP, CUBOID, CUBE_4, CUBE_5, or CURVE does not hold the values of such axes. These are properties of the `DataPrototype` of the COM_AXIS or RES_AXIS. |()

Hence, values of the COM_AXIS itself are described by `SwValueCont`.

[constr_1243] NumericalOrText shall either define vf or vt [Within the context of one `NumericalOrText`, either the attribute `vf` or the attribute `vt` shall be defined. The existence of both attributes at the same time is not permitted.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Class	ApplicationValueSpecification			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	This meta-class represents values for DataPrototypes typed by ApplicationDataTypes (this includes in particular compound primitives). For further details refer to ASAM CDF 2.0. This meta-class corresponds to some extent with SW-INSTANCE in ASAM CDF 2.0.			
Base	ARObject , CompositeRuleBasedValueArgument , ValueSpecification			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element , CalibrationParameterValue.applInitValue , CalibrationParameterValue.implInitValue , CompositeRuleBasedValueSpecification.compoundPrimitiveArgument , ConstantSpecification.valueSpec , CryptoServiceKey.developmentValue , DiagnosticEnvDataCondition.compareValue , DiagnosticEnvDataElementCondition.compareValue , FieldSenderComSpec.initValue , ISignal.initValue , ISignal.timeoutSubstitutionValue , NonqueuedReceiverComSpec.initValue , NonqueuedReceiverComSpec.timeoutSubstitutionValue , NonqueuedSenderComSpec.initValue , NvProvideComSpec.ramBlockInitValue , NvProvideComSpec.romBlockInitValue , NvRequireComSpec.initValue , ParameterDataPrototype.initValue , ParameterProvideComSpec.initValue , ParameterRequireComSpec.initValue , PersistencyDataRequiredComSpec.initValue , PersistencyKeyValuePair.initValue , PortDefinedArgumentValue.value , PortPrototypeBlueprintInitValue.value , RecordValueSpecification.field , SomeipEventDeployment.eventReceptionDefaultValue , StateManagementCompareCondition.compareValue , SwDataDefProps.invalidValue , VariableDataPrototype.initValue			
Attribute	Type	Mult.	Kind	Note
category	Identifier	0..1	attr	Specifies to which category of ApplicationDataType this ApplicationValueSpecification can be applied (e.g. as an initial value), thus imposing constraints on the structure and semantics of the contained values, see [constr_1006] and [constr_2051] .
swAxisCont (ordered)	SwAxisCont	*	aggr	This represents the axis values of a Compound Primitive Data Type (curve or map). The first swAxisCont describes the x-axis, the second swAxisCont describes the y-axis, the third swAxisCont describes the z-axis. In addition to this, the axis can be denoted in swAxisIndex.
swValueCont	SwValueCont	0..1	aggr	This represents the values of a Compound Primitive Data Type.

Table 5.122: ApplicationValueSpecification

Class	NumericalOrText			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	This meta-class represents the ability to yield either a numerical or a string. A typical use case is that two or more instances of this meta-class are aggregated with a VariationPoint where some instances yield strings while other instances yield numerical depending on the resolution of the binding expression.			
Base	ARObject			
Aggregated by	RuleArguments.vtf , SwValues.vtf			
Attribute	Type	Mult.	Kind	Note
vf	Numerical	0..1	attr	This attribute represents the ability to provide a numerical value. The latest binding time of the VariationPoint shall be preCompileTime. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime xml.sequenceOffset=10

Class	NumericalOrText			
vt	String	0..1	attr	This attribute represents the ability to provide a textual value. Tags: xml.sequenceOffset=20

5.6.6 Values for TEXTTABLE

The creation of a [ValueSpecification](#) applied to a [DataPrototype](#) that is typed by an [ImplementationDataType](#) that references a [CompuMethod](#) of category [TEXTTABLE](#) or [BITFIELD_TEXTTABLE](#) needs to make sure that the numerical value is represented in the [CompuMethod](#).

This means that in this specific case, the initialization of a [DataPrototype](#) is typed by an [ImplementationDataType](#) is – contrary to the typical approach for a [ValueSpecification](#) applied in the context of an [ImplementationDataType](#) – actually done in the **physical domain** and thereby it can be ensured that the value provided in the [ValueSpecification](#) is represented in the [CompuMethod](#).

For example, in a specific case the values from 0..10 are covered by corresponding literals of the applicable `CompuMethod`, what is the consequence if the value of the `DataPrototype` is set to the **numerical** value 20? This scenario should be avoided, **unless** the `ValueSpecification` represents an `invalidValue` (see section 5.4.2, specifically [constr_10196]).

[constr_1225] `DataPrototype` is typed by an `ImplementationDataType` that references a `CompuMethod` of category `TEXTTABLE` or `BITFIELD_TEXTTABLE` [If a `DataPrototype` is typed by an `ImplementationDataType` that references a `CompuMethod` of category `TEXTTABLE` or `BITFIELD_TEXTTABLE` the applicable `ValueSpecification` shall be a `TextValueSpecification`.

In this case the value provided shall match to one of the applicable text values (`vt`, `shortLabel`, `symbol`) defined by the applicable `CompuScales`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Please note that several attributes of meta-class `CompuScale` can be taken to describe the actual value. It is therefore necessary to clarify what happens if several of these attributes exist within the context of one `CompuScale`. This clarification can be found in [TPS_SWCT_01696].

5.6.7 Values for `BITFIELD_TEXTTABLE`

A `CompuMethod` of category `BITFIELD_TEXTTABLE` effectively defines a data type where single bits or a set of single bits have an individual meaning.

In other words, the definition of a `ValueSpecification` according to a `CompuMethod` of category `BITFIELD_TEXTTABLE` translates into the statement: “each unique value of attribute `CompuScale.mask` (because this is how the single bits or sets of single bits are identified) in the context of the enclosing `CompuMethod` delivers one contribution to the definition of the `ValueSpecification`”.

[TPS_SWCT_01792] Initialization of a `DataPrototype` associated with a `CompuMethod` of category `BITFIELD_TEXTTABLE` [The initialization of a `DataPrototype` associated with a `CompuMethod` of category `BITFIELD_TEXTTABLE` requires the simultaneous initialization of all single bits or sets of bits represented by the respective definition of the bitmask represented by attribute `CompuScale.mask`.

Access to the elements is possible by using bit-operations, therefore the initialization needs to be defined in a way that bit-operations can be used to apply the provided value.

In other words, the overall value shall be created out of bitwise or-ing (represented by the usage of the “|” symbol) contributions from the individual subsets.]()

An example for the definition of a `ValueSpecification` that can be taken e.g. for the initialization of a `DataPrototype` typed by an `ApplicationDataType` that refers

to a `CompuMethod` of category `BITFIELD_TEXTTABLE` is discussed in Appendix B.3.5.

Please note that areas of the initialized `DataPrototype` that are not covered by the bit-masks may contain arbitrary values. If this needs to be avoided, it is necessary to add “dummy” bit-masks to the semantically not relevant parts of the value of the `DataPrototype`.

5.6.8 Values for Strings

5.6.8.1 String is modeled by `ApplicationDataType`

[TPS_SWCT_01859] Specification of constant value for a String modeled by `ApplicationDataType` [The specification of a constant value for a `DataPrototype` typed by an `ApplicationPrimitiveDataType` of category `STRING` shall be done by specifying an `ApplicationValueSpecification`. Inside the `ApplicationValueSpecification`, the concrete value shall be provided in `ApplicationValueSpecification.swValueCont.swValuesPhys.vt.`]()

An example of how a constant value for a string modeled as `ApplicationDataType` is contained in Listing B.1.

5.6.8.2 String is modeled by `ImplementationDataType`

[TPS_SWCT_01860] Specification of constant value for a String modeled by `ImplementationDataType` [The specification of a constant value for a `DataPrototype` typed by an `ImplementationDataType` that references an `SwBaseType` with a string encoding (e.g. UTF-8) shall be done on the basis of (a series of) `NumericalValueSpecification.`]()

An example of how a constant value for a string modeled by means of an `ImplementationDataType` is contained in Listing B.4.

5.6.9 Specification of Values based on Rules

5.6.9.1 Support for primitive Data Types

[TPS_SWCT_01484] Meaning of `ApplicationRuleBasedValueSpecification` [The purpose of the `ApplicationRuleBasedValueSpecification` is to provide means for a compact provision of values for `DataPrototypes` that otherwise would require a high volume (in terms of serialized ARXML) of e.g. initialization data.

`ApplicationRuleBasedValueSpecification` may be used for `ApplicationArrayDataType`, and also (if applicable) to the so-called Compound Primitive Data Types.]([RS_SWCT_03260](#))

For example, an `ApplicationArrayDataType` that has 100 elements would need to be initialized such that for each element a dedicated initial value is provided.

In the most prominent cases the majority of these elements are initialized with an identical value (e.g. 0) and only the first few elements differ in terms of initialization values.

Please note that `ApplicationRuleBasedValueSpecification` applies for arrays typed by a primitive data type. Rule-based value specification of arrays of a composite data type is done by means of the `CompositeRuleBasedValueSpecification`.

Class	<code>AbstractRuleBasedValueSpecification</code> (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::Constants

Table 5.128: AbstractRuleBasedValueSpecification

[constr_1779] Scope of the definition of an `AbstractRuleBasedValueSpecification` [An `AbstractRuleBasedValueSpecification` shall only be defined in the context of an `ArrayValueSpecification` or a `ConstantSpecification`. If the `AbstractRuleBasedValueSpecification` is defined in the context of a `ConstantSpecification` then a reference to this `ConstantSpecification` shall only be created in the context of an `ArrayValueSpecification`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Class	<code>ApplicationRuleBasedValueSpecification</code>
Package	M2::AUTOSARTemplates::CommonStructure::Constants
Note	This meta-class represents rule based values for DataPrototypes typed by ApplicationDataTypes (ApplicationArrayDataType or a compound ApplicationPrimitiveDataType which also boils down to an array-nature).
Base	<code>ARObject</code> , <code>AbstractRuleBasedValueSpecification</code> , <code>CompositeRuleBasedValueArgument</code> , <code>ValueSpecification</code>

Class	ApplicationRuleBasedValueSpecification			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element, CalibrationParameterValue.applInitValue, CalibrationParameterValue.implInitValue, CompositeRuleBasedValueSpecification.compoundPrimitiveArgument, ConstantSpecification.valueSpec, CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.timeoutSubstitutionValue, NonqueuedReceiverComSpec.initValue, NonqueuedReceiverComSpec.timeoutSubstitutionValue, NonqueuedSenderComSpec.initValue, NvProvideComSpec.ramBlockInitValue, NvProvideComSpec.romBlockInitValue, NvRequireComSpec.initValue, ParameterDataPrototype.initValue, ParameterProvideComSpec.initValue, ParameterRequireComSpec.initValue, PersistencyDataRequiredComSpec.initValue, PersistencyKeyValuePair.initValue, PortDefinedArgumentValue.value, PortPrototypeBlueprintInitValue.value, RecordValueSpecification.field, SomeIpEventDeployment.eventReceptionDefaultValue, StateManagementCompareCondition.compareValue, SwDataDefProps.invalidValue, VariableDataPrototype.initValue			
Attribute	Type	Mult.	Kind	Note
category	Identifier	0..1	attr	This represents the category of the RuleBasedValue Specification Tags: xml.sequenceOffset=-20
swAxisCont (ordered)	RuleBasedAxisCont	*	aggr	This represents the axis values of a Compound Primitive Data Type (curve or map). The first swAxisCont describes the x-axis, the second swAxisCont describes the y-axis, the third swAxisCont describes the z-axis. In addition to this, the axis can be denoted in swAxisIndex.
swValueCont	RuleBasedValueCont	0..1	aggr	This represents the values of an array or Compound Primitive Data Type. Stereotypes: atpSplitable Tags: atp.Splitkey=swValueCont

Table 5.129: ApplicationRuleBasedValueSpecification

[constr_1922] Existence of ApplicationRuleBasedValueSpecification.category [For each ApplicationRuleBasedValueSpecification, attribute category shall exist **at the time when the RTE is generated.**]()

Please note that attribute ApplicationRuleBasedValueSpecification.category is mentioned in [constr_2058], which would fail if the attribute does not exist.

[constr_10041] Value of ApplicationRuleBasedValueSpecification.swAxisCont.category [The value of ApplicationValueSpecification.swAxisCont.category shall not be set to fixAXIS]()

Rationale for the existence of [constr_10041]: the value fixAXIS of attribute category indicates that the respective axis that is calculated out of the value of calibration parameters. Obviously, it does not make sense to initialize an axis of this kind and therefore it is excluded from the usage inside an ApplicationRuleBasedValueSpecification.

Class	RuleBasedAxisCont			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	This represents the values for the axis of a compound primitive (curve, map). For standard and fix axes, SwAxisCont contains the values of the axis directly. The axis values of SwAxisCont with the category COM_AXIS, RES_AXIS are for display only. For editing and processing, only the values in the related GroupAxis are binding.			
Base	ARObject			
Aggregated by	ApplicationRuleBasedValueSpecification.swAxisCont			
Attribute	Type	Mult.	Kind	Note
category	CalprmAxisCategory Enum	0..1	attr	This category specifies the particular axis types: <ul style="list-style-type: none"> • STD_AXIS • COM_AXIS • RES_AXIS (swArraysize necessary) Tags: xml.sequenceOffset=20
ruleBased Values	RuleBasedValue Specification	0..1	aggr	This represents the rule based value specification for the axis of a compound primitive (curve, map). Tags: xml.roleElement=true xml.roleWrapperElement=false xml.sequenceOffset=80 xml.typeWrapperElement=false
swArraysize	ValueList	0..1	aggr	For multidimensional compound primitives (curve, map ...) it is necessary to know the dimensions. They are specified using swArraySize. Tags: xml.sequenceOffset=40
swAxisIndex	AxisIndexType	0..1	attr	This property allows to explicitly assign the axis contents to a particular axis. It is specified by numbers where 1 corresponds to the x-axis. It is also possible to derive the axis association from the sequence of the parent. Tags: xml.sequenceOffset=50
unit	Unit	0..1	ref	This represents the physical unit of the provided values. Tags: xml.sequenceOffset=30

Table 5.130: RuleBasedAxisCont

[constr_1923] Existence of RuleBasedAxisCont.ruleBasedValues [For each RuleBasedAxisCont, attribute ruleBasedValues shall exist at the time when the contract phase generation is executed.]()

Class	RuleBasedValueCont			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	This represents the values of a compound primitive (CURVE, MAP, CUBOID, CUBE_4, CUBE_5, VAL_BLK) or an array.			
Base	ARObject			
Aggregated by	ApplicationRuleBasedValueSpecification.swValueCont			
Attribute	Type	Mult.	Kind	Note

Class	RuleBasedValueCont			
ruleBasedValues	RuleBasedValueSpecification	0..1	aggr	This represents the rule based value specification for the array or compound primitive (CURVE, MAP, CUBOID, CUBE_4, CUBE_5, VAL_BLK). Stereotypes: atpSplittable Tags: atp.Splitkey=ruleBasedValues xml.roleElement=true xml.roleWrapperElement=false xml.sequenceOffset=80 xml.typeWrapperElement=false
swArraysizes	ValueList	0..1	aggr	This attribute defines the size of each dimension for compound primitives CURVE, MAP, CUBOID, CUBE_4, CUBE_5, COM_AXIS, RES_AXIS, VAL_BLK. For each dimension one value has to be defined, e.g. one in case of COM_AXIS and two or more in case of MAP. Tags: xml.sequenceOffset=40
unit	Unit	0..1	ref	This represents the physical unit of the provided values. Tags: xml.sequenceOffset=30

Table 5.131: RuleBasedValueCont

[constr_1924] Existence of [RuleBasedValueCont.ruleBasedValues](#) [For each [RuleBasedValueCont](#), attribute [ruleBasedValues](#) shall exist **at the time when the contract phase generation is executed.**]()

In case the [ApplicationRuleBasedValueSpecification](#) is applied to [Compound Primitive Data Types](#) basically the same rules apply for [ApplicationRuleBasedValueSpecification](#) as defined for [ApplicationValueSpecification](#).

[constr_2057] Mandatory information of a [RuleBasedAxisCont](#) [If the attribute [swAxisCont](#) is defined for an [ApplicationRuleBasedValueSpecification](#) the [RuleBasedAxisCont](#) shall define one [swAxisIndex](#) value and one [swArraysizes](#) value per dimension, even in the case when the owning [ApplicationRuleBasedValueSpecification](#) defines only the content of a single dimensional object like a CURVE.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_2058] Mandatory information of a [RuleBasedValueCont](#) [If the attribute [swValueCont](#) is defined for an [ApplicationRuleBasedValueSpecification](#) the [RuleBasedValueCont](#) shall always define the attribute [swArraysizes](#) if the [ApplicationRuleBasedValueSpecification](#) is of category CURVE, MAP, CUBOID, CUBE_4, CUBE_5, COM_AXIS, RES_AXIS, or VAL_BLK.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Please note that the definition of attribute `swArraysSize` is not required for an `ApplicationRuleBasedValueSpecification` of category `ARRAY` because the applicable size can typically be derived from the context.

Please note further that for multidimensional `Compound Primitive Data Types` (e.g. `MAP`) it is necessary to know the dimensions in order to be able to process the `SwValues`. [constr_2057] and [constr_2058] shall support a consistent handling of single and multidimensional `Compound Primitive Data Types`.

If the `ApplicationRuleBasedValueSpecification` defines values for a `Compound Primitive Data Type` with more than one input axis the `swArraysSize` gets mandatory to ensure the correct processing of the values calculated by rule.

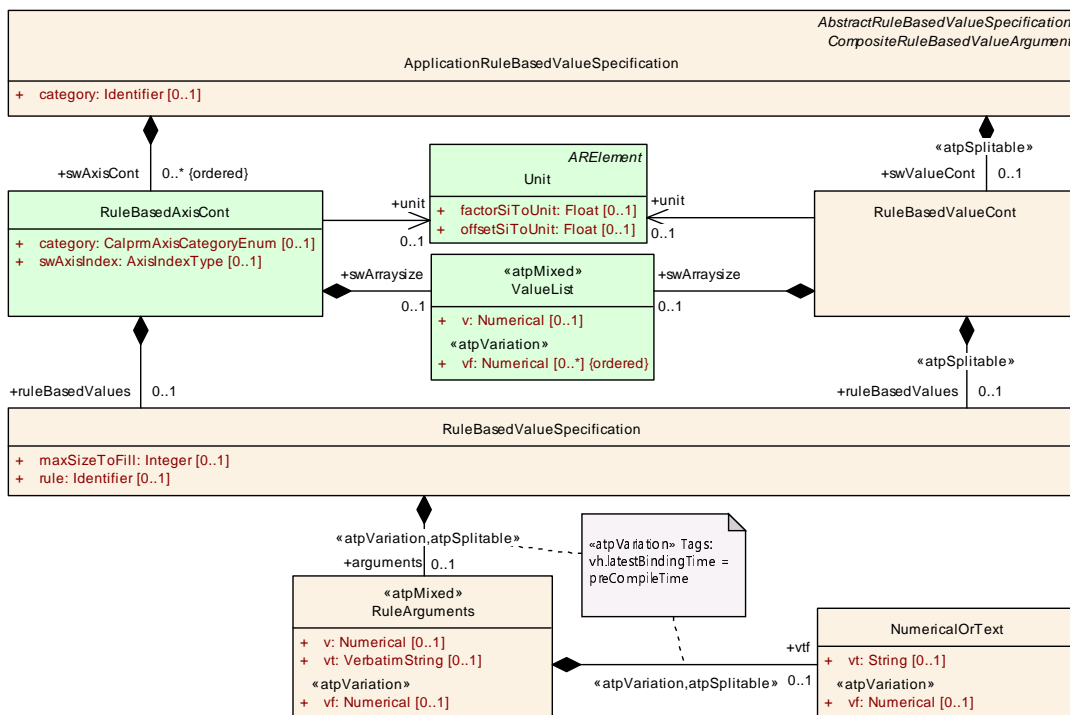

Figure 5.65: Definition of an `ApplicationRuleBasedValueSpecification`

[TPS_SWCT_02053] Values of `RuleBasedAxisCont` with the category `COM_AXIS`, `RES_AXIS` are for display only [In case of `ApplicationRuleBasedValueSpecifications` of category `MAP`, `CUBOID`, `CUBE_4`, `CUBE_5` or `CURVE` it is possible that the `RuleBasedAxisCont` of axes can be omitted if the axis is of category `COM_AXIS` or `RES_AXIS`.

If `RuleBasedAxisCont` values exists in such cases for the axes these are for display purpose only because the related `DataPrototype` of the `MAP` or `CURVE` does not hold the values of such axes. These are properties of the `DataPrototype` of the `COM_AXIS` or `RES_AXIS`.]()

Hence, values of the `COM_AXIS` itself are described by `RuleBasedValueCont`.

[TPS_SWCT_01528] Meaning of `NumericalRuleBasedValueSpecification` [The purpose of the `NumericalRuleBasedValueSpecification` is to provide

means for a compact provision of values for `DataPrototypes` that otherwise would require a high volume (in terms of serialized ARXML) of e.g. initialization data. `NumericalRuleBasedValueSpecification` may be used for `DataPrototypes` typed by `ImplementationDataTypes` of category `ARRAY` or Compound Primitive Data Types mapped to `ImplementationDataTypes` of category `ARRAY`.] ([RS_SWCT_03260](#))

Concerning `initValues` for Compound Primitive Data Types please note as well [[TPS_SWCT_01185](#)].

Class	NumericalRuleBasedValueSpecification			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	This meta-class is used to support a rule-based initialization approach for data types with an array-nature (ImplementationDataType of category ARRAY).			
Base	<i>ARObject, AbstractRuleBasedValueSpecification, ValueSpecification</i>			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element , CalibrationParameterValue.applInitValue , CalibrationParameterValue.implInitValue , ConstantSpecification.valueSpec , CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.timeoutSubstitutionValue, NonqueuedReceiverComSpec.initValue, NonqueuedReceiverComSpec.timeoutSubstitutionValue, NonqueuedSenderComSpec.initValue, NvProvideComSpec.ramBlockInitValue, NvProvideComSpec.romBlockInitValue, NvRequireComSpec.initValue, ParameterDataPrototype.initValue, ParameterProvideComSpec.initValue, ParameterRequireComSpec.initValue, PersistencyDataRequiredComSpec.initValue, PersistencyKeyValuePair.initValue, PortDefinedArgumentValue.value , PortPrototypeBlueprintInitValue.value, RecordValueSpecification.field , SomeipEventDeployment.eventReceptionDefaultValue, StateManagementCompareCondition.compareValue , SwDataDefProps.invalidValue , VariableDataPrototype.initValue

[constr_1754] Aggregation of [NumericalRuleBasedValueSpecification](#)
[Each [ArrayValueSpecification](#) shall only aggregate at most one [NumericalRuleBasedValueSpecification](#) in the role element.

If one [NumericalRuleBasedValueSpecification](#) is aggregated then it shall be the only aggregated element, i.e. no further [ValueSpecification](#) shall exist in the

same aggregation where an `NumericalRuleBasedValueSpecification` is aggregated.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

5.6.9.2 Support for composite Data Types

[TPS_SWCT_01692] Meaning of `CompositeRuleBasedValueSpecification`
[The rule-based initialization of arrays of a composite data type is modeled by means of the `CompositeRuleBasedValueSpecification`.] (*RS_SWCT_03260*)

Class	CompositeRuleBasedValueSpecification			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	This meta-class represents rule-based values for DataPrototypes typed by composite AutosarDataTypes.			
Base	<i>ARObject, AbstractRuleBasedValueSpecification, ValueSpecification</i>			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element , CalibrationParameterValue.applInitValue , CalibrationParameterValue.implInitValue , ConstantSpecification.valueSpec , CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.timeoutSubstitutionValue, NonqueuedReceiverComSpec.initValue , NonqueuedReceiverComSpec.timeoutSubstitutionValue , NonqueuedSenderComSpec.initValue , NvProvideComSpec.ramBlockInitValue , NvProvideComSpec.romBlockInitValue , NvRequireComSpec.initValue , ParameterDataPrototype.initValue , ParameterProvideComSpec.initValue , ParameterRequireComSpec.initValue , PersistencyDataRequiredComSpec.initValue , PersistencyKeyValuePair.initValue , PortDefinedArgumentValue.value , PortPrototypeBlueprintInitValue.value , RecordValueSpecification.field , SomeipEventDeployment.eventReceptionDefaultValue , StateManagementCompareCondition.compareValue , SwDataDefProps.invalidValue , VariableDataPrototype.initValue			
Attribute	Type	Mult.	Kind	Note
argument (ordered)	CompositeValueSpecification	*	aggr	This represents the collection of aggregated Value Specifications. The last ValueSpecification in the collection shall be taken to execute the filling rule. Tags: xml.sequenceOffset=30
compound Primitive Argument (ordered)	CompositeRuleBasedValueArgument	*	aggr	This represents the collection of aggregated Value Specifications for compound primitive data type. The last ValueSpecification in the collection shall be taken to execute the filling rule. Tags: xml.sequenceOffset=35
maxSizeToFill	PositiveInteger	0..1	attr	If a rule is chosen which does not fill until the end, this determines until which size the rule shall fill the values. Tags: xml.sequenceOffset=40
rule	Identifier	0..1	attr	This denotes the name of the rule of the RuleBasedValue Specification. The rule determines the calculation specification according which the arguments are used to calculated the values. Tags: xml.sequenceOffset=20

Table 5.135: CompositeRuleBasedValueSpecification

[constr_1928] Existence of `CompositeRuleBasedValueSpecification.rule`
[For each `CompositeRuleBasedValueSpecification`, attribute `rule` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1929] Existence of CompositeRuleBasedValueSpecification.argument [For each `CompositeRuleBasedValueSpecification`, the aggregation of `CompositeValueSpecification` in the role `argument` shall exist **at the time when the contract phase generation is executed.**]()

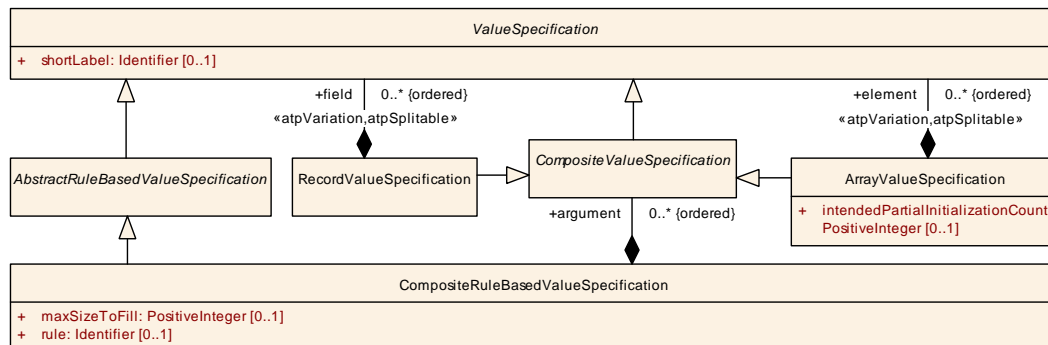

Figure 5.67: Rule-based value specification of arrays of a composite data type

Please find an example of the definition of a `RuleBasedValueSpecification` for primitive array elements in Appendix B.3.9.

Please note that it is not foreseen that an `ArrayValueSpecification` consist of a collection of `CompositeRuleBasedValueSpecification` or even a mixture of `CompositeRuleBasedValueSpecification` with another kind of `ValueSpecification`.

[constr_1755] Aggregation of CompositeRuleBasedValueSpecification [Each `ArrayValueSpecification` shall only aggregate at most one `CompositeRuleBasedValueSpecification` in the role element.

If one `CompositeRuleBasedValueSpecification` is aggregated then it shall be the only aggregated element, i.e. no further `ValueSpecification` shall exist in the same aggregation where an `CompositeRuleBasedValueSpecification` is aggregated.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

An example for the definition of a `CompositeRuleBasedValueSpecification` can be found in section B.3.10.

5.6.9.3 Support for compound primitive Data Types

Please note that the `CompositeRuleBasedValueSpecification` also supports the rule-based initialization of arrays²³ that are typed by a `Compound Primitive Data Type`, e.g. of `category CURVE`.

²³Of course, this capability is restricted to `ApplicationArrayDataType`. On the level of `ImplementationDataType`, `ValueSpecifications` that reflect the structure of the respective `ImplementationDataType` are used.

[TPS_SWCT_01836] Attributes of **CompositeRuleBasedValueSpecification**
[Meta-class **CompositeRuleBasedValueSpecification** can be used to fulfill two distinct use cases:

- Definition of a rule-based value specification for an array of composite data type based on the aggregation of **CompositeValueSpecification** in the role **argument**.
- Definition of a rule-based value specification for an array of **Compound Primitive Data Type** based on the aggregation of **CompositeRuleBasedValueArgument** in the role **compoundPrimitiveArgument**.

]()

[constr_10075] Existence of **CompositeRuleBasedValueSpecification.argument** vs. **compoundPrimitiveArgument** [For every **CompositeRuleBasedValueSpecification**, at most one of the aggregations

- **argument**
- **compoundPrimitiveArgument**

shall exist at the time when the contract phase generation is executed.]()

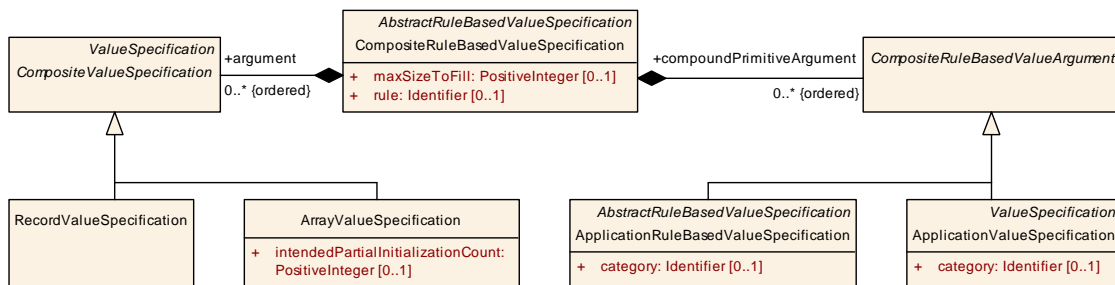

Figure 5.68: Rule-based value specification for compound primitive data objects

Class	CompositeRuleBasedValueArgument (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	This meta-class has the ability to serve as the abstract base class for ValueSpecifications that can be used for compound primitive data types.

Table 5.136: CompositeRuleBasedValueArgument

Please find a simplified example for the rule-based initialization of an array of an **ApplicationPrimitiveDataType** of **category CURVE** with an integrated axis in Appendix **B.3.10**.

5.7 Initial Values

5.7.1 Overview

[TPS_SWCT_01301] Importance of initial values [If the value of a `VariableDataPrototype/ParameterDataPrototype` has not properly been set by a piece of software, it can still happen that another piece of software tries to access the value of the `VariableDataPrototype/ParameterDataPrototype`.

For various reasons it is therefore advised to be able to specify an initial value for a `VariableDataPrototype/ParameterDataPrototype` in case the value has not been assigned in a controlled manner. However, the definition of an initial value in many cases depends on a context in which the value is accessed.]()

Therefore, the AUTOSAR standard foresees means for defining initial values for `VariableDataPrototypes/ParameterDataPrototypes` on different conceptual levels.

That is, although defined for the same `VariableDataPrototype/ParameterDataPrototype`, an initial value defined on one conceptual level can “supersede” the definition of another initial value on a different conceptual level provided that the priority of the first is higher than the priority of the latter.

The meaning of “supersede” in this context is that the definition of an initial value on a specific conceptual level is the only relevant definition of an initial value on that level.

[TPS_SWCT_01518] Priority of initial value definition with respect to conceptual levels [Any initial value defined in the context of a conceptual level of lower priority is ignored!]()

[TPS_SWCT_01855] Definition of initial value for data transmission [Initial values for sender/receiver-based data transmission (i.e. intra-Ecu as well as inter-Ecu) shall only be defined by means of `NonqueuedSenderComSpec.initValue` resp. `NonqueuedReceiverComSpec.initValue`. Any definition of an `initValue` defined in the context of `VariableDataPrototype` shall be ignored.]()

[TPS_SWCT_01182] Conceptual levels for the definition of initial values [The following conceptual levels for the definition of initial values exist:

1. It is possible to aggregate an `initValue` directly at the definition of any `VariableDataPrototype/ParameterDataPrototype`. A restriction applies, please consult with [\[TPS_SWCT_01855\]](#).
2. It is possible to aggregate an `initValue` at the level of a `ComSpec`, namely:
 - `NonqueuedSenderComSpec`
 - `NonqueuedReceiverComSpec`
 - `ParameterProvideComSpec`
 - `ParameterRequireComSpec`

- [NvRequireComSpec](#)
- [NvProvideComSpec](#)

3. It is possible to aggregate a [implInitValue](#) and an [applInitValue](#) at the definition of a [CalibrationParameterValue](#).

The priority of one definition of an initial value over another is reflected by the numerical order of the above enumeration, e.g. a definition on level 3 supersedes a definition on level 2.]()

5.7.2 Initial Value Representation

[TPS_SWCT_01183] Actual value of an [initValue](#) shall be interpreted according to the [AutosarDataType](#) [A [DataPrototype](#) can be typed by either an [ApplicationDataType](#) or else an [ImplementationDataType](#). Therefore, the actual value of an [initValue](#) shall be interpreted according to the [AutosarDataType](#) that types the [DataPrototype](#).

That is, if the [DataPrototype](#) is typed by an [ApplicationDataType](#), the value shall be interpreted as a physical value while, if the [DataPrototype](#) is typed by an [ImplementationDataType](#), the value is to be interpreted as the direct numerical representation.]([RS_SWCT_03216](#), [RS_SWCT_03217](#))

[TPS_SWCT_01184] [ApplicationPrimitiveDataTypes](#) with [category](#) VALUE [In case of [ApplicationPrimitiveDataTypes](#) with [category](#) VALUE it is sufficient if the [initValues](#) are provided as physical values only because the RTE Generator should be able to evaluate the related [CompuMethod](#) appropriately.]([RS_SWCT_03216](#), [RS_SWCT_03217](#))

Please note that [DataPrototypes](#) that refer to [CompuMethods](#) of category [SCALE_LINEAR_AND_TEXTTABLE](#) (or similar) shall be initialized by means of the definition of several [ApplicationValueSpecification.swValueCont.swValuesPhys.vtf](#).

Depending on the evaluation of the binding expression either a numerical value or a string is taken to initialize the [DataPrototype](#).

[TPS_SWCT_01185] [initValues](#) for [Compound Primitive Data Types](#) [The definition of [initValues](#) in the numerical representation for [Compound Primitive Data Type](#) is done such that the [initValues](#) have to be provided as a [RecordValueSpecification](#) respectively an [ArrayValueSpecification](#) or [NumericalRuleBasedValueSpecification](#) matching to the related [ImplementationDataType](#). The additional representation can be provided and associated by means of a [ConstantSpecificationMapping](#).]([RS_SWCT_03216](#))

Please note that the definition of [Compound Primitive Data Type](#) can be found in section 5.6.

[constr_1221] DataPrototype is typed by an ApplicationPrimitiveDataType [If a `DataPrototype` is typed by an `ApplicationPrimitiveDataType`, its `initValue` shall be provided by an `ApplicationValueSpecification`.

If the underlying `ApplicationPrimitiveDataType` represents an enumeration, the value provided shall match to one of the applicable text values (`vt`, `shortLabel`, `symbol`) defined by the applicable `CompuScales`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Please note that several attributes of meta-class `CompuScale` can be taken to describe the actual value. It is therefore necessary to clarify what happens if several of these attributes exist within the context of one `CompuScale`. This clarification can be found in [TPS_SWCT_01696].

[constr_1385] DataPrototype is typed by an ImplementationDataType [If a `DataPrototype` is typed by an `ImplementationDataType`, its `initValue` shall **not** be provided by an `ApplicationValueSpecification`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1222] category of an AutosarDataType used to type a DataPrototype is set to STRING [If the `category` of an `AutosarDataType` used to type a `DataPrototype` is set to `STRING`, the `ApplicationValueSpecification` used to initialize the `DataPrototype` shall be of `category STRING`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1223] DataPrototype is typed by an ApplicationRecordDataType [If a `DataPrototype` is typed by an `ApplicationRecordDataType`, the corresponding `initValue` shall be provided by a `RecordValueSpecification`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1224] DataPrototype is typed by an ApplicationArrayDataType [If a `DataPrototype` is typed by an `ApplicationArrayDataType`, the corresponding `initValue` shall be provided by an `ArrayValueSpecification` (that may contain an `ApplicationRuleBasedValueSpecification`).

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_10439] Initialization of a DataPrototype typed by a Compound Primitive Data Type [If a `DataPrototype` that is typed by a `Compound Primitive Data Type` according to [TPS_SWCT_01179] needs to be initialized by a constant value, then the initialization shall only be provided in the form of an `ApplicationValueSpecification`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

5.7.3 Initial Values For CalibrationParameters

[TPS_SWCT_01188] Definition of calibration data sets through RTE-generator and compiler [It is possible to provide sets of initial values for calibration parameters which are instance specific, thus overriding any initial values predefined by a [ParameterDataPrototype](#), [ParameterRequireComSpec](#) or a [ParameterProvideComSpec](#).

This allows to create the calibration data sets through RTE-generator and compiler. These initial values are specified in [CalibrationParameterValueSet](#) and [CalibrationParameterValue](#). The latter aggregates a [ValueSpecification](#) in two different roles:

- [applInitValue](#) for data structured according to [ApplicationDataType](#). In this case the values are defined in the physical domain.
- [implInitValue](#) for data structured according to [ImplementationDataType](#). In this case the values are defined in the numerical domain.

] ([RS_SWCT_03175](#))

Anyhow, these initial values can be imported from e.g. an ASAM CDF file.

implInitValue	ValueSpecification	0..1	aggr	This is the initial value specification structured according to the ImplementationDataType
initialized Parameter	FlatInstanceDescriptor	0..1	ref	This represents the parameter that is initialized by the CalibrationParameterValue.

Table 5.138: CalibrationParameterValue

[constr_1933] Existence of CalibrationParameterValue.initializedParameter [For each CalibrationParameterValue, the reference to meta-class ConstantSpecification in the role initializedParameter shall exist at the time when the contract phase generation is executed.]()

5.7.4 Initial Value for optional Element

The existence of optional elements in a given AutosarDataType needs to be properly considered for the definition of an initial value.

5.7.4.1 Initial Value for optional ApplicationRecordElement

The initial value for a given `DataPrototype` typed by an `ApplicationRecordDataType` is defined by means of a `RecordValueSpecification`.

[TPS_SWCT_01823] Definition of `ValueSpecification` for an `ApplicationRecordDataType` with unavailable optional elements [If an `ApplicationRecordDataType` contains `ApplicationRecordElements` where attribute `isOptional` is set to `true`, it is still necessary that the corresponding `RecordValueSpecifications` fulfill [constr_1271], i.e. a `ValueSpecification` shall be provided for optional elements that are unavailable as far as the `ValueSpecification` is concerned.

The canonical approach to fulfill [constr_1271] is to fill the place in the structure that represents a non-available optional element of the structure with a special kind of `ValueSpecification` (the `NotAvailableValueSpecification`) in order to unambiguously convey the information that this element is not available for the specific `DataPrototype`, as far as the initial value is concerned.] (*RS_SWCT_03320*)

The statement made by [TPS_SWCT_01823] is to be interpreted such that the `NotAvailableValueSpecification` shall represent the place of the non-available `ApplicationRecordElement` in the enclosing `ApplicationRecordDataType`, even if the data type of the non-available `ApplicationRecordElement` is a composite data type (e.g. an `ApplicationRecordDataType`).

This understanding is sketched in a bare-bones model example:

Example 5.4

```

<CONSTANT-SPECIFICATION>
  <SHORT-NAME>DoThis</SHORT-NAME>
  <VALUE-SPEC>
    <RECORD-VALUE-SPECIFICATION>
      <FIELDS>
        <APPLICATION-VALUE-SPECIFICATION></APPLICATION-VALUE-SPECIFICATION>
        <NOT-AVAILABLE-VALUE-SPECIFICATION></NOT-AVAILABLE-VALUE-SPECIFICATION>
        <APPLICATION-VALUE-SPECIFICATION></APPLICATION-VALUE-SPECIFICATION>
      </FIELDS>
    </RECORD-VALUE-SPECIFICATION>
  </VALUE-SPEC>
</CONSTANT-SPECIFICATION>
    
```

Listing 5.3: Intended application of `NotAvailableValueSpecification`

In other words, `NotAvailableValueSpecification` is not limited to a primitive "leaf" element. `NotAvailableValueSpecification` can be applied on any level of a composite `ValueSpecification`.

There is **no need for delegating** the actual nature of the `ValueSpecification` down to the leaf element, as sketched in the following model excerpt:

Example 5.5

```
<CONSTANT-SPECIFICATION>
  <SHORT-NAME>DontDoThis</SHORT-NAME>
  <VALUE-SPEC>
    <RECORD-VALUE-SPECIFICATION>
      <FIELDS>
        <APPLICATION-VALUE-SPECIFICATION></APPLICATION-VALUE-SPECIFICATION>
        <RECORD-VALUE-SPECIFICATION>
          <FIELDS>
            <NOT-AVAILABLE-VALUE-SPECIFICATION></NOT-AVAILABLE-VALUE-SPECIFICATION>
            <NOT-AVAILABLE-VALUE-SPECIFICATION></NOT-AVAILABLE-VALUE-SPECIFICATION>
          </FIELDS>
        </RECORD-VALUE-SPECIFICATION>
        <APPLICATION-VALUE-SPECIFICATION></APPLICATION-VALUE-SPECIFICATION>
      </FIELDS>
    </RECORD-VALUE-SPECIFICATION>
  </VALUE-SPEC>
</CONSTANT-SPECIFICATION>
```

Listing 5.4: This application of `NotAvailableValueSpecification` is not intended

[TPS_SWCT_01821] Semantics of attribute `NotAvailableValueSpecification.defaultPattern` [The usage of `NotAvailableValueSpecification` explicitly defines that no specific initialization value shall be defined for an optional element.

The memory area occupied by the `NotAvailableValueSpecification` shall however be filled with a deterministic pattern during initialization.

The content of `defaultPattern` shall be used to fill the gap in the memory occupied by an optional element with `NotAvailableValueSpecification` initialization.] (*RS_SWCT_03320*)

[TPS_SWCT_01822] Application of attribute `NotAvailableValueSpecification.defaultPattern` happens only during initialization [The value of `NotAvailableValueSpecification.defaultPattern` is applied only during the initialization of the respective `DataPrototype`.

Therefore, if the optional element is not received during a specific reception, the memory area is untouched. It is the duty of the application to check whether that optional element has actually been received.] (*RS_SWCT_03320*)

[constr_10005] Existence of attribute `NotAvailableValueSpecification.defaultPattern` [For each `NotAvailableValueSpecification`, attribute `defaultPattern` shall exist **at the time when the contract phase generation is executed.**] ()

[constr_10006] Valid interval of attribute `NotAvailableValueSpecification.defaultPattern` [The valid interval for attribute `NotAvailableValueSpecification.defaultPattern` **at the time when the contract phase generation is executed** is 0..255.]()

5.7.4.2 Initial Value for optional `ImplementationDataTypeElement`

[TPS_SWCT_01785] Initial value for `ImplementationDataType` of category `STRUCTURE` where attribute `isStructWithOptionalElement` set to the value `true` [If an initial value is to be provided for an `ImplementationDataType` of category `STRUCTURE` where attribute `isStructWithOptionalElement` set to the value `true` then an initial value shall be defined for all `ImplementationDataTypeElements` including the first `ImplementationDataTypeElement` where the `shortName` is set to the value `availabilityBitfield`.](*RS_SWCT_03320*)

[TPS_SWCT_01786] Initial value for the `ImplementationDataTypeElement` where the `shortName` is set to the value `availabilityBitfield` [The initial value for the `ImplementationDataTypeElement` where the `shortName` is set to the value `availabilityBitfield` shall be defined in a way that the bit that represents the existence of a given element is set to `true` if the element shall initially be available.

If the corresponding element shall not be initially available then the respective bit shall be set to `false`.](*RS_SWCT_03320*)

[TPS_SWCT_01787] Initialization of not-available `ImplementationDataTypeElement` [If a given `ImplementationDataTypeElement` is not available in the context of the definition of an initial value, then a “dummy” initial value shall be defined anyway for the element in order to not break [*constr_1272*].

The provided `ValueSpecification` shall be considered as “don’t care”.]()

From the perspective of performance, it is recommended to use the value 0 (on the level of a leaf element) for an initialization according to [*TPS_SWCT_01787*] of non-available `ImplementationDataTypeElement`.

The usage of a `NotAvailableValueSpecification` is limited to the context of `ApplicationDataType`. Consequently, the “dummy” initial value mentioned in [*TPS_SWCT_01787*] shall not be implemented as an `NotAvailableValueSpecification`, see [*constr_10415*].

[constr_10415] Initial value on the level of an `ImplementationDataTypeElement` where attribute `isOptional` is set to the value `True` [The initial value used on the level of an `ImplementationDataTypeElement` where attribute `isOptional` is set to the value `True` shall **not** be initialized using a `NotAvailableValueSpecification`.

This rule shall be imposed **at the time when the contract phase generation is executed**.]()

6 Compatibility

6.1 Introduction

In order to connect `PortPrototypes` of `SwComponentTypes`, the compatibility of `PortPrototypes` needs to be verified. This section defines the basic rules for formal compatibility of `PortPrototypes`.

Compatibility will be defined bottom-up, i.e. first the rules for compatible `AutosarDataTypes` are set up, then the rules for the different types of `PortInterfaces` are derived.

Another aspect of compatibility is whether two model-elements (e.g. `ApplicationDataType` vs. `ImplementationDataType`) can be mapped to each other.

For the compatibility of `PortInterfaces` basically two options apply:

1. finding of matching pairs of elements of `PortInterfaces` is based on matching `shortName` plus the application of compatibility rules for their attributes.
2. a `PortInterfaceMapping` can be taken to declare two elements of `PortPrototypes` as compatible without applying further formal checks.

6.2 Compatibility of Data Types

The AUTOSAR meta-model defines a number of meta-classes (e.g. `ApplicationPrimitiveDataType`) that eventually refer to a set of attributes (e.g. a lower boundary for its values) relevant for compatibility checking.

Instantiating a data-type related meta-class defines a data type on M1 level (e.g. `temperatureType`). In other words: `ApplicationPrimitiveDataType` is an M2 artifact; it is taken as the template for creating a corresponding M1 artifact `temperatureType`.

In this context, the issue of compatibility refers to the M1 objects, i.e. the instances of sub-classes of `AutosarDataType` need to be considered. For this purpose the relevant part of the AUTOSAR meta-model need to be fully explored with respect to compatibility.

6.2.1 ApplicationDataType

6.2.1.1 ApplicationPrimitiveDataType

[constr_1047] Compatibility of `ApplicationPrimitiveDataTypes` [Instances of `ApplicationPrimitiveDataType` are compatible **at the time when the RTE is generated** if and only if one of the following conditions applies:

1. All the following sub conditions apply:

- (a) They have the same `category`.
 - (b) The `swDataDefProps` (after consideration of [\[constr_1015\]](#)) attached to the M1 data types are compatible.
2. In the context of using the `ApplicationPrimitiveDataType`, a `DataPrototypeMapping` exists that refers to a `DataPrototype` typed by one of the `ApplicationPrimitiveDataTypes` in the role `firstDataPrototype` and to another `DataPrototype` typed by the other `ApplicationPrimitiveDataType` in the role `secondDataPrototype`.
 3. In the context of using the `ApplicationPrimitiveDataType`, a `DataPrototypeMapping` exists that refers to a `DataPrototype` typed by the `ApplicationPrimitiveDataType` in the role `secondDataPrototype` and to another `DataPrototype` typed by an `ApplicationCompositeDataType` in the role `firstDataPrototype` and additionally for the side of the `ApplicationCompositeDataType` a corresponding `ApplicationCompositeDataType-SubElementRef` exists in the role `firstElement` that in turn references an `ApplicationCompositeElementDataPrototype`.

]()

Please note that the meaning of “`swDataDefProps` attached to the M1 data types are compatible” is explained in section [6.2.4](#).

Please note further that it is **not** required that the `shortNames` of two data types shall be identical in order to consider the two data types as compatible.

6.2.1.2 ApplicationCompositeDataType

An instance of an `ApplicationRecordDataType` is never compatible to an instance of an `ApplicationArrayDataType` **unless** a `PortInterfaceMapping` exists that details the terms of compatibility (see [\[TPS_SWCT_01543\]](#)).

[constr_1048] Compatibility of `ApplicationRecordDataTypes` [Instances of `ApplicationRecordDataTypes` are compatible **at the time when the RTE is generated** if and only if one of the following conditions applies:

1. All `elements at the same record position` are of compatible `AutosarDataTypes` (either `ApplicationCompositeDataTypes` or `ApplicationPrimitiveDataTypes`).
2. For each `ApplicationRecordDataType.element`, the attribute `isOptional` shall either
 - not exist on both sides or
 - be set to the value `false` if it only exists on one side or
 - have the identical value on both sides.

3. In the context of a `DataPrototypeMapping`, for each `ApplicationRecordElement` of the required `ApplicationRecordDataType` a `SubElementMapping` exists such that a `ApplicationCompositeDataTypeSubElementRef` in the role `firstElement` or `secondElement` exists that references the required `ApplicationRecordElement` **and** a corresponding `ApplicationCompositeDataTypeSubElementRef` exists in the **other** role (i.e. `secondElement` or `firstElement`) that in turn references an `ApplicationRecordElement` of the provided `ApplicationRecordDataType`.

]()

[constr_1049] Compatibility of `ApplicationArrayDataTypes` [Instances of `ApplicationArrayDataType` are compatible **at the time when the RTE is generated** if and only if one of the following conditions applies:

1. All the following sub conditions apply:
 - (a) Their `elements` are of a compatible `AutosarDataTypes` (either `ApplicationCompositeDataTypes` or `ApplicationPrimitiveDataTypes`).
 - (b) The attributes `maxNumberOfElements` and `arraySizeSemantics` (given the existence) have identical values.
2. In the context of a `DataPrototypeMapping`, for the `ApplicationArrayElement` of the required `ApplicationArrayDataType` a `SubElementMapping` exists such that a `ApplicationCompositeDataTypeSubElementRef` in the role `firstElement` or `secondElement` exists that references the required `ApplicationArrayElement` **and** a corresponding `ApplicationCompositeDataTypeSubElementRef` exists in the **other** role (i.e. `secondElement` or `firstElement`) that in turn references an `ApplicationArrayElement` of the provided `ApplicationArrayDataType`.

]()

6.2.2 ImplementationDataType

[constr_1050] Compatibility of `ImplementationDataTypes` [Instances of `ImplementationDataType` are compatible **at the time when the RTE is generated** if and only if after all type-references are resolved one of the following rules apply:

1. All the following sub conditions apply:
 - (a) They have the same `category`.
 - (b) They have the identical structure (this refers to `ImplementationDataTypeElement` and their `subElements`).

- (c) The attributes `arraySize` and `arraySizeSemantics` have (given the existence) identical values.
 - (d) For each `ImplementationDataType.subElement`, the attribute `isOptional` shall either
 - not exist on both sides or
 - be set to the value `false` if it only exists on one side or
 - have the identical value on both sides.
 - (e) The `swDataDefProps` (after consideration of [\[constr_1015\]](#)) attached to the M1 data types are compatible.
2. In the context of using the `ImplementationDataType`, a `DataPrototypeMapping` exists that refers to a `DataPrototype` typed by one of the `ImplementationDataTypes` in the role `firstDataPrototype` and to another `DataPrototype` typed by the other `ImplementationDataType` in the role `secondDataPrototype`.
 3. In the context of using the `ImplementationDataType`, a `DataPrototypeMapping` exists that refers to a `DataPrototype` typed by the `ImplementationDataTypes` in the role `secondDataPrototype` and to another `DataPrototype` typed by an `ImplementationDataType` with a `subElement` in the role `firstDataPrototype` and additionally for the side of the `ImplementationDataType` with a `subElement` a corresponding `ImplementationDataTypeSubElementRef` exists in the role `firstElement` that in turn references an `ImplementationDataTypeElement`.

]()

Please note that the meaning of “`swDataDefProps` attached to the M1 data types are compatible” is explained in section [6.2.4](#).

Please note that it is **not** required that the `shortNames` of two data types shall be identical in order to consider the two data types as compatible.

The following constraint applies for the case that mode manager and mode user are using different `ImplementationDataTypes`. From the point of view of the RTE there is only the necessity that all possible numbers used to represent `ModeDeclarations` of the mode manager has to fit into the range of the data type used for the mode user.

[constr_1168] Compatibility of `ImplementationDataTypes` used in the `ModeRequestTypeMap` [Both `ImplementationDataTypes` shall fulfill [\[constr_1167\]](#).

In addition to that, the possible numbers used for representing `ModeDeclarations` on the side of the mode manager shall match the supported range of the `ImplementationDataType` used for representing `ModeDeclarations` on the side of the mode user (see [\[constr_1075\]](#)).

This rule shall be imposed **at the time when the RTE is generated.**]()

6.2.3 Compatibility of SwBaseType

[constr_1220] Compatibility of SwBaseType [Two `SwBaseType`s are compatible **at the time when the RTE is generated** if and only if attributes

- `baseTypeSize` respectively
- `byteOrder`,
- `memAlignment`,
- `baseTypeEncoding`, and
- `nativeDeclaration`

have identical values **at the time when the RTE is generated.**]()

6.2.4 Compatibility of SwDataDefProps

[constr_1051] Compatibility of SwDataDefProps [`SwDataDefProps` are compatible **at the time when the RTE is generated** if and only if:

1. They refer to compatible `Unit` definitions, or neither of them has an associated `Unit`.
2. They refer to compatible conversion methods or neither of them associates such a method.
3. They both aggregate a `ValueSpecification` in the role `invalidValue` or neither of them aggregates a `ValueSpecification` in the role `invalidValue`.
4. If existent (see previous condition), one of the following conditions apply to `ValueSpecifications` aggregated in the role `invalidValue` for being considered compatible (after following and resolving indirections created by `ConstantReference`):
 - (a) both are `ApplicationValueSpecifications` and the values are compatible according to [TPS_GST_02501].
 - (b) both are `NumericalValueSpecifications` and the values are compatible according to [TPS_GST_02501].
 - (c) both are `TextValueSpecifications` and the values are identical.
 - (d) both are `ArrayValueSpecifications` and the values are effectively identical, e.g. if one `ArrayValueSpecification` specifies all values explicitly and the other `ArrayValueSpecification` specifies values based on a rule then the yield of both `ArrayValueSpecifications` (i.e. element for element) shall be identical.
 - (e) both are `RecordValueSpecifications` and the values are identical.

- (f) if one is a `NumericalValueSpecification` and the other one is an `ApplicationValueSpecification` then the check for compatibility shall apply the `CompuMethod` on the physical value such that a comparison on the implementation level becomes possible. [TPS_GST_02501] applies¹.

5. They refer to compatible data constraints `dataConstr`.
6. They refer to compatible `swRecordLayouts`

All other attributes (e.g. `swCalibrationAccess` do not affect compatibility).|()

Please note that compatible conversion methods are described in chapter 6.2.4.5.

6.2.4.1 Compatibility of Units

[constr_1052] Compatibility of Units [Two `Unit` definitions are compatible **at the time when the RTE is generated** if and only if:

1. They have compatible (see [TPS_GST_02501]) values of attributes `factorSiToUnit` and `offsetSiToUnit`.
2. One of the following conditions is fulfilled:
 - They refer to compatible definitions of `PhysicalDimension`.
 - Neither of them associates a `PhysicalDimension`.
 - One `Unit` refers to a `PhysicalDimension` with `shortName NoDimension` where all exponents are set to 0 and the other `Unit` does not refer to a `PhysicalDimension`.

|()

Please note that the case of two referenced `PhysicalDimensions` with the `shortName NoDimension` is handled by [constr_1053].

Please note further that it is **not** required that the `shortNames` of two `Units` shall be identical in order to consider the two units as compatible.

[TPS_SWCT_01492] Default values for `factorSiToUnit` and `offsetSiToUnit` [The default value of attribute `Unit.factorSiToUnit` is 1.

The default value of attribute `Unit.offsetSiToUnit` is 0. |()

Further constraints apply specifically for the handling of `Units` in the context of assigning a `ValueSpecification` to a given `AutosarDataPrototype`:

[constr_1391] Compatibility of Units in the context of assignment using an `ApplicationValueSpecification` [If an `ApplicationValueSpecification` is

¹if one is a `NumericalValueSpecification` and the other one is an `ApplicationValueSpecification` and the application of the `CompuMethod` on the side of the `ApplicationValueSpecification` does not yield a valid number a comparison is not possible.

used in the context of an assignment to an `AutosarDataPrototype`, then the `ApplicationValueSpecification.swValueCont.unit` shall be compatible to the `Unit` used in the definition of the given `AutosarDataPrototype`, i.e. `AutosarDataType.swDataDefProps.unit`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1392] Compatibility of Units in the context of assignment using an ApplicationRuleBasedValueSpecification [If an `ApplicationRuleBasedValueSpecification` is used in the context of an assignment to an `AutosarDataPrototype` then the `ApplicationRuleBasedValueSpecification.swValueCont.unit` shall be compatible to the `Unit` used in the definition of the given `AutosarDataPrototype`, i.e. `AutosarDataType.swDataDefProps.unit`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1393] Existence of RuleBasedValueCont.unit [For every `RuleBasedValueCont`, the reference `unit` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1771] Existence of SwValueCont.unit [For every `SwValueCont`, the reference `unit` shall exist **at the time when the contract phase generation is executed.**]()

6.2.4.2 Compatibility of PhysicalDimensions

[constr_1053] Compatibility of PhysicalDimensions [Two `PhysicalDimension` definitions are compatible if and only if the values of

- `lengthExp`
- `massExp`
- `timeExp`
- `currentExp`
- `temperatureExp`
- `molarAmountExp`
- `luminousIntensityExp`

are identical and **either**

- the `shortNames` are identical **or**
- a `PhysicalDimensionMapping` exists that maps one of the `PhysicalDimensions` in the role `firstPhysicalDimension` and the other `PhysicalDimension` in the role `secondPhysicalDimension`.

The imposition time of this constraint depends on the context:

- If the compatibility of `PhysicalDimensions` is evaluated in the context of the creation of a `SwConnector`, then the rule shall be imposed **at the time when the RTE is generated**.
- If the context is the creation of an `ApplicationValueSpecification`, then the rule shall be imposed **at the time when the contract phase generation is executed**.

⌋()

For clarification, there are some physical dimensions around that share the identical values for the exponents but still have a completely different meaning and shall therefore not be considered compatible. For precisely this reason [`constr_1053`] **requires** the `shortNames` of two `PhysicalDimensions` to be identical as a prerequisite for compatibility.

For example, there are at least two physical dimensions that share the values of

- `lengthExp` = 2
- `massExp` = 1
- `timeExp` = -2
- `currentExp` = 0
- `temperatureExp` = 0
- `molarAmountExp` = 0
- `luminousIntensityExp` = 0

The unit described by this set of exponents is usually referred to as “Nm” for *newton-meter* and it can be used for *torque* just as well as for *energy*. Obviously, two `Units` shall never be considered compatible if one refers to *torque* and the other one refers to *energy*.

6.2.4.3 Compatibility of Data Constraints

The compatibility of two `DataConstrs` depends on the context in which the owning data elements are connected:

[constr_1126] Compatibility of `DataConstrs` [The `DataConstr` (e.g. the limits) defined by the type of the providing data element shall be within the constraints defined by the type of the requiring data element.

For client-server communication, the following rules apply:

- For `arguments` with attribute `direction` set to the value `in`, the client shall take the role of the *provider* and the server shall take the role of the *requiring side*.
- For `arguments` with attribute `direction` set to the value `inout` the `DataConstr` shall be equal on both sides.
- For `arguments` with attribute `direction` set to the value `out`, the server shall take the role of the *provider* and the client shall take the role of the *requiring side*.

This rule shall be applied **at the time when the RTE is generated.**]()

In addition, it is always allowed that the requiring element defines no constraints.

[constr_1278] PhysConstrs references a Unit [DataConstrs are only compatible if the `DataConstr.dataConstrRule.physConstrs.unit` are compatible or neither `DataConstr.dataConstrRule.physConstrs.unit` exist **at the time when the RTE is generated.**]()

[constr_1054] No DataConstr available at the provider [If the provider defines no constraints, it is only compatible with a receiver which also defines no constraints at all **at the time when the RTE is generated.**]()

In other words, this is not a compatibility rule for the types but for the data prototypes.

6.2.4.4 Compatibility in case of ImplementationDataType

If the `SwDataDefProps` are owned by an `ImplementationDataType`, further conditions shall be met to ensure compatibility.

Note that depending on the `category` of the `ImplementationDataType`, at most one of these four constraints is actually relevant:

1. `category VALUE`:

[constr_1055] ImplementationDataType has category VALUE [The attributes `baseType` shall refer to a compatible `SwBaseType` **at the time when the contract phase generation is executed.**]() (see explanation in the following rule). The rules regarding the compatibility of `SwBaseTypes` are covered by [constr_1220].

2. `category TYPE_REFERENCE`:

[constr_1056] ImplementationDataType has category TYPE_REFERENCE [The `ImplementationTypes` referenced by the attributes `SwDataDefProps.implementationDataType` shall be compatible **at the time when the contract phase generation is executed.**]()

3. `category DATA_REFERENCE`:

[constr_1057] ImplementationDataType has category DATA_REFERENCE [The attributes `SwDataDefProps.swPointerTargetProps` shall have identical `targetCategory` and shall refer to `SwDataDefProps` where all attributes are identical **at the time when the contract phase generation is executed.**]() (in other words, the target types of the pointers shall be identical, not only compatible).

4. category **FUNCTION_REFERENCE**:

[constr_1058] ImplementationDataType has category FUNCTION_REFERENCE [The attributes `SwDataDefProps.swPointerTargetProps.functionPointerSignature` shall refer to `BswModuleEntry`s which each resolve to the **same function signature at the time when the contract phase generation is executed.**]()

Please note that the term “same signature” refers to the following predicates:

- same number of arguments
- return values and arguments shall have **identical** - not only *compatible* - data types

Two `SwBaseTypes` are compatible (in the sense of allowing a connection of ports via the RTE) if a simple conversion rule exists between the two types in the underlying programming language.

Admittedly, this is a rather weak condition. But because the definition of `SwBaseTypes` can contain a `nativeDeclaration` it is not possible to state this rule more specifically.

However, conversion between base types is considered as a less common use case than the simple case that the connected types just contain two identical `SwBaseTypes` (which is of course included in the rule).

Please note that, in addition, the existence of `ApplicationDataTypes` also constraints the possible `SwBaseTypes` via the compatibility rules for the mapping between `ApplicationDataTypes` and `ImplementationDataType` as will be explained in more detail in chapter 6.2.5.

6.2.4.5 Compatibility of CompuMethods

[constr_1163] Compatibility of CompuMethods [Two `CompuMethod` definitions are compatible **at the time when the RTE is generated** if and only if all attributes **except**

- `shortName`
- `desc`
- `introduction`

- `longName`
- `adminData`
- `annotation`
- `displayFormat`

are **identical and** the `compuScales` and `units` are compatible.]()

[constr_1153] Applicability of compatibility requirements for `CompuScales`
[Compatibility requirements for `CompuScales` shall only apply for `CompuScales` where the `category` of the enclosing `CompuMethod` is one of the following:

- `TEXTTABLE`
- `SCALE_LINEAR_AND_TEXTTABLE`
- `SCALE_RATIONAL_AND_TEXTTABLE`
- `TAB_NOINTP`
- `BITFIELD_TEXTTABLE`
- `LINEAR`
- `RAT_FUNC`
- `IDENTICAL`

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1154] Compatibility of `CompuScales` for sender-receiver communication and similar use cases [For sender-receiver communication and similar use cases, it is required that the set of `CompuScales` defined in the `CompuMethod` of the provider of the communication (i.e. on the side of the `PPortPrototype`) shall be a subset of the set of `CompuScales` defined in the `CompuMethod` on the required side (i.e. on the side of the `RPortPrototype`) **at the time when the RTE is generated.**]()

[constr_1155] Compatibility of `CompuScales` for client-server communication
[For client-server communication, the following rules apply **at the time when the RTE is generated:**

For `arguments` of direction `IN` the `CompuScales` defined in the `CompuMethod` of the client (i.e. on the side of the `RPortPrototype`) shall be a subset of the set of `CompuScales` defined in the `CompuMethod` supported at the server (i.e. on the side of the `PPortPrototype`).

For `arguments` of the direction `OUT` the set of `CompuScales` defined in the `CompuMethod` of the server (i.e. on the side of the `PPortPrototype`) shall be a subset of the set of `CompuScales` defined in the `CompuMethod` supported at the client (i.e. on the side of the `RPortPrototype`).

For `arguments` of direction `INOUT` the set of `CompuScales` defined in the `CompuMethod` of server and client shall be identical.]()

[constr_1156] Relevance of “names” of CompuScales [CompuScales which contribute to tabular conversion by having a `compuConst` are compatible **if and only if** the “names” of the `compuScales`, (namely `shortLabel`, `vt` and `symbol`, according to the priority rules communicated in [TPS_SWCT_01431]) are equal.

If the scale has no `compuConst`, “names” of `CompuScales` are not relevant for compatibility.

This rule shall be imposed **at the time when the RTE is generated.**]()

[TPS_SWCT_01842] Applicability of constraints of CompuScales [The constraints [constr_1154], [constr_1155], and [constr_1156] shall **only** apply in the absence of a `TextTableMapping` which shall take precedence regarding the compatibility if it exists.]()

[constr_1176] Compatibility of CompuScales of category LINEAR and RAT_FUNC [CompuScales of category `LINEAR` and `RAT_FUNC` are considered compatible **at the time when the RTE is generated** if they yield the same conversion.]()

For example, $\frac{n_0+n_1*phys}{d_0+d_1*phys}$ is compatible to $\frac{N_0+N_1*phys}{D_0}$ if $n_0 \sim N_0 \ \&\& \ n_1 \sim N_1 \ \&\& \ d_0 \sim D_0 \ \&\& \ d_1 \sim 0$.

Note that \sim indicates compatibility of numerical values according to [TPS_GST_-02501].

[constr_1192] Compatibility of “IDENTICAL” to “RAT_FUNC” or “LINEAR” [Similar to [constr_1176], a `CompuScale` where the `category` of the enclosing `CompuMethod` is set to `IDENTICAL` is – **at the time when the RTE is generated** – considered compatible to a `CompuScale` where the `category` of the enclosing `CompuMethod` is set to `RAT_FUNC` or `LINEAR` if the following rule applies:

$$int = \frac{N_0+N_1*phys+N_i*phys^i}{D_0+D_1*phys+D_i*phys^i} = phys$$

]()

For example, this is the case for

$$N_0 \sim 0 \ \&\& \ D_0 \sim 1 \ \&\& \ N_1 \sim 1 \ \&\& \ D_1 \sim 0 \ \&\& \ N_i \sim D_i \sim 0 \ \forall i > 1.$$

Please note that the compatibility does not depend on the direction (`compuInternalToPhys` vs. `compuPhysToInternal`) of `CompuMethods` of category `LINEAR`.

6.2.5 Compatibility of ApplicationDataType and ImplementationDataType

The usage of `ApplicationDataTypes` implies that also a corresponding `ImplementationDataType` exists at a certain point in time. The `ImplementationDataType` is required as the basis for configuring and generating the RTE and/or contract phase header files.

[TPS_SWCT_01461] Existence of `ImplementationDataType` [The existence of `ImplementationDataTypes` is **not** required until the methodology step of generating an RTE or executing the RTE contract phase. Before arriving at this step in the methodology, it is perfectly feasible to use only `ApplicationDataTypes` for describing the semantics of software-components.]()

As a consequence, it is necessary to define compatibility rules that unambiguously clarify the conformance of an `ApplicationDataType` with an `ImplementationDataType` and vice versa.

Please note that this kind of compatibility also supports situations where e.g. a `dataElement` typed by an `ApplicationDataType` without a corresponding `ImplementationDataType` in a `PPortPrototype` should be connected to a `dataElement` typed by an `ImplementationDataType` in an `RPortPrototype`.

In general, the compatibility rules for allowing a data type mapping are the same as the rules for connections. Exceptions are explicitly stated in the rules below.

Several rules depend on the `category` of the data types.

6.2.5.1 General Rule

As a general rule, if an `ImplementationDataType` of `category TYPE_REFERENCE` is targeted by a type mapping or port connection, all the rules given below apply to the `ImplementationDataType` which is finally valid after resolving all such references.

This is not repeated in all rules. As an example, if we say that something can be mapped/connected to an `ImplementationDataType` of `category VALUE`, then this shall include the possibility of mapping/connecting to an `ImplementationDataType` of `category TYPE_REFERENCE` which refers to another `ImplementationDataType` of `category VALUE`.

6.2.5.2 Category VALUE

[constr_1059] Compatibility of data types with `category VALUE` [An `ApplicationDataType` of `category VALUE` shall (after all indirections created by `ImplementationDataTypes` of `category TYPE_REFERENCE` are resolved) only be mapped/connected to an `ImplementationDataType` which also has `category VALUE`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

In this case, the `ImplementationDataType.baseType` shall be able to express all the numerical values required by the `ApplicationDataType`, see Figure 5.25.

This condition is fulfilled if the numerical range which can be expressed by the `SwBaseType` at least covers the range defined by the limits in `ApplicationDataType.swDataDefProps.dataConstr` (which are either internal limits or physical limits to be converted via the `CompuMethod` which also has to be provided by the `ApplicationDataType`).

Note that for sender-receiver communication of a data element via a network there is the possibility to reduce the numerical range against what has been defined via the corresponding data type. However, this is not achieved via mapping to another `ImplementationDataType` at the data element itself but via the `networkRepresentation` of the `ComSpec` (for further explanation of this aspect see section 4.5.1).

6.2.5.3 Category ARRAY, VAL_BLK

[constr_1060] Compatibility of data types with category ARRAY, VAL_BLK [

ApplicationDataType	ImplementationDataType: Array of uint8	ImplementationDataType: Array of other
ApplicationArrayDataType of category ARRAY, VAL_BLK, arraySizeSemantics = fixedSize	ImplementationDataType of category ARRAY, with ImplementationDataTypeElement with arraySizeSemantics = fixedSize	ImplementationDataType of category ARRAY, with ImplementationDataTypeElement with arraySizeSemantics = fixedSize
ApplicationArrayDataType of category ARRAY, VAL_BLK, arraySizeSemantics = variableSize	ImplementationDataType of category ARRAY, with ImplementationDataTypeElement with arraySizeSemantics = variableSize or Variable-Size Array Data Type	Variable-Size Array Data Type

This rule shall be imposed at the time when the contract phase generation is executed.

]()

In this case, the array size, the `arraySizeSemantics` (given that it exists) and the type of the array elements of the `ImplementationDataType` shall be such that they can be mapped/transferred 1:1 by order to the corresponding application data and vice versa.

Note that in case of mapping between arrays it is not required that a `DataTypeMap` exists between the data types of the array elements or that the respective `shortNames` are identical.

6.2.5.4 Category STRUCTURE

[constr_1061] Compatibility of data types with category STRUCTURE [An `ApplicationDataType` of category STRUCTURE shall (after all indirections created

by `ImplementationDataTypes` of category `TYPE_REFERENCE` are resolved) only be mapped/connected to an `ImplementationDataType` of category `STRUCTURE`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

This means, that the corresponding pairs of elements shall also have compatible types. Note that it is not required that the data types of the single elements have identical `shortNames` or that a `DataTypeMap` exists for each pair of single element.

[constr_1662] Compatibility of `ApplicationRecordDataType` and `ImplementationDataType` that both represent an `Optional Element Structure` [An `ApplicationRecordDataType` that represents an `Optional Element Structure` shall (after all indirections created by `ImplementationDataTypes` of category `TYPE_REFERENCE` are resolved) only be mapped/connected to an `ImplementationDataType` of category `STRUCTURE` that represents an `Optional Element Structure` if corresponding pairs of elements have the same value of the attribute `isOptional`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

6.2.5.5 Category `BOOLEAN`

[constr_1063] Compatibility of data types with category `BOOLEAN` [An `ApplicationDataType` of category `BOOLEAN` shall (after all indirections created by `ImplementationDataTypes` of category `TYPE_REFERENCE` are resolved) only be mapped/connected to an `ImplementationDataType` of category `VALUE`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

6.2.5.6 Category `COM_AXIS`, `RES_AXIS`, `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, `CUBE_5`

[constr_1064] Compatibility of data types with category `COM_AXIS`, `RES_AXIS`, `CURVE`, `MAP`, `CUBOID`, `CUBE_4`, or `CUBE_5` [An `ApplicationDataType` of category

- `COM_AXIS`,
- `RES_AXIS`,
- `CURVE`,
- `MAP`,
- `CUBOID`,

- CUBE_4, or
- CUBE_5

shall (after all indirections created by `ImplementationDataTypes` of category `TYPE_REFERENCE` are resolved) only be mapped/connected to an `ImplementationDataType` of category

- `STRUCTURE` or
- `ARRAY`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

There are several possibilities how to express these types via plain or nested arrays and/or structures on implementation level.

Some examples are given in section 5.4.4. In any case, the primitive elements of the implementation type shall fit (by their order in memory) to the corresponding `SwRecordLayout`.

It is not required, to define `DataTypeMaps` for the sub-elements of both representations.

6.2.5.7 Forbidden Mappings

[constr_1066] Forbidden mappings to `ImplementationDataType` [An `ApplicationDataType` shall never be mapped to

- an `ImplementationDataType` of category
 - `UNION`,
 - `DATA_REFERENCE`, or
 - `FUNCTION_REFERENCE`,
- or to an `ImplementationDataType` that contains `subElements` of category
 - `UNION`,
 - `DATA_REFERENCE`, or
 - `FUNCTION_REFERENCE`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Concerning the `SwDataDefProps` of an `ApplicationDataType` instance or an `ImplementationDataType` instance which shall be mapped/connected on M1, see **[constr_1015]**. The following rules apply:

1. The cases where the `ImplementationDataType` is not allowed to set a property but only “inherits” it from the `ApplicationDataType` are not relevant for compatibility. These attributes are simply not allowed in the `ImplementationDataType`.
2. In case that only the `ImplementationDataType` may “define” the property this definition shall fit into the semantical requirements given by the `ApplicationDataType` in order to make the two types compatible.

This is namely important for the attribute `baseType` and is explained above in the rule for types of `category` VALUE.

3. In case the `ImplementationDataType` may “add” a property it may only add but not change a property defined by the `ApplicationDataType` (namely `note`, `displayFormat`, and `swImplPolicy`) in order to be compatible.

This means that the respective computation methods can be defined in only one of the types in order to be compatible. In all other cases, only the `ApplicationDataType` may define the computation method.

4. For the compatibility with respect to connectors there are some additional rules for the values of the attribute `swImplPolicy` which are considered general rules on the level of `DataPrototypes` and `PortInterfaces`.

Therefore, these additional rules are explained in chapter 6.3 and chapter 6.4.4.

5. The case that an `ImplementationDataType` may “redefine” a property which is already set by the `ApplicationDataType` is not considered as relevant for the compatibility with respect to mapping of the types in general but of course there may be project specific rules as to which redefinition is allowed (e.g. for `swAddrMethod` or `dataConstr`). See also 5.5.4 about data constraints.
6. For the compatibility with respect to connectors the attribute `dataConstr` shall be treated in the same way as for compatibility of data types in general, for more details please refer to 6.2.4.

6.3 Compatibility of Variable Data Prototypes and Parameter Data Prototypes

[constr_1068] Compatibility of `VariableDataPrototypes` or `ParameterDataPrototypes` typed by primitive data types [Two `VariableDataPrototypes` or `ParameterDataPrototypes` of `ApplicationPrimitiveDataTypes` or `ImplementationDataTypes` of `category` VALUE, BOOLEAN, or STRING are compatible **at the time when the RTE is generated** if and only if one of the following conditions applies:

1. All the following subconditions apply:
 - (a) They are typed by (read “refer to”) compatible `AutosarDataTypes`

- (b) The two `VariableDataPrototypes` or `ParameterDataPrototypes` have identical `shortNames`. This is required to map `VariableDataPrototypes` in unordered `SenderReceiverInterfaces`, `NvDataInterfaces` and `ParameterInterfaces`.
 - (c) The attribute `swImplPolicy` is either set to `queued` for both or none of the `VariableDataPrototypes`.
2. In the context of a `DataPrototypeMapping`, one of the applicable `VariableDataPrototypes` or `ParameterDataPrototypes` is referenced by the `DataPrototypeMapping` in the role `firstDataPrototype` and the other `VariableDataPrototypes` or `ParameterDataPrototypes` is referenced by the same `DataPrototypeMapping` in the role `secondDataPrototype`.

]()

[constr_1187] Compatibility of `VariableDataPrototypes` or `ParameterDataPrototypes` typed by composite data types [

`DataPrototypes` of `ApplicationCompositeDataTypes` or `ImplementationDataTypes` of category `STRUCTURE` or `ARRAY` are compatible **at the time when the RTE is generated** if one of the following conditions evaluates to true:

1. The underlying `ApplicationCompositeDataTypes` or `ImplementationDataTypes` of category `STRUCTURE` or `ARRAY` are identical
2. The underlying `ApplicationCompositeDataTypes` or `ImplementationDataTypes` of category `STRUCTURE` or `ARRAY` fulfill the following condition:
 - They consist of the same number of elements **and**
 - They are composed of compatible `AutosarDataTypes` (either `ApplicationCompositeDataTypes` or `ImplementationDataTypes` of category `STRUCTURE` or `ARRAY` **OR** `ApplicationPrimitiveDataTypes` or `ImplementationDataTypes` of category `VALUE`, `BOOLEAN`, or `STRING`) **in the same order and**
 - All attributes match exactly, except for the `shortName` of the M1 `AutosarDataType`.
3. In the context of a `DataPrototypeMapping`, for each `ApplicationCompositeElementDataPrototype` of the required `DataPrototype` a `SubElementMapping` exists such that a `ApplicationCompositeDataTypeSubElementRef` in the role `firstElement` or `secondElement` exists that references the required `ApplicationCompositeElementDataPrototype` **and** a corresponding `ApplicationCompositeDataTypeSubElementRef` exists in the **other** role (i.e. `secondElement` or `firstElement`) that in turn references an `ApplicationCompositeElementDataPrototype` of the provided `ApplicationCompositeDataType`.

4. If and only if the `DataPrototype` is **not** typed by an `ApplicationDataType` but by an `ImplementationDataType`: in the context of a `DataPrototypeMapping`, for each `ImplementationDataTypeElement` of the required `DataPrototype` a `SubElementMapping` exists such that a `ImplementationDataTypeSubElementRef` in the role `firstElement` or `secondElement` exists that references the required `ImplementationDataTypeElement` **and** a corresponding `ImplementationDataTypeSubElementRef` exists in the **other** role (i.e. `secondElement` or `firstElement`) that in turn references an `ImplementationDataTypeElement` of the provided `ImplementationDataType`.

]()

6.4 Compatibility of Sender Receiver Interfaces, Parameter Interfaces and Non Volatile Data Interfaces

Please note that this compatibility requirement only satisfies static correctness which means that logical consistency is not assured (e.g. that a receiver shall process a certain data value to correctly interpret the following values).

6.4.1 Connection of Required and Provided Port via AssemblySwConnector

The compatibility of `SenderReceiverInterfaces`, `NvDataInterfaces` and `ParameterInterfaces` are considered for connecting of `PortPrototypes` with an `AssemblySwConnector`.

[constr_1069] Compatibility of `PortPrototypes` of different `DataInterfaces` in the context of `AssemblySwConnectors` [`PortPrototypes` of different `DataInterfaces` are compatible **at the time when the RTE is generated** if and only if

1. One of the following conditions applies:
 - (a) For each `VariableDataPrototype` or `ParameterDataPrototype` defined in the context of the `DataInterface` of the required `PortPrototype` a compatible (see [constr_1068]) `VariableDataPrototype` or `ParameterDataPrototype` exists in the `DataInterface` of the provided `PortPrototype`.

The `shortNames` of `VariableDataPrototypes` and `ParameterDataPrototypes` are used to identify the pair.

- (b) A `VariableAndParameterInterfaceMapping.dataMapping` exists for which the following conditions apply:
 - i. It is referenced by the corresponding `SwConnector`.

- ii. It references one of the two `VariableDataPrototypes` or `ParameterDataPrototypes` in the role `firstDataPrototype` and the other in the role `secondDataPrototype`.

2. For each such pair, the values of their `isService` attributes are identical.

]()

The constraint `[constr_1071]` defines which `PortInterface` elements are compatible depending on the `PortInterface` type and the `swImplPolicy` attributes of the `PortInterface` elements.

6.4.2 Connection of Inner and Outer Port via DelegationSwConnector

The compatibility of `SenderReceiverInterfaces`, `NvDataInterfaces` and `ParameterInterfaces` is considered for connecting of `PortPrototypes` with a `DelegationSwConnector`.

[constr_1070] Compatibility of `PortPrototypes` of different `DataInterfaces` in the context of `DelegationSwConnectors` [`PortPrototypes` of different `DataInterfaces` are compatible **at the time when the RTE is generated** if and only if

1. One of the following conditions applies:

- (a) For each `VariableDataPrototype` or `ParameterDataPrototype` defined in the context of the `DataInterface` of the required inner `PortPrototype` a compatible `VariableDataPrototype` or `ParameterDataPrototype` exists in the `DataInterface` of the required outer `PortPrototype`.

The `shortName` of `VariableDataPrototypes` and `ParameterDataPrototypes` are used to identify the pair.

`[constr_1071]` defines which `PortInterface` elements are compatible depending on the `PortInterface` type and the `swImplPolicy` attributes of the `PortInterface` elements.

- (b) A `VariableAndParameterInterfaceMapping.dataMapping` exists for which the following conditions apply:
 - i. It is referenced by the corresponding `SwConnector`.
 - ii. It references one of the two `VariableDataPrototypes` or `ParameterDataPrototypes` in the role `firstDataPrototype` and the other in the role `secondDataPrototype`.

2. One of the following conditions applies:

- (a) For at least one `VariableDataPrototype` or `ParameterDataPrototype` defined in the context of the `SenderReceiverInterface`, `NvDataInterface` or `ParameterInterface` of the provided inner `PortPrototype` a compatible `VariableDataPrototype` or `ParameterDataPrototype` exists in the `SenderReceiverInterface`, `NvDataInterface` or `ParameterInterface` of the provided outer `PortPrototype`.

The `shortNames` of `VariableDataPrototypes` and `ParameterDataPrototypes` are used to identify the pair.

[`constr_1071`] defines which `PortInterface` elements are compatible depending on the `PortInterface` type and the `swImplPolicy` attributes of the `PortInterface` elements.

- (b) A `VariableAndParameterInterfaceMapping.dataMapping` exists for which the following conditions apply:
- It is (if a corresponding `SwConnector` already exists) referenced by the corresponding `SwConnector`.
 - It references one of the two `VariableDataPrototypes` or `ParameterDataPrototypes` in the role `firstDataPrototype` and the other in the role `secondDataPrototype`.

3. For each such pair, the values of their `isService` attributes are identical.

]()

6.4.3 Connection of Required and Provided Port via `PassThroughSwConnector`

[`constr_1248`] Compatibility of `PortPrototypes` of different `DataInterfaces` in the context of a `PassThroughSwConnector` [`PortPrototypes` of different `DataInterfaces` are considered compatible **at the time when the RTE is generated** if and only if

- For **at least one** `VariableDataPrototype` or `ParameterDataPrototype` defined in the context of the `DataInterface` of the required outer `PortPrototype` a compatible `VariableDataPrototype` or `ParameterDataPrototype` exists in the `DataInterface` of the provided outer `PortPrototype`.

Either the `shortName` of `VariableDataPrototypes` and `ParameterDataPrototypes` are used to identify the pair **or** a `PortInterfaceMapping` exists that defines which differently named elements of `PortInterfaces` correlate with each other.

- For each such pair, the values of the `PortInterface.isService` attributes are identical.

]()

The constraint [constr_1071] defines which elements of `PortInterface` are considered compatible depending on the type of `PortInterface` as well as the attribute `swImplPolicy` of the elements of `PortInterfaces`.

6.4.4 Compatibility of `ParameterDataPrototype` and `VariableDataPrototype` depending on `PortInterface` Type

Table [constr_1071] contains a comprehensive description of which combinations of `ParameterDataPrototype` and `VariableDataPrototype` used in `PortPrototypes` typed by various kinds of `PortInterfaces` are considered compatible.

[constr_1071] compatibility of `ParameterDataPrototype` and `VariableDataPrototype`

Provided Port Required Outer Port Provided Inner Port Required Outer Port			Required Port / Required Inner Port / Provided Outer Port / Provided Outer Port					
<code>PortInterface</code>			Prm			S/R		NvD
Interface Element			PDP			VDP		VDP
<code>SwImplPolicyEnum</code>			<code>fixed</code>	<code>const</code>	<code>standard</code>	<code>standard</code>	<code>queued</code>	<code>standard</code>
Prm	PDP	<code>fixed</code>	yes	yes	yes	yes	no	yes
		<code>const</code>	no	yes	yes	yes	no	yes
		<code>standard</code>	no	no	yes	yes	no	yes
S/R	VDP	<code>standard</code>	no	no	no	yes	no	yes
		<code>queued</code>	no	no	no	no	yes	no
NvD	VDP	<code>standard</code>	no	no	no	yes	no	yes

This rule shall be imposed **at the time when the RTE is generated**.

)]()

The following legend applies for the abbreviations used in the table contained in [constr_1071]:

Interface Element i.e. elements of `PortInterface`

PDP `ParameterDataPrototype`

VDP `VariableDataPrototype`

Port Interface i.e. kind of `PortInterface`

Prm `ParameterInterface`

S/R `SenderReceiverInterface`

NvD `NvDataInterface`

[constr_1071] defines which `PortInterface` elements are compatible depending on the kind of `PortInterface` and the `swImplPolicy` attributes of the `PortInterface` elements.

[constr_1287] **Compatibility of `SenderReceiverInterfaces` with respect to `invalidationPolicy`** [`VariableDataPrototypes` defined in the context of the `SenderReceiverInterface` are only compatible if the `invalidationPolicies` have the same value.

This rule shall be imposed **at the time when the RTE is generated.**]()

[TPS_SWCT_01567] **Default behavior for `invalidationPolicy`** [For `VariableDataPrototypes` and `ParameterDataPrototypes` in the context of `NvDataInterface` respectively `ParameterInterface`, the `invalidationPolicy` is treated like “Invalidation is switched off” (`dontInvalidate`).] (*RS_SWCT_00200*)

6.5 Compatibility of Mode Switch Interfaces

Please note that this compatibility requirement only satisfies static correctness which means that logical consistency is not assured (e.g. that a receiver shall process a certain data value to correctly interpret the following values).

Note that concerning the compatibility of `ModeSwitchInterfaces` it is necessary to distinguish between the context of an `AssemblySwConnector`, the context of an `DelegationSwConnector`, and the context of a `PassThroughSwConnector`.

6.5.1 Connection of Required and Provided Port via AssemblySwConnector

Here, the compatibility of `ModeSwitchInterfaces` is considered for the context of an `AssemblySwConnector`.

[constr_1072] **Compatibility of `ModeSwitchInterfaces` in the context of an `AssemblySwConnector`** [`PortPrototypes` of different `ModeSwitchInterfaces` are compatible **at the time when the RTE is generated** if and only if

1. One of the following conditions applies:
 - (a) For the `ModeDeclarationGroupPrototype` defined in the context of the `ModeSwitchInterface` of the required `PortPrototype` a compatible `ModeDeclarationGroupPrototype` exists in the `ModeSwitchInterface` of the provided `PortPrototype`.
 - (b) A `ModeInterfaceMapping.modeMapping` exists for which the following conditions apply:
 - i. It is referenced by the corresponding `SwConnector`.

- ii. It references one of the two `ModeDeclarationGroupPrototypes` in the role `firstModeGroup` and the other in the role `secondModeGroup`.

2. For each such pair, the values of their `isService` attributes are identical.

]()

6.5.2 Connection of Inner and Outer Port via DelegationSwConnector

Here, the compatibility of `ModeSwitchInterfaces` is considered for the context of a `DelegationSwConnector`.

[constr_1073] Compatibility of `ModeSwitchInterfaces` in the context of an `DelegationSwConnector` [`PortPrototypes` of different `ModeSwitchInterfaces` are compatible **at the time when the RTE is generated** if and only if

1. One of the following conditions applies:
 - (a) For the `ModeDeclarationGroupPrototype` defined in the context of the `ModeSwitchInterface` of the inner `PortPrototype` a compatible `ModeDeclarationGroupPrototype` exists in the `ModeSwitchInterface` of the outer `PortPrototype`.
 - (b) A `ModeInterfaceMapping.modeMapping` exists for which the following conditions apply:
 - i. It is referenced by the corresponding `SwConnector`.
 - ii. It references one of the two `ModeDeclarationGroupPrototypes` in the role `firstModeGroup` and the other in the role `secondModeGroup`.

2. For each such pair, the values of their `isService` attributes are identical.

]()

6.5.3 Connection of Outer and Outer Port via PassThroughSwConnector

[constr_1249] Compatibility of `ModeSwitchInterfaces` in the context of a `PassThroughSwConnector` [`PortPrototypes` of different `ModeSwitchInterfaces` are considered compatible **at the time when the RTE is generated** if and only if

1. For the `ModeDeclarationGroupPrototype` defined in the context of the `ModeSwitchInterface` of the required outer `PortPrototype` a compatible `ModeDeclarationGroupPrototype` exists in the `ModeSwitchInterface` of the provided outer `PortPrototype`.

Either the `shortNames` of the `ModeDeclarationGroupPrototypes` are used to identify the pair or a `ModeInterfaceMapping` exists that maps the corresponding `ModeDeclarationGroupPrototypes`.

2. For each such pair, the values of the `PortInterface.isService` attributes are identical.

]()

6.6 Compatibility of Mode Declaration Group Prototypes

[constr_1074] Compatibility of `ModeDeclarationGroupPrototypes` [

`ModeDeclarationGroupPrototypes` are compatible **at the time when the RTE is generated** if and only if one of the following conditions applies:

1. They are typed by (read “refer to”) compatible `ModeDeclarationGroups`.
2. A `ModeDeclarationGroupPrototypeMapping` exists that identifies the differently named `ModeDeclarationGroupPrototypes` that correlate with each other. **[constr_1210]** applies.

]()

6.7 Compatibility of Mode Declaration Groups

[constr_1075] Compatibility of `ModeDeclarationGroups` [`ModeDeclarationGroups` are compatible **at the time when the RTE is generated** if and only if one of the following conditions applies:

1. All the following subconditions apply:
 - (a) They define an identical number of `ModeDeclarations`.
 - (b) Each `ModeDeclaration` on the required side corresponds to a `ModeDeclaration` on the provided side with an identical `shortName`.
 - (c) The `initialModes` on both sides refer to `ModeDeclarations` with identical `shortNames`.
 - (d) The attribute `ModeDeclarationGroup.modeUserErrorBehavior.errorReactionPolicy` has identical values on both sides.
 - (e) The attribute `ModeDeclarationGroup.modeManagerErrorBehavior.errorReactionPolicy` has identical values on both sides.
 - (f) The attribute `ModeDeclarationGroup.modeUserErrorBehavior.defaultMode` either does not exist on both sides or refers on both sides to `ModeDeclarations` with identical `shortNames`.

- (g) The attribute `ModeDeclarationGroup.modeManagerErrorBehavior.defaultMode` either does not exist on both sides or refers on both sides to `ModeDeclarations` with identical `shortNames`.
- (h) one of the following subconditions applies:
- the attribute `category` has the value `ALPHABETIC_ORDER` on both sides.
 - the attribute `category` has the value `EXPLICIT_ORDER` on both sides **and** the matching `ModeDeclarations` according to 1(b) have the identical values of the attributes `ModeDeclaration.value` **and** also the value of `ModeDeclarationGroup.onTransitionValue` matches on both sides.
2. A `ModeDeclarationMapping` is applied which identifies the corresponding `ModeDeclarations`.

In addition, the compatibility of corresponding `ModeTransitions` shall be checked, i.e. [`constr_1194`] and [`constr_1245`] apply.]()

[constr_1245] Consideration of `ModeTransitions` for the compatibility of `ModeDeclarationGroups` [One of the following conditions for the consideration of `ModeTransitions` for the compatibility of `ModeDeclarationGroups` shall apply **at the time when the RTE is generated**:

- **Either** the mode provider **or** the mode user define `ModeTransitions`.
- The `ModeTransitions` defined in the context of the mode provider are **identical** to the `ModeTransitions` defined in the context of the mode user **or** a `ModeDeclarationMapping` mapping is applied.

]()

[constr_1194] Identical `ModeTransitions` [Two `ModeDeclarationGroups` contain identical `modeTransitions` **at the time when the RTE is generated** if and only if

1. For each `ModeTransition` defined in the context of the mode provider one `ModeTransition` with the same `shortName` is defined in the context of the mode user.
2. Each pair of `ModeTransitions` in both `ModeDeclarationGroups` identified by their respective `shortName` have identical targets (in terms of the `shortName` of the referenced `ModeDeclaration`) of the references `enteredMode` and `exitedMode`.

]()

6.8 Compatibility of Argument Prototypes

[constr_1076] Compatibility of `ArgumentDataPrototypes` [Two `ArgumentDataPrototypes` are compatible **at the time when the RTE is generated** if and only if

1. They are typed by compatible `AutosarDataTypes` **or** a `ClientServerOperationMapping.argumentMapping` exists that references one `ArgumentDataPrototype` in the role `firstDataPrototype` and the other `ArgumentDataPrototype` in the role `secondDataPrototype`.
2. They have the same value of the argument `direction` (`in`, `out` or `inout`), i.e. **[constr_1268]** applies.

]0

6.9 Compatibility of Application Errors

[constr_1077] Compatibility of `ApplicationErrors` [Two `ApplicationErrors` are compatible **at the time when the RTE is generated** if and only if one of the following conditions applies:

1. All the following subconditions apply:
 - (a) They have the same `shortName`.
 - (b) They have the same attributes. Especially the `errorCode` shall be identical in both `ApplicationErrors`.
2. A `ClientServerInterfaceMapping.errorMapping` exists that references one of the `ApplicationErrors` in the role `firstApplicationError` and the other `ApplicationErrors` in the role `secondApplicationError`.

]0

6.10 Compatibility of Client/Server Operations

[constr_1078] Compatibility of `ClientServerOperations` [Two `ClientServerOperations` are considered compatible **at the time when the RTE is generated** if their signatures match. In particular, they are compatible if and only if

1. They have the same number of `ArgumentDataPrototypes`.
2. The n-th arguments of both `ClientServerOperations` are compatible. This implies ordering of `ArgumentDataPrototypes`.
3. They have identical values of attribute `diagArgIntegrity` or the attribute `diagArgIntegrity` does not exist on both sides.

4. They have the same `shortName` (again allows for mapping in `PortInterfaces`).
5. The required `ClientServerOperation` specifies a compatible `ApplicationError` for each `ApplicationError` that is possibly raised by the provided `ClientServerOperation`, maybe more. Thereby, `ClientServerOperations` that refer to a `possibleError` that represents the value `E_OK` are compatible to `ClientServerOperations` that do refer to `possibleErrors` where none of them represents the value `E_OK`.

]()

6.11 Compatibility of Client Server Interfaces

Please note that this compatibility requirement only satisfies static correctness which means that logical consistency is not assured (e.g. that a client shall call a certain operation to allow the server to work correctly).

6.11.1 Connection of Required and Provided Port via AssemblySwConnector

[constr_1079] Compatibility of `ClientServerInterfaces` in the context of an `AssemblySwConnector` [`ClientServerInterfaces` are compatible **at the time when the RTE is generated** if and only if

1. One of the following conditions applies:
 - (a) For each `ClientServerOperation` defined in the context of the `ClientServerInterface` of the required `PortPrototype` a compatible `ClientServerOperation` exists in the `ClientServerInterface` of the provided `PortPrototype`. The `shortNames` of `ClientServerOperations` are used to identify the pair.
 - (b) A `ClientServerInterfaceMapping.operationMapping` exists for which the following conditions apply:
 - i. It is referenced by the corresponding `SwConnector`.
 - ii. It references one of the two `ClientServerOperations` in the role `firstOperation` and the other in the role `secondOperation`.
2. For each such pair, the values of their `isService` attributes are identical.

]()

6.11.2 Connection of Inner and Outer Port via DelegationSwConnector

[constr_1080] Compatibility of ClientServerInterfaces in the context of an DelegationSwConnector [ClientServerInterfaces are compatible **at the time when the RTE is generated** if and only if

1. One of the following conditions applies:
 - (a) For each ClientServerOperation defined in the context of the ClientServerInterface of the required inner PortPrototype a compatible ClientServerOperation exists in the ClientServerInterface of the required outer PortPrototype. The shortNames of ClientServerOperations are used to identify the pair.
 - (b) A ClientServerInterfaceMapping.operationMapping exists for which the following conditions apply:
 - i. It is referenced by the corresponding SwConnector.
 - ii. It references one of the two ClientServerOperations in the role firstOperation and the other in the role secondOperation.
2. One of the following conditions applies:
 - (a) For at least one ClientServerOperation defined in the context of the ClientServerInterface of the provided inner PortPrototype a compatible ClientServerOperation exists in the ClientServerInterface of the provided outer PortPrototype. The shortNames of ClientServerOperations are used to identify the pair.
 - (b) A ClientServerInterfaceMapping.operationMapping exists for which the following conditions apply:
 - i. It is referenced by the corresponding SwConnector.
 - ii. It references one of the two ClientServerOperations in the role firstOperation and the other in the role secondOperation.
3. For each such pair, the values of their isService attributes are identical.

]()

6.11.3 Connection of Outer and Outer Port via PassThroughSwConnector

[constr_1250] Compatibility of ClientServerInterfaces in the context of a PassThroughSwConnector [PortPrototypes of different ClientServerInterfaces are considered compatible **at the time when the RTE is generated** if and only if

1. For **at least one** `ClientServerOperation` defined in the context of the `ClientServerInterface` of the provided outer `PortPrototype` a compatible `ClientServerOperation` exists in the `ClientServerInterface` of the required outer `PortPrototype`.

Either the `shortNames` of the `ClientServerOperations` are used to identify the pair **or** a `ClientServerInterfaceMapping` exists that maps the corresponding `ClientServerOperations`.

2. For each such pair, the values of the `PortInterface.isService` attributes are identical.

]()

6.12 Compatibility of Trigger Interfaces

Please note that this compatibility requirement only satisfies static correctness which means that logical consistency is not assured (e.g. that a client shall call a certain operation to allow the server to work correctly).

6.12.1 Connection of Required and Provided Port via AssemblySwConnector

[constr_1081] Compatibility of `TriggerInterfaces` in the context of an `AssemblySwConnector` [`TriggerInterfaces` are compatible **at the time when the RTE is generated** if and only if

1. One of the following conditions applies:
 - (a) For each `Trigger` defined in the context of the `TriggerInterface` of the required `PortPrototype` a compatible `Trigger` exists in the `TriggerInterface` of the provided `PortPrototype`. The `shortNames` of `Trigger` are used to identify the pair.
 - (b) A `TriggerInterfaceMapping.triggerMapping` exists for which the following conditions apply:
 - i. It is referenced by the corresponding `SwConnector`.
 - ii. It references one of the two `Triggers` in the role `firstTrigger` and the other in the role `secondTrigger`.
2. For each such pair, the values of their `isService` attributes are identical.

]()

6.12.2 Connection of Inner and Outer Port via DelegationSwConnector

[constr_1082] **Compatibility of TriggerInterfaces in the context of an DelegationSwConnector** [TriggerInterfaces are compatible **at the time when the RTE is generated** if and only if all the following conditions apply:

1. One of the following subconditions applies:
 - (a) For each Trigger defined in the context of the TriggerInterface of the **required** inner PortPrototype a compatible Trigger exists in the TriggerInterface of the **required** outer PortPrototype. The shortNames of Trigger are used to identify the pair.
 - (b) For at least one Trigger defined in the context of the TriggerInterface of the **provided** outer PortPrototype a compatible Trigger exists in the TriggerInterface of the **provided** inner PortPrototype. The shortNames of Trigger are used to identify the pair.
 - (c) A TriggerInterfaceMapping.triggerMapping exists for which all the following conditions apply:
 - i. It is referenced by the corresponding SwConnector.
 - ii. It references one of the two Triggers in the role firstTrigger and the other in the role secondTrigger.
2. For each such pair, the values of their isService attributes are identical.

]()

6.12.3 Connection of Outer and Outer Port via PassThroughSwConnector

[constr_1251] **Compatibility of PortPrototypes of TriggerInterfaces in the context of a PassThroughSwConnector** [PortPrototypes of different TriggerInterfaces are considered compatible **at the time when the RTE is generated** if and only if

1. For **at least one** Trigger defined in the context of the TriggerInterface of the required outer PortPrototype a compatible Trigger exists in the TriggerInterface of the provided outer PortPrototype.
Either the shortName of Triggers are used to identify the pair **or** a TriggerInterfaceMapping exists that refers to one of the Triggers in the role firstTrigger and to the other in the role secondTrigger.
2. For each such pair, the values of the PortInterface.isService attributes are identical.

]()

6.13 Compatibility of Trigger

[constr_1083] Compatibility of Triggers [Triggers are compatible **at the time when the RTE is generated** if one of the following conditions is fulfilled:

- They have an identical `shortName`.
- A `TriggerMapping` exists that references one of the `Triggers` in the role `firstTrigger` and the other `Trigger` in the role `secondTrigger`.

]()

6.14 Entire Delegation of a Provided Port Prototype

[constr_1084] delegation of a provided outer PortPrototype [The delegation of a provided outer `PortPrototype` is properly defined if the following criteria are fulfilled:

1. For each `VariableDataPrototype` or `ParameterDataPrototype` present in the `SenderReceiverInterface`, `NvDataInterface`, or `ParameterInterface` of the provided outer `PortPrototype` at least one connection via `DelegationSwConnector` to a provided inner `PortPrototype` **or** `PassThroughSwConnector` to a required outer `PortPrototype` with a compatible `VariableDataPrototype` or `ParameterDataPrototype` in the `SenderReceiverInterface` `NvDataInterface` or `ParameterInterface` of the provided inner `PortPrototype` **or** required outer `PortPrototype` exists.

Either the `shortNames` of `VariableDataPrototypes` or `ParameterDataPrototypes` are used to identify the pair or a `PortInterfaceMapping` defines which differently named `PortInterface` elements correlate with each other.

2. For each `VariableDataPrototype` provided by a `PRPortPrototype` that is typed by a `SenderReceiverInterface` or `NvDataInterface` and that is referenced in the role `outerPort` by a `DelegationSwConnector` a corresponding `VariableDataPrototype` owned by an `innerPort` shall be provided by either a `PPortPrototype` or a `PRPortPrototype`.

Either the `shortNames` of `VariableDataPrototypes` are used to identify the pair or a `PortInterfaceMapping` defines which differently named `PortInterface` elements correlate with each other.

3. For the `ModeDeclarationGroupPrototype` present in the `ModeSwitchInterface` of the provided outer `PortPrototype` exactly one connection via `DelegationSwConnector` to a provided inner `PortPrototype` **or** `PassThroughSwConnector` to a required outer `PortPrototype` with a compatible `ModeDeclarationGroupPrototype` in the `ModeSwitchInterface`

of the provided inner `PortPrototype` **or** required outer `PortPrototype` exists.

Either the `shortNames` of `ModeDeclarationGroupPrototypes` are used to identify the pair or a `PortInterfaceMapping` defines which differently named `PortInterface` elements correlate with each other.

4. For each `ClientServerOperation` present in the `ClientServerInterface` of the provided outer `PortPrototype` exactly one connection via `DelegationSwConnector` to a provided inner `PortPrototype` **or** `PassThroughSwConnector` to a required outer `PortPrototype` with a compatible `ClientServerOperation` in the `ClientServerInterface` of the provided inner `PortPrototype` **or** required outer `PortPrototype` exists.

Either the `shortNames` of `ClientServerOperations` are used to identify the pair or a `PortInterfaceMapping` defines which differently named `PortInterface` elements correlate with each other.

5. For each `Trigger` present in the `TriggerInterface` of the provided outer `PortPrototype` exactly one connection via `DelegationSwConnector` to a provided inner `PortPrototype` **or** `PassThroughSwConnector` to a required outer `PortPrototype` with a compatible `Trigger` in the `TriggerInterface` of the provided inner `PortPrototype` **or** required outer `PortPrototype` exists.

Either the `shortNames` of `Triggers` are used to identify the pair or a `PortInterfaceMapping` defines which differently named `PortInterface` elements correlate with each other.

This constraint is associated with two possible imposition times:

- **at the time when the RTE is generated**
- **at the time when the creation of the CompositionSwComponentType is finished**

]()

The constraint [`constr_1071`] defines which `PortInterface` elements are compatible depending on the kind of `PortInterface` and the `swImplPolicy` attributes of the `PortInterface` elements.

6.14.1 Split and Merge of PortInterface Elements

With the definition of compatibility rules in chapter 6.4, 6.11, and 6.12, it is possible to split and distribute elements of a `PortPrototype` typed by a `PortInterface` containing a superset of `PortInterface` elements to `PortPrototypes` of type of `PortInterfaces` containing subsets of `PortInterface` elements.

Please find examples that explain the usage of splitting and merging in section B.5.2.

6.15 Compatibility in Case of a Flat ECU Extract

Please note that in the case of a flat ECU extract of software-components specific compatibility rules apply. To some extent, these rules contradict the rules existing for the pure VFB approach (see chapter 6). That is, if the split-and-merge pattern has been applied on the creation of `DelegationSwConnectors` it might happen that compatibility rules defined in chapter 6 are violated.

However, given that the flattened ECU extract has been created out of a valid `CompositionSwComponentType` the flattened ECU extract does not become invalid in this case. In other words, the transformation does not create an invalid model out of a valid model.

However, to support this statement it is necessary to define additional compatibility rules that properly cover this case and allow for a successful validation of the flattened ECU extract.

For the flat ECU extract the compatibility of `SenderReceiverInterfaces`, `NvDataInterfaces`, and `ParameterInterfaces` is considered for connecting of `PortPrototypes` with a `DelegationSwConnector`.

[constr_1085] Compatibility in the case of a flat ECU extract [`PortPrototypes` of different `SenderReceiverInterfaces`, `NvDataInterfaces`, and `ParameterInterfaces` are compatible if and only if for at least one `VariableDataPrototype` or `ParameterDataPrototype` defined in the context of the `SenderReceiverInterface`, `NvDataInterface`, or `ParameterInterface` of the `RPortPrototype` a compatible `VariableDataPrototype` or `ParameterDataPrototype` exists in the `SenderReceiverInterface`, `NvDataInterface`, or `ParameterInterface` of the provided `PortPrototype`.

The compatibility of `PortInterface` elements depends on the kind of `PortInterface` and the `swImplPolicy` attributes of the `PortInterface` elements.

Either the `shortNames` of `VariableDataPrototypes` and `ParameterDataPrototypes` are used to identify the pair or a `PortInterfaceMapping` defines which differently named `PortInterface` elements correlate with each other.]()

For clarification, [constr_1071] defines which `PortInterface` elements are compatible depending on the kind of `PortInterface` and the `swImplPolicy` attributes of the `PortInterface` elements.

Please note that in case of the flat ECU extract it might happen that `AssemblySwConnectors` that connect to a specific `RPortPrototype` also connect to `PPortPrototypes` that do not fulfill the compatibility rule specified in 6.4.1.

In particular, the `dataElements` might correspond to `dataElements` defined in the scope of different `PPortPrototypes`. In other words, in the flat ECU extract it is possible to merge `dataElements` from different providers.

7 Internal Behavior

7.1 Introduction

[TPS_SWCT_01075] **SwcInternalBehavior** [SwcInternalBehavior provides means for formally defining the behavior of an AtomicSwComponentType.] (RS_SWCT_03040)

This chapter focuses on the description of the SwcInternalBehavior meta-class and the various meta-classes it aggregates. An overview of the meta-class is sketched in Figure 7.2. Please note that SwcInternalBehavior inherits from InternalBehavior.

The role of SwcInternalBehavior in the context of an AUTOSAR software-component is depicted in Figure 7.1. As mentioned in section 3.2, the reason to make the aggregation of SwcInternalBehavior to AtomicSwComponentType «atpSplittable» is to allow for the development of SwcInternalBehavior in a later process step (e.g. after the VFB view has been completed).

Figure 7.1: The “big picture” of SwcInternalBehavior

Class	<i>InternalBehavior</i> (abstract)

includedMode Declaration GroupSet	IncludedMode DeclarationGroupSet	*	aggr	<p>This aggregation represents the included Mode DeclarationGroups</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=includedModeDeclarationGroupSet</p>

Class	SwcInternalBehavior			
instantiationDataDefProps	InstantiationDataDefProps	*	aggr	<p>The purpose of this is that within the context of a given SwComponentType some data def properties of individual instantiations can be modified. The aggregation of InstantiationDataDefProps is subject to variability with the purpose to support the conditional existence of Port Prototypes and component local memories like "per InstanceParameter" or "arTypedPerInstanceMemory".</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=instantiationDataDefProps, instantiationDataDefProps.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
perInstanceMemory	PerInstanceMemory	*	aggr	<p>Defines a per-instance memory object needed by this software component. The aggregation of PerInstanceMemory is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=perInstanceMemory.shortName, perInstanceMemory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
perInstanceParameter	ParameterDataPrototype	*	aggr	<p>Defines parameter(s) or characteristic value(s) that needs to be available for each instance of the software-component. This is typically only useful if supportsMultipleInstantiation is set to "true". The aggregation of perInstanceParameter is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=perInstanceParameter.shortName, perInstanceParameter.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
portAPIOption	PortAPIOption	*	aggr	<p>Options for generating the signature of port-related calls from a runnable to the RTE and vice versa. The aggregation of PortPrototypes is subject to variability with the purpose to support the conditional existence of ports.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=portAPIOption, portAPIOption.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>

Class	SwcInternalBehavior			
runnable	RunnableEntity	*	aggr	<p>This is a RunnableEntity specified for the particular Swc InternalBehavior.</p> <p>The aggregation of RunnableEntity is subject to variability with the purpose to support the conditional existence of RunnableEntities. Note: the number of RunnableEntities might vary due to the conditional existence of Port Prototypes using DataReceivedEvents or due to different scheduling needs of algorithms.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=runnable.shortName, runnable.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
service Dependency	SwcServiceDependency	*	aggr	<p>Defines the requirements on AUTOSAR Services for a particular item.</p> <p>The aggregation of SwcServiceDependency is subject to variability with the purpose to support the conditional existence of ports as well as the conditional existence of ServiceNeeds.</p> <p>The SwcServiceDependency owned by an SwcInternal Behavior can be located in a different physical file in order to support that SwcServiceDependency might be provided in later development steps or even by different expert domain (e.g OBD expert for Obd related Service Needs) tools. Therefore the aggregation is <<atp Splitable>>.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=serviceDependency.shortName, serviceDependency.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
shared Parameter	ParameterData Prototype	*	aggr	<p>Defines parameter(s) or characteristic value(s) shared between SwComponentPrototypes of the same Sw ComponentType The aggregation of sharedParameter is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=sharedParameter.shortName, sharedParameter.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
supports Multiple Instantiation	Boolean	0..1	attr	<p>Indicate whether the corresponding software-component can be multiply instantiated on one ECU. In this case the attribute will result in an appropriate component API on programming language level (with or without instance handle).</p>
variationPoint Proxy	VariationPointProxy	*	aggr	<p>Proxy of a variation points in the C/C++ implementation.</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=variationPointProxy.shortName</p>

Table 7.2: SwcInternalBehavior

[constr_1935] Existence of attribute [SwcInternalBehavior.supportsMultipleInstantiation](#) [For each [SwcInternalBehavior](#), attribute [supportsMultipleInstantiation](#) shall exist **at the time when the contract phase generation is executed.**]()

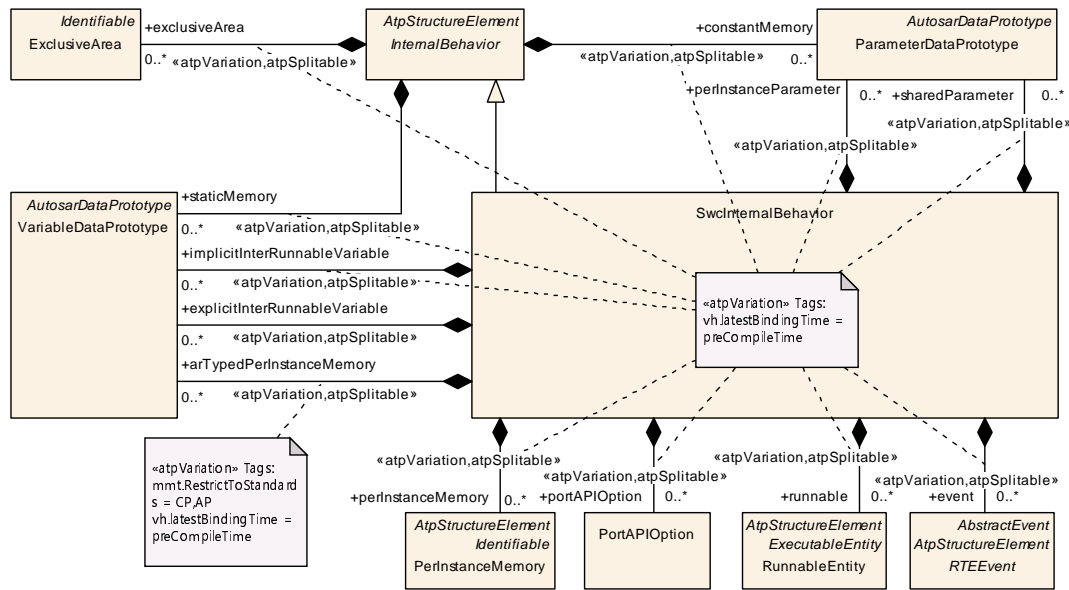

Figure 7.2: SwcInternalBehavior

7.2 Runnable Entity

The concept of [RunnableEntity](#) (more details can be found in Figure 7.3) is defined in the specification of the Virtual Functional Bus [3].

[TPS_SWCT_01030] RunnableEntity [RunnableEntities are the smallest code-fragments that are provided by a software-component and are (at least indirectly) a subject for scheduling by the underlying operating system or else (in rare cases) for execution in ISR context.] (RS_SWCT_03040, RS_SWCT_00070, RS_SWCT_00090, RS_SWCT_03050)

[TPS_SWCT_01097] CompositionSwComponentType cannot have RunnableEntities [It is intentionally not possible for CompositionSwComponentType to define a SwcInternalBehavior. Consequently, CompositionSwComponentTypes don't have RunnableEntities by themselves.] (RS_SWCT_00070, RS_SWCT_00090, RS_SWCT_03050)

[TPS_SWCT_01098] Only AtomicSwComponentType can have RunnableEntities [Only the AtomicSwComponentType that are populating a CompositionSwComponentType as SwComponentPrototypes may have RunnableEntities.] (RS_SWCT_03040, RS_SWCT_00070, RS_SWCT_00090, RS_SWCT_03050)

This correlation is depicted in Figure 7.4.

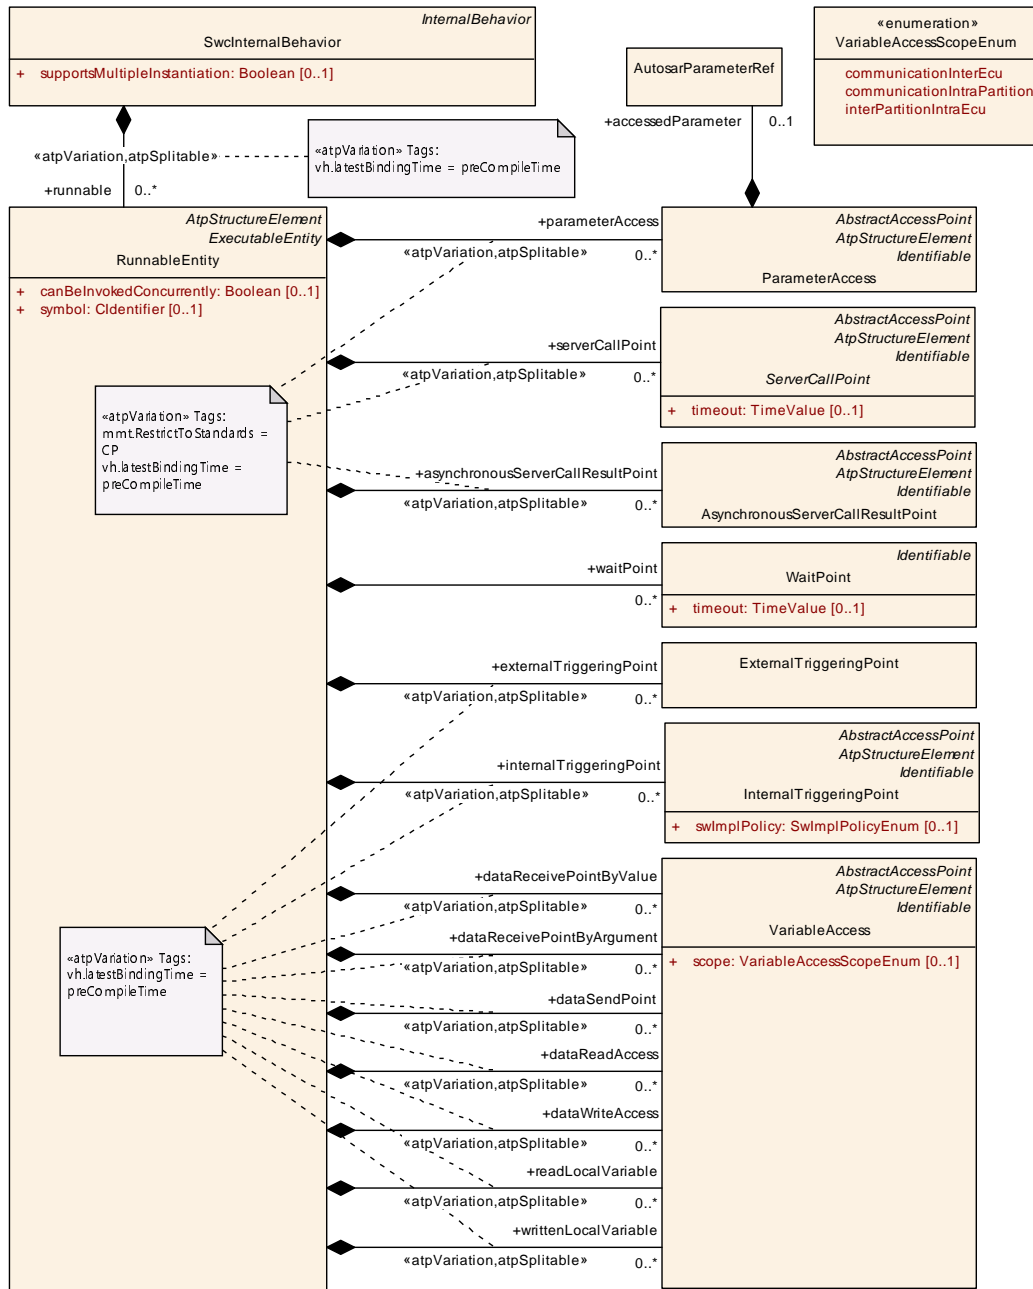

Figure 7.3: Details of RunnableEntity

Please note that [RunnableEntities](#) exist in several categories that have different properties. Please find more explanation about categories of [RunnableEntities](#) in section [7.2.4.4](#).

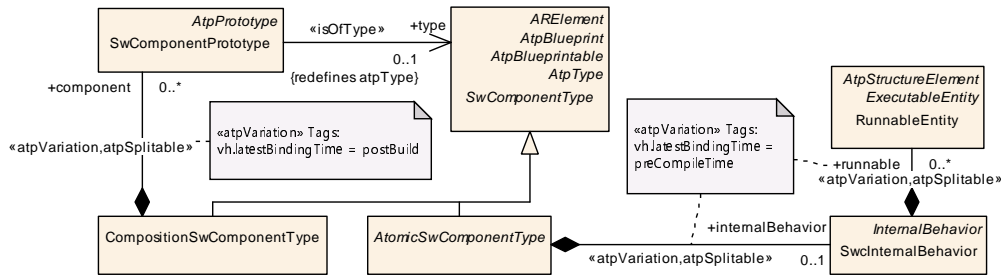

Figure 7.4: Only AtomicSwComponentTypes may have RunnableEntities

[TPS_SWCT_01302] **Semantics of `minimumStartInterval`** [The attribute `ExecutableEntity.minimumStartInterval` defines the time interval that the RTE will guarantee to not go below between scheduling two consecutive executions of the corresponding `RunnableEntity`.] (*RS_SWCT_03040*)

[constr_1936] **Existence of attribute `RunnableEntity.symbol`** [For each `RunnableEntity`, attribute `symbol` shall exist **at the time when the contract phase generation is executed**.] ()

[TPS_SWCT_01303] **`symbol` attribute describes the `RunnableEntity`'s entry point** [The `RunnableEntity.symbol` attribute is describing the `RunnableEntity`'s entry point.] (*RS_SWCT_03040*)

The implication `RunnableEntity.symbol` on the uniqueness of symbols in the scope of one `EcuInstance` is described in [constr_2025] [10].

A `RunnableEntity` inherits several attributes from its base class `ExecutableEntity` due to the fact that these are also used in the Basic Software Module Description Template [6]. Here the following constraint applies:

[constr_4082] **`RunnableEntity.reentrancyLevel` shall not be set.** [The optional attribute `reentrancyLevel` shall not be set for a `RunnableEntity`. This attribute would define more specific reentrancy features than the mandatory attribute `canBeInvokedConcurrently`. These features are currently only supported for Basic Software.

This rule shall be imposed **at the time when the contract phase generation is executed**.] ()

Class	RunnableEntity			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior			
Note	A <code>RunnableEntity</code> represents the smallest code-fragment that is provided by an <code>AtomicSwComponentType</code> and are executed under control of the RTE. <code>RunnableEntities</code> are for instance set up to respond to data reception or operation invocation on a server.

Table 7.3: RunnableEntity

Please note that the formal definition of the semantics of a [RunnableEntity](#) has strong relations to the specification of the AUTOSAR RTE [2]. The definition of the RTE semantics, however, is not in the scope of this document.

However, the formal definition requires some background discussion that can't be completely left out of this document. Otherwise, the meaning of specific model elements could not be understood properly.

Please note further that there are legitimate use cases for software-components without any [RunnableEntities](#), e.g. in following situations:

- An [NvBlockSwComponentType](#) does not require any [RunnableEntity](#) if there is no need to proxy any [PortPrototype](#) typed by either of the [ClientServerInterfaces](#) `NvMService` or `NvMAdmin`.
- A [ServiceSwComponentType](#) runs in a reduced configuration and does not have to offer any [PortPrototype](#) to any service-using application software-component.
- A software-component is configured in a reduced configuration where none of the functionality is selected. In this case, it's simpler to keep the empty software-component instead of adding further [VariationPoints](#) at many other elements, e.g. [SwComponentPrototype](#).

On top of that, a variation-based approach would require the conditional existence of other [ARElements](#) which are not yet supported, e.g. a [SwImplementation](#) that references the [AtomicSwComponentType](#).

7.2.1 Concurrency and Reentrancy of a RunnableEntity that cannot be Invoked Concurrently

This section applies to the case that the value of the attribute `canBeInvokedConcurrently` is `false`. During runtime, each `RunnableEntity` of each instance of an `AtomicSwComponentType` is in a specific run-time state.

The details of the definition and semantics of run-time states can be found in [2]. Nevertheless, this chapter contains a brief description of the fundamental concepts in order to properly being able to discuss the formal modeling of `RunnableEntity`s.

[TPS_SWCT_01313] Conditions for a transition from suspended to to be started [The `SwcInternalBehavior` describes for each `RunnableEntity` the conditions for a transition from `suspended` to `to be started` should occur. This is done using the concept of an `RTEEvent`.] ([RS_SWCT_03040](#))

When a `RunnableEntity` is in state `to be started`, the RTE can decide to start running the `RunnableEntity`. The delay between entering the state `to be started` (e.g. a message has been received in response to which the `RunnableEntity` should run) and moving into the state `running` (the first instruction of the `RunnableEntity` has been executed) depends on the scheduling strategy of the RTE, i.e. the mapping of `RunnableEntity`s on AUTOSAR OS tasks.

The transition from the state `running` into the state `suspended` is in the hands of the `RunnableEntity`: the transition occurs when the `RunnableEntity` returns (thereby handing over control to the AUTOSAR OS [32]). Some `RunnableEntity`s (like `cat. 2 RunnableEntity`s) might never return to the `suspended` state once they entered the `running` state.

They might enter the `preempted` state when being preempted. The same applies if a `RunnableEntity` needs to wait for a `WaitPoint` to be unblocked.

[TPS_SWCT_01304] Cat. 1A and 1B RunnableEntitys will eventually terminate [Cat. 1A and 1B `RunnableEntity`s will eventually return after having executed a specific finite algorithm (the execution time of which might be provided).] ([RS_SWCT_03040](#))

[TPS_SWCT_01305] RunnableEntity as one that cannot be invoked concurrently [In case the `SwcInternalBehavior` defines a `RunnableEntity` as one that cannot be invoked concurrently it is the responsibility of the RTE to make sure that the `RunnableEntity` is never started concurrently (for example, in two different AUTOSAR OS tasks). This implies that the implementation of the `AtomicSwComponentType` does not need to worry about concurrency issues.] ([RS_SWCT_03040](#))

For example: The internal behavior of an `AtomicSwComponentType` `MyComponentType` describes a `RunnableEntity` `R1` which should be enabled when an `operation` on a client-server `PPortPrototype` of the `AtomicSwComponentType` is invoked. The `AtomicSwComponentType` specifies that the `RunnableEntity` `R1` cannot be invoked concurrently.

The `AtomicSwComponentType MyComponentType` is instantiated on an ECU. When a call of the operation is received, the corresponding instance of the `RunnableEntity R1` is enabled and the RTE will start executing the `RunnableEntity` (the `RunnableEntity` is in state `running`) in a task eventually managed by the AUTOSAR OS.

If another call of the `operation` is received while the `RunnableEntity` is in state `running`, it is not allowed that the RTE runs the `RunnableEntity` again in a second task. Rather, the RTE has to wait (and maybe queue the second incoming request) until the `RunnableEntity` has returned and has moved to the `suspended` state.

7.2.2 Concurrency and Reentrancy of a `RunnableEntity` that can be Invoked Concurrently

This section applies to the case that the value of the attribute `canBeInvokedConcurrently` is set to `true`.

In this case, it is allowed that the same `RunnableEntity` is running several times concurrently in different AUTOSAR OS tasks. This implies that the state machine defined in [2] is not the state of the `RunnableEntity` anymore, but can be cloned an arbitrary number of times.

[TPS_SWCT_01306] Software-component description itself does not put any bounds on the number of concurrent invocations of a `RunnableEntity` [The software-component description itself does not put any bounds on the number of concurrent invocations of the `RunnableEntity` that are allowed.

The software-component description only specifies whether the `RunnableEntity` can be invoked concurrently or not.

Allowing concurrent invocation of a `RunnableEntity` implies that the implementation of the `AtomicSwComponentType` needs to take care of this additional form of concurrency.]([RS_SWCT_03040](#))

Example 7.1

The `SwcInternalBehavior` of a component-type `MyComponentType` describes a `RunnableEntity R1` which should be enabled when a `ClientServerOperation` on a `PPortPrototype` typed by a `ClientServerInterface` of the `AtomicSwComponentType` is invoked.

The `AtomicSwComponentType` specifies that the `RunnableEntity R1` can be invoked concurrently. The `AtomicSwComponentType MyComponentType` is instantiated on an ECU.

When a call of the `ClientServerOperation` is received the corresponding instance of the `RunnableEntity R1` is enabled and the RTE will start executing the `RunnableEntity` (the `RunnableEntity` is in state `running`) in a task eventually managed by the AUTOSAR OS.

If another call of the `ClientServerOperation` is received, it is allowed that the same `RunnableEntity` is started again in a different task.

A typical use-case of concurrent `RunnableEntity`s is the implementation of AUTOSAR services. The AUTOSAR services will typically take care of concurrency internally: several software-components can directly use the services in parallel.

The ECU-integrator could then decide that the `RunnableEntity` implementing the AUTOSAR service runs directly in the context (in the task) of the `AtomicSwComponentType` invoking the service.

This is a very efficient and direct coupling between the client and the server: the connector between the client and the server is reduced to a local function-call.

7.2.3 Timed Activation of Runnable Entities

In many cases, `RunnableEntity`s need to be activated in response to timing events rather than related to communication (e.g. the reception of a response to an asynchronous operation invocation). Many `RunnableEntity`s will need to run cyclically with a fixed rate.

The approach taken in the software-component description is to define so-called `TimingEvent`s (please find more details in Figure 7.5) as special kinds of `RTEEvent`s. So far, only one kind of timing-related `RTEEvent` has been defined: a simple periodic `TimingEvent`.

Figure 7.5: Periodic activation of RunnableEntities

[TPS_SWCT_01519] RTE executes certain `RunnableEntity` periodically [If the `SwcInternalBehavior` of an `AtomicSwComponentType` requires that the RTE executes certain `RunnableEntity`s periodically, the description needs to define a `TimingEvent` with the desired period.

This `TimingEvent` then contains a reference to the `RunnableEntity` that needs to be executed with this period.] (*RS_SWCT_03040*)

[constr_2031] Value of `TimingEvent.period` shall be greater than 0 [Attribute `TimingEvent.period` shall exist and its value shall be greater than 0 **at the time when the RTE is generated.**] ()

Note that it is possible to override the attribute `period` on the level of instantiation. See [TPS_SWCT_02507] for more details.

Class	TimingEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This event is used to start RunnableEntities that shall be executed periodically.			
Base	ARObject, AbstractEvent, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable, Multilanguage Referrable, RTEEvent, Referrable			
Aggregated by	AtpClassifier.atpFeature, SwcInternalBehavior.event			
Attribute	Type	Mult.	Kind	Note
offset	TimeValue	0..1	attr	The value makes an assumption about the time offset of the first activation of the RunnableEntity triggered by the mapped TimingEvent relative to the periodic activation of the time base of this TimingEvent. Unit: second.
period	TimeValue	0..1	attr	Period of timing event in seconds. The value of this attribute shall be greater than zero.

Table 7.4: TimingEvent

[constr_1622] Value of TimingEvent.offset vs. TimingEvent.period [If a value is defined for attribute `TimingEvent.offset` then this value shall be greater than 0 and less or equal than the value of attribute `TimingEvent.period` of the respective `TimingEvent` at the time when the RTE is generated.]()

The motivation for the existence of `[constr_1622]` is that the mapped `TimingEvent` could not be implemented with the given `period` if the activation `offset` is greater than the period of the `TimingEvent`.

7.2.4 Additional Remarks and Clarifications

7.2.4.1 Reentrancy and Multiple Instantiation

This chapter is emphasizing on the specific meanings of combinations of the attributes `SwcInternalBehavior.supportsMultipleInstantiation` and `RunnableEntity.canBeInvokedConcurrently`.

[TPS_SWCT_01307] Semantics of combining supportsMultipleInstantiation and canBeInvokedConcurrently [

<code>supportsMultipleInstantiation</code>	<code>canBeInvokedConcurrently</code>	Implication for an implementation of a <code>RunnableEntity</code>
false	false	This implies that the implementation of the <code>RunnableEntity</code> will never be invoked concurrently from several tasks. The implementation does not need to care about reentrancy issues and can typically use static variables to store state.
true	false	In case there are several instances of the same <code>AtomicSwComponentType</code> on the local ECU, the implementation of the <code>RunnableEntity</code> can still be invoked concurrently from several tasks. However, there will be no concurrent invocations of the implementation with the same <code>instance handle</code> . To ensure that this is safe, the implementation will typically use per-instance memory.
true	true	In this case the <code>RunnableEntity</code> can be invoked concurrently from several tasks, even with the same instance handle.

] (`RS_SWCT_03040`)

In case the implementation of a `AtomicSwComponentType` decides to map several `RunnableEntity`s to the same `symbol` there are reentrancy problems to be sorted out. However, this scenario is not supported by RTE [2] anyway and shall therefore be avoided.

7.2.4.2 Reentrancy and “Library Functions”

Note that all code that is called by different `RunnableEntity`s (like e.g. library routines, etc.) shall obviously be reentrant. A filter algorithm implemented in C, for example, is not allowed to store values from previous runs by means of static variables or variables with external binding.

7.2.4.3 Compatibility of `ClientServerOperations` triggering the same `RunnableEntity`

[TPS_SWCT_01309] signature of a `RunnableEntity` depends on the connected `RTEEvent` [The signature of a `RunnableEntity` depends on the connected `RTEEvent`.

Multiple `OperationInvokedEvents` that trigger the same `RunnableEntity` are only supported if all referenced `ClientServerOperations` would result in the same `RunnableEntity` signature for the server `RunnableEntity`.] (*RS_SWCT_03040*)

[constr_2000] Compatibility of `ClientServerOperations` triggering the same `RunnableEntity` [The `ClientServerOperations` are considered compatible **at the time when the contract phase generation is executed** if

- the number of `arguments` (which can be `ArgumentDataPrototypes` or related `PortDefinedArgumentValues`) is equal and
- the corresponding `arguments` (i.e. first `argument` on both sides, second `argument` on both sides, etc.) are compatible or both are typed by "new-world" `Variable-Size Array Data Types` where the data types of the array elements are compatible (but the array sizes may differ).
- and the respective values of `PortAPIOption.errorHandling` are identical.

In particular, this means that:

- for combinations of `ArgumentDataPrototypes` and `ArgumentDataPrototypes` where the `serverArgumentImplPolicy` is set to `useArgumentType` the referred `ImplementationDataTypes` shall be compatible.

In case of data types of `category STRUCTURE` all by order matching `ImplementationDataTypes` shall be named equally.

- for combinations of `PortDefinedArgumentValues` and `ArgumentDataPrototypes` where the `serverArgumentImplPolicy` is set to `useArgumentType` the referred `ImplementationDataTypes` shall be compatible.

In case of `ImplementationDataTypeElements` of category `STRUCTURE` all by order matching `ImplementationDataTypeElements` of the structure shall be named equally.

- for `ArgumentDataPrototypes` where the `serverArgumentImplPolicy` is set to `useVoid` an arbitrary `ImplementationDataType` is referred to.

In addition, it is required that the **return value defined on both sides shall match** (in terms of `Std_ReturnType` vs. `void`) and also the `possibleErrors` are compatible. `]()`

[TPS_SWCT_01520] Implication of the existence of `possibleError` on compatibility of `ClientServerOperations` [An implication of `[constr_2000]` is that a `ClientServerOperation` that defines **any** `possibleError` is **not** compatible with a `ClientServerOperation` that defines **no** `possibleError` at all because this configuration leads to different data type of the return value of the C function that implements the applicable `RunnableEntity`.] `(RS_SWCT_03040)`

7.2.4.4 Categories of Runnable Entities

[TPS_SWCT_01310] Categories of `RunnableEntity`s [`RunnableEntity`s are subdivided into the following categories:

Category 1 `RunnableEntity`s of Category 1 do not have `WaitPoints` and are required to terminate in a finite amount of time. Category 1 is divided into two subcategories: Category 1A and Category 1B.

Category 1A `RunnableEntity`s are only allowed to use implicit APIs.

Category 1B `RunnableEntity`s are additionally allowed to invoke a server, to use explicit APIs, to issue triggers, to switch modes and to use `ExclusiveAreas`.

Category 2 In contrast to Category 1, `RunnableEntity`s, `RunnableEntity`s of Category 2 always aggregate at least one `WaitPoint`¹. Typically, such a `RunnableEntity` implements an internal loop where one iteration through the loop is triggered whenever a `WaitPoint` is resolved.

`] (RS_SWCT_03040)`

For more details regarding details of the modeling of meta-class `RunnableEntity`, please refer to Figure 7.3.

¹Category 2 `RunnableEntity`s usually have to be mapped to *Extended Tasks*, because only extended tasks provide the task state WAITING.

The resource need of a `RunnableEntity` in its later integration usually depends on the used features of the Runtime Environment.

In the AUTOSAR Methodology, the ECU integrator is required to map various `RunnableEntities` to a limited amount of OS Tasks in a specific order.

The `RunnableEntity` categories are useful to indicate the later integration effort and resource need on the basis of the `RunnableEntity`'s design.

Thereby Category 1A `RunnableEntities` do not utilize RTE features which are blocking or delaying the execution of the `RunnableEntity`. As long as the `RunnableEntity` implementation guaranties stable execution times it's rather simple and reliable to integrate them in a calculation chain.

As opposed to Category 1A, the scheduling behavior of Category 2 `RunnableEntities` at runtime depends on the interaction with the interfaces of the enclosing software component.

For instance, the suspend-times of the OS Task, where the `RunnableEntity` is mapped to, may depend on actual data reception and/or occurrence of timeouts.

Moreover, it's usually not possible to map more than one `RunnableEntity` to an OS Task when the `RunnableEntity` implements an infinite internal loop, triggered whenever a `WaitPoint` is resolved.

In case of Category 1B, additional side conditions impact the schedule behavior and required OS features. For instance, a server call might be simply implemented as direct function call in case of intra partition communication **or** might require a more complex implementation in case of inter-ECU communication.

7.2.4.5 Arguments of a Runnable Entity

In many cases an RTE generator will be able to figure out not only the number and data type of arguments to a `RunnableEntity` but also the name of the arguments. In some cases, however, formal support from the upstream templates is required to facilitate this task.

[TPS_SWCT_01311] Name of an operation argument [This support is available by means of the meta-class `RunnableEntityArgument` that contributes the name of the argument by means of the value of the attribute `symbol`.

As a `RunnableEntity` might need to define many arguments the aggregation of `RunnableEntityArgument` at `RunnableEntity` in the role `argument` has the multiplicity `0..*` and as the order of these arguments is significant the meta-model defines the aggregation as `ordered2`.]()

²as the arguments are **ordered** they do not need to be `Referrable` in order to be able to identify individual `arguments`

[constr_1164] Number of arguments owned by a RunnableEntity [If a given `RunnableEntity` owns `RunnableEntityArguments` in the role `argument`, then the number of these `RunnableEntityArguments` shall be identical to the number of applicable `portArgValues` of the `PortAPIOption` that references the `PortPrototype` that in turn is referenced by the `OperationInvokedEvent` that references the `RunnableEntity` **plus** the number of `ArgumentDataPrototypes` aggregated in the role `argument` by the `ClientServerOperation` referenced by said `OperationInvokedEvent` **at the time when the contract phase generation is executed.**]()

[constr_1165] Applicability of RunnableEntityArgument [The existence of a `RunnableEntityArgument` is limited to `RunnableEntity`s triggered by a `ClientServerOperation`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01312] RunnableEntity has a mapping to BswModuleEntry [The existence of `RunnableEntityArguments` in the role `argument` owned by a `RunnableEntity` shall be **ignored** by an RTE generator if a mapping to a `BswModuleEntry` exists.

In this case the name of arguments to the `RunnableEntity` shall be derived from the applicable `SwServiceArgs` owned by the mapped `BswModuleEntry`.] (*RS_SWCT_03040*)

Figure 7.6: Arguments of a RunnableEntity

Class	RunnableEntityArgument

symbol	CIdentifier	0..1	attr	This represents the symbol to be generated into the actual signature on the level of the C programming language.

Table 7.5: RunnableEntityArgument

[constr_1938] Existence of attribute RunnableEntityArgument.symbol [For each `RunnableEntityArgument`, attribute `symbol` shall exist **at the time when the contract phase generation is executed.**]()

7.2.5 Activation Reason of a Runnable Entity

It is feasible to activate a given `RunnableEntity` by means of several `RTEEvents`. In many cases, it is therefore necessary to retrieve the information about the activating `RTEEvent` from within the implementation of the `RunnableEntity`.

As a typical use case, consider a `RunnableEntity` that is cyclically activated (by means of a `TimingEvent`) and in addition it shall also be executed sporadically, e.g. in response to the reception (`DataReceivedEvent`) of a `dataElement`.

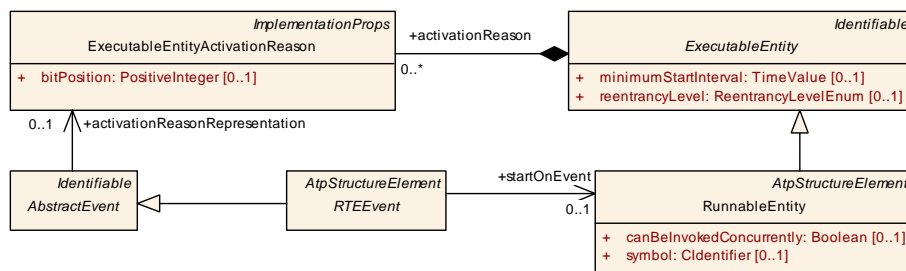

Figure 7.7: `ExecutableEntityActivationReason` and `RunnableEntity`

[TPS_SWCT_01469] RTE API for retrieving the current activation reason [The aggregation of a `ExecutableEntityActivationReason` allows for the RTE generator to create an RTE API for retrieving the current activation reason.] ([RS_SWCT_03040](#), [RS_SWCT_03045](#))

For details about the implementation of this feature, please refer to the specification of the RTE [2]

[constr_1226] Applicable range for `ExecutableEntityActivationReason.bitPosition` [The value of attribute `ExecutableEntityActivationReason.bitPosition` shall be in the range of 0 .. 31 **at the time when the contract phase generation is executed.**]()

[constr_1227] Value of attribute `ExecutableEntityActivationReason.bitPosition` shall be unique [The value of attributes `ExecutableEntityActivationReason.bitPosition` and `ExecutableEntityActivationReason.symbol` shall be unique in the context of the enclosing `RunnableEntity` **at the time when the contract phase generation is executed.**]()

[constr_1228] `RTEEvent` that is referenced by a `WaitPoint` in the role `trigger` shall not reference `ExecutableEntityActivationReason` [An `RTEEvent` that is referenced by a `WaitPoint` in the role `trigger` shall not reference `ExecutableEntityActivationReason` in the role `activationReasonRepresentation` **at the time when the RTE is generated.**]()

The rationale for the existence of [constr_1228] is obviously that in the described situation the `RunnableEntity` is already activated and therefore the mentioned `RTEEvent` does not deliver any information related to the activation reason of said `RunnableEntity`.

Class	ExecutableEntity (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::InternalBehavior			
Note	Abstraction of executable code.

[constr_1939] Existence of attribute ExecutableEntityActivationReason.bitPosition [For each ExecutableEntityActivationReason, attribute bitPosition shall exist **at the time when the contract phase generation is executed.**]()

Please note that the attribute ExecutableEntityActivationReason.symbol is needed for the generation of a unique identifier that represents the specific activation reason in the RTE code.

7.2.6 Runnable Entity for Initialization Purpose

One way to make sure that certain initializations are applied before a software-component enters its state of normal operation is to use the AUTOSAR mode-management, in particular by defining a ModeDeclarationGroup that contains a specific ModeDeclaration with the semantics of representing a mode that is exclusively used for setting up and initializing a software-component.

However, this approach comes with a certain amount of footprint that may be acceptable in some cases but there may also be cases where a simpler approach comes in handy. The simple approach to initialization consists of a RunnableEntity that is triggered by a special kind of RTEEvent, i.e. the so-called InitEvent.

[TPS_SWCT_01525] InitEvent references a RunnableEntity in the role startOnEvent [In addition to using a mode-based approach for executing initialization RunnableEntities it is also possible to let an InitEvent reference a RunnableEntity in the role startOnEvent.

This approach to the initialization of software-components is orthogonal to the mode-based approach. Especially, the RunnableEntities triggered by an InitEvent are expected to be executed after the RTE has been fully initialized. This means restrictions regarding the availability of RTE APIs during the ECU initialization are not relevant for RunnableEntities triggered by an InitEvent.](RS_SWCT_03290)

[constr_1257] No WaitPoints allowed [A RunnableEntity referenced by an InitEvent in the role startOnEvent shall not aggregate a WaitPoint **at the time when the RTE is generated.**]()

Rationale: a WaitPoint may indefinitely defer the completion of the RunnableEntities triggered by an InitEvent and therefore contradict the semantics of the RunnableEntity.

[constr_1258] Value of `minimumStartInterval` for `RunnableEntity`s triggered by an `InitEvent` [The value of the attribute `ExecutableEntity.minimumStartInterval` for a `RunnableEntity`s that is triggered by an `InitEvent` shall always be set to 0 **at the time when the RTE is generated.**]()

Rationale: it does not make sense to talk about intervals of activating `RunnableEntity`s triggered by an `InitEvent` as these are not supposed to be executed repeatedly.

[constr_1259] Aggregation of `AsynchronousServerCallPoint` and `AsynchronousServerCallResultPoint` [A `RunnableEntity` referenced by an `InitEvent` in the role `startOnEvent` may aggregate an `AsynchronousServerCallPoint` but it shall not aggregate an `AsynchronousServerCallResultPoint` **at the time when the RTE is generated.**]()

Rationale: as mentioned before `WaitPoints` shall not be aggregated by a `RunnableEntity`s triggered by an `InitEvent` in the role `startOnEvent`. It is allowed (although considered unlikely to happen) to have an `AsynchronousServerCallPoint` but it is not allowed to fetch the result of the call within the same `RunnableEntity`.

A `RunnableEntity` triggered by an `InitEvent` in the role `startOnEvent` may aggregate a `SynchronousServerCallPoint` but the usage of this configuration is discouraged.

[constr_1260] No mode disabling for `InitEvents` [An `InitEvent` shall not have a reference to a `ModeDeclaration` in the role `disabledMode` **at the time when the RTE is generated.**]()

Rationale: the concept of `RunnableEntity` triggered by an `InitEvent` is (as mentioned before) orthogonal to the mode concept and therefore shall be implemented independent of modes.

7.3 RTEEvent

During execution, several `RTEEvent`s will occur, such as the reception of a remote invocation of a `ClientServerOperation` on a `PPortPrototype` or a timeout on an `RPortPrototype` that is not receiving the `VariableDataPrototypes` it expects to receive.

[TPS_SWCT_01314] `RTEEvent` [An `RTEEvent` defines:

- what the trigger for the occurrence of that `RTEEvent` is
- whether specific `ModeDeclarations` disable the processing of this `RTEEvent`
- which `RunnableEntity` shall be started when this `RTEEvent` occurs.

] (*RS_SWCT_03040*)

Class	AbstractEvent (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::InternalBehavior			
Note	This meta-class represents the abstract ability to model an event that can be taken to implement application software or basic software in AUTOSAR.			
Base	ARObject, Identifiable , MultilanguageReferrable , Referrable			
Subclasses	BswEvent , RTEEvent			
Attribute	Type	Mult.	Kind	Note
activationReasonRepresentation	ExecutableEntity ActivationReason	0..1	ref	If the activationReasonRepresentation is referenced from the enclosing AbstractEvent this shall be taken as an indication that the latter contributes to the activating vector of this ExecutableEntity that owns the referenced ExecutableEntityActivationReason.

Table 7.8: AbstractEvent

Class	RTEEvent (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	Abstract base class for all RTE-related events			
Base	ARObject, AbstractEvent , AtpClassifier , AtpFeature , AtpStructureElement , Identifiable , MultilanguageReferrable , Referrable			
Subclasses	AsynchronousServerCallReturnsEvent , BackgroundEvent , DataReceiveErrorEvent , DataReceivedEvent , DataSendCompletedEvent , DataWriteCompletedEvent , ExternalTriggerOccurredEvent , InitEvent , InternalTriggerOccurredEvent , ModeSwitchedAckEvent , OperationInvokedEvent , OsTaskExecutionEvent , SwcModeManagerErrorEvent , SwcModeSwitchEvent , TimingEvent , TransformerHardErrorEvent			
Aggregated by	AtpClassifier.atpFeature , SwcInternalBehavior.event			
Attribute	Type	Mult.	Kind	Note
disabledMode	ModeDeclaration	*	iref	Reference to the Modes that disable the Event. Stereotypes: atpSplitable Tags: atp.Splitkey=disabledMode.contextPort, disabledMode.contextModeDeclarationGroupPrototype, disabledMode.targetModeDeclaration InstanceRef implemented by: RModeInAtomicSwcInstanceRef
startOnEvent	RunnableEntity	0..1	ref	The referenced RunnableEntity starts when the corresponding RTEEvent is raised.

Table 7.9: RTEEvent

Class	AsynchronousServerCallReturnsEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This event is raised when an asynchronous server call is finished.			
Base	ARObject, AbstractEvent , AtpClassifier , AtpFeature , AtpStructureElement , Identifiable , MultilanguageReferrable , RTEEvent , Referrable			
Aggregated by	AtpClassifier.atpFeature , SwcInternalBehavior.event			
Attribute	Type	Mult.	Kind	Note
eventSource	AsynchronousServerCallResultPoint	0..1	ref	The referenced AsynchronousServerCallResultPoint raises this AsynchronousServerCallReturnsEvent when the asynchronous server call returns.

Class	DataWriteCompletedEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This event is raised when an implicit write access was successful or an error occurred.			
Base	ARObject, AbstractEvent, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable, Multilanguage Referrable, RTEEvent, Referrable			
Aggregated by	AtpClassifier.atpFeature, SwcInternalBehavior.event			
Attribute	Type	Mult.	Kind	Note
eventSource	VariableAccess	0..1	ref	The referenced VariableAccess raises this DataWrite CompletedEvent when the implicit write access was successful or an error occurred.

Table 7.12: DataWriteCompletedEvent

[constr_1942] Existence of attribute DataWriteCompletedEvent.eventSource
[For each DataWriteCompletedEvent, attribute eventSource shall exist at the time when the contract phase generation is executed.]()

Class	DataReceivedEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This event is raised when the referenced data element is received.			
Base	ARObject, AbstractEvent, AtpClassifier, AtpFeature, AtpStructureElement, Identifiable, Multilanguage Referrable, RTEEvent, Referrable			
Aggregated by	AtpClassifier.atpFeature, SwcInternalBehavior.event			
Attribute	Type	Mult.	Kind	Note
data	VariableDataPrototype	0..1	iref	The referenced VariableDataPrototype raises this Data ReceivedEvent when the data has been received. InstanceRef implemented by: RVariableInAtomicSwc InstanceRef

Table 7.13: DataReceivedEvent

[constr_1943] Existence of attribute `DataReceivedEvent.data` [For each `DataReceivedEvent`, attribute `data` shall exist **at the time when the contract phase generation is executed.**]()

Class	DataReceiveErrorEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This event is raised when the Com layer detects and notifies an error concerning the reception of the referenced VariableDataPrototype.			
Base	<i>ARObject</i> , <i>AbstractEvent</i> , <i>AtpClassifier</i> , <i>AtpFeature</i> , <i>AtpStructureElement</i> , <i>Identifiable</i> , <i>Multilanguage Referrable</i> , <i>RTEEvent</i> , <i>Referrable</i>			
Aggregated by	<i>AtpClassifier.atpFeature</i> , <i>SwcInternalBehavior.event</i>			
Attribute	Type	Mult.	Kind	Note
data	VariableDataPrototype	0..1	iref	The referenced VariableDataPrototype raises this Data ReceiveErrorEvent when there was an error during the reception. InstanceRef implemented by: RVariableInAtomicSwc InstanceRef

Table 7.14: DataReceiveErrorEvent

[constr_1944] Existence of attribute `DataReceiveErrorEvent.data` [For each `DataReceiveErrorEvent`, attribute `data` shall exist **at the time when the contract phase generation is executed.**]()

Class	OperationInvokedEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This event is raised when the ClientServerOperation referenced in OperationInvokedEvent.operation shall be invoked.			
Base	<i>ARObject</i> , <i>AbstractEvent</i> , <i>AtpClassifier</i> , <i>AtpFeature</i> , <i>AtpStructureElement</i> , <i>Identifiable</i> , <i>Multilanguage Referrable</i> , <i>RTEEvent</i> , <i>Referrable</i>			
Aggregated by	<i>AtpClassifier.atpFeature</i> , <i>SwcInternalBehavior.event</i>			
Attribute	Type	Mult.	Kind	Note
operation	ClientServerOperation	0..1	iref	This represents the ClientServerOperation which shall be invoked. InstanceRef implemented by: POperationInAtomicSwc InstanceRef

Table 7.15: OperationInvokedEvent

[constr_1945] Existence of attribute `OperationInvokedEvent.operation` [For each `OperationInvokedEvent`, attribute `operation` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1523] No mode disabling for `OperationInvokedEvents` [An `OperationInvokedEvent` shall not have a reference to a `ModeDeclaration` in the role `disabledMode` **at the time when the RTE is generated.**]()

Rationale for the existence of [constr_1523]:

The RTE does not support the disabling of server `RunnableEntity`s by modes. Instead, the server shall respond with an explicit error code if the execution of the server operation is not possible in specific side conditions.

For more explanation about the semantics of meta-class [TimingEvent](#), please refer to section [7.2.3](#).

Class	BackgroundEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This event is used to start RunnableEntities that are supposed to be executed in the background.

[constr_1950] Existence of attribute [InternalTriggerOccurredEvent.eventSource](#) [For each [InternalTriggerOccurredEvent](#), the attribute [eventSource](#) shall exist **at the time when the RTE is generated.**]()

Class	InitEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This RTEEvent is supposed to be used for initialization purposes, i.e. for starting and restarting a partition. It is not guaranteed that all RunnableEntities referenced by this InitEvent are executed before the 'regular' RunnableEntities are executed for the first time. The execution order depends on the task mapping.			
Base	ARObject, AbstractEvent , AtpClassifier, AtpFeature, AtpStructureElement, Identifiable , Multilanguage Referrable , RTEEvent , Referrable			
Aggregated by	AtpClassifier.atpFeature, SwcInternalBehavior.event			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table 7.22: InitEvent

Class	TransformerHardErrorEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This event is raised when data are received which should trigger a Client/Server operation or an external Trigger but during transformation of the data a hard transformer error occurred.			
Base	ARObject, AbstractEvent , AtpClassifier, AtpFeature, AtpStructureElement, Identifiable , Multilanguage Referrable , RTEEvent , Referrable			
Aggregated by	AtpClassifier.atpFeature, SwcInternalBehavior.event			
Attribute	Type	Mult.	Kind	Note
operation	ClientServerOperation	0..1	iref	This represents the ClientServerOperation for which the transformer can raise this TransformerHardErrorEvent. InstanceRef implemented by: POperationInAtomicSwcInstanceRef
requiredTrigger	Trigger	0..1	iref	This represents the Trigger for which the transformer can raise this TransformerHardErrorEvent. InstanceRef implemented by: RTriggerInAtomicSwcInstanceRef

Table 7.23: TransformerHardErrorEvent

[constr_1397] Existence of attributes of [TransformerHardErrorEvent](#) [For any given [TransformerHardErrorEvent](#), **either** the attribute [TransformerHardErrorEvent.operation](#) **or** [TransformerHardErrorEvent.requiredTrigger](#)

shall exist **at the time when the contract phase generation is executed.**]()

In other words, the attributes `operation` and `requiredTrigger` of meta-class `TransformerHardErrorEvent` shall be used mutually exclusive.

[TPS_SWCT_01315] Interaction of `RunnableEntity` with `RTEEvent` [As described in the `Virtual Functional Bus` specification [3], the `RunnableEntities` of an `AtomicSwComponentType` can interact with the occurrence of such `RTEEvents` in two ways:

- the RTE can be instructed to enable a specific `RunnableEntity` when the `RTEEvent` occurs
- the RTE can provide `WaitPoints`, that allow a `RunnableEntity` to block until an `RTEEvent` in a set of `RTEEvents` occurs.

] (`RS_SWCT_03040`)

Class	OsTaskExecutionEvent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This RTEEvent is supposed to execute RunnableEntities which have to react on the execution of specific OsTasks. Therefore, this event is unconditionally raised whenever the OsTask on which it is mapped is executed. The main use case for this event is scheduling of Runnables of Complex Drivers which have to react on task executions.			
Base	<i>ARObject</i> , <i>AbstractEvent</i> , <i>AtpClassifier</i> , <i>AtpFeature</i> , <i>AtpStructureElement</i> , <i>Identifiable</i> , <i>Multilanguage Referrable</i> , <i>RTEEvent</i> , <i>Referrable</i>			
Aggregated by	<i>AtpClassifier.atpFeature</i> , <i>SwcInternalBehavior.event</i>			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table 7.24: OsTaskExecutionEvent

[constr_10016] Applicability of `OsTaskExecutionEvent` [An `OsTaskExecutionEvent` is only applicable for a `SwcInternalBehavior` in the context of a `ComplexDeviceDriverSwComponentType`, `EcuAbstractionSwComponentType`, or `ServiceSwComponentType` **at the time when the contract phase generation is executed.**]()

7.3.1 Defining an Event

The description of the `SwcInternalBehavior` includes a description of all `RTEEvents` that the `SwcInternalBehavior` of the `AtomicSwComponentType` relies on.

[TPS_SWCT_01316] Abstract base class `RTEEvent` [The meta-class `RTEEvent` shows up as an “abstract” base-class in the meta-model: the exact attributes of the `RTEEvent` depend on the specific sub-class of `RTEEvent` that is used for the purpose.]()

Please note that more explanation about the semantics of the meta-classes [SwcModeManagerErrorEvent](#) and [ModeErrorBehavior](#) can be found in section 9.4.

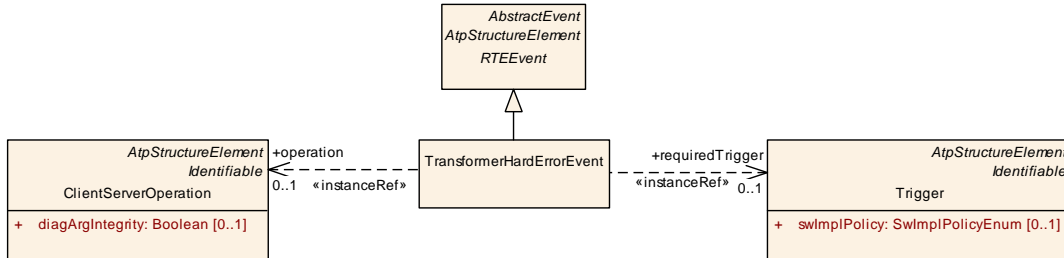

Figure 7.11: **RTEEvent** used in the context of data transformation

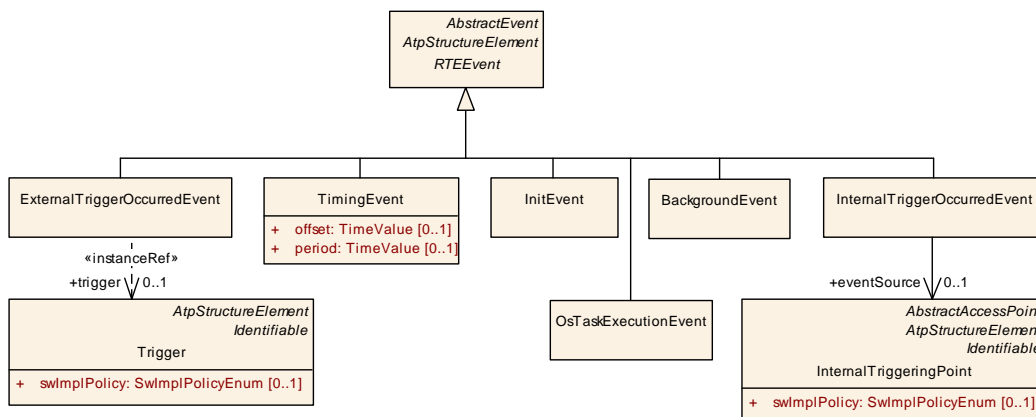

Figure 7.12: **RTEEvents** for purposes other than communication

The details of the various kinds of concrete **RTEEvents** (such as the [TimingEvent](#), [DataSendCompletedEvent](#), etc.), is described in chapters 7.5.1, 7.5.2 and 7.2.3.

7.3.2 Defining how to Respond to an Event

[TPS_SWCT_01317] RTE triggers [RunnableEntity](#) in response to occurring **RTEEvent** [If the software-component description contains a reference from an **RTEEvent** to a [RunnableEntity](#) in the role `startOnEvent`, it is the responsibility of the RTE to trigger the execution of the corresponding [RunnableEntity](#) when the **RTEEvent** occurs.] ([RS_SWCT_03040](#))

Figure 7.13 gives an overview of the modeling of [WaitPoint](#).

[TPS_SWCT_01318] [RunnableEntity](#) and [WaitPoint](#) [In case the [RunnableEntity](#) wants to block and wait for **RTEEvents** (which makes the [RunnableEntity](#) into a cat. 2 [RunnableEntity](#)), the description of the [RunnableEntity](#) may include the definition of a [WaitPoint](#).

Such a [WaitPoint](#) contains a reference to an **RTEEvent** that can unblock the specific [WaitPoint](#). In other words: the [WaitPoint](#) will block until the referenced

RTEEvent occurs or the period specified in the attribute `timeout` expires.](RS_-SWCT_03040)

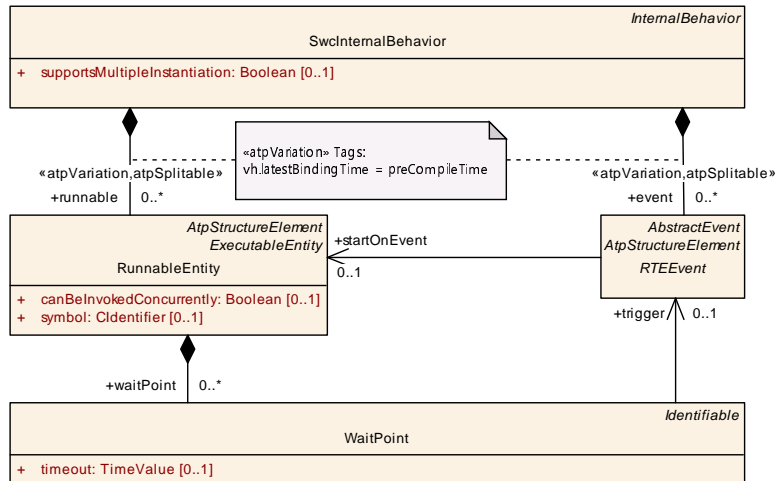

Figure 7.13: Description of the interaction between an RTEEvent and RunnableEntitys

[constr_1091] RTEEvent that may reference a WaitPoint [A WaitPoint shall only be referenced from the listed RTEEvent:

- DataReceivedEvent
- DataSendCompletedEvent
- ModeSwitchedAckEvent
- AsynchronousServerCallReturnsEvent

This rule shall be imposed at the time when the contract phase is executed.]()

[TPS_SWCT_01319] RTEEvent can be used to trigger WaitPoints in different RunnableEntitys [It is in general possible that a single RTEEvent can be used to trigger WaitPoints in different RunnableEntitys.]()

Concerning DataReceivedEvents consider as well [constr_2021].

Class	WaitPoint			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents			
Note	This defines a wait-point for which the RunnableEntity can wait.			
Base	ARObject, Identifiable, MultilanguageReferrable, Referrable			
Aggregated by	RunnableEntity, waitPoint			
Attribute	Type	Mult.	Kind	Note
timeout	TimeValue	0..1	attr	Time in seconds before the WaitPoint times out and the blocking wait call returns with an error indicating the timeout.
trigger	RTEEvent	0..1	ref	This is the RTEEvent this WaitPoint is waiting for.

Table 7.25: WaitPoint

[constr_1951] Existence of attribute `WaitPoint.timeout` [For each `WaitPoint`, attribute `timeout` shall exist **at the time when the RTE is generated.**]()

[constr_1952] Existence of reference `WaitPoint.trigger` [For each `WaitPoint`, the reference to `RTEEvent` in the role `trigger` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1096] `SwcModeSwitchEvent` and `WaitPoint` [A `RunnableEntity` that has a `WaitPoint` shall not be referenced by a `SwcModeSwitchEvent` **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01320] `RunnableEntity`s of category 2 [`RunnableEntity`s that aggregate a `WaitPoint` are by definition of category 2 and therefore are not required to terminate ever. It is therefore difficult to let a `RunnableEntity` of category 2 implement a mode switch.] (*RS_SWCT_03040*)

[constr_1097] `RunnableEntity` that has a `WaitPoint` [A `RunnableEntity` that has a `WaitPoint` shall not be referenced by an `RTEEvent` that has a reference in the role `disabledMode` **at the time when the RTE is generated.**]()

[TPS_SWCT_01324] Mode switches need to be completed in finite time [Mode switches need to be completed in finite time and a `RunnableEntity` that has a `WaitPoint` can never guarantee that the `WaitPoint` is resolved within finite time.] (*RS_SWCT_03040*)

In addition to this, the `RunnableEntity` with a `WaitPoint` that would be affected by a mode disabling would typically already run when the mode disabling applies. It could not be terminated at this point in time.

7.4 Communication among Runnable Entities

It is taken for granted that particular `RunnableEntity`s within a specific `AtomicSwComponentType` will need to communicate among each other.

[TPS_SWCT_01321] Communication among `RunnableEntity`s [The RTE needs to provide synchronization mechanisms to the `RunnableEntity`s such that safe (in the multi-threading sense) exchange of data is possible.

In this case, the use of `PortPrototypes` is (although technically feasible) not required for the purpose.] (*RS_SWCT_00120*)

[TPS_SWCT_01592] Communication among `RunnableEntity`s of different instances of the same `AtomicSwComponentType` [The communication among `RunnableEntity`s of different instances of the same `AtomicSwComponentType` is only supported via `PortPrototypes`.] (*RS_SWCT_00120*)

Several concepts for implementing communication among `RunnableEntity`s can be identified.

As an introduction, the section 2.3.1 describes the various techniques that the RTE might use to provide efficient interaction between `RunnableEntity`s within one `AtomicSwComponentType`.

Two possible approaches for formal specification of this kind of communication are described:

- Specifying that several `RunnableEntity`s belong in a specific `ExclusiveArea`
- Specifying the data exchanged between the `RunnableEntity`s

7.4.1 Description Possibility 1: Exclusive Area

This section describes how the concept of `ExclusiveAreas` can be used in the description of the `SwcInternalBehavior` of an `AtomicSwComponentType`.

Please note that `ExclusiveAreas` are actually owned by the base class of `SwcInternalBehavior`, i.e. `InternalBehavior`. These `ExclusiveAreas` do not imply a specific implementation (e.g. with mutual-exclusion semaphores).

Class	ExclusiveArea			
Package	M2::AUTOSARTemplates::CommonStructure::InternalBehavior			
Note	Prevents an executable entity running in the area from being preempted.			
Base	<code>ARObject</code> , <code>Identifiable</code> , <code>MultilanguageReferrable</code> , <code>Referrable</code>			
Aggregated by	<code>InternalBehavior.exclusiveArea</code>			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table 7.26: ExclusiveArea

[TPS_SWCT_01031] ExclusiveArea [An `ExclusiveArea` merely specifies a constraint on the scheduling policy and configuration of the RTE:

If two or more `RunnableEntity`s refer to the same `ExclusiveArea` only one of these `RunnableEntity`s is allowed to be executed while being inside that `ExclusiveArea`.] (`RS_SWCT_00120`, `RS_SWCT_02090`)

In other words: these `RunnableEntity`s shall not run concurrently (preempt each other) while executing inside the `ExclusiveArea`.

Please find more details about the formal definition of meta-class `ExclusiveArea` in Figure 7.14.

[TPS_SWCT_01049] Two ways to use the ExclusiveAreas [There are in general two ways to use the `ExclusiveAreas`. During its execution, a `RunnableEntity` can enter and exit an `ExclusiveArea` (in which case `ExecutableEntity.canEnter` shall exist).

As an alternative, it can be specified that the entire execution of a given `RunnableEntity` shall be guarded by an `ExclusiveArea` (this requires the existence of `ExecutableEntity.runsInside`).] ([RS_SWCT_00120](#), [RS_SWCT_02090](#))

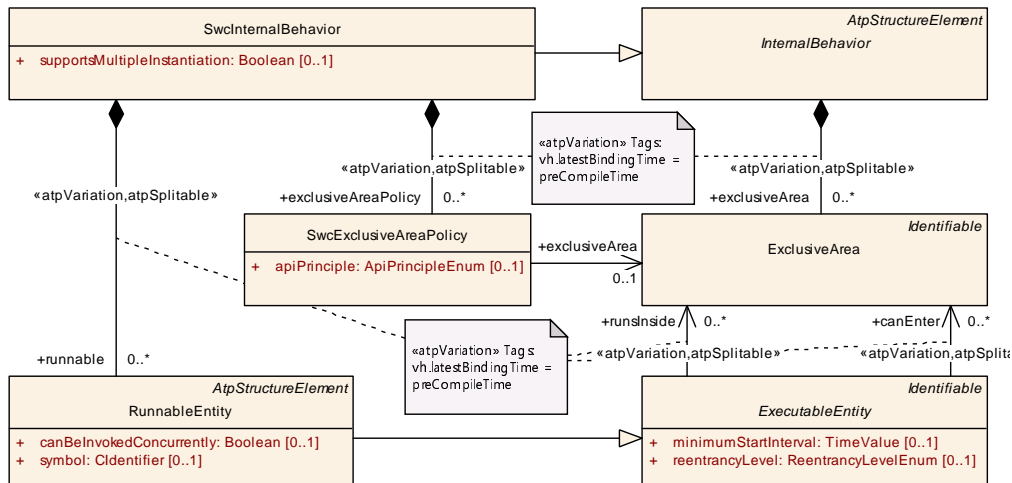

Figure 7.14: Description of logical exclusive areas

Please note that the options for entering an `ExclusiveArea` are documented in section 7.4.1.1 and section 7.4.1.2

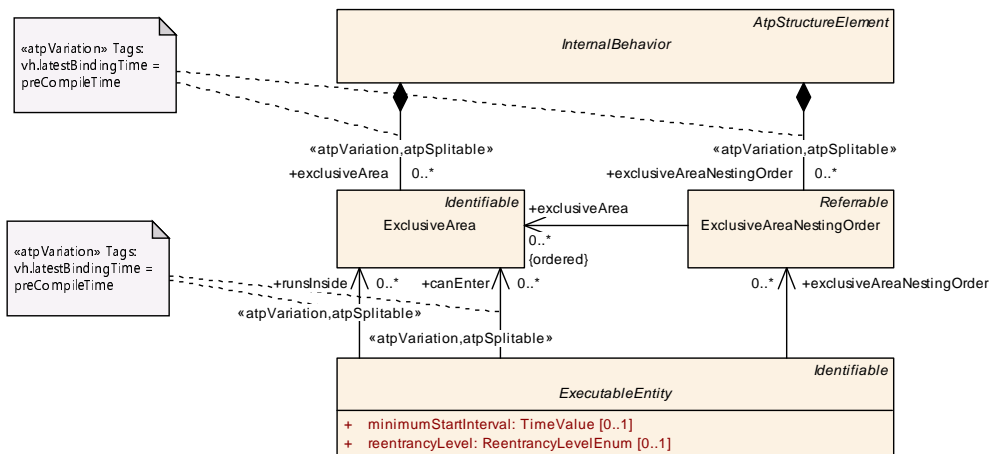

Figure 7.15: Description of nested usage of `ExclusiveArea`

[TPS_SWCT_01457] `ExclusiveAreaNestingOrder` [The optional `ExclusiveAreaNestingOrders` shall (if used at all) describe possible nesting orders (including single `ExclusiveAreas`) which can occur in the `RunnableEntity`. Each possible locking situation requires its own `ExclusiveAreaNestingOrder`.] ([RS_SWCT_03055](#))

[TPS_SWCT_01458] Indicate that the locking behavior is fully described for `RunnableEntity` [All `ExclusiveAreas` which are configured in the `InternalBehavior` should be referenced by an `ExclusiveAreaNestingOrder` to indicate that the locking behavior is fully described for this `RunnableEntity`.] ([RS_SWCT_03055](#))

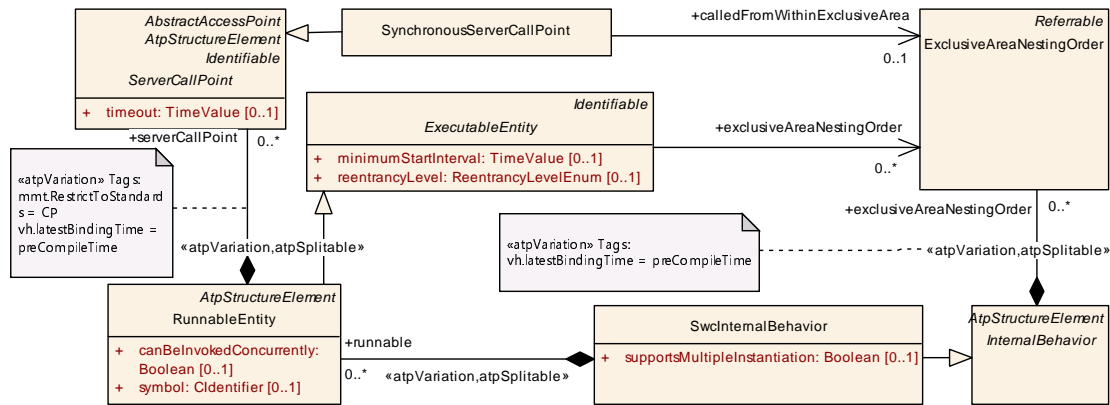

Figure 7.16: Nested usage of ExclusiveArea and the impact on SynchronousServerCallPoint

[TPS_SWCT_01459] Locking behavior is not described for this RunnableEntity [If ExclusiveAreas are not referenced by any ExclusiveAreaNestingOrder (this is the default scenario), this means that the locking behavior is not described for this RunnableEntity and the provided information might be incomplete and cannot be used for a global offline analysis of locking behavior.] (RS_SWCT_03055)

An ExclusiveAreaNestingOrder is aggregated by the InternalBehavior that in turn also owns RunnableEntity.

Class	ExclusiveAreaNestingOrder				
Package	M2::AUTOSARTemplates::CommonStructure::InternalBehavior				
Note	This meta-class represents the ability to define a nesting order of ExclusiveAreas. A nesting order (that may occur in the executable code) is formally defined to be able to analyze the resource locking behavior.				
Base	ARObject, Referrable				
Aggregated by	InternalBehavior.exclusiveAreaNestingOrder				
Attribute	Type	Mult.	Kind	Note	
exclusiveArea (ordered)	ExclusiveArea	*	ref	This represents a specific scenario of how Exclusive Areas can be used in terms of the nesting order.	

Table 7.27: ExclusiveAreaNestingOrder

[TPS_SWCT_01460] Relation of SynchronousServerCallPoint to ExclusiveAreaNestingOrder [In case other RunnableEntities are invoked synchronously from within the RunnableEntity the ExclusiveAreaNestingOrder can then be referenced by one or several SynchronousServerCallPoints to specify the calling environment of the invoked server with regard to ExclusiveAreas.] (RS_SWCT_03055)

The purpose of this configuration is to analyze the resource locking behavior for complete call trees.

7.4.1.1 Entire Runnable Runs in the Exclusive Area

[TPS_SWCT_01050] RunnableEntity always runs inside an ExclusiveArea
[In the first approach, the formal description specifies that certain RunnableEntities always run inside an ExclusiveArea.] (RS_SWCT_00120, RS_SWCT_02090)

Example 7.2

If the formal description specifies that both RunnableEntity 'r1' and RunnableEntity 'r2' run within ExclusiveArea 's1', the RTE shall make sure that RunnableEntities 'r1' and 'r2' never run concurrently; the scheduler should never preempt 'r1' to run 'r2'.

Note that this pattern does not force the RTE to implement this by using semaphores or mutexes that are taken before the RunnableEntity starts and given when the RunnableEntity returns. It only obliges the RTE to make sure that both RunnableEntities are never running concurrently.

This requirement could be implemented by several of the implementation strategies described above. Examples for such implementation strategies are listed below.

Example 7.3

Scheduling strategy: if, for example, RunnableEntities 'r1' and 'r2' (mentioned in Example 7.2) are mapped to the same task, the criterion is automatically satisfied. For this purpose it is necessary to make sure that the OS can only execute a single instance of the task into which the RunnableEntities are put.

Example 7.4

Mutual exclusion semaphores: in case 'r1' and 'r2' are mapped to different tasks ('T1', respectively 'T2'), the OS shall make sure that while 'T1' is executing 'r1', 'T2' running 'r2' can never preempt it and vice-versa. This could be implemented by taking a mutual-exclusion semaphore before executing 'r1' (or 'r2') in the context of 't1' (or 't2') and returning the semaphore on exiting the RunnableEntity.

7.4.1.2 Runnable would Dynamically Enter and Leave the Exclusive Area

[TPS_SWCT_01051] RunnableEntity explicitly enters and leaves a specific ExclusiveArea
[In the second approach, the RunnableEntity would explicitly make API-calls to the RTE within the implementation of the RunnableEntity to enter and leave a specific ExclusiveArea.] (RS_SWCT_00120, RS_SWCT_02090)

This could, for example, be implemented by means of the priority ceiling concept described in chapter 2.3.1.3.

Additionally, it is possible to define the execution time the `RunnableEntity` will spend in this `ExclusiveArea` segment. Please note that although this aspect is described in [6] the concept can be applied to software-components as well.

7.4.1.3 Configuration of API Generation

For certain usage scenarios of `ExclusiveAreas` it is considered advantageous if each `RunnableEntity` uses a distinct set of enter and exit APIs.

This distinct set of APIs support `ExclusiveArea` implementations where for the `RunnableEntity(s)` with the highest priority the lock is omitted.

This is possible when the `RunnableEntity(s)` with the highest priority can't be interrupted by `RunnableEntitys` scheduled with lower priority.

To support this kind of implementation, the software-component description has to state (by means of attribute `SwcInternalBehavior.exclusiveAreaPolicy.apiPrinciple`) that it requests APIs individually for each `RunnableEntity` referencing an `ExclusiveArea` in the role `canEnter`.

Class	SwcExclusiveAreaPolicy			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior			
Note	Options how to generate the ExclusiveArea related APIs. If no SwcExclusiveAreaPolicy is specified for an ExclusiveArea the default values apply.			
Base	ARObject			
Aggregated by	SwcInternalBehavior.exclusiveAreaPolicy			
Attribute	Type	Mult.	Kind	Note
apiPrinciple	ApiPrincipleEnum	0..1	attr	Specifies for this ExclusiveArea if either one common set of Enter and Exit APIs for the whole software component is requested from the Rte or if the set of Enter and Exit APIs is expected per RunnableEntity. The default value is "common".
exclusiveArea	ExclusiveArea	0..1	ref	This reference represents the ExclusiveArea for which the policy applies.

Table 7.28: SwcExclusiveAreaPolicy

[constr_1953] Existence of attribute `SwcExclusiveAreaPolicy.apiPrinciple`
 [For each `SwcExclusiveAreaPolicy` that refers to an `exclusiveArea`, attribute `apiPrinciple` shall exist **at the time when the RTE is generated.**]()

Enumeration	ApiPrincipleEnum
Package	M2::AUTOSARTemplates::CommonStructure::InternalBehavior
Note	This enumeration represents the ability to control the granularity of API generation.
Aggregated by	BswExclusiveAreaPolicy.apiPrinciple, <code>SwcExclusiveAreaPolicy.apiPrinciple</code>
Literal	Description

Enumeration	ApiPrincipleEnum
common	The Rte or SchM API is provided for the whole software component / BSW Module Tags: atp.EnumerationLiteralIndex=0
perExecutable	The Rte or SchM API is provided for a specific ExecutableEntity of a software component / BSW Module Tags: atp.EnumerationLiteralIndex=1

Table 7.29: ApiPrincipleEnum

[TPS_SWCT_01713] ExclusiveArea is entered and exited by a common set of APIs [If the value of attribute `SwcExclusiveAreaPolicy.apiPrinciple` is set to `ApiPrincipleEnum.common` then the RTE provides **one set** of enter and exit APIs to be shared among all `RunnableEntity`s of the whole software-component.] ([RS_SWCT_00120](#), [RS_SWCT_02090](#))

In this case, the same enter and exit code is executed by all affected `RunnableEntity`s and there is no way to have a special treatment for the `RunnableEntity`(s) executed in the context with the highest priority.

[TPS_SWCT_01714] ExclusiveArea is entered and exited by an individual set of APIs [If the value of attribute `SwcExclusiveAreaPolicy.apiPrinciple` is set to `ApiPrincipleEnum.perExecutable` then the RTE provides **individual** sets of APIs for entering and exiting `ExclusiveArea`s for each affected `RunnableEntity`.] ([RS_SWCT_00120](#), [RS_SWCT_02090](#))

In this case, the implementation of enter and exit code for the `RunnableEntity` executed in the execution context with the highest priority can be left empty.

In order to avoid the existence of contradicting settings of `SwcExclusiveAreaPolicies` for one `ExclusiveArea` [[constr_1468](#)] applies.

[constr_1468] Limitation on the number of SwcExclusiveAreaPolicies [An `ExclusiveArea` shall only be referenced by **at most** one `SwcExclusiveAreaPolicy` **at the time when the contract phase generation is executed.**]()

7.4.2 Description Possibility 2: Inter-Runnable Variable

For certain cases the `ExclusiveArea` concept does not provide enough information to configure the RTE correctly. In these cases it may be advised to opt for a different approach that is based on the guarded access to variables protected by the RTE.

For the purpose of identifying pieces of data that shall be accessed concurrently from different `RunnableEntity`s formal support is required. In AUTOSAR, this aspect is summarized under the term "inter-runnable variable".

[TPS_SWCT_01052] Inter-runnable variable [These so-called "inter-runnable variables" are described with the element `VariableDataPrototype` aggregated in

the role `explicitInterRunnableVariable` or `implicitInterRunnableVariable`.] (*RS_SWCT_00120*, *RS_SWCT_02090*)

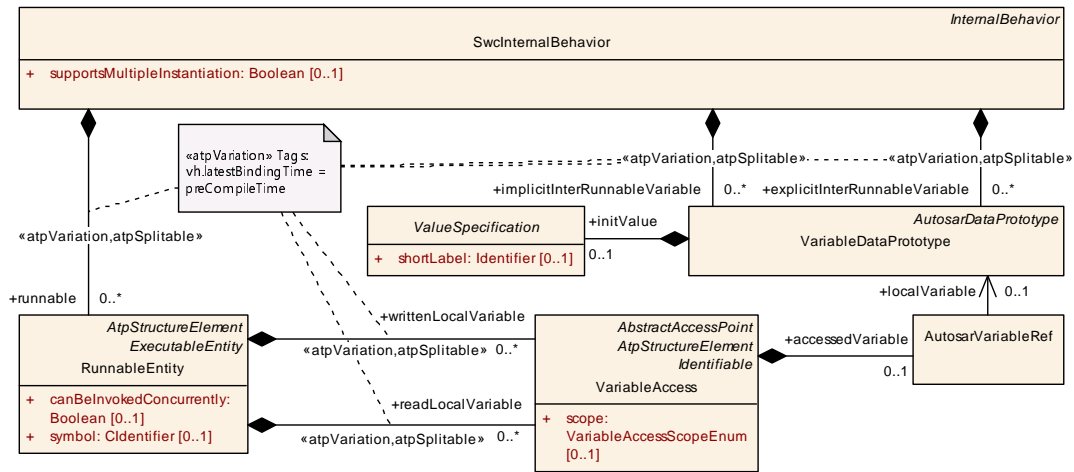

Figure 7.17: `implicitInterRunnableVariable` vs. `explicitInterRunnableVariable`

[TPS_SWCT_01053] Relationship of interchanged data with `RunnableEntity` [Furthermore, the relationship of these data with `RunnableEntity`s shall be specified.

For this specific purpose, `RunnableEntity` aggregates `VariableAccess` in the roles `readLocalVariable` and `writtenLocalVariable`.

Also, `SwcInternalBehavior` aggregates `VariableDataPrototype` in the roles `explicitInterRunnableVariable` and `implicitInterRunnableVariable`.

The connection between `RunnableEntity` and the `explicitInterRunnableVariable` and `implicitInterRunnableVariable` is created if the reference `AutosarVariableRef.localVariable` to the respective `VariableDataPrototype` exists.] (*RS_SWCT_00120*, *RS_SWCT_02090*)

[TPS_SWCT_01521] Use `AutosarVariableRef.localVariable` for referencing inter-runnable variables [A `RunnableEntity` that defines a `VariableAccess` in role `writtenLocalVariable` and `readLocalVariable` shall make use of `AutosarVariableRef.localVariable`.] (*RS_SWCT_03040*)

[constr_2026] Referenced `VariableDataPrototype` from `AutosarVariableRef` of `VariableAccess` in role `writtenLocalVariable` and `readLocalVariable` [A `VariableDataPrototype` in the `localVariable` reference needs to be owned by the same `SwcInternalBehavior` as this `RunnableEntity` belongs to, and the referenced `VariableDataPrototype` has to be defined in the role `implicitInterRunnableVariable` or `explicitInterRunnableVariable`.

This rule shall be imposed **at the time when the contract phase generation is executed.**] ()

Obviously, the data-type of an `implicitInterRunnableVariable` or `explicitInterRunnableVariable` is described by the data type of the `VariableDataPrototype` (which is derived from `DataPrototype`).

[TPS_SWCT_01637] Initial value for a specific `implicitInterRunnableVariable` or `explicitInterRunnableVariable` [It is possible (but not mandatory) to define an initial value for a specific `implicitInterRunnableVariable` or `explicitInterRunnableVariable`.

For this purpose the `VariableDataPrototype` in the role of `explicitInterRunnableVariable` or `implicitInterRunnableVariable` is able to aggregate a `ValueSpecification` in the role `initValue`.]([RS_SWCT_02090](#))

The statement made by [\[TPS_SWCT_01637\]](#) is reflected by [Figure 7.17](#)

[TPS_SWCT_01522] No initial value is specified for `implicitInterRunnableVariable` or `explicitInterRunnableVariable` [Please note that the behavior is undefined if no initial value is specified and a `RunnableEntity` reads an `implicitInterRunnableVariable` or `explicitInterRunnableVariable` before it is actually written to by another `RunnableEntity`.]([RS_SWCT_03040](#))

As already mentioned before, the concept of an "inter-runnable variable" can be used in *two different flavors* This is indicated by the two different roles `explicitInterRunnableVariable` or `implicitInterRunnableVariable` in which the `VariableDataPrototype` serving as the "inter-runnable variable" is aggregated.

These resemble the communication principles applied for the communication on the level of `SwComponentTypes`.

Please note that the two different kinds of inter-runnable variables are accessed via different RTE [\[2\]](#) API calls.

[TPS_SWCT_01054] Semantics of the `explicitInterRunnableVariable` [The semantics of the `explicitInterRunnableVariable` is that *explicit* implies the direct access to the value of a `VariableDataPrototype` used in the role `explicitInterRunnableVariable`.

By this means it is possible to get different values for a specific `VariableDataPrototype` each time the corresponding API call is executed.]([RS_SWCT_00120](#), [RS_SWCT_02090](#))

[TPS_SWCT_01055] Semantics of `implicitInterRunnableVariable` [The `implicitInterRunnableVariable` corresponds to an execution model where the value of an `VariableDataPrototype` does not change (for the reading `RunnableEntity`, obviously) during the runtime of a `RunnableEntity`.]([RS_SWCT_00120](#), [RS_SWCT_02090](#))

This approach is in detail described in chapter [2.3.1.4](#).

[constr_1296] **DataPrototypes** used as **explicitInterRunnableVariable** or **implicitInterRunnableVariable** and **category DATA_REFERENCE** [A **VariableDataPrototype** shall not be aggregated by **SwcInternalBehavior** in either the role:

- **explicitInterRunnableVariable**, or
- **implicitInterRunnableVariable**

if the **VariableDataPrototype** (after potential indirections via **TYPE_REFERENCE** are resolved) is either typed by, or mapped to, an:

- **ImplementationDataType** of **category DATA_REFERENCE**, or
- **ImplementationDataType** that contains **subElements** that (after potential indirections via **TYPE_REFERENCE** are resolved) are of **category DATA_REFERENCE**.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

7.4.3 Inter Runnable Triggering

The concept of *inter-runnable triggering* allows one **RunnableEntity** to trigger another **RunnableEntity** within an **AtomicSwComponentType**. This approach conceptually supports the decoupling of calculation and processing sequences inside a software-component.

By mappings of the **InternalTriggerOccurredEvents** to OS Tasks running at different priorities the triggered **RunnableEntities** are in turn executed with a different priority as the triggering **RunnableEntity**.

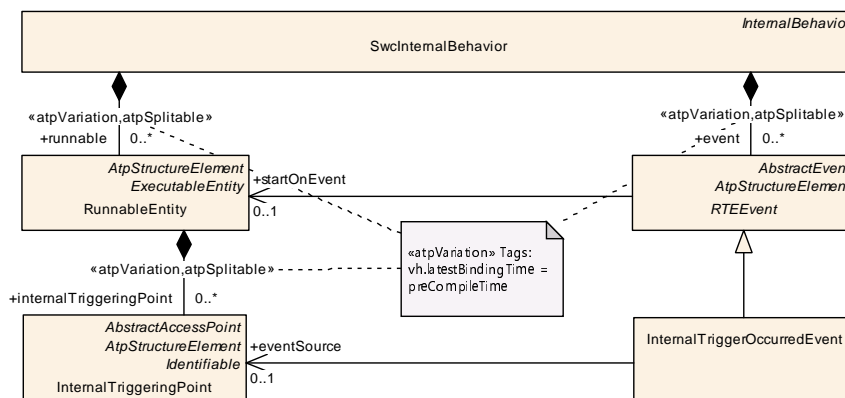

Figure 7.18: Model of software-component Inter Runnable Triggering

For example, a cyclically triggered **RunnableEntity** which shall not exceed a certain worst case execution time (WCET) activates a second **RunnableEntity** if an error occurred in order to be able to execute a (potentially) time-consuming exception-handling on a lower level of priority.

As illustrated in Figure 7.18, the triggering `RunnableEntity` needs an `InternalTriggeringPoint`.

The activation of `RunnableEntities` in the same software-component instance is affected through the generic event-handling mechanism.

[TPS_SWCT_01523] Internal trigger event [A `RunnableEntity` that shall be activated at the occurrence of an internal trigger event is defined by means of an `InternalTriggerOccurredEvent` which references the particular `InternalTriggeringPoint` and additionally the to-be-activated `RunnableEntity`.] (*RS_SWCT_03040*)

[TPS_SWCT_01022] Queued processing of internal trigger [The attribute `InternalTriggeringPoint.swImplPolicy` can be used to specify a requirement whether the internal triggering of the enclosing `RunnableEntity` using the given `InternalTriggeringPoint` shall be queued.] (*RS_SWCT_03040*)

[constr_1182] Allowed values for `InternalTriggeringPoint.swImplPolicy` [The **only** allowed values for the attribute `swImplPolicy` of meta-class `InternalTriggeringPoint` are either `STANDARD` (in which case the processing of the internal triggering does not use a queue) or `QUEUED` (in which case the processing of internal triggering positively uses a queue).

This rule shall be imposed **at the time when the RTE is generated.**] ()

Class	<code>InternalTriggeringPoint</code>			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::Trigger			
Note	If a <code>RunnableEntity</code> owns an <code>InternalTriggeringPoint</code> it is entitled to trigger the execution of <code>RunnableEntities</code> of the corresponding software-component.

<code>swImplPolicy</code>	<code>SwImplPolicyEnum</code>	0..1	attr	This attribute, when set to value <code>queued</code> , allows for a queued processing of Triggers.

Table 7.30: InternalTriggeringPoint

The description of the corresponding *external* trigger communication is contained in chapter 7.5.3.

7.5 Data Access of RunnableEntities

This section describes the communication properties of an `AtomicSwComponentType`. This is done mainly from the point of view of a `RunnableEntity` (the concept of a `RunnableEntity` is introduced in chapter 7.2).

However, the usage of a `PortPrototype` in a specific role within an `AtomicSwComponentType` also has an impact on communication behavior.

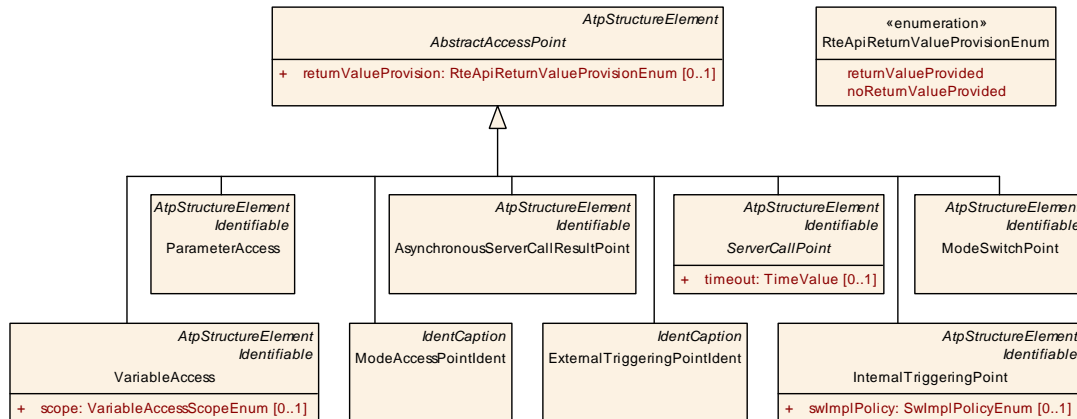

Figure 7.19: Modeling of the `AbstractAccessPoint`

Access of `RunnableEntity`s to the different elements in `PortInterfaces` or the `InternalBehavior` are modeled by a set of meta-classes specific to the communication pattern and the kind of access.

Nevertheless, all of those meta-classes inherit from `AbstractAccessPoint` in order to enable the ability to be referenced in a harmonized way to by additional descriptions.

Class	<code>AbstractAccessPoint</code> (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::AccessCount			
Note	Abstract class indicating an access point from an ExecutableEntity.			
Base	<code>ARObject</code> , <code>AtpClassifier</code> , <code>AtpFeature</code> , <code>AtpStructureElement</code> , <code>Identifiable</code> , <code>MultilanguageReferrable</code> , <code>Referrable</code>			
Subclasses	<code>AsynchronousServerCallResultPoint</code> , <code>ExternalTriggeringPointIdent</code> , <code>InternalTriggeringPoint</code> , <code>ModeAccessPointIdent</code> , <code>ModeSwitchPoint</code> , <code>ParameterAccess</code> , <code>ServerCallPoint</code> , <code>VariableAccess</code>

Attribute	Type	Mult.	Kind	Note
returnValue Provision	<code>RteApiReturnValueProvisionEnum</code>	0..1	attr	This attribute controls the provision of return values for RTE APIs that correspond to the enclosing access point.

Table 7.31: AbstractAccessPoint

Enumeration	<code>RteApiReturnValueProvisionEnum</code>
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::AccessCount
Note	This meta-class provides values to control how return values from RTE APIs are provided.
Aggregated by	<code>AbstractAccessPoint.returnValueProvision</code>
Literal	Description
noReturnValue Provided	The RTE API shall not provide a return value. Tags: atp.EnumerationLiteralIndex=1
returnValue Provided	The RTE API shall provide a return value. Tags: atp.EnumerationLiteralIndex=0

Table 7.32: RteApiReturnValueProvisionEnum

`RunnableEntity` that access `DataPrototypes` in the context of `PortPrototypes` are **not** allowed to extend the data access to sub-elements of the respective `DataPrototypes`.

For example, assume a `DataPrototype` that effectively implements a structure of two elements A and B. It is **not** supported to only send or receive only element A or B of the structure.

This assertion leads to the existence of `[constr_1429]` and, by extension, `[constr_1430]`.

[constr_1429] Access to data within `PortPrototypes` from within `RunnableEntities` [For a `VariableAccess` that is aggregated in the roles

- `RunnableEntity.dataWriteAccess`
- `RunnableEntity.dataReadAccess`
- `RunnableEntity.dataSendPoint`
- `RunnableEntity.dataReceivePointByArgument`
- `RunnableEntity.dataReceivePointByValue`

the existence of the following attributes is not allowed:

- `VariableAccess.accessedVariable.autosarVariable.contextDataPrototype`
- `VariableAccess.accessedVariable.autosarVariable.rootVariableDataPrototype`
- `VariableAccess.accessedVariable.autosarVariableInImplDatatype`
- `VariableAccess.accessedVariable.localVariable`

In other words: in this case, only the references

- `VariableAccess.accessedVariable.autosarVariable.portPrototype` and
- `VariableAccess.accessedVariable.autosarVariable.targetDataPrototype`

shall exist and the latter shall **exclusively** refer to a `VariableDataPrototype` that is aggregated as either

- `SenderReceiverInterface.dataElement` or
- `NvDataInterface.nvData`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1430] Access to local data from within `RunnableEntities` [For `VariableAccess` that is aggregated in the roles

- `RunnableEntity.writtenLocalVariable`
- `RunnableEntity.readLocalVariable`

the existence of the following attributes is not allowed:

- `VariableAccess.accessedVariable.autosarVariableInImpl-Datatype`
- `VariableAccess.accessedVariable.autosarVariable`

In other words, **only** the reference `VariableAccess.accessedVariable.local-Variable` shall be used in this case.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1431] Access to parameters from within RunnableEntitys [For a `ParameterAccess` that is aggregated in the role `RunnableEntity.parameterAccess` the existence of the following attributes is not allowed:

- `ParameterAccess.accessedParameter.autosarParameter.context-DataPrototype`
- `ParameterAccess.accessedParameter.autosarParameter.rootParameterDataPrototype`

In other words: in this case, **one** of the following alternatives is allowed to exist:

- a combination of
 - `ParameterAccess.accessedParameter.autosarParameter.port-Prototype` and
 - `ParameterAccess.accessedParameter.autosarParameter.targetDataPrototype` that **exclusively** refers to a `ParameterDataPrototype` aggregated by a `ParameterInterface` in the role `parameter`.
- `ParameterAccess.accessedParameter.localParameter` that refers to a `ParameterDataPrototype` that is either aggregated as
 - `InternalBehavior.constantMemory` or
 - `SwcInternalBehavior.perInstanceParameter` or
 - `SwcInternalBehavior.sharedParameter`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

7.5.1 RunnableEntities and Sender Receiver Communication

This section describes aspects relevant for the sender-receiver communication of a software-component. These mainly influence the behavior and API of the AUTOSAR RTE.

[TPS_SWCT_01322] Interaction patterns for the application of the sender-receiver paradigm [The possible interaction patterns for the application of the sender-receiver paradigm are explained, namely:

1. Data-access in a cat. 1 [RunnableEntity](#),
2. explicit sending,
3. the [DataSendCompletedEvent](#): dealing with the success/failure of an explicit send, and
4. the [DataReceivedEvent](#): responding to the reception of data
5. the [DataReceiveErrorEvent](#): notifying an error concerning the reception of data.

]([RS_SWCT_00200](#))

7.5.1.1 Terminology

The AUTOSAR meta-model foresees two different approaches for sender-receiver communication. These are described in detail in chapters [7.5.1.2](#) and [7.5.1.3](#). However, it turned out that it is rather cumbersome to discuss issues of communication approaches directly on the basis of meta-classes and their attributes.

Therefore, it seems appropriate to introduce a dedicated terminology for this purpose. The approach eventually selected was originally introduced by the contributors to the RTE specification.

This terminology proposes to use the term “implicit” for communication based on *data-access* (for more information about details of this approach please consult chapter [7.5.1.2](#)) and “explicit” for communication based on so-called *data-points* (please refer to chapter [7.5.1.3](#)).

The motivation for the differentiation between “implicit” and “explicit” was originally the characteristics of the RTE specification that foresaw an API for handling a [dataSendPoint](#) or [dataReceivePointByValue](#) in contrast to the *data-access* that was supposed to be part of the function signature (therefore, no API was required) of a specific [RunnableEntity](#).

Although the specification of the RTE changed in the meantime (and the original motivation no longer applies) it turned out that the terminology based on “implicit” and “explicit” communication was already widely used within AUTOSAR.

As no consensus could be reached over alternative proposals this terminology approach is taken over by this document as well.

7.5.1.2 Data Access

[TPS_SWCT_01323] Read and write access to a **dataElement** [The *SwcInternalBehavior* may specify that a *RunnableEntity* needs read-access (respectively write-access) to the *VariableDataPrototypes* in the role *dataElement* of an *RPortPrototype* (respectively *PPortPrototype*, or *PRPortPrototype*).] (*RS_SWCT_00200*)

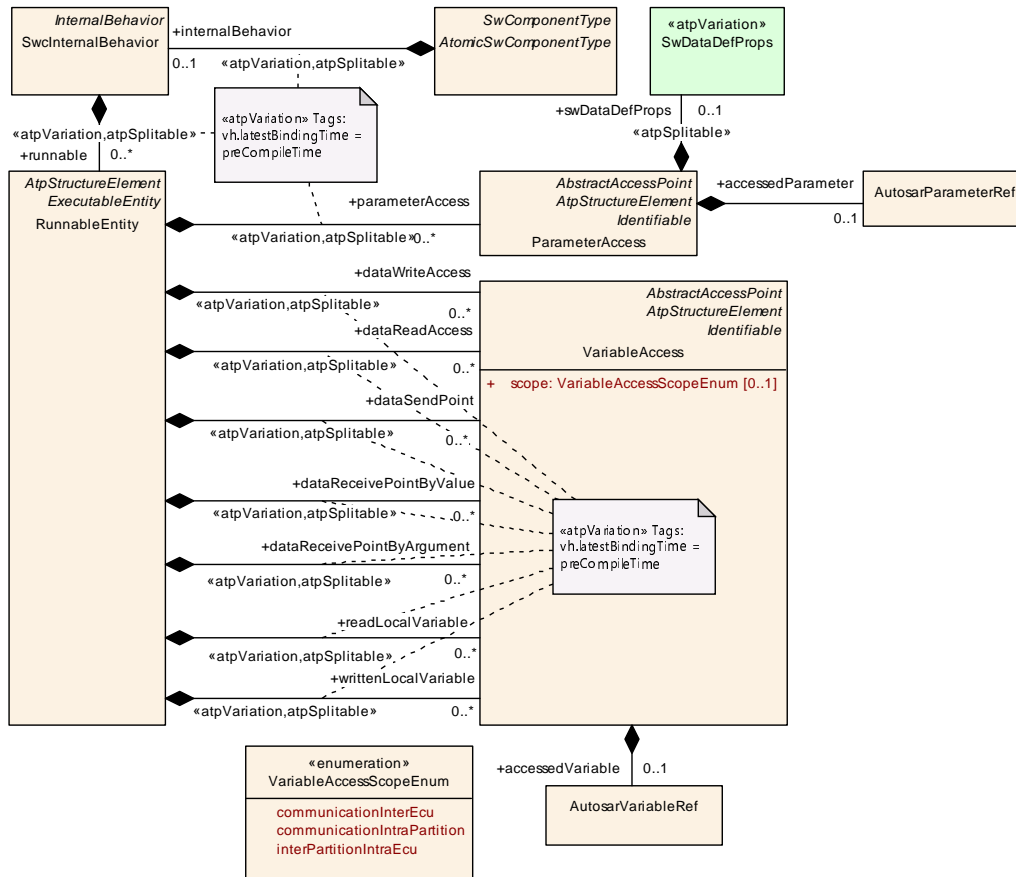

Figure 7.20: DataReadAccess and DataWriteAccess

[TPS_SWCT_01325] Read and write access is only applicable for **RunnableEntities** of category 1 [The usage of the data-access mechanism to the *VariableDataPrototypes* is appropriate for cat. 1 *RunnableEntity*s only because it by concept guarantees finite response time (as opposed to e.g. unlimited blocking wait for some data).] (*RS_SWCT_00200*)

For more explanation, let's suppose a cat. 2 *RunnableEntity* would have a *dataReadAccess* and a *dataWriteAccess*. The received *dataElement* would be updated **before** the *RunnableEntity* actually starts being executed and even if the *RunnableEntity* runs for a very long time the value of the *dataElement* would remain as is and never change.

On the other hand, the `RunnableEntity` might use its `dataWriteAccess` to perform a write access on the `dataElement` but the actual value might never make it beyond the `RunnableEntity` because

1. the latter is not required to terminate ever and
2. the actual write access is executed *after* the `RunnableEntity` terminates.

Class	VariableAccess			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::DataElements			
Note	The presence of a VariableAccess implies that a RunnableEntity needs access to a VariableData Prototype. The kind of access is specified by the role in which the class is used.

Aggregated by	<i>AtpClassifier.atpFeature</i> , <i>ReceiverComSpec.replaceWith</i> , <i>RunnableEntity.dataReadAccess</i> , <i>RunnableEntity.dataReceivePointByArgument</i> , <i>RunnableEntity.dataReceivePointByValue</i> , <i>RunnableEntity.dataSendPoint</i> , <i>RunnableEntity.dataWriteAccess</i> , <i>RunnableEntity.readLocalVariable</i> , <i>RunnableEntity.writtenLocalVariable</i>			
Attribute	Type	Mult.	Kind	Note
accessed Variable	AutosarVariableRef	0..1	aggr	This denotes the accessed variable.
scope	VariableAccessScope Enum	0..1	attr	This attribute allows for constraining the scope of the corresponding communication. For example, it possible to express whether the communication is intended to cross the boundary of an ECU or whether it is intended not to cross the boundary of a single partition.

Table 7.33: VariableAccess

[constr_1954] Existence of attribute `VariableAccess.accessedVariable` [For each `VariableAccess`, attribute `accessedVariable` shall exist **at the time when the contract phase generation is executed.**](/)

Enumeration	VariableAccessScopeEnum
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::DataElements
Note	This enumeration defines scopes for communication.
Aggregated by	VariableAccess.scope
Literal	Description
communicationInter Ecu	This case is foreseen to express that the corresponding communication shall be considered inter-ECU, i.e. it will cross the ECU boundary. This is considered the default case. Tags: atp.EnumerationLiteralIndex=0
communicationIntra Partition	This case is foreseen to express that the corresponding communication shall not cross the boundary of a partition. Tags: atp.EnumerationLiteralIndex=1
interPartitionIntra Ecu	In this case the communication shall cross the boundaries of partitions within one ECU but it shall not cross the boundaries of the ECU itself. Tags: atp.EnumerationLiteralIndex=2

Table 7.34: VariableAccessScopeEnum

[TPS_SWCT_01326] Constrain the scope of a specific communication [The purpose of the attribute `scope` of meta-class `VariableAccess` is to constrain the scope of the corresponding communication.

The main use-case for this ability is the development of a software-component where certain end-points of communication from or to the software-component are known to fulfill a certain constraint, e.g. execute within the same partition.](RS_SWCT_00200)

[TPS_SWCT_01328] Default value of attribute `scope` [The default value of attribute `scope` is set to `communicationInterEcu`.](RS_SWCT_00200)

[constr_1141] Applicability of the `scope` attribute [

The attribute `scope` of meta-class `VariableAccess` shall **only** be applied with respect to the aggregation of `VariableAccess` in the following roles:

- `dataReadAccess`
- `dataWriteAccess`
- `dataSendPoint`
- `dataReceivePointByValue`
- `dataReceivePointByArgument`

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

This aspect is depicted in Figure 7.20.

7.5.1.3 Explicit Sending and Receiving

[TPS_SWCT_01330] `RunnableEntity` can also have `dataSendPoints` [A `RunnableEntity` can also have `dataSendPoints` (i.e. aggregate `VariableAccess` in the role `dataSendPoint`).

Using an `instanceRef` association, these eventually reference a `VariableDataPrototype` in the context of an `AbstractProvidedPortPrototype`, owned by the `AtomicSwComponentType` that is associated with the `RunnableEntity` that in turn owns the `dataSendPoint`.](RS_SWCT_00200)

[constr_2004] Referenced `VariableDataPrototype` from `AutosarVariableRef` of `VariableAccess` in role `dataSendPoint` [A `VariableAccess` in the role `dataSendPoint` shall refer to a `PPortPrototype` or `PRPortPrototype` that is typed by either a `SenderReceiverInterface` or a `NvDataInterface` **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01331] `dataWriteAccess` vs. `dataSendPoint` [As opposed to the `dataWriteAccess`:

- Using the `dataSendPoint`, the `RunnableEntity` needs to explicitly “send” through an API; when using a `dataWriteAccess`, the `RunnableEntity` only needs to modify the value of certain variables.

- Using `dataSendPoint`, the Runnable can decide to “send” an arbitrary number of times; when using `dataWriteAccess` the new value of the `VariableDataPrototype` is only made available after the `RunnableEntity` terminates.
- The presence of a `dataSendPoint` per definition lets the corresponding `RunnableEntity` attain cat. 1B.

](RS_SWCT_00200)

[constr_1773] Value of attribute `dataSendPoint.returnValueProvision` [All `RunnableEntity.dataSendPoint` that refer to the same `accessedVariable` shall define the identical value for attribute `returnValueProvision` at the time when the contract phase generation is executed.]()

Rationale for the existence of [constr_1773]: different `RunnableEntities` could aggregate `VariableAccess` in the role `dataSendPoint` with a different configuration of attribute `returnValueProvision`.

However, in such a case it would not be possible to generate the corresponding RTE API because the API exists once per software-component and it is therefore indispensable to have all affected `VariableAccess` aggregated in the role `dataSendPoint` agree on the configuration of attribute `returnValueProvision`.

This relation is sketched in Figure 7.21.

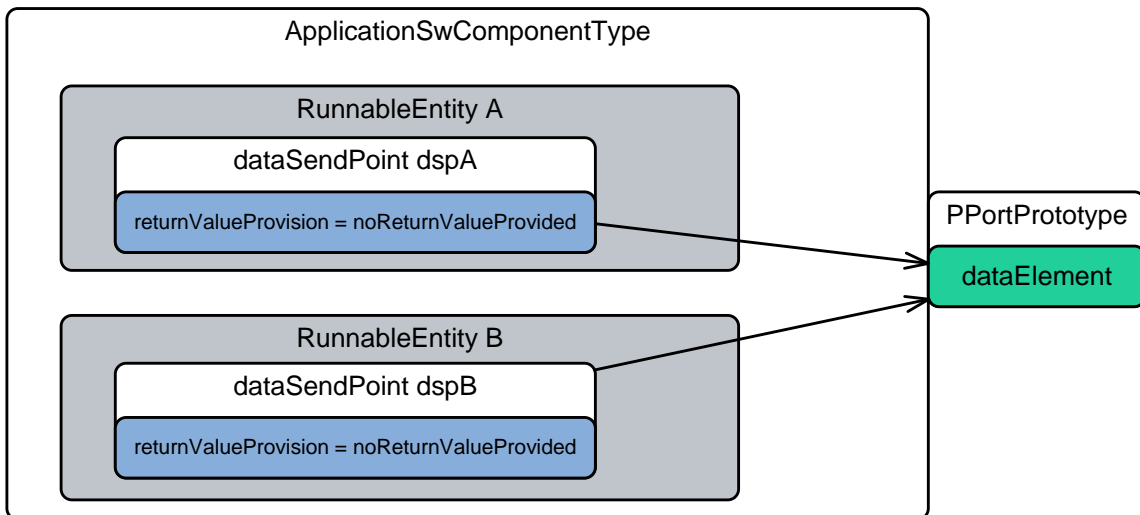

Figure 7.21: Modeling of attribute `dataSendPoint.returnValueProvision`

[TPS_SWCT_01663] `dataReadAccess` vs. `dataReceivePointByValue` or `dataReceivePointByArgument` [As opposed to the `dataReadAccess`:

- Using the `dataReceivePointByValue` or `dataReceivePointByArgument`, the `RunnableEntity` always “receives” the latest value of the `dataElement` for each call to the respective API during the execution of the `RunnableEntity`.

- When using a `dataReadAccess`, the value of the respective `dataElement` is received before the `RunnableEntity` starts and does not change during the execution of the `RunnableEntity` independently of the number of API calls for implicit reception.
- The presence of a `dataReceivePointByValue` or `dataReceivePointByArgument` per definition lets the corresponding `RunnableEntity` attain cat. 1B.

](RS_SWCT_00200)

For more details, please refer to section 4.9.

[TPS_SWCT_01332] **dataReceivePointByValue vs. dataReceivePointByArgument** [In analogy to explicitly sending data it is also possible to define explicit polling for new available data through a `dataReceivePointByValue` or `dataReceivePointByArgument`.]()

This aspect is visualized in Figure 7.23.

[constr_1277] **SwDataDefProps.swImplPolicy of a VariableDataPrototype referenced by a VariableAccess aggregated in the role dataReceivePointByValue** [The `SwDataDefProps.swImplPolicy` of a `VariableDataPrototype` referenced by a `VariableAccess` aggregated in the role `dataReceivePointByValue` shall not be set to `queued at the time when the contract phase generation is executed`.]()

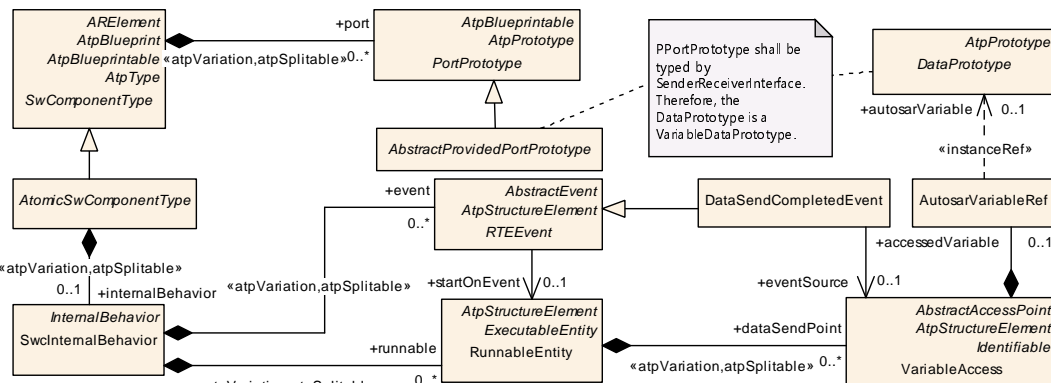

Figure 7.22: DataSendPoint

Rationale for [constr_1277]: when using the return value of the applicable RTE API function to return the value of a `VariableDataPrototype` there is no way³ to provide an indication that the queue is empty. Therefore, the only safe approach is to not permit this scenario at all, hence the constraint.

³That is, other than to use a function argument to return the status of the queue but that would obviously beat the purpose of the API function.

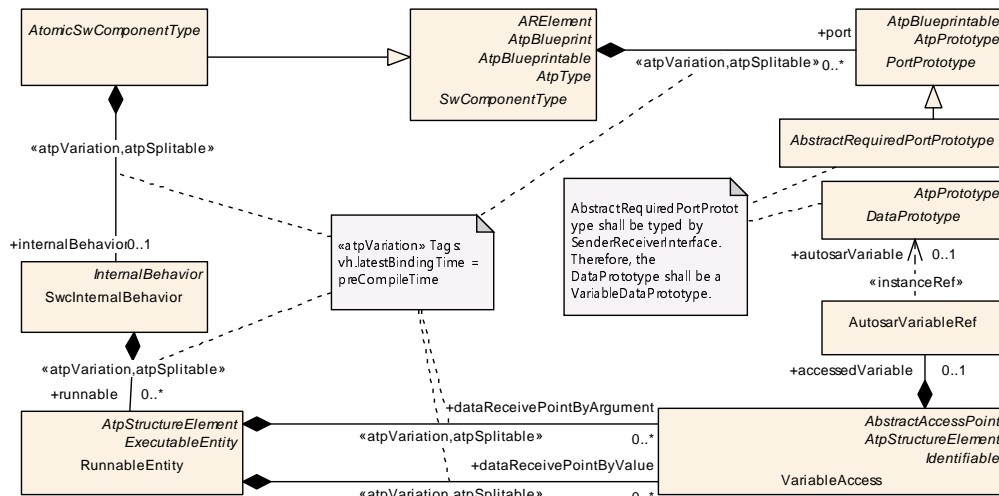

Figure 7.23: Definition of an explicit request to receive data

[TPS_SWCT_01333] **dataReceivePointByValue/dataReceivePointByArgument vs. dataReadAccess** [By using a `dataReceivePointByValue` or `dataReceivePointByArgument` instead of `dataReadAccess` the constraining access to the referenced `VariableDataPrototype` (other `RunnableEntity`s shall not change the `VariableDataPrototype` during the read execution) is limited to a short, well-defined amount of time.] (*RS_SWCT_00200*)

[TPS_SWCT_01334] **RunnableEntitys of category 1 may have dataReceivePointByValues/dataReceivePointByArguments** [Therefore, category 1 `RunnableEntity`s may also have `dataReceivePointByValues/dataReceivePointByArguments` and consequently become `RunnableEntity`s of category 1B] (*RS_SWCT_00200*)

Please note that the categories of `RunnableEntity` are explained in section 7.2.4.4.

Similar to the `dataReadAccess`, constraints apply to the reference target of the `AutosarVariableRef` of `VariableAccess` in role `dataReceivePointByValue` or `dataReceivePointByArgument`.

[constr_1774] **Value of attribute dataReceivePointByArgument.returnValueProvision** [All `RunnableEntity.dataReceivePointByArgument` that refer to the same `accessedVariable` shall define the identical value for attribute `returnValueProvision` at the time when the contract phase generation is executed.] ()

Rationale for the existence of [constr_1774]: different `RunnableEntity`s could aggregate `VariableAccess` in the role `dataReceivePointByArgument` with a different configuration of attribute `returnValueProvision`.

However, in such a case it would not be possible to generate the corresponding RTE API because the API exists once per software-component and it is therefore indispensable to have all affected `VariableAccess` aggregated in the role `dataReceivePointByArgument` agree on the configuration of attribute `returnValueProvision`.

This relation is exemplarily (for the case of `dataSendPoint.returnValueProvision`) sketched in Figure 7.21.

[constr_2005] Referenced `VariableDataPrototype` from `AutosarVariableRef` of `VariableAccess` in role `dataReceivePointByValue` or `dataReceivePointByArgument` [A `VariableAccess` in the role `dataReceivePointByValue` or `dataReceivePointByArgument` shall refer to an `RPortPrototype` or `PRPortPrototype` that is typed by either a `SenderReceiverInterface` or an `NvDataInterface` **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01335] Combine `dataReceivePointByValue` or `dataReceivePointByArgument` with a `WaitPoint` [In general, it is possible to combine a `dataReceivePointByValue` or `dataReceivePointByArgument` with a `WaitPoint` in the scope of a particular `RunnableEntity`.

This allows for a call to a blocking receive routine implemented by the RTE. The `timeout` attribute of meta-class `WaitPoint` can be used to specify the time until the blocking call expires.

But in case of non-queued communication it is **not supported** that a `DataReceivedEvent` is used in combination with a `WaitPoint` (see [constr_2021]). This contradicts the approach of the last-is-best semantics.](*RS_SWCT_00200*)

[constr_2021] `WaitPoint` referencing a `DataReceivedEvent` can not be used for non-queued communication [A `WaitPoint` referencing a `DataReceivedEvent` is permitted **if and only if** the `swImplPolicy` of the `VariableDataPrototype` referenced by this `DataReceivedEvent` is set to `queued`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

Please note however, that in this case (in response to the presence of a `WaitPoint`) the `RunnableEntity` becomes category 2.

7.5.1.4 Implicit Sending and Receiving

Implicit sending and receiving aims at the optimization of computation effort for sender-receiver communication.

Instead of executing the full amount of functionality for each call to a send-API or receive-API the implicit communication only receives implicitly received values latest before the start of the execution of a `RunnableEntity` and sends implicitly sent values earliest after termination of the `RunnableEntity`.

[TPS_SWCT_01329] Access to specific data is implemented by means of aggregating the meta-class `VariableAccess` in specific roles [Please note that from the formal point of view access to specific data is implemented by means of aggregating the meta-class `VariableAccess` in specific roles.

This means that `dataReadAccess` for a read-access while the write-access is defined by means of aggregating `VariableAccess` in the role `dataWriteAccess`.](RS-SWCT_00200)

This aspect is depicted in Figure 7.19.

The following constraints apply to the reference target of the `AutosarVariableRef` of `VariableAccess` in role `dataReadAccess` or `dataWriteAccess`.

[constr_2002] Referenced `VariableDataPrototype` from `AutosarVariableRef` of `VariableAccess` in role `dataReadAccess` [A `VariableAccess` in the role `dataReadAccess` shall refer to an `RPortPrototype` or `PPortPrototype` that is typed by either a `SenderReceiverInterface` or a `NvDataInterface`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_2003] Referenced `VariableDataPrototype` from `AutosarVariableRef` of `VariableAccess` in role `dataWriteAccess` [A `VariableAccess` in the role `dataWriteAccess` shall refer to a `PPortPrototype` or `PRPortPrototype` that is typed by either a `SenderReceiverInterface` or a `NvDataInterface`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

By access with `VariableAccess` in the `dataReadAccess` role always the last value of the `VariableDataPrototype` buffered before the `RunnableEntity` starts will be read during the execution of the `RunnableEntity`.

It would therefore not make any sense to provide a queue of values for the purpose of accessing a `dataElement` in the role `dataReadAccess`.

[constr_2020] `dataReadAccess` can not be used for queued communication [The `swImplPolicy` of the `VariableDataPrototype` referenced by a `VariableAccess` in role `dataReadAccess` shall **not** be set to **queued at the time when the contract phase generation is executed.**]()

[constr_1256] Acknowledgement feedback in n:1 writer case [Within the scope of one `SwcInternalBehavior`, it is **not** allowed that two or more aggregated `RunnableEntities` own either `dataSendPoints` or `dataWriteAccesses` that in turn point to the identical `accessedVariable.autosarVariable.targetDataPrototype` **if** the attribute `transmissionAcknowledge` exists in the context of the `SenderComSpec` owned by the `dataSendPoint.accessedVariable.autosarVariable.portPrototype` (or the respective construct for `dataWriteAccess`) that also refers to said `dataElement`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

The background of **[constr_1256]** is that if two or more `RunnableEntities` exist that can write to the identical `dataElement` it may happen that more than one

`RunnableEntity` actually write to the respective `dataElement` before the “first” acknowledgement is received. In this case it will never be possible to determine exactly which transmission has been acknowledged.

The difference between implicit and explicit sender/receiver communication is explained in [TPS_SWCT_01331] and [TPS_SWCT_01663].

7.5.1.5 DataSendCompletedEvent

[TPS_SWCT_01336] `dataSendPoint` also allows for the definition of a `DataSendCompletedEvent` [The `dataSendPoint` also allows for the definition of a `DataSendCompletedEvent`. This `RTEEvent` occurs when the data has been successfully sent or when an error has occurred during sending.] (*RS_SWCT_00200*)

[constr_2033] **Timeout of `DataSendCompletedEvent`** [The `timeout` value of a `WaitPoint` associated with a `DataSendCompletedEvent` shall have the same value as the corresponding value of `TransmissionAcknowledgementRequest.timeout` at the time when the `RTE` is generated.] ()

7.5.1.6 DataWriteCompletedEvent

[TPS_SWCT_01557] `dataWriteAccess` also allows for the definition of a `DataWriteCompletedEvent` [The `dataWriteAccess` also allows for the definition of a `DataWriteCompletedEvent`. This `RTEEvent` occurs when the data has been successfully sent or when an error has occurred during sending.] (*RS_SWCT_00200*)

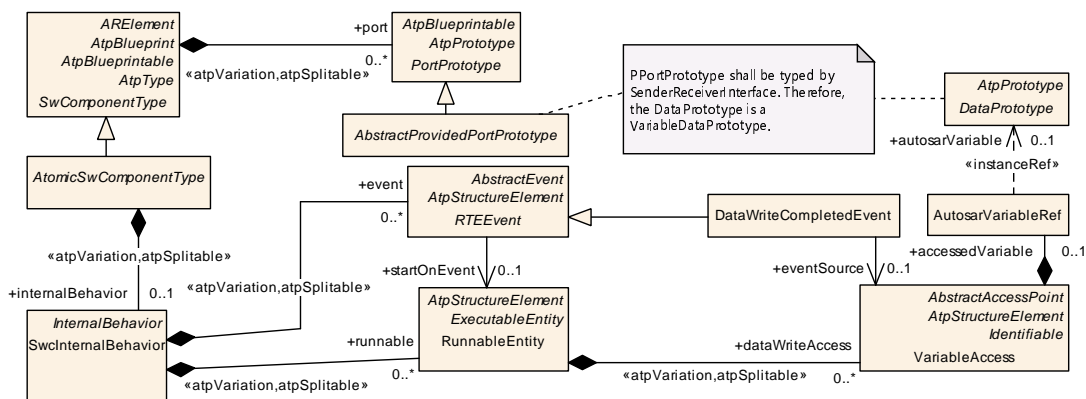

Figure 7.24: DataWriteAccess

[TPS_SWCT_01558] `DataWriteCompletedEvent` cannot be combined with a `WaitPoint` [Please note that a `DataWriteCompletedEvent` cannot be associated with a `WaitPoint`, see [constr_1091].] (*RS_SWCT_00200*)

7.5.1.7 DataReceivedEvent

[TPS_SWCT_01337] **DataReceivedEvent** [A receiver is notified through the same event mechanism when a [VariableDataPrototype](#) is received. The [DataReceivedEvent](#) is directly associated with the corresponding [VariableDataPrototype](#).] (RS_SWCT_00200)

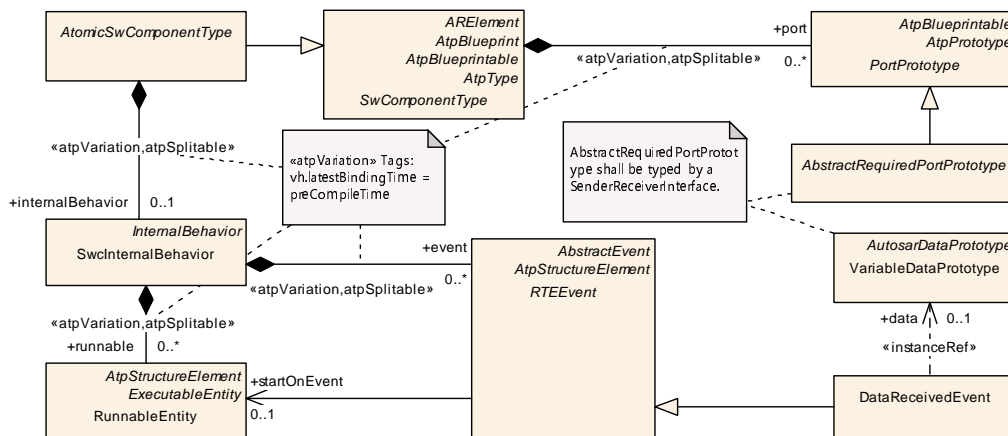

Figure 7.25: Receiver is notified by an event when new data has arrived

7.5.1.8 DataReceiveErrorEvent

[TPS_SWCT_01338] **DataReceiveErrorEvent** [A receiver is notified of [DataReceiveErrorEvent](#) through the activation of its [RunnableEntity](#) which is referenced by this [RTEEvent](#).

A [DataReceiveErrorEvent](#) includes a reference to a [VariableDataPrototype](#) and is raised by the RTE when an error concerning the reception of the referenced data is detected by the COM⁴ layer.

The following cases present some situations which will cause the RTE to raise a [DataReceiveErrorEvent](#):

- the RTE receives a signal-outdated notification from the COM layer when a monitored periodic signal is not received in time. The COM layer monitors the validity of the signal's value based on the value of the `aliveTimeout` attribute of `ReceiverComSpec` referencing the [VariableDataPrototype](#) associated with the signal. If the time elapsed since the last update of a signal's value exceeds its `aliveTimeout` then the COM layer notifies the RTE of a signal outdated error.
- The RTE receives a signal invalid notification from the COM layer when the COM layer detects that an incoming signal has the predefined "invalid" value.

] (RS_SWCT_00200)

⁴In case of internal communication the RTE is not enforced to use the COM layer. It is also possible to implement the required behavior directly in the RTE.

[constr_10073] Existence of DataReceiveErrorEvent [A DataReceiveErrorEvent shall only exist if it latest **at the time when the contract phase generation is executed** refers to a given VariableDataPrototype in the role data where either

- the VariableDataPrototype is referenced from a NonqueuedReceiverComSpec in the role dataElement and the attribute aliveTimeout of the NonqueuedReceiverComSpec exists and is set to a value > 0 or
- the VariableDataPrototype is aggregated by a SenderReceiverInterface where attribute invalidationPolicy.handleInvalid exists and is set to the value keep.

]()

[TPS_SWCT_01339] RTE activates RunnableEntity in response to DataReceiveErrorEvent [A DataReceiveErrorEvent is used by the RTE to activate a RunnableEntity that is supposed to handle the above-mentioned errors.

The error code will be made available to the activated RunnableEntity through the appropriate RTE API function.](RS_SWCT_00200)

[TPS_SWCT_01340] DataReceiveErrorEvent cannot be combined with a WaitPoint [Please note that a DataReceiveErrorEvent cannot be associated with a WaitPoint, see [constr_1091].

It can only be used for the receiver software-component in a sender-receiver communication and its data reference is restricted to VariableDataPrototypes with their swImplPolicy attribute not set to queued.](RS_SWCT_00200)

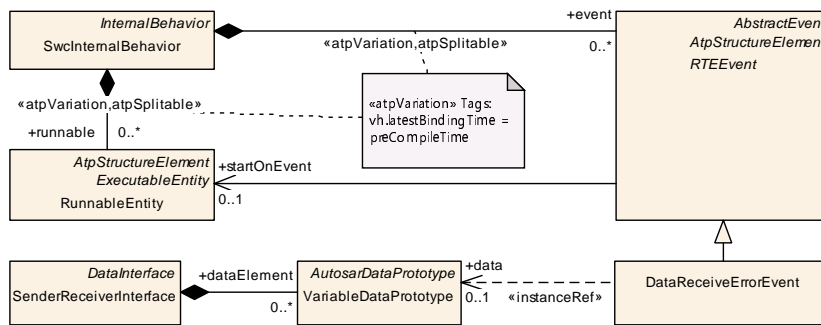

Figure 7.26: DataReceiveErrorEvent references a Runnable and a VariableDataPrototype

[TPS_SWCT_01341] DataReceiveErrorEvent is directly associated with the corresponding VariableDataPrototype [The DataReceiveErrorEvent is directly associated with the corresponding VariableDataPrototype and references the RunnableEntity that is activated due to the occurrence of this RTEEvent.](RS_SWCT_00200)

This aspect is depicted in Figure 7.26.

7.5.2 RunnableEntities and Client Server Communication

7.5.2.1 Invoking an Operation

[TPS_SWCT_01342] **Invocation of a server operation** [A `RunnableEntity` invokes a server operation formally defined as a `ClientServerOperation` via an `RPortPrototype` of the enclosing `SwComponentPrototype` typed by a particular `AtomicSwComponentType`.] (*RS_SWCT_00200*)

[TPS_SWCT_01343] **Synchronous vs. asynchronous invocation** [A `ClientServerOperation` itself can be invoked either “synchronously” or “asynchronously”.] (*RS_SWCT_00200*)

In the majority of cases the `ClientServerOperation` will be invoked at a different `SwComponentPrototype` but in general it would be possible to invoke a `ClientServerOperation` on the same `SwComponentPrototype` as well.

The decision whether a specific `ClientServerOperation` is called synchronously or asynchronously needs to be specified in the formal description of the corresponding `AtomicSwComponentType`, namely in the context of an `SwcInternalBehavior` (see Figure 7.27 for more details).

But it is not supported to invoke the same instance of a `ClientServerOperation` synchronously and asynchronously together.

[constr_2022] **Mutually exclusive use of `SynchronousServerCallPoints` and `AsynchronousServerCallPoints`** [A `ClientServerOperation` of a particular `RPortPrototype` shall be mutually exclusive referenced by either a `SynchronousServerCallPoints` or an `AsynchronousServerCallPoints` **at the time when the contract phase generation is executed.**] ()

[constr_1775] **Value of attribute `serverCallPoint.returnValueProvision`** [All `RunnableEntity.serverCallPoint` that refer to the same operation shall define the identical value of attribute `returnValueProvision` **at the time when the contract phase generation is executed.**] ()

Rationale for the existence of [constr_1775]: different `RunnableEntities` could aggregate `ServerCallPoint` with a different configuration of attribute `returnValueProvision`.

However, in such a case it would not be possible to generate the corresponding RTE API because the API exists once per software-component and it is therefore indispensable to have all affected `ServerCallPoints` agree on the configuration of attribute `returnValueProvision`.

This relation is exemplarily (for the case of `dataSendPoint.returnValueProvision`) sketched in Figure 7.21.

[constr_2023] **Consistency of `timeout` values** [The `timeout` values of all `ServerCallPoints` referencing the same instance of `ClientServerOperation`

in a `RPortPrototype` shall be identical **at the time when the RTE is generated.**)]()

[TPS_SWCT_01345] Synchronous operation invocation [In case of a synchronous operation invocation the particular `RunnableEntity` merely needs a `SynchronousServerCallPoint`.] (*RS_SWCT_00200*)

More information can be found in Figure 7.27.

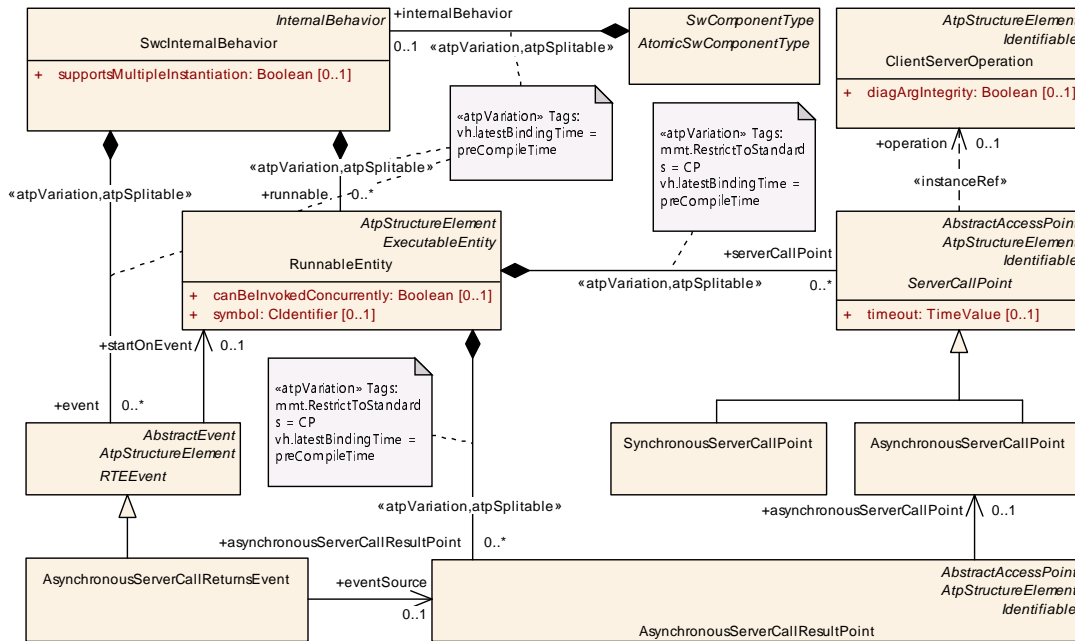

Figure 7.27: Model of a server call point.

[TPS_SWCT_01346] Asynchronous operation invocation [Asynchronous invocation is a bit more complex because it is necessary to specify how to respond to a notification about the completion of the corresponding operation.

This is done using the generic `RTEEvent` mechanism: the notification about an asynchronously executed operation having completed is implemented as an `AsynchronousServerCallReturnsEvent`.

Therefore, if an `AsynchronousServerCallReturnsEvent` is raised the RTE can either trigger the execution of a specific `RunnableEntity` or the `AtomicSwComponentType` can implement a `WaitPoint` that blocks the execution of the calling `RunnableEntity` until the `AsynchronousServerCallReturnsEvent` is recognized.] (*RS_SWCT_00200*)

For example, let's consider the case of an asynchronous call to a remote operation where the RTE is supposed to trigger a specific `RunnableEntity` when the operation completes. The description of the corresponding `AtomicSwComponentType` would typically contain the following elements:

1. The `AtomicSwComponentType` contains an `RPortPrototype` 'myPort' typed by a `PortInterface` that in turn contains the definition of an `ClientServerOperation` 'remoteOperation'.
2. The `AtomicSwComponentType`'s `SwcInternalBehavior` contains at least two `RunnableEntities`: the `RunnableEntity` 'main' is supposed to invoke the operation; the `RunnableEntity` 'callback' is the one that should be called when the operation completes.
3. The description of the `RunnableEntity` 'main' contains an `AsynchronousServerCallPoint` 'invokeMyOperation' referencing the respective `ClientServerOperation` in the `PortInterface` used to type the `PortPrototype` 'myPort'. This implies that the `RunnableEntity` is allowed to invoke this operation asynchronously.
4. The description of the `RunnableEntity` 'callback' contains an `AsynchronousServerCallResultPoint` 'fetchMyOperationResults' referencing the respective `AsynchronousServerCallPoint` 'invokeMyOperation'. This implies that the `RunnableEntity` is allowed to fetch the results of the asynchronously invoked operation.
5. The description of the `SwcInternalBehavior` includes an `AsynchronousServerCallReturnsEvent` 'myOperationReturns' which references the previously defined `AsynchronousServerCallResultPoint` 'fetchMyOperationResults'.
6. The description of the `AsynchronousServerCallReturnsEvent` 'myOperationReturns' references the `RunnableEntity` 'callback', indicating that the RTE should trigger the execution of this `Runnable` when 'myOperationReturns' is raised.

[constr_1776] Value of attribute `asynchronousServerCallResultPoint.returnValueProvision` [All `RunnableEntity.asynchronousServerCallResultPoint` that refer to the same `AsynchronousServerCallPoint.operation` shall define the identical value of attribute `returnValueProvision` at the time when the contract phase generation is executed.]()

Rationale for the existence of [constr_1776]: different `RunnableEntities` could aggregate `AsynchronousServerCallResultPoint` with a different configuration of attribute `returnValueProvision`.

However, in such a case it would not be possible to generate the corresponding RTE API because the API exists once per software-component and it is therefore indispensable to have all affected `AsynchronousServerCallResultPoints` agree on the configuration of attribute `returnValueProvision`.

This relation is exemplarily (for the case of `dataSendPoint.returnValueProvision`) sketched in Figure 7.21.

Aggregated by	AtpClassifier.atpFeature , RunnableEntity.asynchronousServerCallResultPoint			
Attribute	Type	Mult.	Kind	Note
asynchronous ServerCallPoint	AsynchronousServerCallPoint	0..1	ref	The referenced Asynchronous Server Call Point defines the asynchronous server call from which the results are returned.

Table 7.38: AsynchronousServerCallResultPoint

[constr_2006] Number of [AsynchronousServerCallResultPoint](#) referencing to one [AsynchronousServerCallPoint](#) [The [AsynchronousServerCallPoint](#) may be referenced by at most one [AsynchronousServerCallResultPoint](#) **at the time when the contract phase generation is executed**.

If the reference exists, this means that only the [RunnableEntity](#) with this [AsynchronousServerCallResultPoint](#) can fetch the result of the asynchronous server invocation of this particular [AsynchronousServerCallPoint](#).]()

Please note that if an [AsynchronousServerCallPoint](#) is **not** referenced by an [AsynchronousServerCallResultPoint](#) this means that there is no operation result to fetch or the caller **is not interested** in the result.

This information might be used by the RTE generator to optimize the data consistency mechanisms.

[TPS_SWCT_01347] Blocking access to operation result in an asynchronous operation invocation [If the call of the RTE fetching the operations results shall block until the server returns, the [RunnableEntity](#) with the [AsynchronousServerCallResultPoint](#) needs additional a [WaitPoint](#) referencing

the `AsynchronousServerCallReturnsEvent` which is associated with the `AsynchronousServerCallResultPoint` representing the operations results access.

In this case the `AsynchronousServerCallReturnsEvent` shall not define a `startOnEvent` reference to a `RunnableEntity`. (*RS_SWCT_00200*)

[constr_2030] AsynchronousServerCallResultPoint combined with WaitPoint shall belong to the same RunnableEntity [A `WaitPoint` referencing a `AsynchronousServerCallReturnsEvent` as well as a `AsynchronousServerCallResultPoint` referenced by said `AsynchronousServerCallReturnsEvent` shall be aggregated by the same `RunnableEntity` at the time when the contract phase generation is executed.]()

[constr_1521] Reference from AsynchronousServerCallReturnsEvent to AsynchronousServerCallResultPoint [In the context of a `RunnableEntity`, a given `AsynchronousServerCallResultPoint` shall only be referenced by one `AsynchronousServerCallReturnsEvent` in the role `eventSource` at the time when the contract phase generation is executed.]()

7.5.2.2 Providing an Implementation of an Operation

A software-component can define an `OperationInvokedEvent` for each operation inside one of the server `AbstractProvidedPortPrototypes`. This way a `RunnableEntity` may respond to such an invocation through the generic event handling mechanisms described above (as formally expressed in Figure 7.28).

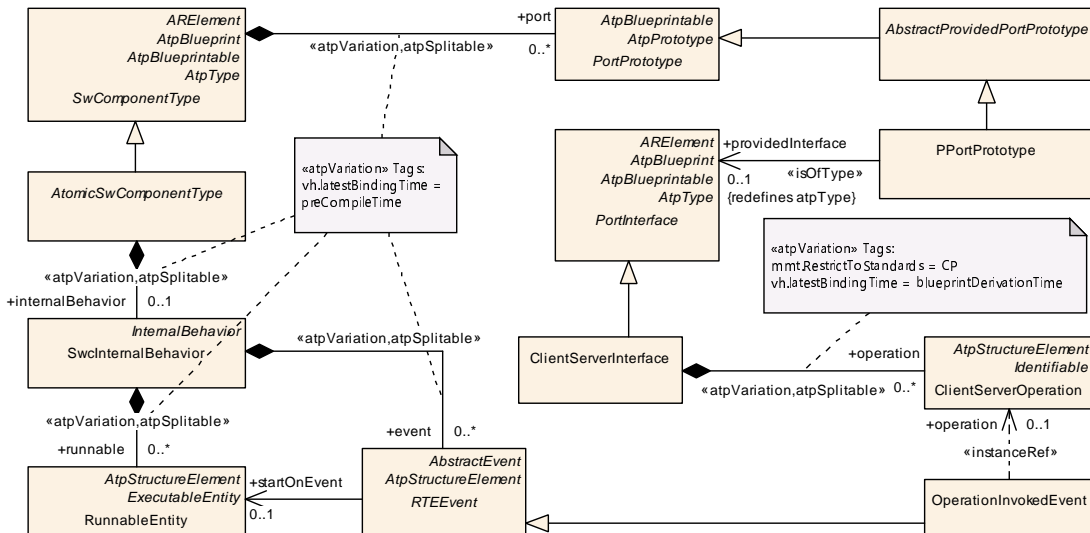

Figure 7.28: The `OperationInvokedEvent` references the operation that was called by a client.

7.5.2.3 Reacting on Data Transformation Errors

[TPS_SWCT_01624] Hard error occurs during the execution of a transformer chain [If a hard error occurs during the execution of a transformer chain which is executed

- on the server side of a client/server communication and re-transforms the data which trigger a server `RunnableEntity` or
- on the trigger sink side of an inter-ECU external trigger communication,

this server `RunnableEntity` or trigger sink `RunnableEntity` cannot be started because the re-transformed data are not available.] ([RS_SWCT_03222](#))

This might be a problem for the software-component if the software-component wants to react on transformer errors.

[TPS_SWCT_01616] Semantics of `TransformerHardErrorEvent` [A software-component can define a `TransformerHardErrorEvent`

- for each `ClientServerOperation` inside one of the server `PPortPrototypes` (i.e. typed by a `ClientServerInterface`) or
- for each `Trigger` in trigger sink `RPortPrototypes` (i.e. typed by a `TriggerInterface`).

This way, a given `RunnableEntity` may define its response to a transformer error.] ([RS_SWCT_03222](#))

7.5.3 RunnableEntities and External Trigger Event Communication

7.5.3.1 Trigger Source

[TPS_SWCT_01348] Trigger source [A `RunnableEntity` of the triggering software-component raises an external trigger event via an `AbstractProvidedPortPrototype` of the enclosing `SwComponentPrototype` typed by a particular `AtomicSwComponentType`.

For this purpose the particular `RunnableEntity` needs an `ExternalTriggeringPoint` that references the particular instance of the trigger in a `PPortPrototype`.] ([RS_SWCT_00200](#))

[constr_1777] Value of attribute `externalTriggeringPoint.returnValueProvision` [All `RunnableEntity.externalTriggeringPoint` that refer to the same `trigger` shall define the identical value of attribute `returnValueProvision` at the time when the contract phase generation is executed.]()

Rationale for the existence of [\[constr_1777\]](#): different `RunnableEntities` could aggregate `ExternalTriggeringPoints` with a different configuration of attribute `returnValueProvision`.

However, in such a case it would not be possible to generate the corresponding RTE API because the API exists once per software-component and it is therefore indispensable to have all affected `ExternalTriggeringPoints` agree on the configuration of attribute `returnValueProvision`.

This relation is exemplarily (for the case of `dataSendPoint.returnValueProvision`) sketched in Figure 7.21.

Figure 7.29: Model structure of a trigger source.

Table 7.39: ExternalTriggeringPoint

7.5.3.2 Trigger Sink

The activation of `RunnableEntity` in the trigger sink is effected through the generic event handling mechanism.

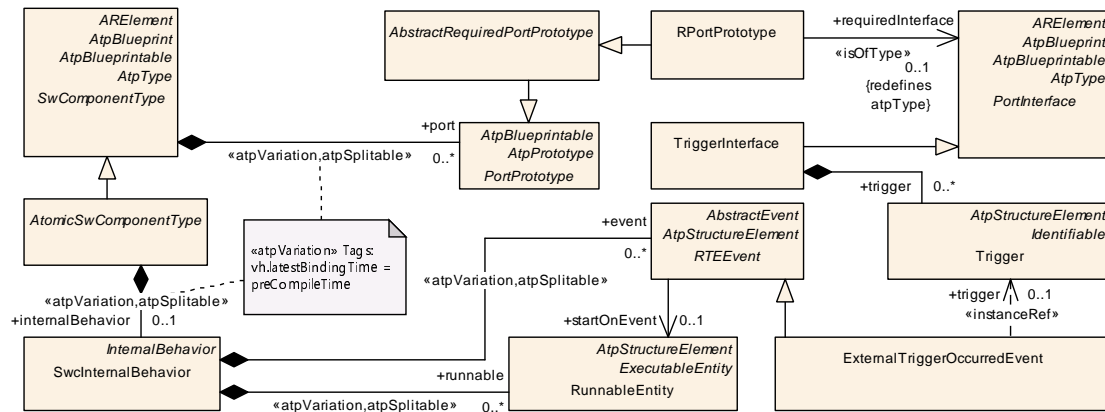

Figure 7.30: Model structure of a trigger sink

[TPS_SWCT_01349] **Trigger sink** [The fact that a `RunnableEntity` shall be activated on occurrence of an external trigger event is formally defined by means of `ExternalTriggerOccurredEvent` that references a particular instance of the trigger in a `RPortPrototype` and additionally the `RunnableEntity` to be executed in response to the event.] (*RS_SWCT_00200*)

7.5.4 RunnableEntities and Parameter Access

There are several ways a Calibration Parameter is provided within a software component.

[TPS_SWCT_01350] **Calibration Parameters shared among several `SwComponentTypes`** [As mentioned above, if Calibration Parameters are shared among several `SwComponentTypes` a dedicated `PortInterface` in a `PortPrototype` will be used.] (*RS_SWCT_00200*)

The designer of a software-component can use this access mechanism when designing a `RunnableEntity` using, as input value, a `DataPrototype`

- from an arbitrary `RPortPrototype` associated with a `ClientServerInterface`, `SenderReceiverInterface` or a `NvDataInterface`,
- `VariableDataPrototype` in the context of an `SwcInternalBehavior`

This input value will be fed to an interpolation routine whose result can be used internally or transferred to an adjacent `SwComponentPrototype` via dedicated `PortPrototypes`.

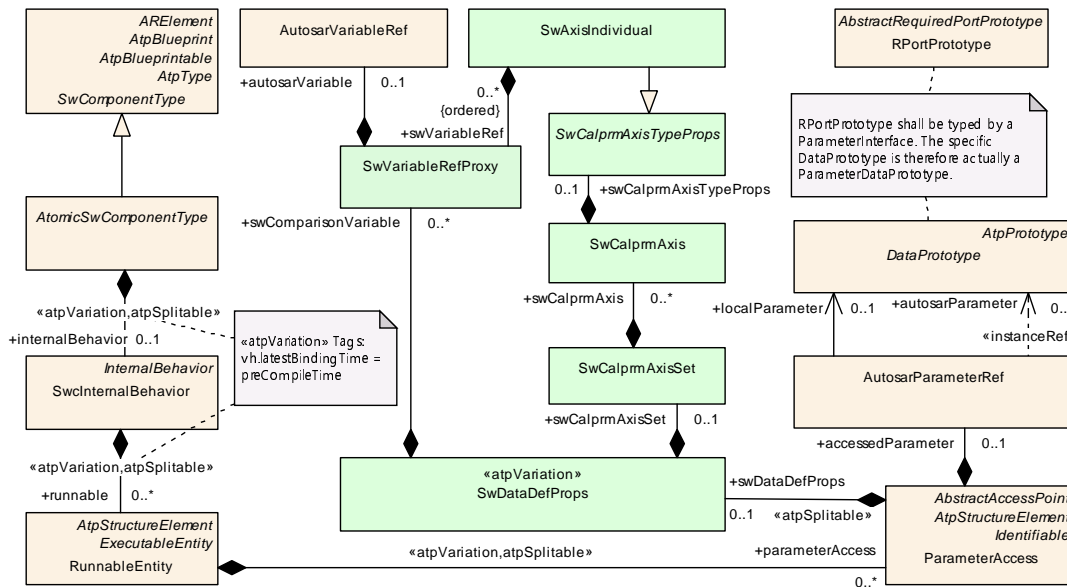

Figure 7.31: Runnable Access to a Calibration Port

Typically, there will be a dedicated `RunnableEntity` that is executed on reception of the input value and that itself calls the interpolation routine with the appropriate input value and the appropriate `ParameterDataPrototype`.

Note that the `ParameterAccess` also allows to set input values or shared axis through `SwDataDefProps` which are specific to the access point.

The result of this interpolation routine call is provided as an `ArgumentDataPrototype` with `direction` being either set to `out` or `inout` in a `ClientServerInterface`.

Class	ParameterAccess

Table 7.40: ParameterAccess

[constr_1958] Existence of attribute `ParameterAccess.accessedParameter`
 [For each `ParameterAccess`, attribute `accessedParameter` shall exist at the time when the contract phase generation is executed.]()

[TPS_SWCT_01351] Access to a [ParameterDataPrototype](#) [The access to a [ParameterDataPrototype](#) will be indicated

- by the [ParameterAccess](#) entity if the [RunnableEntity](#) wants to access it from a [RPortPrototype](#).
- by defining the [ParameterAccess](#) association from a [RunnableEntity](#) to the [ParameterDataPrototype](#) in the roles [sharedParameter](#) or [perInstanceParameter](#).

]([RS_SWCT_00200](#))

Please find more information about the topic of [TPS_SWCT_01351] in Figure 7.31 as well as in Figure 2.3 in the lower association from [RunnableEntity](#) to [ParameterDataPrototype](#)

Note: A [ParameterDataPrototype](#) in the roles [constantMemory](#) is not provided by the RTE and therefore the [ParameterAccess](#) association is not required to control the RTE API generation.

7.5.4.1 InstantiationDataDefProps

Typically, the accessibility and further information like alias names for a particular piece of data is modeled on the level of [DataPrototypes](#) (especially [VariableDataPrototypes](#), [ParameterDataPrototypes](#)).

But due to the recursive structure of the meta-model concerning data types (an [ApplicationCompositeDataType](#) consists of [DataPrototypes](#)), a part of the relevant MCD information is described directly in the data type (in case of a [ApplicationCompositeDataType](#)).

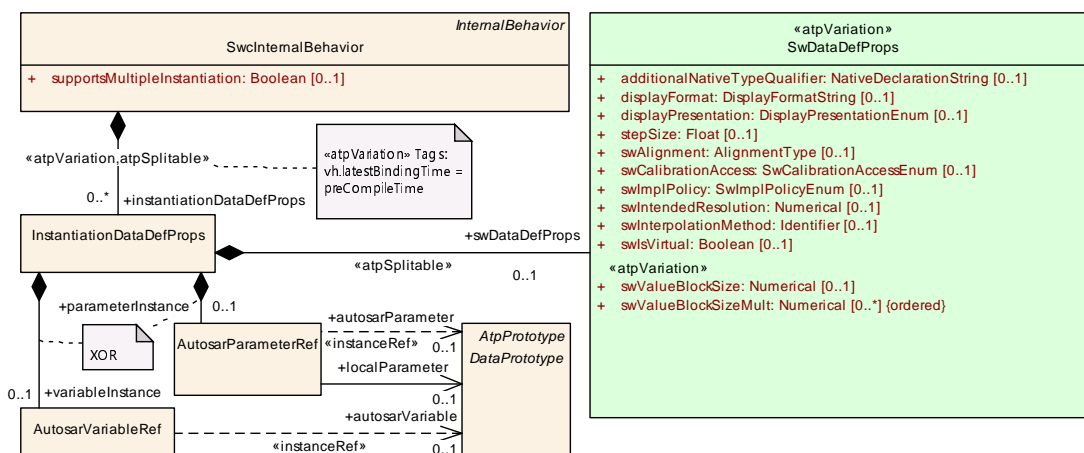

Figure 7.32: applying instantiation specific data definition properties

This is a strong restriction in the re-use of data types because the [ApplicationCompositeDataType](#) should be re-used for different [VariableDataPrototypes](#) and [ParameterDataPrototypes](#) to guarantee type compatibility on C-implementation

level (e.g. data of a [PortPrototype](#) is stored in a PIM or a [ParameterDataPrototype](#) used as ROM Block and shall be typed by the same data type as NVRAM Block).

This restriction is overcome by [InstantiationDataDefProps](#) as shown in figure 7.32

Class	InstantiationDataDefProps			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::InstantiationDataDefProps			
Note	<p>This is a general class allowing to apply additional SwDataDefProps to particular instantiations of a Data Prototype.</p> <p>Typically the accessibility and further information like alias names for a particular data is modeled on the level of DataPrototypes (especially VariableDataPrototypes, ParameterDataPrototypes). But due to the recursive structure of the meta-model concerning data types (a composite (data) type consists out of data prototypes) a part of the MCD information is described in the data type (in case of Application CompositeDataType).</p> <p>This is a strong restriction in the reuse of data typed because the data type should be re-used for different VariableDataPrototypes and ParameterDataPrototypes to guarantee type compatibility on C-implementation level (e.g. data of a Port is stored in PIM or a ParameterDataPrototype used as ROM Block and shall be typed by the same data type as NVRAM Block).</p> <p>This class overcomes such a restriction if applied properly.</p>

[constr_1959] Existence of attribute [InstantiationDataDefProps.swDataDefProps](#) [For each [InstantiationDataDefProps](#), attribute [swDataDefProps](#) shall exist **at the time when the contract phase generation is executed.**]()

Documented use cases for the application of [InstantiationDataDefProps](#) can be found in [[TPS_SWCT_01846](#)], [[TPS_SWCT_01847](#)], and [[TPS_SWCT_01848](#)].

7.5.5 RunnableEntities and Mode Communication

For the communication of modes between [RunnableEntities](#) we have to distinguish between two use cases.

[TPS_SWCT_01352] Requested mode is just sent and received as an ordinary data value [In the first case, a requested mode is just sent and received as an ordinary data value without specifying the details of mode switching in the corresponding port interface.

This mechanism is used if the receiving `RunnableEntity` is not directly implementing a mode switch but does further processing of the mode request. This is especially needed to transfer mode requests between ECUs.

In this case, the mode is transferred via sender-receiver communication so that the involved `RunnableEntities` just need the same type of APIs against the RTE as for sender-receiver communication.

This is possible, because `ModeDeclarationGroupPrototypes` can be mapped to an `ImplementationDataTypes`.] ([RS_SWCT_00200](#))

This concept and the meta-classes needed for the mapping are further explained in chapter [4.2.5](#).

[TPS_SWCT_01353] RunnableEntities react on a mode request via a corresponding RTEEvent [In the second case, one `RunnableEntity` “sends” a mode request and one or more other `RunnableEntities` react on the request via a corresponding `RTEEvent` or by being suppressed from being triggered any longer by other `RTEEvents`.

In this case, special APIs against the RTE are required and the RTE has to implement the actual mode switch. This kind of communication is only possible between software-components on the same ECU.] ([RS_SWCT_00200](#), [RS_SWCT_03202](#))

For further explanation of the general concept refer to chapter [4.2.5](#) and for the details of the meta-model for mode switches refer to chapter [9](#).

7.6 Port API Options

[TPS_SWCT_01354] PortAPIOption [The RTE Generator needs additional options per `PortPrototype` to choose the proper generation schema. These are subsumed in the `PortAPIOption` element.] ([RS_SWCT_03040](#))

Please note that meta-class `PortAPIOption` is depicted in Figure [7.33](#).

Class	<code>PortAPIOption</code>
Package	<code>M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::PortAPIOptions</code>
Note	Options how to generate the signatures of calls for an <code>AtomicSwComponentType</code> in order to communicate over a <code>PortPrototype</code> (for calls into a <code>RunnableEntity</code> as well as for calls from a <code>RunnableEntity</code> to the <code>PortPrototype</code>).
Base	<code>ARObject</code>
Aggregated by	<code>SwcInternalBehavior.portAPIOption</code>

Class	PortAPIOption			
Attribute	Type	Mult.	Kind	Note
enableTakeAddress	Boolean	0..1	attr	If set to true, the software-component is able to use the API reference for deriving a pointer to an object.
errorHandling	DataTransformationErrorHandlingEnum	0..1	attr	This specifies whether a RunnableEntity accessing a Port Prototype that is referenced by this PortAPIOption shall specifically handle transformer errors or not.
indirectAPI	Boolean	0..1	attr	If set to true this attribute specifies an "indirect API" to be generated for the associated port which means that the software-component is able to access the actions on a port via a pointer to an object representing a port. This allows e.g. iterating over ports in a loop. This option has no effect for PPortPrototypes of client/server interfaces.
port	PortPrototype	0..1	ref	The option is valid for generated functions related to communication over this port
portArgValue (ordered)	PortDefinedArgumentValue	*	aggr	An argument value defined by this port.
supportedFeature	SwcSupportedFeature	*	aggr	This collection specifies which features are supported by the RunnableEntitys which access a PortPrototype that it referenced by this PortAPIOption.
transformerStatusForwarding	DataTransformationStatusForwardingEnum	0..1	attr	This attribute specifies whether a RunnableEntity accessing a PortPrototype that is referenced by this Port APIOption shall be able to forward a status code to the transformer chain.

transformerErrorHandling	The runnable implements the handling of transformer errors. Tags: atp.EnumerationLiteralIndex=1

Table 7.43: DataTransformationErrorHandlingEnum

[constr_1960] Existence of attribute [PortAPIOption.port](#) [For each [PortAPIOption](#), attribute `port` shall exist **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01626] Error notification of data transformer errors [If the attribute [PortAPIOption.errorHandling](#) is set to `transformerErrorHandling` then all [RunnableEntitys](#) accessing the [PortPrototype](#) referenced by `port` shall handle the extended transformer error notification.] ([RS_SWCT_03222](#), [RS_SWCT_03221](#))

[TPS_SWCT_03500] Status forwarding to data transformer [If the attribute [PortAPIOption.transformerStatusForwarding](#) is set to `transformerStatusForwarding`, then all [RunnableEntitys](#) accessing the [PortPrototype](#) referenced in

the role `PortAPIOption.port` shall provide the `argument` named `forwardedCode` to the transformer chain. [\(RS_SWCT_03040, RS_SWCT_03221\)](#)

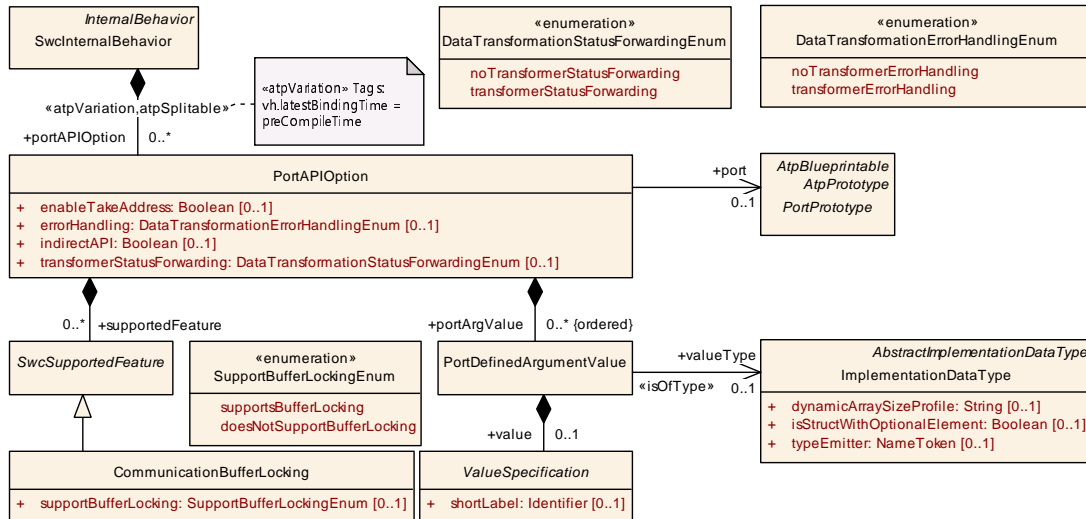

Figure 7.33: Port API Options.

[TPS_SWCT_03501] Applicability of status forwarding to data transformer [The attribute `PortAPIOption.transformerStatusForwarding` shall only be set to `transformerStatusForwarding` if the transported data is originating from a transformed source and is not altered.] [\(RS_SWCT_03040, RS_SWCT_03221\)](#)

Enumeration	DataTransformationStatusForwardingEnum
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::PortAPIOptions
Note	This enumeration defines different ways how a RunnableEntity shall be able to forward status code into the transformer chain.
Aggregated by	<code>PortAPIOption.transformerStatusForwarding</code>
Literal	Description
noTransformerStatusForwarding	The RunnableEntity is not able to forward a transformer status code. Tags: atp.EnumerationLiteralIndex=0
transformerStatusForwarding	The RunnableEntity is able to forward a transformer status code. Tags: atp.EnumerationLiteralIndex=1

Table 7.44: DataTransformationStatusForwardingEnum

The restriction of [\[TPS_SWCT_03501\]](#) is especially necessary in case of E2E protected data routing where the source of the data is received with a *transformer error* using `PortAPIOption.errorHandling = transformerErrorHandling`.

7.6.1 Enable to Take Address

[TPS_SWCT_01355] enableTakeAddress = true [If the attribute `enableTakeAddress = true` the generated API functions related to this `PortPrototype` shall be

implemented by means of true/native C functions (as opposed to function-like preprocessor macros) so that it is possible to access the API functions via their address (by means of function-pointers).] ([RS_SWCT_03040](#))

The main focus of the feature is support for configuration of AUTOSAR Services which are limited to single instances.

[constr_2024] enableTakeAddress is restricted to single instantiation [The definition of a `PortAPIOption` with `enableTakeAddress` set to `true` is only permitted for software-components where the attribute `SwcInternalBehavior.supportMultipleInstantiation` is set to `false` **at the time when the contract phase generation is executed.**] ()

7.6.2 Indirect API Generation

[TPS_SWCT_01356] indirectAPI option switches the generation of the RTE's indirect API functionality [The `indirectAPI` option switches the generation of the RTE's indirect API functionality for a certain `PortPrototype`. The generated indirect API does allow iterating over ports within the SW-Component.] ([RS_SWCT_03040](#))

7.6.3 Port Defined Argument Value

[TPS_SWCT_01357] Definition of implicit values that are passed by the RTE to the server's entry point [In addition to the formal parameters of a client/server invocation that are defined as part of the server's `PortInterface`, it is possible to specify a number of implicit values that are passed by the RTE to the server's entry point.] ([RS_SWCT_03040](#))

The initial need for this feature arises in the context of basic software services - although it is not limited to those.

For a service like the NVRAM manager, every accessing port is in addition to its logical identity - as a sequence of `shortNames` - uniquely identified through a NVRAM specific memory block id. This block id shall be defined in the context of ECU integration and not by the client components.

Instead of exposing this mechanism on the logical `ClientServerInterface` level in form of a formal `argument`, one or more `PortDefinedArgumentValues` can be specified.

[TPS_SWCT_01358] Values are hidden from the client components [Because these values are specified in the context of the provide-port only they are hidden from the client components keeping their design and code independent of the server component details.] ([RS_SWCT_03040](#))

In the example of the NVRAM manager, this allows to define the block id in the context of ECU integration and not by the client components.

Figure 7.33 shows the meta-model of Port API Options and the `portArgValue`.

[constr_1150] Usage of `valueType` for `PortDefinedArgumentValue` [The `valueType` (typically this boils down to integer values used to specify an “id”) associated with `PortDefinedArgumentValue` shall be of `category VALUE` or `TYPE_REFERENCE`. The latter case is only supported if the value of `category` of the target data type is set to `VALUE`.

This rule shall be imposed **at the time when the RTE is generated.**]()

In case of a `PPortPrototype` of the NVRAM example this list would have just one value of type `int8` or `int16` holding the memory block id.

[constr_1386] `PortDefinedArgumentValue` shall only be defined for `AbstractProvidedPortPrototype` [A `PortAPIOption` which aggregates at least one `PortDefinedArgumentValue` in the role `portArgValue` shall reference an `AbstractProvidedPortPrototype` typed by a `ClientServerInterface` in the role `port` **at the time when the RTE is generated.**]()

To be clear, this means that `PortDefinedArgumentValues` may not be used together with `RPortPrototypes`.

Class	PortDefinedArgumentValue			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::PortAPIOptions			
Note	A <code>PortDefinedArgumentValue</code> is passed to a <code>RunnableEntity</code> dealing with the <code>ClientServerOperations</code> provided by a given <code>PortPrototype</code> . Note that this is restricted to <code>PPortPrototypes</code> of a <code>ClientServerInterface</code> .

[constr_1962] Existence of attribute `PortDefinedArgumentValue.valueType` [For each `PortDefinedArgumentValue`, attribute `valueType` shall exist **at the time when the RTE is generated.**]()

7.6.4 Supported Features

Historically, the `PortAPIOption` has undergone a number of extensions that usually ended up in additional primitive or composite attributes.

As further requests for extensions keep coming in, focus was put on limiting the complexity of the overall modeling of `PortAPIOption`. In response to this, a new extension approach has been defined to keep the surroundings of `PortAPIOption` manageable.

In particular, `PortAPIOption` aggregates the abstract meta-class `SwcSupportedFeature` in the role `supportedFeature` (see Figure 7.33).

The actual aggregation of `supportedFeature` will consist of concrete sub-classes of `SwcSupportedFeature`.

It will be possible to add further sub-classes of `SwcSupportedFeature` to add further functionality without increasing the modeling complexity of `PortAPIOption`, at the expense of having to formulate additional constraints.

Class	<code>SwcSupportedFeature</code> (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::PortAPIOptions			
Note	This meta-class represents a abstract base class for features that can be supported by a <code>RunnableEntity</code> .

Aggregated by	CommunicationBufferLocking.supportBufferLocking			
Literal	Description			
doesNotSupportBufferLocking	Buffer locking is not supported. Tags: atp.EnumerationLiteralIndex=0			
supportsBufferLocking	Buffer locking is supported. Tags: atp.EnumerationLiteralIndex=1			

Table 7.48: SupportBufferLockingEnum

7.7 PerInstanceMemory

[TPS_SWCT_01359] Private memory per instance [AtomicSwComponentTypes that support multiple instantiation (attribute supportsMultipleInstantiation == true) will typically need a given amount of private memory per instance. It is the responsibility of the RTE to provide a mechanism with which each instance of an AtomicSwComponentType can access its own instance-specific memory.](RS_SWCT_03040)

[TPS_SWCT_01360] Arbitrary number of per-instance memory blocks [An AtomicSwComponentType can define an arbitrary number of per-instance memory blocks.](RS_SWCT_03040)

[TPS_SWCT_01361] attribute supportsMultipleInstantiation == false [AtomicSwComponentTypes that do not support multiple instantiation (attribute supportsMultipleInstantiation == false) do not necessarily need to use the

`PerInstanceMemory`: because there will only be a single instance of the `AtomicSwComponentType` on an ECU, the `AtomicSwComponentType` can use static variables to store the `AtomicSwComponentType`'s internal state.

However, the usage of `PerInstanceMemory` is also allowed in this case. (RS_SWCT_03040)

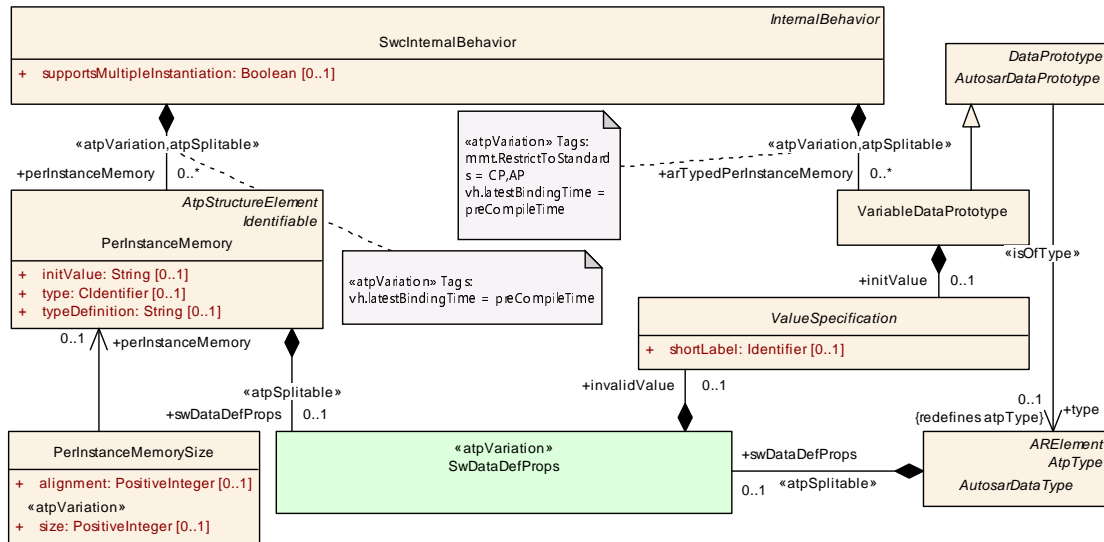

Figure 7.34: `PerInstanceMemory`

[TPS_SWCT_01362] Initialization of `PerInstanceMemory` [Note that the `PerInstanceMemory` is not initialized by the RTE if no `initValue` is defined. In this case, it is the responsibility of the `AtomicSwComponentType` to initialize the `PerInstanceMemory`.] ()

7.7.1 `PerInstanceMemory` typed by “C” Data Types

[TPS_SWCT_01363] `PerInstanceMemory` typed by “C” Data Types [For each such memory block, the software-component description shall provide the name of the data type (the “C”-type) it needs to store in the memory block in the attribute `type`.

This attribute allows for the RTE to generate an API function that provides a convenient and type-safe access to the data item.

In addition, the software-component description shall define the data type in the attribute `typeDefinition`. This attribute is supposed to contain a C typedef of the data type in valid C-syntax. (RS_SWCT_03040)

In other words, this `typeDefinition` shall be formulated such that it can be included verbatim in a C header file.

[constr_2007] Consistency of `typeDefinition` attribute [All `PerInstanceMemory`s of the same `SwcInternalBehavior` with identical `type` attribute shall define an identical `typeDefinition` attribute as well.]()

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01364] Initial value of a `PerInstanceMemory` typed by “C” Data Types [The `initValue` is a comma separated list which can be used verbatim by the RTE generator as constant initializer.]()

[TPS_SWCT_01574] `PerInstanceMemory.typeDefinition` shall not contain a function pointer [The attribute `PerInstanceMemory.typeDefinition` is not allowed to contain a function pointer.]()

Please note that, although [TPS_SWCT_01574] is formulated like a constraint and the statement that it makes certainly has a constraint-ish nature, there is hardly a way to actually **enforce** the regulation because the content of `PerInstanceMemory.typeDefinition` is non-formal (modeled by the non-specific i.e. `String`).

Therefore, a specification item has been used for the description of the respective semantics rather than a constraint.

More details on the use of these attributes in the generation of software-component header-files can be found in the RTE specification [2].

Class	PerInstanceMemory			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::PerInstanceMemory			
Note	Defines a 'C' typed memory-block that needs to be available for each instance of the SW-component. This is typically only useful if <code>supportsMultipleInstantiation</code> is set to "true" or if the software-component defines NVRAM access via permanent blocks.			
Base	<code>ARObject</code> , <code>AtpClassifier</code> , <code>AtpFeature</code> , <code>AtpStructureElement</code> , <code>Identifiable</code> , <code>MultilanguageReferrable</code> , <code>Referrable</code>			
Aggregated by	<code>AtpClassifier.atpFeature</code> , <code>SwcInternalBehavior.perInstanceMemory</code>			
Attribute	Type	Mult.	Kind	Note
<code>initValue</code>	<code>String</code>	0..1	attr	Specifies initial value(s) of the <code>PerInstanceMemory</code>
<code>swDataDefProps</code>	<code>SwDataDefProps</code>	0..1	aggr	This represents the ability to allocate RAM at specific memory sections, for example, to support the RAM Block recovery strategy by mapping to uninitialized RAM. Stereotypes: <code>atpSplittable</code> Tags: <code>atp.Splitkey=swDataDefProps</code>

<code>typeDefinition</code>	<code>String</code>	0..1	attr	A definition of the type with the syntax of a 'C' typedef.

Table 7.49: PerInstanceMemory

[constr_1964] Existence of attribute `PerInstanceMemory.type` [For each `PerInstanceMemory`, attribute `type` shall exist **at the time when the contract phase generation is executed.**]()

[constr_1965] Existence of attribute `PerInstanceMemory.typeDefinition` [For each `PerInstanceMemory`, attribute `typeDefinition` shall exist **at the time when the contract phase generation is executed.**]()

7.7.2 `PerInstanceMemory` typed by AUTOSAR Data Types

[TPS_SWCT_01365] `PerInstanceMemory` typed by AUTOSAR Data Types [A `PerInstanceMemory` typed with AUTOSAR data types is defined by a `VariableDataPrototype` in the role `arTypedPerInstanceMemory`.

`VariableDataPrototype` is derived from `DataPrototype` which has an association to an `AutosarDataType`.]()

This defines the data type of the AUTOSAR-typed `PerInstanceMemory`.

[TPS_SWCT_01366] Initial value of a `PerInstanceMemory` typed by AUTOSAR Data Types [The `initValue` is described with a `ValueSpecification`]([RS_SWCT_03040](#))

[TPS_SWCT_01367] Typed by AUTOSAR data type vs. typed by C data type [In contrast to the “C” typed `PerInstanceMemory`, the AUTOSAR-typed `PerInstanceMemory` is able to define information controlling the visibility in an MCD system via an `SwDataDefProps` for the purpose of measurement or defining an input value of an axis.]([RS_SWCT_03040](#))

For more information about the relevance for measurement please refer to chapter [5.4.3](#). The aspect of defining an input value of an axis is explained in chapter [5.4.5](#).

Note: Due to the use of `AutosarDataType` the AUTOSAR-typed `PerInstanceMemory` can not support C++ specific types or pointer types directly.

7.8 Static Memory and Constant Memory

[TPS_SWCT_01368] Describe static and constant memory [Static memory (formalized by means of `InternalBehavior.staticMemory`) and constant memory (formalized by means of `InternalBehavior.constantMemory`) can be used whenever `AutosarDataTypes` should be used in the implementation of an `AtomicSwComponentType` but no involvement of the RTE (for memory allocation and management) is required.]([RS_SWCT_03040](#))

This includes special cases of measurement and calibration but also debugging.

[TPS_SWCT_01483] Use static and constant memory to support Measurement and Calibration [The information about these characteristic values and variables is given with the purpose to support Measurement and Calibration and has to be taken into account for the generation of A2L files.

A proprietary generator shall take care of these data for the purpose of generating A2L.](RS_SWCT_03040)

Please note that the topic “measurement and calibration” is discussed in chapter 2.2.

Figure 7.35: Static Memory and Constant Memory

[TPS_SWCT_01369] **Static and constant memory is not instantiated by the RTE** [In contrast to the other kinds of memory like `implicitInterRunnableVariable`, `implicitInterRunnableVariable`, `PerInstanceMemory`, `sharedParameter` or `perInstanceParameter` the `staticMemory` and `constantMemory` are **not** instantiated by the RTE.](RS_SWCT_03040)

This allows for more efficient implementations (especially for software-components provided as object code) by avoidance of the additional indirection caused by the RTE’s component data structure.

Further on, this kind of memory reduces the dependencies of the software-component implementation to generated RTE code which is appreciated for safety related functionalities.

Due to the instantiation of the memory by the software-component’s implementation the `constantMemory` behaves like a `sharedParameter` (see chapter 2.2.3.2)

[constr_2028] **staticMemory is restricted to single instantiation** [The `staticMemory` is only supported if the attribute `supportsMultipleInstantiation` of the owning `SwcInternalBehavior` is set to `false` **at the time when the RTE is generated**]()

This constraint prevents hidden communication between `SwComponentPrototypes` of the same `SwComponentType`.

[TPS_SWCT_01849] **shortName of constantMemory and staticMemory** [The `shortName` of a `VariableDataPrototype` in role `staticMemory` or a `ParameterDataPrototype` in role `constantMemory` has to be equal with the ‘C’ identifier of the described variable or constant.](RS_SWCT_03040)

7.9 Included AUTOSAR Data Types

[TPS_SWCT_01155] **IncludedDataSet** [An `IncludedDataSet` declares that a set of `AutosarDataTypes` are used for the C / C++ implementation

of the software component. The [AutosarDataTypes](#) become part of the contract.] ([RS_SWCT_03040](#))

[TPS_SWCT_01156] Required if the [AutosarDataType](#) is not used for any [DataPrototype](#) [This information is required if the [AutosarDataType](#) is not used for any [DataPrototype](#) owned by this software component or if a prefix for C language identifiers belonging to [AutosarDataTypes](#) shall be defined.] ([RS_SWCT_03040](#))

Figure 7.36: Included AUTOSAR Data Types

This supports the common usage of the AUTOSAR data type system for RTE provided memory objects and memory objects declared by the software component implementation.

Further on, this enables the generation of the RTE Application Types Header File for AUTOSAR services containing the required data types for the C-API before the data type usage in dedicated ports for an ECU is known.

Class	IncludedDataTypeSet			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::IncludedDataTypes			
Note	<p>An includedDataTypeSet declares that a set of AutosarDataType is used by a basic software module or a software component for its implementation and the AutosarDataType becomes part of the contract.</p> <p>This information is required if the AutosarDataType is not used for any DataPrototype owned by this software component or if the enumeration literals, lowerLimit and upperLimit constants shall be generated with a literalPrefix.</p> <p>The optional literalPrefix is used to add a common prefix on enumeration literals, lowerLimit and upperLimit constants created by the RTE.</p>			
Base	ARObject			
Aggregated by	BswInternalBehavior.includedDataTypeSet, SwcInternalBehavior.includedDataTypeSet			
Attribute	Type	Mult.	Kind	Note
dataType	AutosarDataType	*	ref	AutosarDataType belonging to the includedDataTypeSet
literalPrefix	Identifier	0..1	attr	LiteralPrefix defines a common prefix for all AutosarDataTypes of the includedDataTypeSet to be added on enumeration literals, lowerLimit and upperLimit constants created by the RTE.

Table 7.50: IncludedDataTypeSet

[TPS_SWCT_01157] Attribute [literalPrefix](#) of [IncludedDataTypeSet](#) [In addition, the [literalPrefix](#) might be used to separate the namespace of C language identifiers belonging to equally named [AutosarDataTypes](#) used for the same software component C implementation.] ([RS_SWCT_03040](#))

7.10 Included Mode Declaration Groups

[TPS_SWCT_01153] **IncludedModeDeclarationGroupSet** [Similar to the consideration of data types using `IncludedDataSet`, `SwcInternalBehavior` aggregates `IncludedModeDeclarationGroupSet` that in turn allows for referencing `ModeDeclarationGroups` with the intent to express that the referenced `ModeDeclarationGroups` are used in the context of the enclosing `AtomicSwComponentType`.] (*RS_SWCT_03040*, *RS_SWCT_03110*)

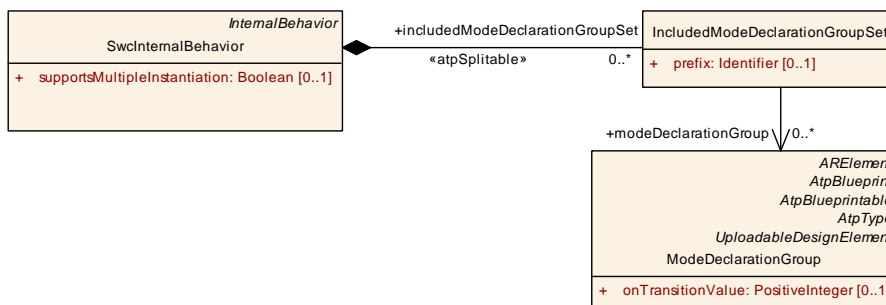

Figure 7.37: Included `ModeDeclarationGroups`

prefix	Identifier	0..1	attr	The prefix shall be used by the RTE generator as a prefix for the creation of symbols related to the referenced <code>ModeDeclarationGroups</code> , e.g <code>RTE_TRANSITION_<ModeDeclarationGroup></code> .

Table 7.51: `IncludedModeDeclarationGroupSet`

[TPS_SWCT_01154] **Attribute `prefix` of `IncludedModeDeclarationGroupSet`**
 [The optional attribute `prefix` of `IncludedModeDeclarationGroupSet` can be used to define a prefix that the RTE generator shall use to define symbols related to the included `ModeDeclarationGroups` with the intent to avoid potential name clashes.] (*RS_SWCT_03040*, *RS_SWCT_03110*)

Rationale: If the attribute `prefix` is required, changes to software-component source code may be necessary.

7.11 Service Needs

7.11.1 Overview

[TPS_SWCT_01043] **ApplicationSwComponentTypes** are independent from actual ECU Hardware [ApplicationSwComponentTypes are designed to be independent of their mapping to actual ECU Hardware.] (RS_SWCT_02060)

However, each software-component might need services which are provided by the ECU Basic Software through AUTOSAR Services.

[TPS_SWCT_01044] **ServiceNeeds** [The ServiceNeeds are used to provide detailed information what the software-component expects from the AUTOSAR Services when integrated on an actual ECU.

Note that only AtomicSwComponentTypes and NvBlockSwComponentTypes can be connected to AUTOSAR Services.] (RS_SWCT_02060)

Please note that some ServiceNeeds are on display in Figures 7.38, 13.16, 13.13, and 13.18.

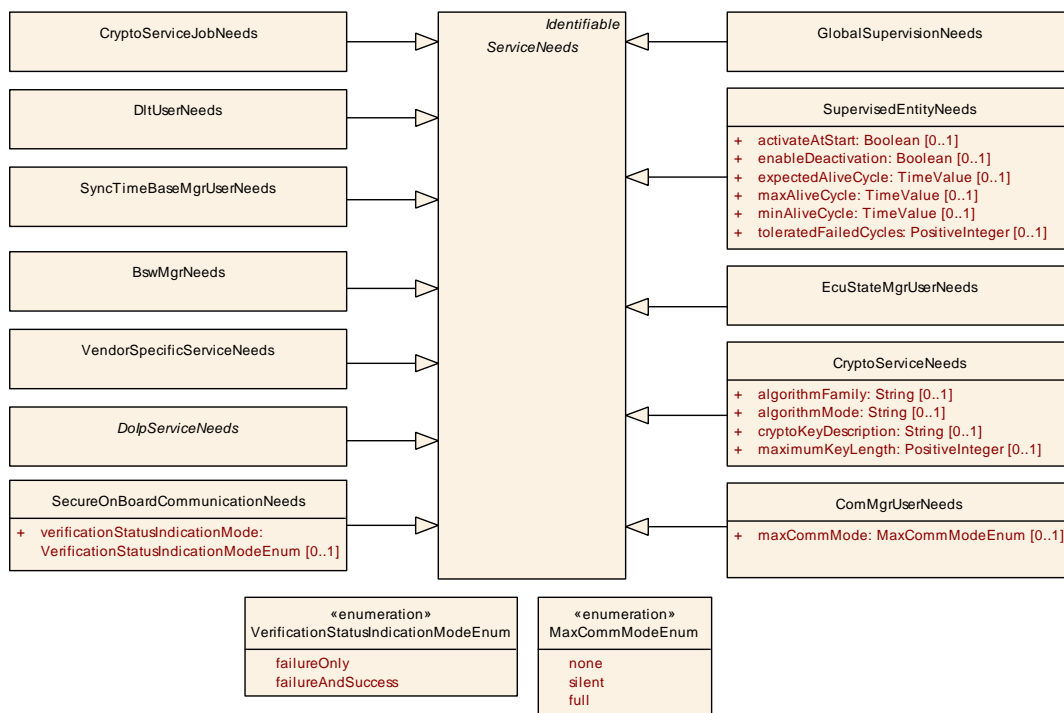

Figure 7.38: Meta-class ServiceNeeds and some of its specializations

[TPS_SWCT_01045] **Actual values of ECU configuration parameters fulfill the requirements given by the ServiceNeeds** [When integrating application software-components on an ECU, the actual values of ECU configuration parameters shall be chosen so that they fulfill the requirements given by the ServiceNeeds of all the integrated AtomicSwComponentTypes.] (RS_SWCT_02060)

Note that the actual values of configuration parameters will in addition depend on the properties of the basic software and the hardware of that specific ECU, see also chapter 11.

For further information about the relation between the `ServiceNeeds` and the ECU configuration parameters see [33].

The meta-class `ServiceNeeds` and the sub-classes for several Services are located in the `CommonStructure` package of the meta-model because they are also used in the Basic Software Module Description Template [6].

The semantics of sub-classes of `ServiceNeeds` is explained in the respective sub-chapters of chapter 13.

Class	ServiceNeeds (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	This expresses the abstract needs that a Software Component or Basic Software Module has on the configuration of an AUTOSAR Service to which it will be connected. "Abstract needs" means that the model abstracts from the Configuration Parameters of the underlying Basic Software.			
Base	<i>ARObject</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>			
Subclasses	BswMgrNeeds, ComMgrUserNeeds, CryptoKeyManagementNeeds, CryptoServiceJobNeeds, CryptoServiceNeeds, <i>DiagnosticCapabilityElement</i> , DltUserNeeds, <i>DolpServiceNeeds</i> , EcuStateMgrUserNeeds, ErrorTracerNeeds, FunctionInhibitionAvailabilityNeeds, FunctionInhibitionNeeds, GlobalSupervisionNeeds, HardwareTestNeeds, IdsMgrCustomTimestampNeeds, IdsMgrNeeds, IndicatorStatusNeeds, J1939DcmDm19Support, J1939RmIncomingRequestServiceNeeds, J1939RmOutgoingRequestServiceNeeds, NvBlockNeeds, SecureOnBoardCommunicationNeeds, SupervisedEntityCheckpointNeeds, SupervisedEntityNeeds, SyncTimeBaseMgrUserNeeds, V2xDataManagerNeeds, V2xFacUserNeeds, V2xMUserNeeds, VendorSpecificServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds, SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table 7.52: ServiceNeeds

Please note that the vast majority of the subclasses of meta-class `ServiceNeeds` are associated with standardized behavior of AUTOSAR services. However, there are cases where a user-specific behavior is required and for this purpose a specific flavor of `ServiceNeeds` is available.

[TPS_SWCT_01693] Usage of `VendorSpecificServiceNeeds` [It is possible to define `VendorSpecificServiceNeeds` for the purpose of implementing a vendor-specific, i.e. non-standardized, service. `VendorSpecificServiceNeeds` does not provide any attributes and its meaning shall be described by means of the `category` attribute.] ([RS_SWCT_02060](#))

Class	VendorSpecificServiceNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	This represents the ability to define vendor-specific service needs.

Class	VendorSpecificServiceNeeds			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table 7.53: VendorSpecificServiceNeeds

7.11.2 Assignment of Service Needs to Ports and Data

[TPS_SWCT_01046] **ServiceNeeds** are defined in the scope of the **SwcInternalBehavior** [ServiceNeeds specified by AtomicSwComponentTypes are defined in the scope of the SwcInternalBehavior because in several cases they need associations to other parts of the SwcInternalBehavior.

In most cases they are related to certain PortPrototypes belonging to the AtomicSwComponentTypes because AtomicSwComponentTypes communicate with AUTOSAR Services via these PortPrototypes.] (RS_SWCT_02060)

In addition, a ServiceNeeds element can also have relations to some data declared within the same SwcInternalBehavior, namely some use cases of the NVRAM Service, require a Permanent RAM Block and/or ROM Block declared in the context of the single software component.

A further use case requires that a ServiceNeeds element is linked to a PortGroup. Especially, a ServiceNeeds can represent a group of PortPrototypes as input to configure the communication manager in order to handle the communication state of those PortPrototypes.

These relationships to PortPrototypes, data and PortGroups are required as input for tools in order to generate the XML descriptions and configurations of the basic software which implements the Service according to the needs of several AtomicSwComponentTypes are integrated on an ECU, see chapter 11.

The relationship to PortPrototypes is defined via the meta-class RoleBasedPortAssignment and the relationship to data is defined via the meta-class RoleBasedDataAssignment.

Class	RoleBasedPortAssignment			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::ServiceMapping			
Note	This class specifies an assignment of a role to a particular service port (RPortPrototype or PPort Prototype) of an AtomicSwComponentType. With this assignment, the role of the service port can be mapped to a specific ServiceNeeds element, so that a tool is able to create the correct connector.			
Base	ARObject			
Aggregated by	NvBlockDescriptor.clientServerPort, SwcServiceDependency.assignedPort			
Attribute	Type	Mult.	Kind	Note

Class	RoleBasedPortAssignment			
portPrototype	PortPrototype	0..1	ref	Service PortPrototype used in the assigned role. This PortPrototype shall either belong to the same AtomicSw ComponentType as the SwcInternalBehavior which owns the ServiceDependency or to the same NvBlockSw ComponentType as the NvBlockDescriptor.
role	Identifier	0..1	attr	This is the role of the assigned Port in the given context. The value shall be a shortName of the Blueprint of a Port Interface as standardized in the Software Specification of the related AUTOSAR Service.

Table 7.54: RoleBasedPortAssignment

Both are aggregating an attribute `role` which allows to define the role of the `Port-Prototypes` or data in the specific context.

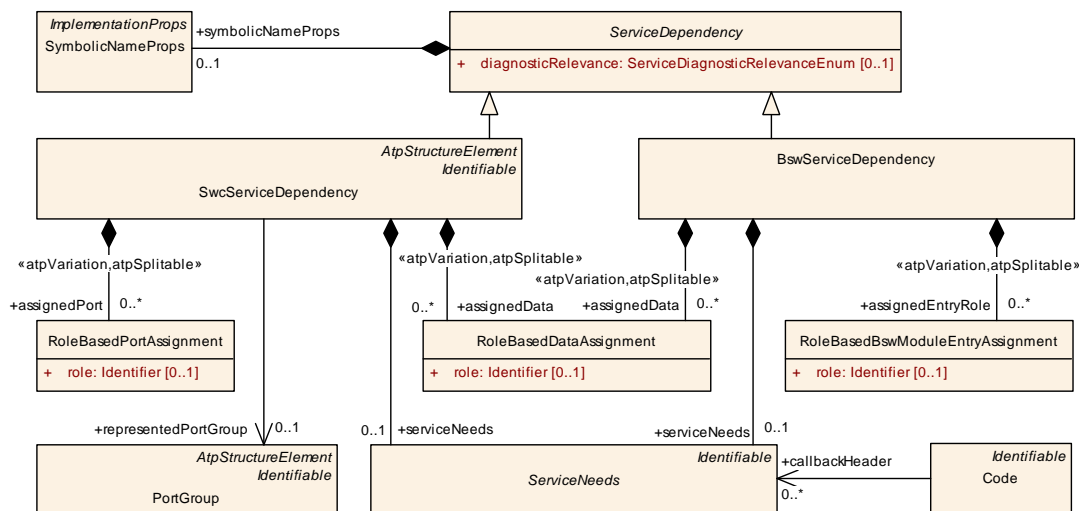

Figure 7.39: ServiceDependency is the abstract base class of SwcServiceDependency

[constr_2027] SwcServiceDependency shall be defined for service ports only [A PortPrototype that is referenced by a SwcServiceDependency via assignedPort or via assignedData shall be typed by a PortInterface that has isService set to true **at the time when the RTE is generated.**

This rule does **not** apply to PortPrototypes referenced by a RoleBasedPortAssignment where the attribute `role` is set to any of the following values:

- NvMService
- NvMNotifyJobFinished
- NvMNotifyInitBlock
- NvMAdmin
- NvMMirror
- NvDataPort

Furthermore, the rule does **not** apply to the case described in [TPS_SWCT_01579], [TPS_SWCT_01831], [TPS_SWCT_01580], and [TPS_SWCT_01572].] ()

The actual mapping between the *ServiceNeeds* element and its various relationships is provided by the meta-class *SwcServiceDependency* as shown in figure 7.40.

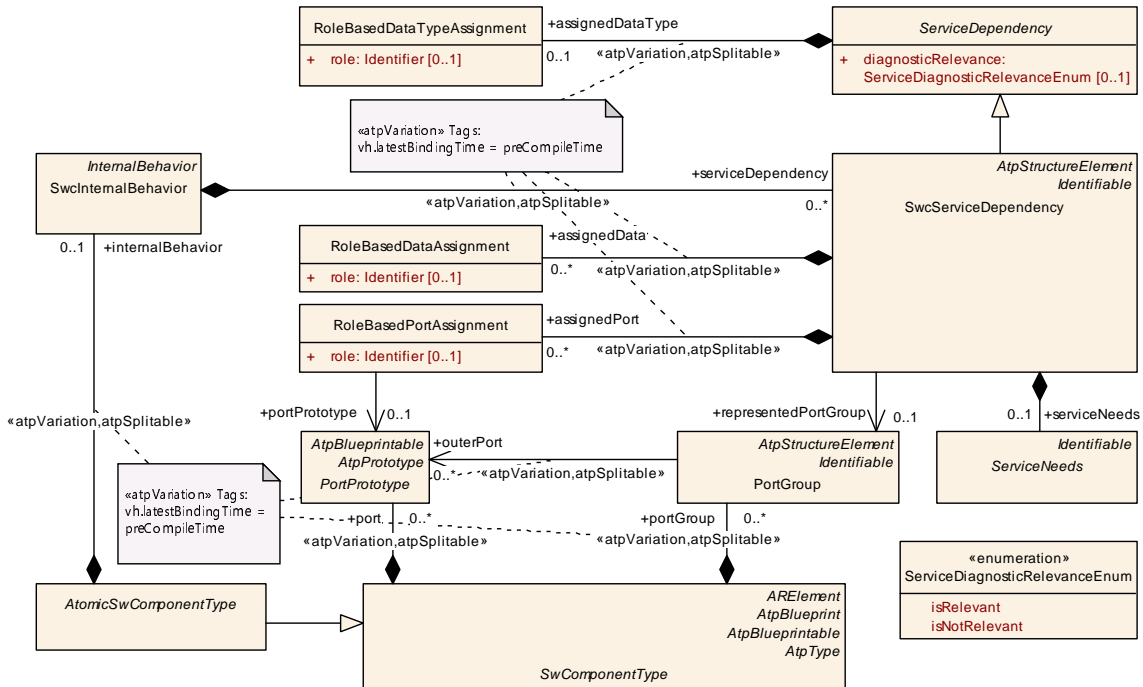

Figure 7.40: *SwcServiceDependency* in the *SwcInternalBehavior*

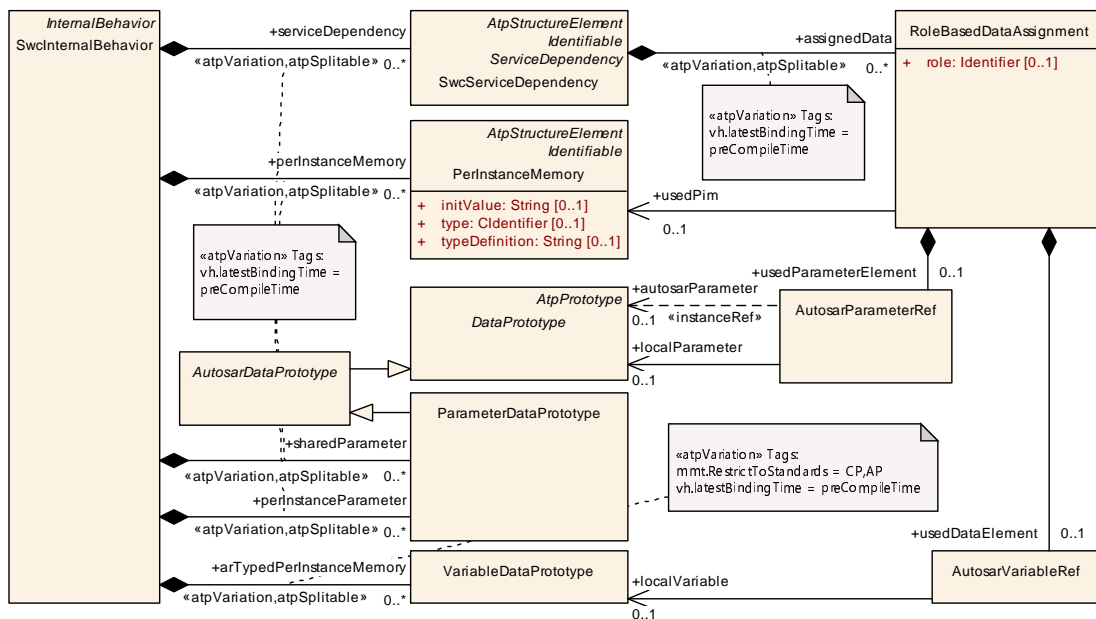

Figure 7.41: Details of *RoleBasedDataAssignment* for local data

Note the difference between the associations to [PortPrototypes](#) and to [PortGroups](#): While the [RoleBasedPortAssignment](#) is part of the [SwcInternalBehavior](#) a [PortGroup](#) is defined for the [SwComponentType](#) (thus belongs to the VFB level) and it is linked to the [PortGroups](#) of other [SwComponentTypes](#).

This means a [PortGroup](#) represents a system feature, whereas the [RoleBasedPortAssignment](#) is a local feature for the purpose of communication with the AUTOSAR Service.

Class	RoleBasedDataAssignment

Table 7.60: RoleBasedDataTypeAssignment

[constr_10020] Existence of attribute `RoleBasedDataTypeAssignment.usedImplementationDataType` [For each `RoleBasedDataTypeAssignment`, attribute `usedImplementationDataType` shall exist **at the time when the RTE is generated.**] ()

Please note that there are cases where the granularity of existing ServiceInterfaces does not match the granularity of existing `SwcServiceDependency.serviceNeeds`.

In other words, there are Service Interfaces that cover the semantics of different kinds of *ServiceNeeds*. One example is the *ClientServerInterface* `DataServices_{Data}` which basically supports the access to diagnostic values **as well as** I/O control of the same value.

Figure 7.44 provides a graphical sketch of how the modeling for this case is foreseen.

[TPS_SWCT_01689] Relation between *SwcServiceDependencies* and *PortPrototypes* [It is positively possible to create a model where two or more *SwcServiceDependencies*, by way of the *RoleBasedPortAssignment* or *RoleBasedDataAssignment*, refer to a single *PortPrototype*.] (*RS_SWCT_02060*)

As indicated by Figure 7.44, there are two potentially competing *SwcServiceDependencies* that could be taken to contribute their *shortName* for filling in the suffix of the `DataServices_{Data}`.

In this case, it is actually necessary to settle the “over-supply of *shortNames*” by regulation of the AUTOSAR standard. [TPS_SWCT_01691] has been created for this purpose.

Another realistic example where [TPS_SWCT_01689] applies is an *AtomicSwComponentType* that exposes a *PPortPrototype* typed by a *SenderReceiverInterface* and the *dataElement(s)* within the *PPortPrototype* are both accessed as diagnostic values (see chapter 13.8.4.3) **and** are used to send mode requests to the BswM (see chapter 13.6.4).

Note that in this case a regulation regarding the *shortNames* of the affected *SwcServiceDependencies* is not required because the applicable *SenderReceiverInterface* is not standardized and does not require the assignment of a name suffix from the existing model.

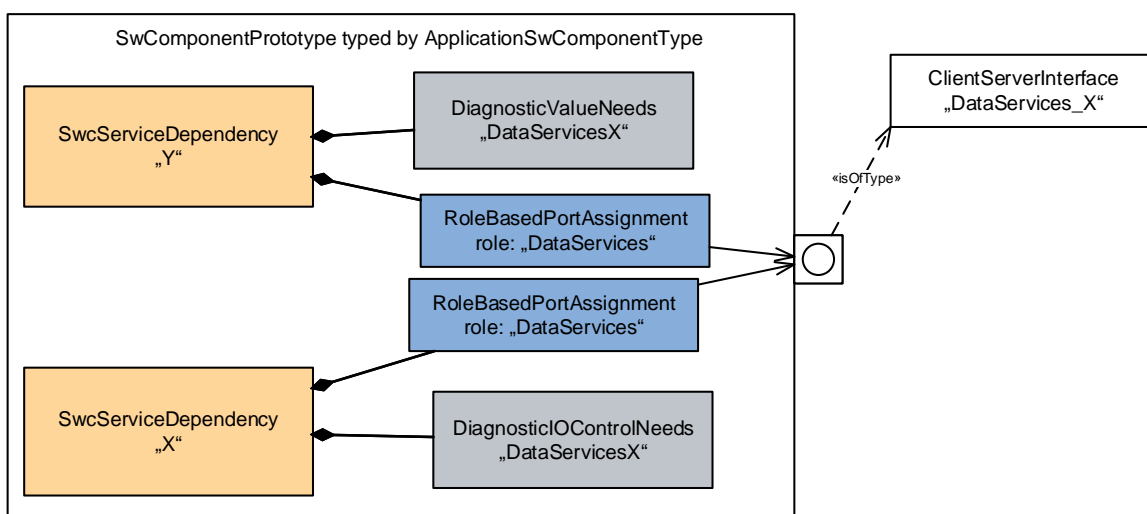

Figure 7.44: Two *SwcServiceDependencies* referencing one *PortPrototype*

[TPS_SWCT_01005] Usage of **SwcServiceDependency**s for vendor-specific services [SwcServiceDependency can also be used for vendor-specific services. In this case the SwcServiceDependency shall not contain any of the standardized ServiceNeeds. For this purpose the VendorSpecificServiceNeeds is available.](RS_SWCT_02060)

[TPS_SWCT_01833] Semantics of **ServiceDependency.diagnosticRelevance** [The attribute ServiceDependency.diagnosticRelevance can be used to indicate a diagnostic relevance of the ServiceDependency, especially for ServiceDependency that are not related to diagnostics, but which are still required for the integration of the diagnostic stack.](RS_SWCT_02060)

One example for the usage of ServiceDependency.diagnosticRelevance would be the communication between the application software and the BswM, i.e. in the context of a SwcServiceDependency that aggregates a BswMgrNeeds. This communication may be relevant for the configuration of so-called "mode conditions" in the Dcm.

Please note that the modeling of attribute is very general and can be applied to every foreseeable service configuration. However, the only know use case that is actually relevant is the mentioned communication between application software and the BswM.

In order to not open the door for the uncontrolled usage of uncharted territory (that may nevertheless later be explored, use case by use case), restrictions apply for the usage of ServiceDependency.diagnosticRelevance, as documented in [constr_10032].

[constr_10032] Restrictions for the usage of **ServiceDependency.diagnosticRelevance** [The attribute ServiceDependency.diagnosticRelevance shall only be used for a SwcServiceDependency that aggregates a BswMgrNeeds **at the time when the RTE is generated.**]()

7.12 Variation Point Proxy

[TPS_SWCT_01370] **VariationPointProxy** [Description of variability inside a software-component may exist in two different levels of abstraction:

- A **structural** variation point affects the existence or non-existence of structural model elements. A structural variation point is modeled by means of the meta-class `VariationPoint`.
- A **functional** variation point affects solely the functionality in the implementation (read: source code) of the software-component. A functional variation point is modeled by means of the meta-class `VariationPointProxy`.

In other words, this enables the developer of a software-component to implement variability that is limited to the software-component's functionality. This kind of variability is resolved

- by a code generator (`bindingTime = codeGenerationTime`)

- by the preprocessor (`bindingTime = preCompileTime`).
- as a post-build value evaluation (in this case `postBuildValueAccess` and `postBuildVariantCondition` shall exist).

|(RS_SWCT_03100)

Class	VariationPointProxy			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::VariantHandling			
Note	The VariationPointProxy represents variation points of the C/C++ implementation. In case of <code>bindingTime = compileTime</code> the RTE provides defines which can be used for Pre Processor directives to implement <code>compileTime</code> variability.

value	Integer	1	attr	This is the particular value of the post-build variant criterion. Stereotypes: atpVariation Tags: vh.latestBindingTime=preCompileTime

Table 7.64: PostBuildVariantCondition

Please note that in the first two cases of the second bullet list in [TPS_SWCT_01370] the evaluation of `conditionAccess` shall replace the formula by the result.

The name `VariationPointProxy` was motivated by the fact that it represents a model element that is not directly related to the **structure** but to the code and from this point of view acts as a proxy to the **functional** variation existing in the code.

The consequence of the two levels of abstraction is that (from a model processing point of view) it would be possible to bind all structural variation points entirely while keeping some or all of the functional variation points unbound. This is an explanation for the existence of [TPS_SWCT_01371].

[TPS_SWCT_01371] **VariationPointProxy vs. VariationPoint** [The difference between a `VariationPoint` and a `VariationPointProxy` is that if during the process of binding the formula evaluates to 0 the `VariationPointProxy` remains in the model while the `VariationPoint` as well as its owner is removed from the model.] ([RS_SWCT_03100](#))

Nevertheless, the binding of the variability is described by the means of `SwSystem-constantValueSets` and `PostBuildVariantCriterionValueSets`.

[TPS_SWCT_01448] Pre-defined values for the **category** of **VariationPointProxy** [AUTOSAR pre-defines two possible values for the **category** of **VariationPointProxy**. The meaning of the values, however, depends on the particular modeling of individual **VariationPointProxys**, see [TPS_SWCT_01370].

VALUE In the “pre-build” case this means that **valueAccess** shall yield an integer literal. In the “post-build” case, on the other hand, this means that **postBuildValueAccess** shall yield an integer value conform with the **implementationDataType**.

In this context, [constr_1388] applies.

CONDITION In this case it is **possible** (though not mandatory) to define a **VariationPointProxy** that actually works in a combination of the “pre-build” and “post-build” scenario.

In other words, in the “pre-build” case **conditionAccess** shall yield a *boolean* value and in the “post-build” case **postBuildVariantCondition** shall also yield a *boolean* value.

An *and* operator shall be applied to all boolean values returned by **conditionAccess** and the collection of **postBuildVariantCondition** in order to yield the actual result of the condition. [TPS_GST_00259] and [SWS_Rte_08069] apply.

For the **postBuildVariantCondition** an implicit reference to the **PlatformData Type boolean** shall be assumed.

In contrast to the value **VALUE** it is possible to define a **VariationPointProxy** that uses **both** **conditionAccess** **and** **postBuildVariantCondition**.

](RS_SWCT_03100)

[constr_1388] **VariationPointProxy** of **category** **VALUE** shall not mix “pre-build” and “post-build” use-cases [If the value of **category** of the **VariationPointProxy** is set to **VALUE** then there can only be one value yield from the evaluation of a **VariationPointProxy**. In other words, a **VariationPointProxy** of **category** **VALUE** shall not mix the “pre-build” and “post-build” use-cases.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1389] Restriction regarding the value of **category** of **VariationPointProxy.implementationDataType** [**VariationPointProxy.implementationDataType** shall **not** be of **category** **STRUCTURE**, **ARRAY**, **UNION**, **FUNCTION_REFERENCE**, and **DATA_REFERENCE**.

The **VariationPointProxy.implementationDataType** shall be of **category** **VALUE** or **TYPE_REFERENCE** that, after all references are resolved, yields an **ImplementationDataType** of **category** **VALUE**.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

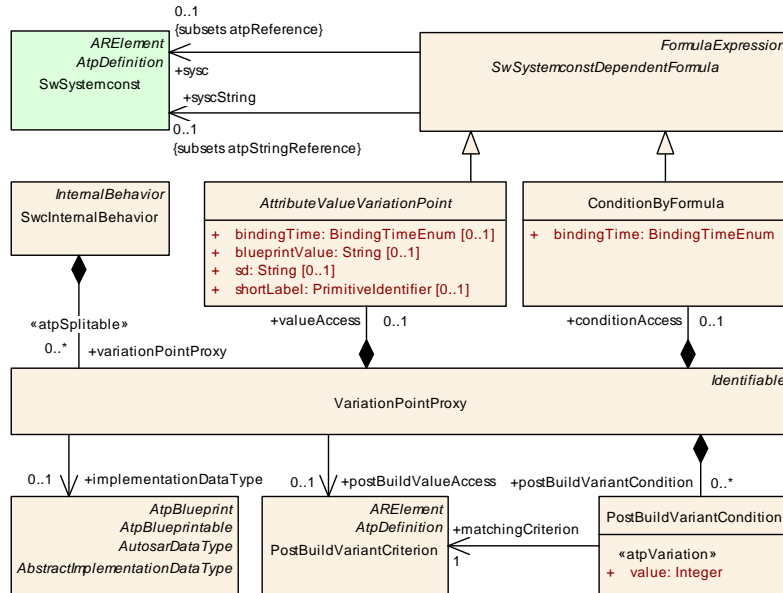

Figure 7.45: VariationPointProxy

[TPS_SWCT_01372] bindingTime = preCompileTime [In case of `bindingTime = preCompileTime` the RTE provides macro definitions that can be used for pre-processor directives to implement `preCompileTime` variability in C/C++ code.]([RS_SWCT_03100](#))

The generation of macro definitions implies the creation of suffixes that indicate the type of the constant value (e.g. "u" for "unsigned") defined in the context of the macro. This is especially important where the MISRA [34] rules need to be observed.

According to the definition of the AUTOSAR formula language (see TPS Generic Structure Template [11]), numerical values yielded by a formula expression will not have a suffix that clarifies the data type associated with the constant value.

It is therefore in general necessary to provide a formal association between the value yielded by a formula expression and an `ImplementationDataType` that can provide the information about the suffix to be applied in the specific case.

[TPS_SWCT_01858] Optional existence of reference VariationPointProxy.implementationDataType if the bindingTime is set to preCompileTime [If the value of attribute `bindingTime` of `VariationPointProxy.valueAccess` is set to the value `preCompileTime`, then the creation of a reference to an `ImplementationDataType` in the role `VariationPointProxy.implementationDataType` shall be taken to determine the suffix to qualify the numerical value yielded from the formula expression for the creation of a preprocessor macro.]([RS_SWCT_03100](#))

For more clarification, the actual information about the suffix shall be derived from the value of `ImplementationDataType.swDataDefProps.baseType.baseTypeDefinition.baseTypeEncoding` and `baseTypeSize`.

Class	<<atpMixedString>> AttributeValueVariationPoint (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling::AttributeValueVariationPoints			
Note	This class represents the ability to derive the value of the Attribute from a system constant (by Sw SystemconstDependentFormula). It also provides a bindingTime.			
Base	ARObject, FormulaExpression, SwSystemconstDependentFormula			
Subclasses	AbstractEnumerationValueVariationPoint, AbstractNumericalVariationPoint, BooleanValueVariationPoint, FloatValueVariationPoint, IntegerValueVariationPoint, PositiveIntegerValueVariationPoint, TimeValueVariationPoint, UnlimitedIntegerValueVariationPoint			
Aggregated by	VariationPointProxy.valueAccess			
Attribute	Type	Mult.	Kind	Note
bindingTime	BindingTimeEnum	0..1	attr	This is the binding time in which the attribute value needs to be bound. If this attribute is missing, the attribute is not a variation point. In particular this means that It needs to be a single value according to the type specified in the pure model. It is an error if it is still a formula. Tags: xml.attribute=true
blueprintValue	String	0..1	attr	This represents a description that documents how the value shall be defined when deriving objects from the blueprint. Tags: xml.attribute=true
sd	String	0..1	attr	This special data is provided to allow synchronization of Attribute value variation points with variant management systems. The usage is subject of agreement between the involved parties. Tags: xml.attribute=true
shortLabel	PrimitivIdentifier	0..1	attr	This allows to identify the variation point. It is also intended to allow RTE support for CompileTime Variation points. Tags: xml.attribute=true

Table 7.65: AttributeValueVariationPoint

[TPS_SWCT_01373] RTE generator shall evaluate the **SwSystemconstDependentFormula** [It is in the scope of the RTE generator to evaluate the **SwSystemconstDependentFormula** which has a higher precedence than the standard C Pre-processor and to provide the resulting values to the software-component's implementation.] (*RS_SWCT_03100*)

For further details (beyond the statements made in [TPS_SWCT_01372] and [TPS_SWCT_01373]) about the impact of the existence of a **VariationPointProxy** on the RTE please refer to [2].

Please note that the usage of attributes of meta-class **VariationPointProxy** is not arbitrarily possible but subject to conditions. In particular, there are certain use-cases that dictate how and with which multiplicity attributes of **VariationPointProxy** shall be used.

In particular, the applicable use-cases are defined by a combination of the binding time, i.e. *PreBuild* (all pre-build binding times are summarized as *PreBuild*) vs. *PostBuild*, and the value of **VariationPointProxy.category** (the details are explained in [constr_1253], respectively).

[constr_1253] Allowed multiplicities for attributes of `VariationPointProxy` depending on the applicable binding time and the value of `VariationPointProxy.category` [

BindingTime	category	Allowed Attribute Multiplicity
<i>PreBuild</i>	VALUE	<code>valueAccess [1]</code> , <code>implementationDataType [0..1]</code>
	CONDITION	<code>conditionAccess [1]</code>
<i>PostBuild</i>	VALUE	<code>postBuildValueAccess [1]</code> , <code>implementationDataType [1]</code>
	CONDITION	<code>postBuildVariantCondition [1..*]</code> , <code>conditionAccess [0..1]</code>

This rule shall be imposed **at the time when the contract phase generation is executed.**

]|()

For clarification, the multiplicities of attributes of meta-class `VariationPointProxy` that are **not** explicitly mentioned in a given row of the table contained in `[constr_1253]` shall be interpreted as `[0]`.

8 Implementation

Previous versions of this document contained a comprehensive description of the meta-class `Implementation`. This meta-class still exists but the description of most of its content has been moved to another document, in particular the specification of the Basic Software Module Description Template [6].

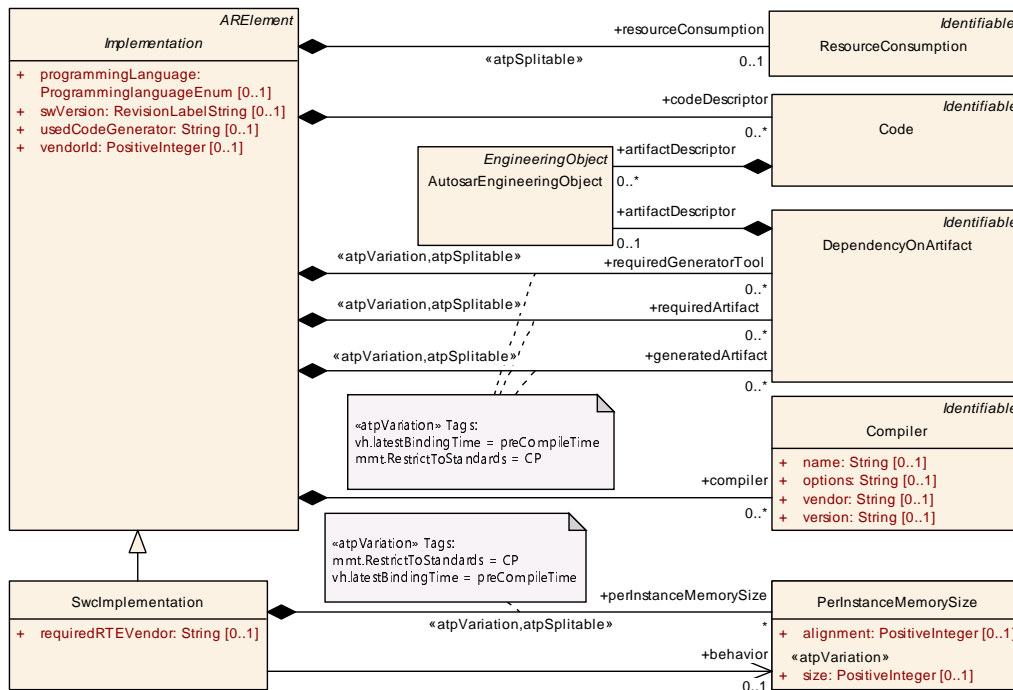

Figure 8.1: Implementation part specific to the Software Component Template

Please note that the Software Component Template and the Basic Software Module Description Template share the content of `Implementation`. However, the semantics of `Implementation` is closer to the Basic Software Module Description Template.

Nevertheless, there is still content strictly related to the Software Component Template. This part of `Implementation` consisting of `SwcImplementation` (see Figure 8.1) remains in this document.

Class	<i>Implementation</i> (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::Implementation			
Note	Description of an implementation a single software component or module.			
Base	ARElement , ARObject , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Subclasses	BswImplementation , SwcImplementation			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note

Class	Implementation (abstract)			
buildActionManifest	BuildActionManifest	0..1	ref	A manifest specifying the intended build actions for the software delivered with this implementation. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=buildActionManifest.buildActionManifest, buildActionManifest.variationPoint.shortLabel vh.latestBindingTime=codeGenerationTime
codeDescriptor	Code	*	aggr	Specifies the provided implementation code.
compiler	Compiler	*	aggr	Specifies the compiler for which this implementation has been released
generatedArtifact	DependencyOnArtifact	*	aggr	Relates to an artifact that will be generated during the integration of this Implementation by an associated generator tool. Note that this is an optional information since it might not always be in the scope of a single module or component to provide this information. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=generatedArtifact.shortName, generatedArtifact.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
hwElement	HwElement	*	ref	The hardware elements (e.g. the processor) required for this implementation.
linker	Linker	*	aggr	Specifies the linker for which this implementation has been released.
mcSupport	McSupportData	0..1	aggr	The measurement & calibration support data belonging to this implementation. The aggregation is <<atpSplitable>> because in case of an already existing BSW Implementation model, this description will be added later in the process, namely at code generation time. Stereotypes: atpSplitable Tags: atp.Splitkey=mcSupport
programmingLanguage	ProgramminglanguageEnum	0..1	attr	Programming language the implementation was created in.
requiredArtifact	DependencyOnArtifact	*	aggr	Specifies that this Implementation depends on the existence of another artifact (e.g. a library). This aggregation of DependencyOnArtifact is subject to variability with the purpose to support variability in the implementations. Different algorithms in the implementation might cause different dependencies, e.g. the number of used libraries. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=requiredArtifact.shortName, requiredArtifact.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
requiredGeneratorTool	DependencyOnArtifact	*	aggr	Relates this Implementation to a generator tool in order to generate additional artifacts during integration. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=requiredGeneratorTool.shortName, requiredGeneratorTool.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
resourceConsumption	ResourceConsumption	0..1	aggr	All static and dynamic resources for each implementation are described within the ResourceConsumption class. Stereotypes: atpSplitable Tags: atp.Splitkey=resourceConsumption.shortName

Class	Implementation (abstract)			
swcBsw Mapping	SwcBswMapping	0..1	ref	This allows a mapping between an SWC and a BSW behavior to be attached to an implementation description (for AUTOSAR Service, ECU Abstraction and Complex Driver Components). It is up to the methodology to define whether this reference has to be set for the Swc- or Bsw Implementation or for both.
swVersion	RevisionLabelString	0..1	attr	Software version of this implementation. The numbering contains three levels (like major, minor, patch), its values are vendor specific.
usedCode Generator	String	0..1	attr	Optional: code generator used.
vendorId	PositiveInteger	0..1	attr	Vendor ID of this Implementation according to the AUTOSAR vendor list

9 Mode Management

In general, the Software Component Template doesn't define the kind of modes that shall be supported by State Managers or software-components explicitly. However the Software Component Template provides generic mechanisms for describing modes.

In this section the general relationship between modes, interfaces, and software-components is discussed.

The assumption from the software-component point of view is that State Managers are using a Standardized AUTOSAR `PortInterface`¹ to influence the `SwComponentType` and also provide a `PortInterface` to get requests and confirmations from the `SwComponentType`.

They will be implemented as AUTOSAR services and be part of the Basic Software on each ECU. The actual modes a State Manager provides will have to be standardized as well to allow compatibility between software-components.

It is also possible to define a mode manager in the Application Software and the same functionality is supported as for mode managers implemented in the Basic Software.

[TPS_SWCT_01581] Communication patterns for mode-related communication [Mode-related communication shall implement a 1:1 or 1:n scenario but the creation of an n:1 configuration shall be considered invalid.] ([RS_SWCT_03200](#), [RS_SWCT_03110](#))

As a consequence of [\[TPS_SWCT_01581\]](#), [\[constr_1101\]](#) is formulated.

[constr_1101] Mode-related communication [An `RPortPrototype` typed by `ModeSwitchInterface` shall not be referenced by more than one `SwConnector` at the time when the RTE is generated.] ()

9.1 Declaration of Modes

The SW-Component Template provides some simple means to define collections of modes.

[TPS_SWCT_01071] ModeDeclaration [The name of the mode is the most important attribute that has to be provided for each `ModeDeclaration`. The `ModeDeclarations` are grouped together within the `ModeDeclarationGroup`.] ([RS_SWCT_03200](#), [RS_SWCT_03110](#))

[TPS_SWCT_01067] Initial mode [The `initialMode` is active before any mode switches occurred.] ([RS_SWCT_03200](#))

This is shown in [Figure 9.1](#)

¹See also AUTOSAR Glossary for "Standardized AUTOSAR Interface".

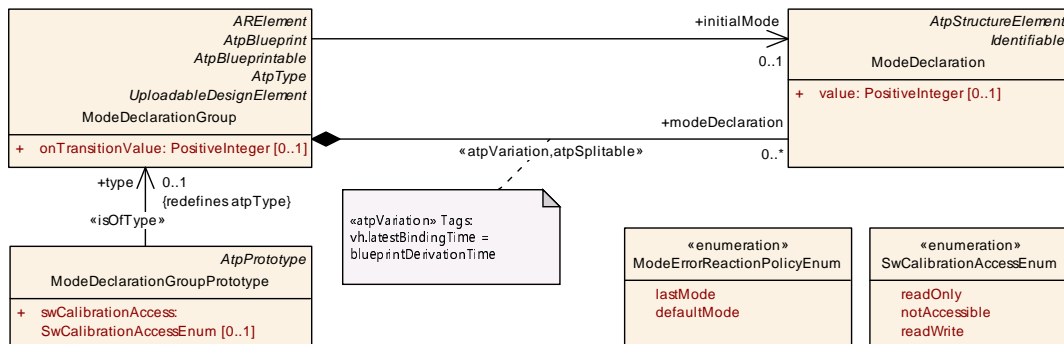

Figure 9.1: ModeDeclaration

The class `ModeDeclarationGroup` has been introduced to support the grouping of modes and (on M1 level) to provide predefined sets of modes that could be standardized and re-used. The set of modes eventually defines a flat (i.e. no hierarchical states) state-machine where only one mode can be active at a given point in time.

Again, please note that the actual definition of modes and their relationship is not in the responsibility of this document. In other words: the definition of modes represents M1 artifacts whereas this document is limited to describing M2 model elements.

Both `ModeDeclaration` and `ModeDeclarationGroup` own attributes that facilitate the generation of C source code from the formal definition.

[TPS_SWCT_01008] Definition of positive integer values that are directly taken over by the RTE generator for creating the programmatic representations of the `ModeDeclaration` [The attributes `ModeDeclaration.value` and `ModeDeclarationGroup.onTransitionValue` allow for the definition of positive integer values that are directly taken over by the RTE generator for creating the programmatic representations of the `ModeDeclaration` and `ModeDeclarationGroup` in the source code.]([RS_SWCT_03200](#))

[constr_1399] Standardized values of `ModeDeclarationGroup.category` [The AUTOSAR standard defines the following values of the attribute `ModeDeclarationGroup.category` with a standardized meaning:

- EXPLICIT_ORDER
- ALPHABETIC_ORDER

[TPS_SWCT_01010] defines the meaning of these values.

It is **not allowed** to define any custom or project-specific value of the attribute `ModeDeclarationGroup.category`.

This rule shall be imposed **at the time when the contract phase generation is executed.**()

As the attributes `ModeDeclaration.value` and `ModeDeclarationGroup.onTransitionValue` are optional the following rule applies:

[constr_1298] Existence of attributes if `category` of a `ModeDeclarationGroup` is set to `EXPLICIT_ORDER` [The attributes `ModeDeclarationGroup.onTransitionValue` and `ModeDeclaration.value` (for each `ModeDeclaration`) shall be set if the `category` of a `ModeDeclarationGroup` is set to `EXPLICIT_ORDER`.

This rule shall be imposed **at the time when the contract phase generation is executed.**]()

[constr_1299] Existence of attributes if `category` of a `ModeDeclarationGroup` is set to other than `EXPLICIT_ORDER` [The attributes `ModeDeclarationGroup.onTransitionValue` or `ModeDeclaration.value` (for any `ModeDeclaration`) shall **not** be set if the `category` of a `ModeDeclarationGroup` is set to any value other than `EXPLICIT_ORDER` **at the time when the contract phase generation is executed.**]()

[constr_1181] Numerical values used in `ModeDeclaration.value` and `ModeDeclarationGroup.onTransitionValue` [The numerical values used to define the `value` attributes and the `onTransitionValue` attribute of a `ModeDeclarationGroup` shall not overlap **at the time when the contract phase generation is executed.**]()

In other words, it is not allowed that the values of two `value` attributes within one `ModeDeclarationGroup` have the same numerical value. Neither is it allowed that the numerical value of the `ModeDeclarationGroup.onTransitionValue` attribute and the numerical value of one of the corresponding `value` attributes are identical.

[TPS_SWCT_01009] The numerical values used to define the values of `ModeDeclaration.value` and `ModeDeclarationGroup.onTransitionValue` can be arbitrarily defined [As long as the constraints [\[constr_1181\]](#), [\[constr_1298\]](#), and [\[constr_1299\]](#) are fulfilled, the numerical values used to define the values of `ModeDeclaration.value` and `ModeDeclarationGroup.onTransitionValue` can be arbitrarily defined. The numerical values are not required to be consecutive. Gaps are positively allowed.] ([RS_SWCT_03200](#))

Example 9.1

The following set of numerical values fulfills all requirements on the definition of `ModeDeclaration.value` and `ModeDeclarationGroup.onTransitionValue`: {1,2, 5, 100}.

Please note that the ability to define `ModeDeclaration.value` and `ModeDeclarationGroup.onTransitionValue` introduces second heuristics for “ordering” `ModeDeclarations`. If `ModeDeclaration.value` and `ModeDeclarationGroup.onTransitionValue` are not defined the assignment of numerical values to the representations of individual `ModeDeclarations` it is up to the RTE generator to come up with the applicable numerical values.

[TPS_SWCT_01010] `category`s for the definition of a `ModeDeclarationGroup` [In order to support a clear separation between the two possible ways to influence the

definition of the programmatic representation of `ModeDeclarations` two `category`s shall be defined for the definition of a `ModeDeclarationGroup`.

- The value of `category` of a `ModeDeclarationGroup` shall be set to `EXPLICIT_ORDER` if it is intended to control the source code generation by means of the values of the attributes `ModeDeclaration.value` and `ModeDeclarationGroup.onTransitionValue`.
- The value of `category` of a `ModeDeclarationGroup` shall be set to `ALPHABETIC_ORDER` if it is intended to let the RTE generator control the source code generation according to the alphabetical sorting.

]([RS_SWCT_03200](#))

More information regarding this aspect can be found in [SWS_Rte_02568].

[TPS_SWCT_01011] **Default `category` of a `ModeDeclarationGroup`** [For reasons of backwards-compatibility with previous releases of AUTOSAR the default value of the `category` of a `ModeDeclarationGroup` shall be `ALPHABETIC_ORDER`.] ([RS_SWCT_03200](#))

Class	ModeDeclaration

Attribute	Type	Mult.	Kind	Note
initialMode	ModeDeclaration	0..1	ref	The initial mode of the ModeDeclarationGroup. This mode is active before any mode switches occurred.

Class	ModeDeclarationGroup			
mode Declaration	ModeDeclaration	*	aggr	The ModeDeclarations collected in this ModeDeclaration Group. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=modeDeclaration.shortName, mode Declaration.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime
modeManager ErrorBehavior	ModeErrorBehavior	0..1	aggr	This represents the ability to define the error behavior expected by the mode manager in case of errors on the mode user side (e.g. terminated mode user).
modeTransition	ModeTransition	*	aggr	This represents the available ModeTransitions of the ModeDeclarationGroup
modeUserError Behavior	ModeErrorBehavior	0..1	aggr	This represents the definition of the error behavior expected by the mode user in case of errors on the mode manager side (e.g. terminated mode manager).
onTransition Value	PositiveInteger	0..1	attr	The value of this attribute shall be taken into account by the RTE generator for programmatically representing a value used for the transition between two statuses.

Table 9.2: ModeDeclarationGroup

[constr_1973] Existence of attribute [ModeDeclarationGroup.initialMode](#) [For each [ModeDeclarationGroup](#), the reference to [ModeDeclaration](#) in the role [initialMode](#) shall exist **at the time when the contract phase generation is executed.**]()

[constr_1974] Existence of attribute [ModeDeclarationGroup.modeDeclaration](#) [For each [ModeDeclarationGroup](#), at least one [ModeDeclaration](#) shall be aggregated in the role [modeDeclaration](#) **at the time when the contract phase generation is executed.**]()

[TPS_SWCT_01450] Semantics of a [ModeTransition](#) [In addition to the ability to specify [ModeDeclarations](#) within a [ModeDeclarationGroup](#) it is also feasible to define possible transitions between [ModeDeclarations](#) within the given [ModeDeclarationGroup](#). This can be done by means of aggregation [ModeTransition](#) at [ModeDeclarationGroup](#) in the role [modeTransition](#).] ([RS_SWCT_03200](#))

More details are explained in Figure 9.2.

[TPS_SWCT_01451] Relations between [ModeTransition](#) and [ModeDeclaration](#) [[ModeTransition](#) has two associations with the multiplicity 1 to [ModeDeclaration](#):

- The reference [enteredMode](#) denotes a [ModeDeclaration](#) that can be entered as part of the enclosing [ModeTransition](#).
- The reference [exitedMode](#) denotes a [ModeDeclaration](#) that can be exited as part of the enclosing [ModeTransition](#).

] ([RS_SWCT_03200](#))

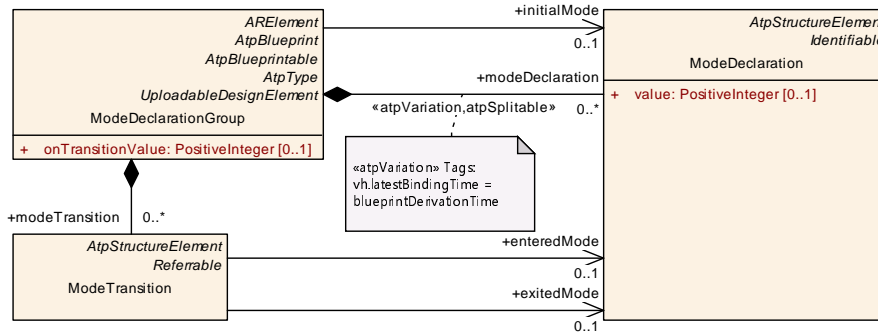

Figure 9.2: ModeTransition

[constr_1193] ModeDeclaration shall be referenced by at least one ModeTransition in the role enteredMode [For each ModeDeclaration at least one ModeTransition shall reference the ModeDeclaration in the role enteredMode.]()

This constraint shall apply **at the time when the RTE is generated only** if there is at least one ModeTransition defined in the context of the enclosing ModeDeclarationGroup and it shall **not** apply to the initialMode.]()

For clarification, the ModeDeclarationGroup.initialMode does not need to be referenced by an enteredMode because by identifying this ModeDeclaration in the role initialMode it is clear that the ModeDeclaration will be entered at least once.

Class	ModeTransition			
Package	M2::AUTOSARTemplates::CommonStructure::ModeDeclaration			
Note	This meta-class represents the ability to describe possible ModeTransitions in the context of a Mode DeclarationGroup.

Aggregated by	AtpClassifier.atpFeature, ModeDeclarationGroup.modeTransition			
Attribute	Type	Mult.	Kind	Note
enteredMode	ModeDeclaration	0..1	ref	This represents the entered model of the ModeTransition.
exitedMode	ModeDeclaration	0..1	ref	This represents the exited mode of the ModeTransition

Table 9.3: ModeTransition

[constr_1975] Existence of attribute ModeTransition.enteredMode [For each ModeTransition, the reference to ModeDeclaration in the role enteredMode shall exist **at the time when the RTE is generated.**]()

[constr_1976] Existence of attribute ModeTransition.exitedMode [For each ModeTransition, the reference to ModeDeclaration in the role exitedMode shall exist **at the time when the RTE is generated.**]()

9.2 Modes and Events

[TPS_SWCT_01376] Software-components need to be capable of reacting to state changes [Software-components need to be capable of reacting to state changes issued by some `Mode Manager` and adopt their behavior to the new situation.] ([RS_SWCT_03110](#))

Such a mode dependent software-component is shown in Figure 9.3.

[TPS_SWCT_01077] Configure the response to mode changes [Since the behavior of `AtomicSwComponentTypes` is mainly determined by the `RunnableEntities` contained in the `SwcInternalBehavior`, it is necessary to configure the response to mode changes on the level of `RunnableEntities`.] ([RS_SWCT_03120](#))

Figure 9.3: State Managers and software-components

Figure 9.4 shows an excerpt of the meta-model illustrating how the relationship between the current mode and the `SwcInternalBehavior` of the `AtomicSwComponentType` can be described.

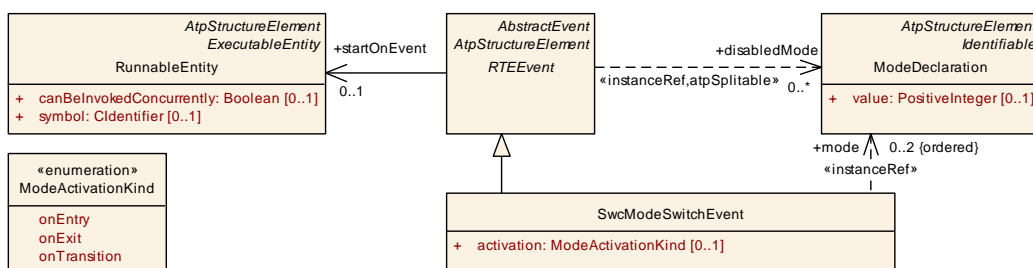

Figure 9.4: Modes and events

[TPS_SWCT_01377] Two mechanisms to define how SwcInternalBehavior should interact with the mode management [A `AtomicSwComponentType` can use two mechanisms to define how its `SwcInternalBehavior` should interact with the mode management.] ([RS_SWCT_03110](#))

Both mechanisms are visible in Figure 9.4.

[TPS_SWCT_01378] **AtomicSwComponentType** can define an **SwcModeSwitchEvent** to execute **RunnableEntity** [Using the first mechanism, an **AtomicSwComponentType** can define an **SwcModeSwitchEvent** to specify that a particular **RunnableEntity** shall be started whenever a mode is entered, exited, or a transition between two specified modes occurs.]([RS_SWCT_03110](#))

[constr_4003] **Semantics of SwcModeSwitchEvent** [If the value of **SwcModeSwitchEvent.activation** is **onTransition**, then **SwcModeSwitchEvent** shall refer to two different **ModeDeclarations** belonging to the same instance of **ModeDeclarationGroup**.

Their order defines the direction of the transition from one mode into another. In all other cases **SwcModeSwitchEvent** shall refer to exactly one **ModeDeclaration**.

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1195] **SwcModeSwitchEvent** and the definition of **ModeTransition** [For each pair of **ModeDeclarations** referenced by a **SwcModeSwitchEvent** with attribute **activation** set to **onTransition** a **ModeTransition** shall be defined in the corresponding direction (i.e. from **exitedMode** to **enteredMode**). This constraint shall only apply **at the time when the RTE is generated** if the respective **ModeDeclarationGroup** defines at least one **modeTransition**.]()

[TPS_SWCT_01379] **AtomicSwComponentType** can indicate whether an **RTEEvent** that starts an associated **RunnableEntity** is disabled in a certain mode [Using the second mechanism, the **AtomicSwComponentType** can indicate whether an **RTEEvent** that starts an associated **RunnableEntity** is disabled in a certain mode.

That is, **RTEEvents** without an association in the role **disabledMode** are processed regularly according to their definition.

RTEEvents with the optional association **disabledMode** have the additional limitation that the associated **RunnableEntity** is *not* started when the **ModeDeclaration** referenced as **disabledMode** is active.]([RS_SWCT_03110](#))

The mechanisms discussed so far have to be applied for the **SwcInternalBehavior** on the receiver side of mode switches. Since mode switches are received via **PortPrototypes** the following constraints apply:

[TPS_SWCT_01380] **Mode management behavior on the sender side** [On the sender side, a **RunnableEntity** shall have **ModeSwitchPoints** that eventually associate a **RunnableEntity** with the specific **ModeDeclarationGroups** which it manages.]([RS_SWCT_03110](#))

For more information, please refer to Figure 9.5.

[constr_1778] **Value of attribute modeSwitchPoint.returnValueProvision** [All **RunnableEntity.modeSwitchPoint** that refer to the same **modeGroup** shall define the identical value of attribute **returnValueProvision** **at the time when the contract phase generation is executed.**]()

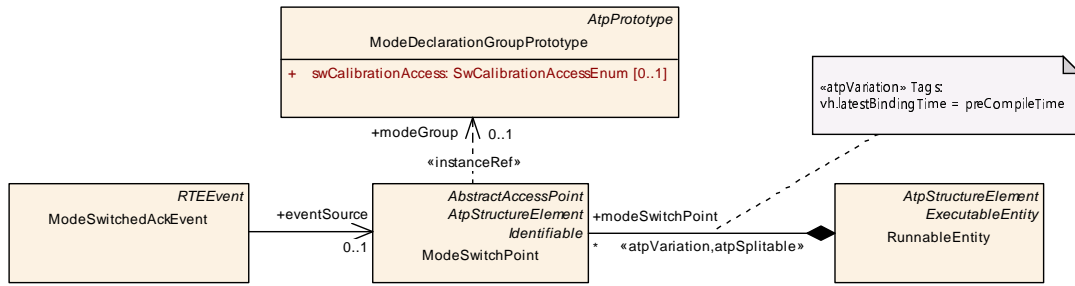

Figure 9.5: ModeSwitchPoint

Rationale for the existence of [constr_1778]: different `RunnableEntities` could aggregate `ModeSwitchPoints` with a different configuration of attribute `returnValueProvision`.

However, in such a case it would not be possible to generate the corresponding RTE API because the API exists once per software-component and it is therefore indispensable to have all affected `ModeSwitchPoints` agree on the configuration of attribute `returnValueProvision`.

This relation is exemplarily (for the case of `dataSendPoint.returnValueProvision`) sketched in Figure 7.21.

Aggregated by	<code>AtpClassifier.atpFeature</code> , <code>RunnableEntity.modeSwitchPoint</code>			
Attribute	Type	Mult.	Kind	Note
modeGroup	<code>ModeDeclarationGroupPrototype</code>	0..1	iref	The mode declaration group that is switched by this runnable. InstanceRef implemented by: <code>PModeGroupInAtomicSwcInstanceRef</code>

Table 9.4: ModeSwitchPoint

[TPS_SWCT_01383] **ModeSwitchPoint** [The `ModeSwitchPoint` also allows for the definition of a `ModeSwitchedAckEvent` if this is requested by the definition of the `PPortPrototype`. This `RTEEvent` is eventually owned by a mode manager to allow for getting confirmation of a mode change.]([RS_SWCT_03110](#))

[TPS_SWCT_01555] **ModeSwitchedAckEvent** is triggered by the RTE regardless [The `ModeSwitchedAckEvent` is triggered by the RTE (for more details please refer to [2]) regardless which `RunnableEntity` has requested the mode switch notification, even if the Meta-Model implies a reference from `ModeSwitchedAckEvent` to a specific `ModeSwitchPoint` in the role `eventSource`.]([RS_SWCT_03110](#))

[constr_4012] Timeout of ModeSwitchedAckEvent [The timeout value of a `WaitPoint` associated with a `ModeSwitchedAckEvent` shall be equal to the corresponding `ModeSwitchedAckRequest.timeout` at the time when the RTE is generated.]()

Figure 9.6: ModeAccessPoint

[TPS_SWCT_01381] Read the currently active mode [For *Mode Manager* and *Mode User* it might additionally be required to read the currently active mode. For that purpose, a `RunnableEntity` that requires read-access to the `ModeDeclarationGroupPrototype`'s current mode has to define a `ModeAccessPoint`.] ([RS_SWCT_03110](#))

Class	ModeAccessPoint			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::ModeDeclarationGroup			
Note	A <code>ModeAccessPoint</code> is required by a <code>RunnableEntity</code> owned by a <code>Mode Manager</code> or <code>Mode User</code> . Its semantics implies the ability to access the current mode (provided by the RTE) of a <code>ModeDeclarationGroupPrototype</code> 's <code>ModeDeclarationGroup</code> .			
Base	<i>ARObject</i>			
Aggregated by	<code>RunnableEntity.modeAccessPoint</code>			
Attribute	Type	Mult.	Kind	Note
ident	<code>ModeAccessPointIdent</code>	0..1	aggr	The aggregation in the role <code>ident</code> provides the ability to make the <code>ModeAccessPoint</code> identifiable. From the semantical point of view, the <code>ModeAccessPoint</code> is considered a first-class <code>Identifiable</code> and therefore the aggregation in the role <code>ident</code> shall always exist (until it may be possible to let <code>ModeAccessPoint</code> directly inherit from <code>Identifiable</code>). Stereotypes: <code>atpIdentityContributor</code> Tags: <code>xml.sequenceOffset=-100</code>
modeGroup	<code>ModeDeclarationGroupPrototype</code>	0..1	iref	The mode declaration group that is accessed by this runnable. Tags: <code>xml.typeElement=true</code> InstanceRef implemented by: <code>ModeGroupInAtomicSwcInstanceRef</code>

Table 9.5: ModeAccessPoint

[TPS_SWCT_01382] Mode switch requests are handled asynchronously by the RTE [Mode switch requests are handled asynchronously by the RTE. Therefore, *Mode Managers* implementation might require reading back the current active mode to synchronize internally to the RTE. A `ModeSwitchPoint` does **not** automatically provide read access to the `ModeDeclarationGroupPrototype`'s current mode.] ([RS_SWCT_03110](#))

[constr_1098] Mode switch and mode disabling [A `SwcModeSwitchEvent` shall not simultaneously reference to the same `ModeDeclaration` in both the roles `mode` and `disabledMode` **at the time when the RTE is generated.**]()

If **[constr_1098]** would not apply, it might happen that a `RunnableEntity` would be triggered by a `SwcModeSwitchEvent` and, at the same time, it would be suppressed by the mode disabling.

9.3 Initialization / Finalization

The AUTOSAR standard shall support the execution of initialization code for every `AtomicSwComponentType`.

[TPS_SWCT_01384] Execution of initialization code for software-components [Most `AtomicSwComponentTypes` will need to initialize by executing specific code; this code shall complete before any other code in the component is executed. Data will be initializing to specific values before the "normal" application software is running.] (*RS_SWCT_03110*)

[TPS_SWCT_01385] Execution of finalization code for software-components [Most `AtomicSwComponentTypes` will need to finalize by calling specific code; this code shall complete before the functionality of the application software shut down (e.g. a motor drive in a start or end position).] (*RS_SWCT_03110*)

[TPS_SWCT_01388] Initial modes of `AtomicSwComponentTypes` are defined by the `initialMode` [The initial modes of `AtomicSwComponentTypes` are defined by the `initialMode` references of the required `ModeDeclarationGroups`. These modes are activated before any other mode activation has occurred. It is the responsibility of the RTE to activate all initial modes on a certain ECU.] (*RS_SWCT_03110*)

For more details please refer to the specification of the SWS RTE [2].

9.4 Mode Error Behavior

With the advent of partitions in the AUTOSAR standard, it is important to consider the behavior of mode management with respect to the following scenarios:

- The partition of the mode manager is terminated.
- The partition of the mode user is terminated.

Whenever one of the two scenarios becomes reality, it is important to implement a stable reaction of both mode manager and mode user to the event. In addition, mode manager and mode user should be able to synchronize in terms of which mode shall apply as fast and seamless as possible.

For this purpose, additional modeling support has been defined such that the applicable `ModeDeclarationGroup` (which is part of the contract between mode manager and mode user) becomes the place where the policy towards a reaction to e.g. a partition restart is defined.

[TPS_SWCT_01530] Error behavior of mode manager and mode user [The behavior in response to a mode manager getting out of sync with a mode user (because the partition of the mode user has been terminated) or vice versa (because the partition of the mode manager has been terminated) can be defined for the mode manager by means of the attribute `ModeDeclarationGroup.modeManagerErrorBehavior` and for the mode user by means of the attribute `ModeDeclarationGroup.modeUserErrorBehavior`.] (*RS_SWCT_03110*)

[TPS_SWCT_01531] The semantics of `ModeErrorReactionPolicyEnum` [The attribute `ModeErrorBehavior.errorReactionPolicy` shall be used to specify the behavior in the event of a mode error:

`lastMode` The last mode applicable before the event shall be assumed.

`defaultMode` This represents the ability to specify a dedicated mode that shall be made applicable. The identified `ModeDeclaration` could be identical to the `ModeDeclarationGroup.initialMode` but it can just as well be any other `ModeDeclaration` defined in the context of the enclosing `ModeDeclarationGroup`.

] (*RS_SWCT_03110*)

[TPS_SWCT_01532] The role of `ModeErrorBehavior.defaultMode` [The attribute `ModeErrorBehavior.defaultMode` shall be used to identify the particular `ModeDeclaration` if `ModeErrorBehavior.errorReactionPolicy` is set to `defaultMode`.] (*RS_SWCT_03110*)

[constr_1263] Existence of `ModeErrorBehavior.defaultMode` [The optional attribute `ModeErrorBehavior.defaultMode` **shall exist** if the value of the attribute `ModeErrorBehavior.errorReactionPolicy` is set to `defaultMode`.

This rule shall be imposed **at the time when the RTE is generated**.] ()

Please note that the modeling of the `ModeErrorBehavior` is depicted in Figure 7.10.

[TPS_SWCT_01533] `ModeDeclarationGroup.initialMode` shall be assumed in the absence of `ModeDeclarationGroup.modeManagerErrorBehavior` [If the attribute `ModeDeclarationGroup.modeManagerErrorBehavior` is not defined it shall be assumed that the `ModeDeclarationGroup.initialMode` becomes applicable in case of the mode manager getting out of sync with a mode user (because the partition of the mode user has been terminated).] (*RS_SWCT_03110*)

[TPS_SWCT_01534] `ModeDeclarationGroup.initialMode` shall be assumed in the absence of `ModeDeclarationGroup.modeUserErrorBehavior` [If the attribute `ModeDeclarationGroup.modeUserErrorBehavior` is not defined it shall be assumed that the `ModeDeclarationGroup.initialMode` becomes applicable

in case of the mode user getting out of sync with a mode manager (because the partition of the mode manager has been terminated).] ([RS_SWCT_03110](#))

Class	ModeErrorBehavior			
Package	M2::AUTOSARTemplates::CommonStructure::ModeDeclaration

Aggregated by	ModeErrorBehavior.errorReactionPolicy
Literal	Description
defaultMode	This represents the ability to switch to the defaultMode in case of a mode error. Tags: atp.EnumerationLiteralIndex=0
lastMode	This represents the ability to keep the last mode in case of a mode error. Tags: atp.EnumerationLiteralIndex=1

Table 9.7: ModeErrorReactionPolicyEnum

[TPS_SWCT_01535] Mode manager reacts on mode error [If the mode manager is getting out of sync with a mode user (because the partition of the mode user has been terminated) or vice versa (because the partition of the mode manager has been terminated) it shall be possible for the mode manager to react on such an event.

For this purpose the formal [SwcModeManagerErrorEvent](#) is defined that can be taken to e.g. trigger the execution of a [RunnableEntity](#) in response to an error with respect to mode switch communication.] ([RS_SWCT_03110](#))

Class	SwcModeManagerErrorEvent
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::RTEEvents
Note	This event is raised when an error occurred during the handling of the referenced ModeDeclarationGroup Prototype.
Base	ARObject, AbstractEvent , AtpClassifier , AtpFeature , AtpStructureElement , Identifiable , Multilanguage , Referrable , RTEEvent , Referrable

Class	SwcModeManagerErrorEvent			
Aggregated by	<i>AtpClassifier.atpFeature</i> , SwcInternalBehavior.event			
Attribute	Type	Mult.	Kind	Note
modeGroup	ModeDeclarationGroup Prototype	0..1	iref	This represents the ModeDeclarationGroupPrototype for which this SwcModeManagerErrorEvent is raised in case of an error. InstanceRef implemented by: PModeGroupInAtomic SwcInstanceRef

Table 9.8: SwcModeManagerErrorEvent

[constr_1978] Existence of attribute [SwcModeManagerErrorEvent.modeGroup](#) [For each [SwcModeManagerErrorEvent](#), the instance reference to [ModeDeclaration](#) in the role [modeGroup](#) shall exist **at the time when the RTE is generated.**]()

As mentioned in [\[constr_1075\]](#), it is possible to overrule the default compatibility rules by the definition of a [PortInterfaceMapping](#).

In this case the demand for having identical definitions of [ModeDeclarationGroup.modeUserErrorBehavior](#) and [ModeDeclarationGroup.modeManagerErrorBehavior](#) is no longer valid.

However, there is one additional caveat to observe in this case. This affects the implementation of error behavior in case that several mode users are connected to a mode manager.

[TPS_SWCT_01536] Coherent behavior of all mode users in case of errors in the mode switch communication [The behavior in case of errors with the communication of mode switches needs to be **coherent for all** connected mode users **especially** if the individual [SwConnectors](#) are legitimized by the existence of a [PortInterfaceMapping](#).](*RS_SWCT_03110*)

[TPS_SWCT_01541] Preferential selection of [modeUserErrorBehavior](#) [The definition of mode error behavior on the provided side of shall be considered **dominant** over the definition of mode error behavior on the required side.

This means that a [ModeSwitchInterface.modeGroup.type.modeUserErrorBehavior](#) used to type an [AbstractProvidedPortPrototype](#) shall be considered **dominant** over the definition of a corresponding [modeUserErrorBehavior](#) and defined in the context of an [AbstractRequiredPortPrototype](#).](*RS_SWCT_03110*)

[TPS_SWCT_01542] Preferential selection of [modeManagerErrorBehavior](#) [The definition of mode error behavior on the provided side of shall be considered **dominant** over the definition of mode error behavior on the required side.

This means that a [ModeSwitchInterface.modeGroup.type.modeManagerErrorBehavior](#) used to type an [AbstractProvidedPortPrototype](#) shall be

considered **dominant** over the definition of a corresponding `modeManagerErrorBehavior` defined in the context of an `AbstractRequiredPortPrototype`.] ([RS_SWCT_03110](#))

The consequence of [\[TPS_SWCT_01541\]](#) and [\[TPS_SWCT_01542\]](#) is that the **mode manager shall be considered the master of the definition of mode error behavior**.

The details of how the run-time behavior of mode manager and mode user shall look like in the event of the mode manager getting out of sync with a mode user (because the partition of the mode user has been terminated) or vice versa (because the partition of the mode manager has been terminated) as well as the applicable RTE APIs are explained in [\[2\]](#).

9.5 Summary Meta-Model Excerpt Related to Modes

Figure [9.7](#) provides an overview of all meta-model elements that have a direct relationship to the meta-classes involved in the modeling of mode switches.

To get the complete picture, it should be noted that also the concepts of `PortGroups` (see [4.6](#)) and `ServiceProxySwComponentType` (see [11.3](#)) have a semantical relationship to mode management, though this is not expressed via relations in the meta-model.

10 ECU Abstraction and Complex Drivers

10.1 Introduction

During the design of embedded systems there is one crucial point where the hardware and software have to be related. In AUTOSAR the ECU Resource Template describes the provided hardware resources.

On the other hand, the Software Component Template describes software generally without specific hardware in mind. But there are some places where both have to meet and fit.

One interface between hardware and software is discussed in the memory and execution time section of [6]. In this chapter the overall system view of the interface between sensors/actuators and software is described and the consequences for the Software Component Template are derived.

10.2 High Level Hardware and Software Architecture

The AUTOSAR concept defines a software architecture (see Figure 10.1) and within this layered architecture the interfaces between the hardware and the software are explicitly modeled.

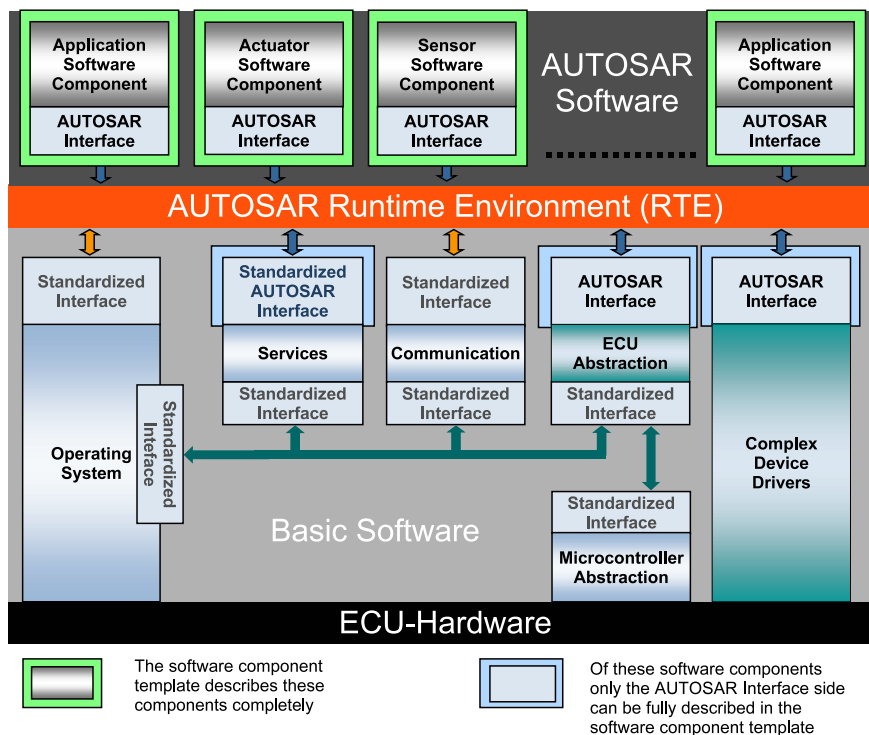

Figure 10.1: AUTOSAR ECU Software Architecture

The signal¹ flow from a hardware to software and vice versa will be described in the following sections.

A sensor² is converting a physical value (1) in Figure 10.2 (e.g. temperature, force, light intensity) into an electrical signal (2) which can be either a current or a voltage.

Inside the ECU generally there will be some electronics to enhance the electrical signal provided by the sensor. In AUTOSAR this is called ECU Electronics. This electronics device is also responsible for the conversion of the electrical signal into a micro-controller compatible form (3), usually a voltage.

After the electrical signal has been enhanced and converted it will be captured by the micro-controller. This can either be done by a simple digital input, an analogue to digital converter or maybe a pulse-width demodulation module. Now the electrical signal is available as a software data value (4).

This signal flow is sketched in the top part of Figure 10.2.

Figure 10.2: Interfaces between hardware and software

The interaction shown in Figure 10.2 shows an exemplary scenario. The usage of `ClientServerInterface` is just an example for the interaction pattern.

This signal chain is represented one-to-one in the AUTOSAR software architecture and depicted in the lower part of Figure 10.2.

In an implementation of AUTOSAR, only the micro-controller Abstraction (MCAL) has direct access to the peripheral hardware. This layer is going to be standardized and all hardware access should go through this layer. The idea of the AUTOSAR signal flow is to map the hardware to the corresponding software modules.

¹The term “signal” is not going to be used here at its own but more specific terms will be used for the different abstractions of signals at the different stages of the signal flow.

²For the sake of simplicity this discussion is limited to the sensor aspects. Nevertheless, the same applies also for actuators.

So if an electrical current is the input to the micro-controller peripheral, the MCAL will deliver a data value that represents this current. As the ECU Electronics has enhanced and converted the electrical signal prior to the micro-controller, the corresponding software entity is reversing this conversion. This is performed in the ECU Abstraction layer.

So if the input to the ECU is an electrical current and the ECU Electronics has converted this current into a voltage (from 2 to 3), the ECU Abstraction will convert the data value voltage into an AUTOSAR signal representing a current (from 4 to 5). This AUTOSAR signal represents the actual current that was provided by the sensor (2).

Now the first step in the conversion has to be reversed: the sensor has converted a physical value into an electrical signal. And so the Sensor Software Component has to reverse this again. The Sensor Software Component will read the AUTOSAR signal representing the electrical value and transform it into an AUTOSAR signal representation of the physical value (from 5 to 6).

Now this physical value is available on the RTE and can be consumed or read by other SW-Components. Although the interface between the ECU Abstraction and the Sensor Software Component is also an AUTOSAR interface and could be routed through some communication-bus, it will not be practical to separate the ECU Abstraction and the corresponding `SensorActuatorSwComponentType` due to potentially high communication effort.

In Figure 10.3 a complete signal flow from a sensor input to an actuator output is shown.

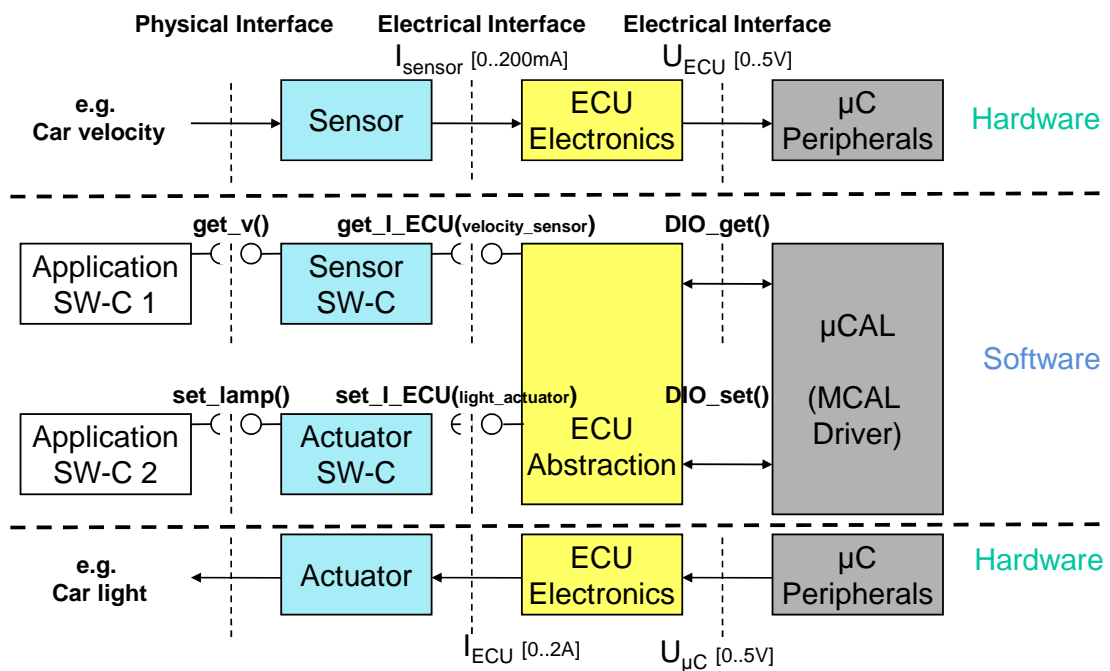

Figure 10.3: Sensor and Actuator Signal Flow

The interaction shown in Figure 10.3 shows an exemplary scenario. The usage of `ClientServerInterface` is just an example for the interaction pattern.

In the next section the interfaces between the involved software modules are discussed.

10.3 Interfaces and APIs

Two fundamentally different interfaces are involved when converting from sensors/actuators to software components, see markers “4” and “5” in Figure 10.2.

The interface between the micro-controller Abstraction and the ECU Abstraction is a Standardized Interface (see AUTOSAR Glossary [35]). This interface is not visible on the *Virtual Functional Bus* and therefore the MCAL and ECU Abstraction have to be present on the same ECU.

For further description of this interface please refer to the ECU Resource Template documentation.

The interface to the *SensorActuatorSwComponentTypes* is visible on the *Virtual Functional Bus*. In general the *SensorActuatorSwComponentType* should be on the same ECU as the ECU hardware abstraction.

Also, the interface between the *SensorActuatorSwComponentTypes* and the actual *AtomicSwComponentTypes* representing the application is visible on the VFB. To describe the data that is going to be exchanged via this interface the standard AUTOSAR Interface description mechanisms are used (see chapter 3.4).

10.3.1 ECU Abstraction and its AUTOSAR Interfaces

Since the AUTOSAR standard is designed with the focus on the integration of software-components coming from different contractors, the interfaces between the different software-components obviously have to be compatible.

In the case of the sensors and actuators the interface is gathered in the ECU Abstraction. For each sensor and actuator there is one AUTOSAR *PortPrototype* that represents the AUTOSAR Signal that is delivered by the sensor or the AUTOSAR Signal that is consumed by the actuator. This relationship is depicted in Figure 10.4.

The interaction shown in Figure 10.4 shows an exemplary scenario. The usage of *ClientServerInterface* is just an example for the interaction pattern.

Each sensor and actuator has an AUTOSAR *PortPrototype* at the ECU Abstraction. Connected to this port is the *SensorActuatorSwComponentType*.

The *SensorActuatorSwComponentType* has one *PortPrototype* (i.e. IF_2) to the ECU Abstraction (which provides the values via IF_1) where it gets the AUTOSAR signals from the hardware, and one *PortPrototype* (i.e. IF_3) to *AtomicSwComponentTypes* where it provides the actual physical value to the rest of AUTOSAR on the RTE.

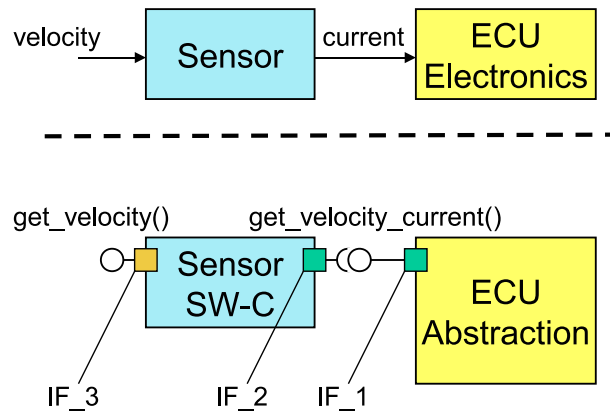

Figure 10.4: Interfaces of signals in software

In addition, the Interfaces between the ECU Abstraction and the [SensorActuatorSwComponentType](#) have to be compatible like defined in chapter 6.

10.4 Sensors/Actuators

In the layered software architecture described in [5] each hardware sensor/actuator is coupled to a [SensorActuatorSwComponentType](#) (see Figure 10.5).

[TPS_SWCT_01047] Reference from the software representation of a sensor/actuator to the actual hardware element [Since the Software Component Template is going to be used to describe the [SensorActuatorSwComponentType](#) as well, there is also a reference needed from the software representation of a sensor/actuator to the actual hardware element described in the ECU Resource description.] ([RS_SWCT_02080](#), [RS_SWCT_03090](#))

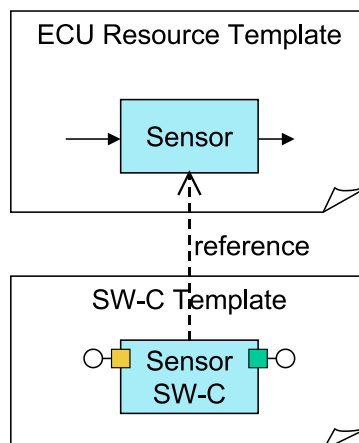

Figure 10.5: Shipment of a sensor

So each time a sensor/actuator is selected to be connected to an ECU also the corresponding [SensorActuatorSwComponentType](#) is available.

[constr_1144] SensorActuatorSwComponentType, EcuAbstractionSwComponentType, and ComplexDeviceDriverSwComponentType may only reference a HwType [The attribute `sensorActuator` of `SensorActuatorSwComponentType`, the attribute `hardwareElement` of `EcuAbstractionSwComponentType`, and the attribute `hardwareElement` of `ComplexDeviceDriverSwComponentType` may only reference a `HwType`. References to other subclasses of `HwDescriptionEntity` are not allowed **at the time when the contract phase generation is executed.**.]()

Figure 10.6 depicts the reference of `SensorActuatorSwComponentType` designed as a specialization of an `AtomicSwComponentType` with an additional reference to a `HwType`.

Figure 10.6: Sensor/actuator to Hardware Relationship

[constr_1109] Mapping of SwComponentPrototypes typed by a SensorActuatorSwComponentType [A `SwComponentPrototype` typed by a `SensorActuatorSwComponentType` needs to be mapped and run on exactly that ECU that contains the `HwElement` corresponding to the `HwType` that its `SensorActuatorSwComponentType` refers to in case it accesses the hardware via the I/O hardware abstraction layer.

This rule shall be imposed **at the time when the RTE is generated.**.]()

[TPS_SWCT_01048] SensorActuatorSwComponentType may use the I/O hardware abstraction directly [In contrast to an `ApplicationSwComponentType`, a `SensorActuatorSwComponentType` may use the I/O hardware abstraction directly (via ports/connectors).] (*RS_SWCT_02080, RS_SWCT_03090*)

In case the sensor/actuator hardware is accessed via bus communication, e.g. is located on a LIN slave, no such mapping constraints apply (note that this is not handled via the IO hardware abstraction layer).

Class	SensorActuatorSwComponentType

11 Services

11.1 Overview: Generation of Service-related Model Elements

This chapter covers the description and handling of AUTOSAR `Service` configuration.

[TPS_SWCT_01397] Hybrid concept between Basic Software Modules and a `SwComponentType` [AUTOSAR `Services` can be seen as a hybrid concept between Basic Software Modules and a `SwComponentType`. AUTOSAR `Services` actually provide access to low-level and ECU-wide “standard functionalities” commonly referred to as “service”.

`AtomicSwComponentTypes` that require AUTOSAR `Services` use Standardized AUTOSAR `Interfaces` to communicate with these. The connection of `PortPrototypes` of the `ServiceSwComponentTypes` and `PortPrototypes` of the `AtomicSwComponentTypes` implement several communication patterns.]()

[TPS_SWCT_01398] Communication patterns for AUTOSAR services [

I	II	III	IV
A	1..n	PPort:RPort	Distribution of data or modes to <i>n</i> software-components, e.g. used for ECU mode.
A*	1..n	RPort:PPort	Currently not used, not supported for client-server communication.
A**	1..n	PRPort:RPort	Distribution of data or modes to <i>n</i> software-components, e.g. used for ECU mode.
B	1..1	PPort:RPort	Software-component acts as Server, used for so called “call-backs”.
B	1..1	RPort:PPort	Service acts as Server, typical Service usage.
C*	n..1	PPort:RPort	Conceptually not used to support index abstraction via <code>PortDefinedArgumentValues</code> .
C	n..1	RPort:PPort	Software-component acts as Server, used for so called “call-backs” invoked by more than one Service.
D	1..1	PR-Port:PRPort	I/O control data.

]()

III Kind of PortPrototype at service : software-component

IV Description, use case

[TPS_SWCT_01403] Impact of AUTOSAR services on the methodology [Due to this special nature, such AUTOSAR `Services` need to be handled with particular attention in the methodology [4]. That is, a number of elements need to be generated during ECU integration.]()

The following list of paragraphs presents a short overview over the steps required for the configuration of AUTOSAR `Services`.

Note that most of these steps are performed by tools and the model elements being created in these steps are rather specific to `Service` configuration and are not to be modeled manually within AUTOSAR authoring tools.

In particular, the following requirements apply:

- **[TPS_SWCT_01399] Dependency is modeled by aggregating required and provided `PortPrototypes`** [The dependency of an `AtomicSwComponentType` (or more precisely, one of its non-abstract derived meta-classes) from an AUTOSAR `Service` is modeled by aggregating required and provided `PortPrototypes`.]()

[TPS_SWCT_01400] `PortInterface` selected from the set of standardized `Service Interfaces` [The `PortInterface` being implemented by the `PortPrototypes` needs to be one of a number of standardized `Service Interfaces` which is indicated by having its `isService` attribute set to `true` and is (via several levels of indirection) finally referenced by `ServiceNeeds`.]()

Additionally, the software components and `Basic Software Modules` shall specify `ServiceNeeds` containing further input information for the later `Service` configuration step.

- **[TPS_SWCT_01401] Form a top-level `RootSwCompositionPrototype`** [When defining a software system, the `AtomicSwComponentType` is used in the form of `SwComponentPrototypes` within a `CompositionSwComponentType`. In this step, the non-service ports of all required interfaces are being connected using `AssemblySwConnectors` and `DelegationSwConnectors` in order to eventually form a top-level `RootSwCompositionPrototype` which can be referenced in an AUTOSAR `System`.]()
- **[TPS_SWCT_01402] Mapping of all `AtomicSwComponentType` instances to `EcuInstances`** [In `System Configuration Phase`, the mapping of all `AtomicSwComponentType` instances to `EcuInstances` is done (for the specification of `EcuInstance` see [10]). The `ServiceNeeds` may be used by tools to check for available resources on the targeted ECUs.]()
- **[TPS_SWCT_01404] Creation of the `Ecu Extract`** [The `ECU Extract` is extracted from the `System Configuration` for each ECU. As explained in the AUTOSAR `System Template` [10], this contains an ECU-centric view onto the system description.

This includes a reduced version of the system's `RootSwCompositionPrototype` where `SwComponentPrototypes` not being mapped to the ECU are being left out and all `Compositions` are stripped off, so that in the `ECU Extract` only one instance of `CompositionSwComponentType` remains which aggregates all `SwComponentPrototypes` on the ECU in a flat manner.]()

- **[TPS_SWCT_01405] Creation of the `ServiceSwComponentTypes`** [In ECU Configuration, for each `Service` required on the ECU exactly one `ServiceSwComponentType` is created based on the needs from the `AtomicSwComponentTypes`: An adequate number of `PortPrototypes` are created on this `ServiceSwComponentType` for each needed port at the `AtomicSwComponentType`.

Thereby the specified communication pattern A, B, C or D for a specific kind of `ServicePort` has to be considered.]()

See also chapter 11.2 and [TPS_SWCT_01398].

- **[TPS_SWCT_01406] Creation of `SwComponentPrototype` typed by a `ServiceSwComponentType`** [Per `Service` exactly one `SwComponentPrototype` typed by a `ServiceSwComponentType` is created based on the `ServiceSwComponentType`. Additionally, the connectors are constructed that connect the pairs of `PortPrototypes` belonging to the `SwComponentPrototypes` requiring services and those belonging to the actual services.]()
- **[TPS_SWCT_01407] Creation of `InternalBehavior` typed by a `ServiceSwComponentType`** [For each `ServiceSwComponentType` an `SwcInternalBehavior` is created or extended providing the information about `PortDefinedArgumentValues`, `RunnableEntitys` and `RTEEvents` necessary for RTE generation.]()

Further, detailing of the service ports by filling in these `PortDefinedArgumentValues` is also done in ECU Configuration phase. See also chapter 7.6.3.

- **[TPS_SWCT_01408] Creation of `SwcBswMapping`** [For the RTE module configuration an implementation of the AUTOSAR `Service` described by a `Basic Software Module Description` needs to be selected. The `SwcBswMapping` to the corresponding `SwComponentPrototype` needs to be created accordingly.

For each `SwcInternalBehavior` one `SwcImplementation` is being created. The information for `SwcImplementation` should be generated based on the available information of `BswImplementation`¹.]()

- **[TPS_SWCT_01409] Update of `PortDefinedArgumentValues`** [Depending on the configuration of the `Service BSW` it might be necessary to update the `ValueSpecifications` belonging to the `PortDefinedArgumentValues` generated in a previous step.]()

¹This step does in general not require copying any attributes or elements aggregated in `BswImplementation` into the generated instance of `SwcImplementation` since the only mandatory information for the RTE configuration is the reference from `SwcImplementation` to the selected `SwcInternalBehavior`.

Table 11.1: SwcBswMapping

11.2 Service Software Component Type

As mentioned in [TPS_SWCT_01405], AUTOSAR Services are represented by a meta-model class of their own, the [ServiceSwComponentType](#). As can be seen in Figure 11.1, [ServiceSwComponentType](#) is a specialization of [AtomicSwComponentType](#).

Like any other [SwComponentType](#) they can aggregate [PortPrototypes](#).

[constr_2019] [ServiceSwComponentType](#) shall have service ports only [In the case of [ServiceSwComponentType](#), all aggregated [PortPrototypes](#) need to have an `<<isOfType>>` relationship to a [PortInterface](#) which has its `isService` attribute set to `true` **at the time when the RTE is generated**.

The exceptions described in

- [TPS_SWCT_01572],

- [TPS_SWCT_01579],
- [TPS_SWCT_01831] and
- [TPS_SWCT_01580]

apply.]()

[TPS_SWCT_01579] Dcm can directly access **SenderReceiverInterface.dataElements**, **NvDataInterface.nvDatas**, or **ParameterInterface.parameters** in **AbstractProvidedPortPrototype** [An exception to the rule described in [constr_2019] applies: the Dcm can directly access **SenderReceiverInterface.dataElements**, **NvDataInterface.nvDatas**, or **ParameterInterface.parameters** in **AbstractProvidedPortPrototypes** (**PPortPrototype** in case of **ParameterInterface.parameter**) as long as [constr_1071] is fulfilled.

For this purpose, the **ServiceSwComponentType** that represents the Dcm functionality can have **AbstractRequiredPortPrototypes** typed by a compatible **SenderReceiverInterface** that may set attribute **isService** to **false**.]()

Please note that the inclusion of **ParameterInterface.parameters** in [TPS_SWCT_01579] is done under the assumption that the **ServiceSwComponentType** that represents the Dcm would connect to a **PPortPrototype** owned by a **ParameterSwComponentType**.

[TPS_SWCT_01831] Dcm can directly access **SenderReceiverInterface.dataElements** or **NvDataInterface.nvDatas** in **AbstractRequiredPortPrototypes** [An exception to the rule described in [constr_2019] applies: the Dcm can directly access **SenderReceiverInterface.dataElements** or **NvDataInterface.nvDatas** in **AbstractRequiredPortPrototypes** as long as [constr_1071] is fulfilled.

For this purpose, the **ServiceSwComponentType** that represents the Dcm functionality can have **AbstractProvidedPortPrototypes** typed by a compatible **SenderReceiverInterface** that may set attribute **isService** to **false**.]()

Please note that the exclusion of **ParameterInterface.parameters** from [TPS_SWCT_01831] is a direct consequence of [constr_1137], i.e. the **ServiceSwComponentType** that represents the Dcm is not allowed to expose a **PPortPrototype** typed by a **ParameterInterface**.

[TPS_SWCT_01580] Dem can directly access **SenderReceiverInterface.dataElements**, **NvDataInterface.nvDatas**, or **ParameterInterface.parameters** in **PPortPrototypes** [An exception to the rule described in [constr_2019] applies: the Dem can directly access **SenderReceiverInterface.dataElements**, **NvDataInterface.nvDatas**, or **ParameterInterface.parameters** in **AbstractProvidedPortPrototypes** (**PPortPrototype** in case of **ParameterInterface.parameter**) as long as [constr_1071] is fulfilled.

For this purpose, the `ServiceSwComponentType` that represents the `Dem` functionality can have `RPortPrototypes` typed by a compatible `SenderReceiverInterface` that may set attribute `isService` to `false`.²()

Please note that the inclusion of `ParameterInterface.parameters` in [TPS_SWCT_01580] is done under the assumption that the `ServiceSwComponentType` that represents the `Dem` would connect to a `PPortPrototype` owned by a `ParameterSwComponentType`.

[TPS_SWCT_01411] Use cases for a `ServiceSwComponentType` to express `ServiceNeeds` [There are valid use cases for a `ServiceSwComponentType` to express `ServiceNeeds`². This leads to a situation where `ServiceSwComponentTypes` are iteratively created in response to `ServiceNeeds` expressed by other `ServiceSwComponentTypes`. Please refer to the AUTOSAR methodology [4] for more details about how this shall be implemented into the workflow.]()

Similar to an `EcuAbstractionSwComponentType` and a `ComplexDeviceDriverSwComponentType`, the `ServiceSwComponentType` represents a hybrid concept between Software Component and Basic Software Module. The BSW part is described by the means of the BSW Module Description Template [6].

The mapping between the `ServiceSwComponentType` and the corresponding `BswModuleDescription` is provided by the class `SwcBswMapping` which in addition also maps the two corresponding `InternalBehaviors` (see [TPS_SWCT_01408]). This mechanism is further explained in [6].

[TPS_SWCT_01412] `ServiceSwComponentType` shall be added in ECU Configuration phase [`ServiceSwComponentType` shall not be used when modeling application software using `CompositionSwComponentType`; they are only added in ECU Configuration phase where exactly one `SwComponentPrototype` per `ServiceSwComponentType` per ECU is added to the ECU Description model.

The Base ECU Config Generator tool needs to take care that for all service ports of `SwComponentPrototypes` mapped to the ECU service ports at the appropriate `ServiceSwComponentTypes` are created.

In case of pattern A for each different type of service port one port on the `ServiceSwComponentType` is created.

In case of pattern B and C for each service port of a `SwComponentPrototype` one port on the `ServiceSwComponentType` is created.

More explicitly, all instances of `AtomicSwComponentType` need to be checked for `PortPrototypes` of `PortInterfaces` with `isService` attribute set to `true` and referenced by `ServiceNeeds` and for each of these `PortInterface` instances belonging to the AUTOSAR `Service` to be configured one `PortPrototype` implementing the same or a compatible `PortInterface` needs to be created on the `ServiceSwComponentType`.²()

²Thereby the previously existing constraint 1127 becomes invalid.

Table 11.2: ServiceSwComponentType

In the process of creating [PortPrototypes](#) the specified communication pattern A, B, or C for a specific kind of service port has to be considered, see [\[TPS_SWCT_01398\]](#).

[TPS_SWCT_02500] Roles on Application/Service Components need to Match [The roles of the [PortPrototypes](#) (required/provided) on the Application Component and the Service Component side obviously need to match. For example an [RPortPrototype](#) attached to an application [AtomicSwComponentType](#) matches a [PPortPrototype](#) attached to a [ServiceSwComponentType](#).]()

11.3 Service Proxy Component Type

[TPS_SWCT_01413] Local communication with services [Application software components may communicate with an instance of a [ServiceSwComponentType](#) only locally on an ECU.]()

[TPS_SWCT_01414] Mode manager needs to communicate with application software components located on other ECUs [There are however use cases for the application and vehicle mode management, where a mode manager (namely the [Basic Software Mode Manager](#), see [\[21\]](#)) is part of the basic software but conceptually still needs to communicate with application software components located on other ECUs.

In order to make this communication possible, the [ServiceProxySwComponentType](#) is used.

For the application software and the RTE it behaves like a “normal” `AtomicSwComponentType`, but it is actually a proxy for an AUTOSAR `Service`.]()

The concept of mode requests across ECU boundaries is exemplified in Figure 11.2.

[TPS_SWCT_01415] Interfaces of `ServiceProxySwComponentType` [This means that on the one side it has to communicate over service ports with the ECU-local `ServiceSwComponentType` it represents. On the other side it has to offer the corresponding `PortPrototypes` to the `ApplicationSwComponentTypes`.]()

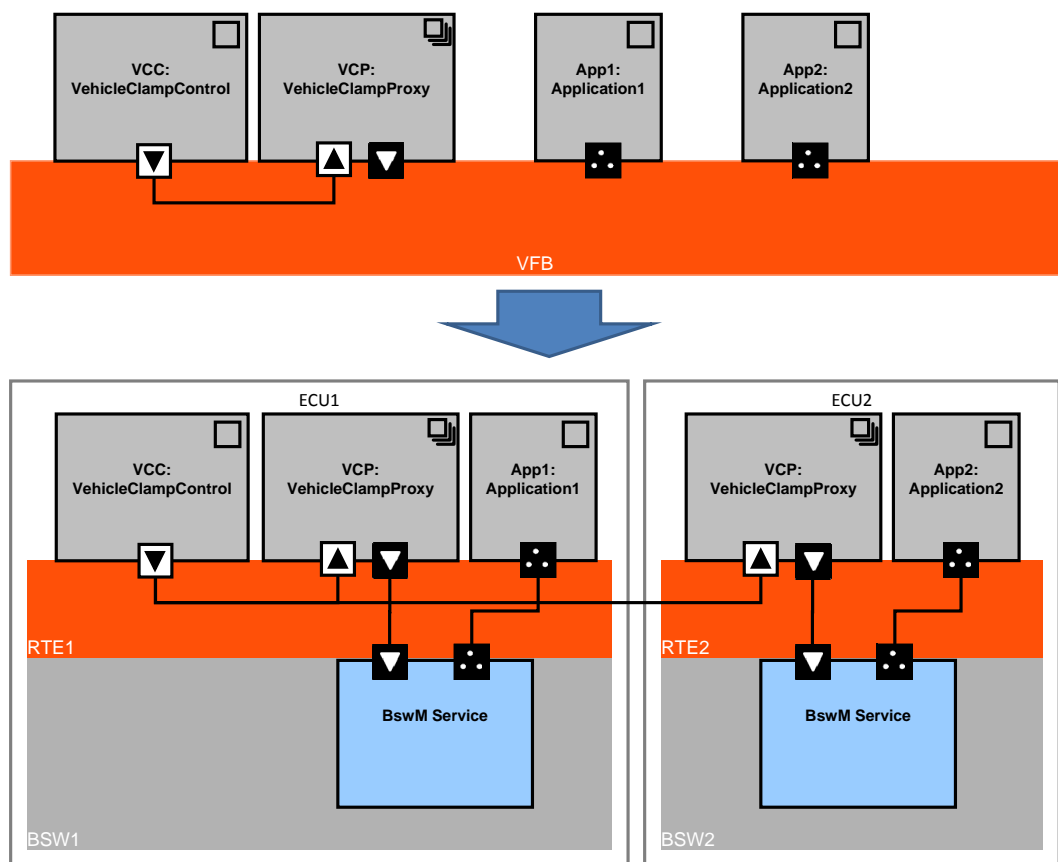

Figure 11.2: Mode request over the network [3]

In the meta-model, the `ServiceProxySwComponentType` does not differ from an `ApplicationSwComponentType` except by its class. It is up to the implementer to meet the restrictions imposed by the semantics as a proxy.

[TPS_SWCT_01416] Difference between a `ServiceProxySwComponentType` and an `ApplicationSwComponentType` [The main difference between a `ServiceProxySwComponentType` and an `ApplicationSwComponentType` is on system level:

A prototype of a [ServiceProxySwComponentType](#) can be mapped to several ECUs even if it appears only once in the VFB system, because such a prototype is required on each ECU, where it has to address a local [ServiceSwComponentType](#).

As a result of this, a [ServiceProxySwComponentType](#) can only receive but not send signals over the network. More details are explained in the class table below. `()`

[constr_2016] Connections between SwComponentPrototypes of type ServiceProxySwComponentType [A connection between [PortPrototypes](#) belonging to [SwComponentPrototypes](#) where both are typed by [ServiceProxySwComponentType](#) is not permitted **at the time when the RTE is generated.**] `()`

Class	ServiceProxySwComponentType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	<p>This class provides the ability to express a software-component which provides access to an internal service for remote ECUs. It acts as a proxy for the service providing access to the service.</p> <p>An important use case is the request of vehicle mode switches: Such requests can be communicated via sender-receiver interfaces across ECU boundaries, but the mode manager being responsible to perform the mode switches is an AUTOSAR Service which is located in the Basic Software and is not visible in the VFB view. To handle this situation, a ServiceProxySwComponentType will act as proxy for the mode manager. It will have R-Ports to be connected with the mode requestors on VFB level and Service-Ports to be connected with the local mode manager at ECU integration time.</p> <p>Apart from the semantics, a ServiceProxySwComponentType has these specific properties:</p> <ul style="list-style-type: none"> • A prototype of it can be mapped to more than one ECUs in the system description. • Exactly one additional instance of it will be created in the ECU-Extract per ECU to which the prototype has been mapped. • For remote communication, it can have only R-Ports with sender-receiver interfaces and 1:n semantics. • There shall be no connectors between two prototypes of any ServiceProxySwComponentType. <p>Tags: atp.recommendedPackage=SwComponentTypes</p>

Table 11.3: ServiceProxySwComponentType

[constr_2017] Ports of ServiceProxySwComponentTypes [[ServiceProxySwComponentType](#) is only permitted to define

- [RPortPrototypes](#) that are typed by [SenderReceiverInterface](#) or
- [PortPrototypes](#) that are typed by a [PortInterface](#) where the `isService` attribute is set to true.

This rule shall be imposed **at the time when the RTE is generated.**] `()`

[constr_2018] Supported remote communication of a ServiceProxySwComponentType [For remote communication, [ServiceProxySwComponentType](#) can have only [RPortPrototypes](#) typed by [SenderReceiverInterfaces](#) in a 1:n communication scenario.

This rule shall be imposed **at the time when the RTE is generated.**]()

11.4 Non Volatile Memory

11.4.1 Introduction

The AUTOSAR Architecture defines two alternatives how a software component can access non-volatile memory.

- The first option is that the software component defines in its `InternalBehavior` a `PerInstanceMemory` and a `NvBlockNeeds` referring to the `PerInstanceMemory` via a `RoleBasedDataAssignment`.

In this case the `NVRAM Block` is exclusively accessed by this software component and the `NvM` [36]. Therefore, the `nv data` is encapsulated inside the software component and can not be accessed directly by other software components.

The `PerInstanceMemory` can be typed with `AutosarDataTypes` in the case of `arTypedPerInstanceMemory` or with C data types in the case of `perInstanceMemory`. For further information see section 7.7 and 13.

- The second option is that the software component uses communication based on `PortPrototypes` to access `nv data` provided by a `NvBlockSwComponentType`.

In this case it is possible that `nv data` used by different `AtomicSwComponentTypes` is packed in one larger `NVRAM Block` to reduce the `NVRAM Block` management overhead or that the same `nv data` used by several software components with a reduced RAM overhead. The `nv data` of a `NvBlockSwComponentType` is typed with `AutosarDataTypes`.

More details regarding particular scenarios of interacting with the `NvM` [36] can be found in section 13.2.

11.4.2 NvBlockComponent

[TPS_SWCT_01142] non-volatile data are provided by a specialized `AtomicSwComponentType` [On the VFB [3], the non-volatile data are provided by a specialized `AtomicSwComponentType`, the `NvBlockSwComponentType`.

An `NvBlockSwComponentType` can represent one or more `NVRAM Blocks` managed by the `NVRAM Manager`. The `nv data PortPrototypes` of the `NvBlockSwComponentType` are exclusively typed by `NvDataInterfaces`.](*RS_SWCT_03225*)

[TPS_SWCT_01143] Non-volatile data represented by an `NvBlockSwComponentType` can be read and written [The non-volatile data represented by an `NvBlockSwComponentType` can be read and written. For this purpose the `NvBlockSwComponentType` is allowed to have `PPortPrototypes` and `RPortPrototypes`.] (*RS_SWCT_03225*)

Additionally, the `NvBlockSwComponentType` might have client server `PortPrototypes` to offer the block-related services, administrative services or notifications.

[constr_2009] Supported kinds of `PortPrototypes` of a `NvBlockSwComponentType` [With respect to external communication, `NvBlockSwComponentType` is limited to the definition of the following kinds of `PortPrototype`:

- `PortPrototypes` typed by either `NvDataInterfaces` or `ClientServerInterfaces`
- `RPortPrototypes` typed by `ModeSwitchInterfaces`

This rule shall be imposed **at the time when the RTE is generated.**] ()

Figure 11.3: `NvDataInterface`

[constr_2010] Connections between `SwComponentPrototypes` of type `NvBlockSwComponentType` [The existence of `SwConnectors` that refer to `PortPrototypes` belonging to `SwComponentPrototypes` where both are typed by `NvBlockSwComponentType` is not permitted **at the time when the RTE is generated.**] ()

Class	<code>NvBlockSwComponentType</code>

11.4.3 Software-Components using NVRAM data of NvBlockComponents

[TPS_SWCT_01141] [AtomicSwComponentType](#) may have [AbstractRequiredPortPrototypes](#) typed by an [NvDataInterface](#) [An [AtomicSwComponentType](#) may have [AbstractRequiredPortPrototypes](#) typed by an [NvDataInterface](#).

If such an [AbstractRequiredPortPrototype](#) remains unconnected the [nvData](#) still need to have reasonable value³.] ([RS_SWCT_03225](#))

[constr_2011] Connections between [SwComponentPrototypes](#) typed by [NvBlockSwComponentType](#) and [SwComponentPrototypes](#) typed by other [AtomicSwComponentTypes](#) [A [PortPrototype](#) typed by an [NvDataInterface](#) owned by a [SwComponentPrototype](#) typed by an [NvBlockSwComponentType](#) shall be connected to a [PortPrototype](#) typed by **either** an [NvDataInterface](#) **or**

³Note that it is assumed that only a subset of meta-classes that inherit from [AtomicSwComponentType](#) will actually apply for the definition of initial values for [nvData](#). Most likely the [ApplicationSwComponentType](#) and the [SensorActuatorSwComponentType](#) will be candidates for using this feature but it will obviously not be reasonable for e.g. [NvBlockSwComponentType](#).

a `SenderReceiverInterface` owned by a `SwComponentPrototype` that is typed by an other subclass of `AtomicSwComponentType`.

This rule shall be imposed **at the time when the RTE is generated.**]()

There is no valid use case to connect a `PortPrototype` typed by a `ParameterInterface` to a `PortPrototype` typed by an `NvDataInterface`.

[constr_1148] PortInterfaces of PortPrototypes used to connect to NvBlockSwComponentTypes [PortInterfaces of PortPrototypes used to connect to `NvBlockSwComponentTypes` as well as the PortInterfaces used in the context of `NvBlockSwComponentTypes` shall **always** set the value of the attribute `isService` to `false` **at the time when the RTE is generated.**]()

[constr_1149] PortPrototypes used for NV data management [A `PortPrototype` typed by a `ClientServerInterface` used for NV data management, i.e. the interaction of `ApplicationSwComponentTypes` with `NvBlockSwComponentTypes`, shall be typed by `ClientServerInterfaces` that are compatible to the particular `ClientServerInterfaces` derived from `MOD_GeneralBlueprints` [29]. **[constr_1148]** applies.

This rule shall be imposed **at the time when the RTE is generated.**]()

For details see chapter 6.4.4.

Note: In case of *nv data* which is read and written and shared between several `SwComponentPrototypes` the `NvBlockSwComponentType` establishes a not directly obvious kind of communication.

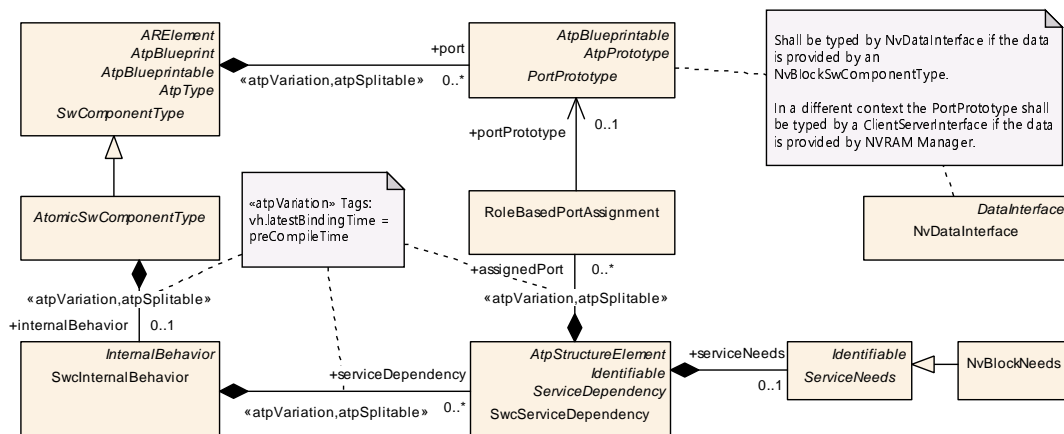

Figure 11.4: NvBlockNeeds for nv data PortPrototypes

Nevertheless, this is intentionally supported and it is under responsibility of the VFB designer to take care that only *nv data* is shared where the functionality of the software components is not impaired.

To determine for an VFB designer which *nv data* can be potentially by mapped into the same `NVRAM Block` a software-component can specify further attributes for its *nv data PortPrototypes* by the definition of `SwcServiceDependency(s)` with `NvBlockNeeds`.

In this case the role attribute of the `assignedPort` has to be set to the value `NvDataPort`. This aspect is also explained in section 13.2.4.

In contrast to the `NvBlockNeeds` that describe the expected configuration of a whole NVRAM Block, the `NvBlockNeeds` for `nv data PortPrototypes` defines only the attributes which are required from the point of view of a software-component to ensure its functionality.

This means an empty attribute has the semantic of “don’t care”.

Further on the VFB designer has got the freedom to specify how the requested NVRAM Block attributes are fulfilled by the created `NvBlockDescriptor`.

For instance, `nv data` with different `writingFrequency` might be mapped to one NVRAM Block. In this case the `NvBlockNeeds` of the `NvBlockDescriptor` has to indicate the worst case which is the higher frequency.

[TPS_SWCT_01675] Recommendations for attributes of `NvBlockNeeds` or for `NvBlockDescriptor`

Attribute of <code>NvBlockNeeds</code>	<code>NvBlockNeeds</code> of different <code>nv data PortPrototypes</code> of software-components	<code>NvBlockNeeds</code> of <code>NvBlockDescriptor</code>
<code>readonly</code>	Recommended to match for all connected <code>nv data PortPrototypes</code> if specified.	Recommended to be identical as requested by <code>nv data PortPrototypes</code> .
<code>reliability</code>	Can be different.	Recommended to be set to the highest reliability class request by any mapped <code>nv data PortPrototypes</code> .
<code>resistantToChangedSw</code>	Recommended to match for all connected <code>nv data PortPrototypes</code> if specified.	Recommended to be identical as requested by <code>nv data PortPrototypes</code> .
<code>restoreAtStart</code>	Recommended to match for all connected <code>nv data PortPrototypes</code> if specified.	Recommended to be identical as requested by <code>nv data PortPrototypes</code> .
<code>storeAtShutdown</code>	Recommended to match for all connected <code>nv data PortPrototypes</code> if specified.	Recommended to be identical as requested by <code>nv data PortPrototypes</code> .
<code>writeOnlyOnce</code>	Recommended to match for all connected <code>nv data PortPrototypes</code> if specified.	Recommended to be identical as requested by <code>nv data PortPrototypes</code> .
<code>writingFrequency</code>	Can be different.	Recommended to be set to the highest requested frequency of the mapped <code>nv data PortPrototypes</code> .
<code>writingPriority</code>	Can be different.	Recommended to be set to the highest requested priority of the mapped <code>nv data PortPrototypes</code> .
<code>writeVerification</code>	Can be different.	Recommended to set to true if any of the <code>nv data PortPrototypes</code> requests a write verification.
<code>calcRamBlockCrc</code>	Can be different.	Recommended to set to true if any of the <code>nv data PortPrototypes</code> requests a CRC calculation.
<code>checkStaticBlockId</code>	Can be different.	Recommended to set to true if any of the <code>nv data PortPrototypes</code> requests a check of the static block ID.
<code>ramBlockStatusControl</code>	Can be different.	Recommended to set to <code>RamBlockStatusControlEnum.api</code> if any of the <code>nv data PortPrototypes</code> requests a use of the API for accessing the block.

Attribute of <code>NvBlockNeeds</code>	<code>NvBlockNeeds</code> of different <code>nv data PortPrototypes</code> of software-components	<code>NvBlockNeeds</code> of <code>NvBlockDescriptor</code>
<code>storeCyclic</code>	Can be different.	Recommended to set to true if any of the <code>nv data PortPrototypes</code> requests cyclic writing.
<code>storeEmergency</code>	Can be different.	Recommended to set to true if any of the <code>nv data PortPrototypes</code> requests emergency writing.
<code>storeImmediate</code>	Can be different.	Recommended to set to true if any of the <code>nv data PortPrototypes</code> requests immediate writing.
<code>storeOnChange</code>	Can be different.	Recommended to set to true if any of the <code>nv data PortPrototypes</code> requests on-change writing.
<code>selectBlockForFirstInitAll</code>	Recommended to match for all connected <code>nv data PortPrototypes</code> if specified.	Recommended to be identical as requested by <code>nv data PortPrototypes</code> .

]([RS_SWCT_03225](#))

But please note that [[TPS_SWCT_01675](#)] does not represent a binding constraint.

With respect to the completeness of [[TPS_SWCT_01675](#)] (which intentionally doesn't contain a remark regarding the value of `cyclicWritingPeriod`), it should be noted that (according to [[TPS_SWCT_01585](#)]) the value of `NvBlockDescriptor.nvBlockNeeds.cyclicWritingPeriod` shall be ignored in favor of `NvBlockDescriptor.timingEvent.period`.

Therefore, the missing statement for `cyclicWritingPeriod` in the spirit of [[TPS_SWCT_01675](#)] is that the values of `SwcServiceDependency.serviceNeeds.cyclicWritingPeriod` can be different from the value of `NvBlockDescriptor.timingEvent.period`.

It is recommended that the value of `NvBlockDescriptor.timingEvent.period` shall be set to the lowest requested time value of the mapped `nv data PortPrototypes` (implemented by `SwcServiceDependency.serviceNeeds.cyclicWritingPeriod`).

11.4.4 Software-Components connected to `NvBlockComponents`

Please note that restrictions apply on the creation of `AssemblySwConnectors` between `NvBlockSwComponentType` and other `AtomicSwComponentTypes`.

In particular `ApplicationSwComponentTypes` communicating with each other used buffers generated and controlled by the RTE to exchange data. An `NvBlockSwComponentType`, however, maintains its own buffer in form of the `ramBlock`.

Thus, an `ApplicationSwComponentType` that reads a `dataElement` that may be provided by either another `ApplicationSwComponentType` or an `NvBlockSwComponentType` could not actually access the `dataElement` because it cannot decide whether it needs to access the buffer provided by the RTE or the `ramBlock`.

Therefore, scenarios like this are considered invalid by regulation of the AUTOSAR standard.

[constr_1417] Invalid connection between NvBlockSwComponentType and other AtomicSwComponentType (I) [A configuration where an RPortPrototype owned by an AtomicSwComponentType is simultaneously and directly connected to AbstractProvidedPortPrototypes of a collection of AtomicSwComponentTypes where at least one in the collection is an NvBlockSwComponentType for a matching set of dataElements in all these PortPrototypes shall be considered invalid **at the time when the RTE is generated.**]()

The scenario covered by [constr_1417] is depicted in Figures B.45 and B.46.

[constr_1418] Invalid connection between NvBlockSwComponentType and other AtomicSwComponentType (II) [A configuration where a PPortPrototype owned by an AtomicSwComponentType is connected to a PPortPrototype owned by an NvBlockSwComponentType for a matching set of dataElements in all these PortPrototypes shall be considered invalid **at the time when the RTE is generated.**]()

The scenario covered by [constr_1418] is depicted in Figure B.47.

Please note that the constraints [constr_1417] and [constr_1418] are following up on the general regulation for the creation of SwConnectors between kinds of PortPrototype as described by [constr_1202]. That is, [constr_1202] is agnostic of the specific SwComponentTypes that own the respective PortPrototypes.

In contrast, [constr_1417] and [constr_1418] add some information about the nature of the SwComponentTypes that own the respective PortPrototypes to the overall picture and therefore refine (rather than contradict) the regulations imposed by [constr_1202].

11.4.5 NvBlockDescriptor

[TPS_SWCT_01144] NvBlockDescriptor specifies the properties of exactly one NVRAM Block [A NvBlockDescriptor specifies the properties of exactly one NVRAM Block of a NvBlockSwComponentType.

It contains information about the requested NVRAM Block configuration of the NVRAM Manager, ramBlock and romBlock, the mapping between the PortPrototypes of the NvBlockSwComponentType and the data inside a ramBlock as well as the role of the clientServerPorts expressed in terms of RoleBasedPortAssignment.]()

Class	NvBlockDescriptor			
Package	M2::AUTOSARTemplates::SWComponentTemplate::NvBlockComponent

Class	NvBlockDescriptor			
nvBlockData Mapping	NvBlockDataMapping	*	aggr	Defines the mapping between the VariableData Prototypes in the NvBlockComponents ports and the VariableDataPrototypes of the RAM Block. The aggregation of NvBlockDataMapping is subject to variability with the purpose to support the conditional existence of nv data ports. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=nvBlockDataMapping, nvBlockData Mapping.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
nvBlockNeeds	NvBlockNeeds	0..1	aggr	Specifies the abstract needs on the configuration of the NVRAM Manager for the single NVRAM Block described by this NvBlockDescriptor. In addition, it may define requirements for writing strategies in an implementation of an NvBlockSw ComponentType by the RTE. Please note that the attributes nDataSets and nRom Blocks are not relevant for this aggregation because the RTE will allocate just one block anyway. In a different context, however, they do make sense.
ramBlock	VariableDataPrototype	0..1	aggr	Defines the RAM Block of the NVRAM Block provided by NvBlockSwComponentType.
romBlock	ParameterData Prototype	0..1	aggr	Defines the ROM Block of the NVRAM Block provided by NvBlockSwComponentType.
supportDirty Flag	Boolean	0..1	attr	Specifies whether calling of NvM functions for writing and/or status control of potentially modified RAM Blocks to NV memory shall be controlled by the RTE.
timingEvent	TimingEvent	0..1	ref	this reference can be taken to identify the TimingEvent to be used by the RTE for implementing a cyclic writing strategy for this block
writingStrategy	RoleBasedData Assignment	*	aggr	This attribute allows for assigning a specific writing strategy for an incoming AutosarDataPrototype.

Table 11.6: NvBlockDescriptor

[constr_1981] Existence of attribute [NvBlockDescriptor.nvBlockNeeds](#) [For each [NvBlockDescriptor](#), attribute [nvBlockNeeds](#) shall exist **at the time when the RTE is generated.**]()

For more explanation about the semantics of the attribute [NvBlockDescriptor.supportDirtyFlag](#) please refer to the SWS RTE [2].

[constr_1095] Values of [nDataSets](#) vs. [reliability](#) [If the value of [nDataSets](#) is greater than 0, the value of [reliability](#) shall not be set to [errorCorrection](#) **at the time when the RTE is generated.**]()

The reason for the existence of [\[constr_1095\]](#) is that the AUTOSAR NvM [\[36\]](#) does not support error correction for NV data sets.

If the value of [nDataSets](#) is equal to 0, the value of [reliability](#) can take any value out of [NvBlockNeedsReliabilityEnum](#).

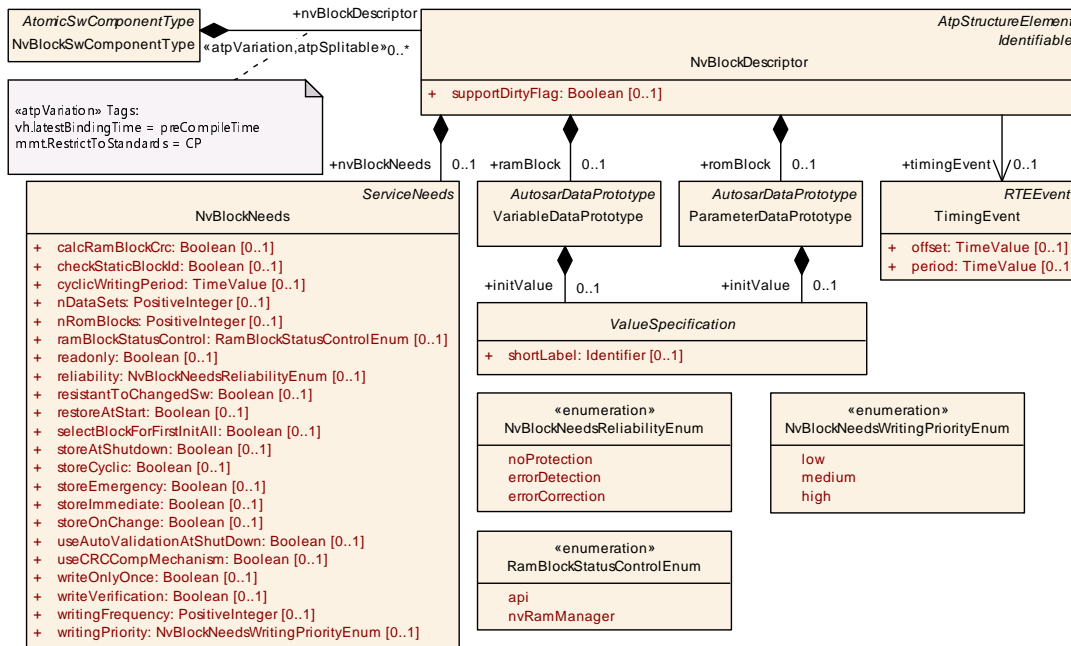

Figure 11.5: NvBlockSwComponentType and NvBlockDescriptor

11.4.5.1 Writing Strategies

[TPS_SWCT_01586] Writing strategies for *nv data* [By setting certain attributes in the meta-class `NvBlockDescriptor` it is possible to configure different writing strategies for the values of an RAM Block to the NVRAM storage. [constr_1310] applies.

The following use cases are supported:

- Write data **cyclically**. This use case requires the existence of attribute `NvBlockDescriptor.nvBlockNeeds.storeCyclic` with the value `true` and also attribute `NvBlockDescriptor.nvBlockNeeds.cyclicWritingPeriod` needs to exist and have a reasonable value.

In the context of using the attribute `NvBlockDescriptor.nvBlockNeeds.cyclicWritingPeriod` the constraints [constr_1308] and [constr_1309] apply.

- Write data **immediately**. This means that data send to the `NvBlockSwComponentType` will be written immediately to NVRAM storage.

This use case corresponds to setting the value of attribute `NvBlockDescriptor.nvBlockNeeds.storeImmediate` to the value `true`.

- Write on **emergency**. With this setting, data shall be written to NVRAM storage if the ECU fails in some way.

This use case corresponds to setting the value of attribute `NvBlockDescriptor.nvBlockNeeds.storeEmergency` to `true`.

As explained in [TPS_SWCT_01589], setting the value of this attribute is not sufficient to achieve the intended semantics.

- Write at **shutdown**. Here, the data is written to NVRAM storage when the ECU shuts down.

This use case corresponds to setting the value of attribute `NvBlockDescriptor.nvBlockNeeds.storeAtShutdown` to `true`.

- Write on **mode switch**. Here, the data is written to NVRAM in response to a mode switch configured to trigger the writing.

This use case corresponds to the existence of attribute `NvBlockDescriptor.modeSwitchEventTriggeredActivity`.

- Write on **change**. Here, the data is written to NVRAM if the value is different than the respective value in the `ramMirror`.

This use case corresponds to setting the value of attribute `NvBlockDescriptor.nvBlockNeeds.storeOnChange` to `true`.

](RS_SWCT_03225)

Please refer to [TPS_SWCT_01587] and Figure 11.6 for more information about how the use case to write data cyclically can be configured.

Please refer to [TPS_SWCT_01588] and Figure 11.7 for more information about how the use case to write data immediately can be configured.

Of course, the actual implementation of the different writing strategies goes beyond setting the value of attributes and requires the existence of dedicated `RunnableEntities` in the `SwcInternalBehavior` of the enclosing `NvBlockSwComponentType` that are triggered in response to `RTEEvents` applicable for the particular use case.

[TPS_SWCT_01587] The cyclic writing of *nv data* requires the existence of a `TimingEvent` [The implementation of cyclic writing of *nv data* requires the existence of a `TimingEvent` that can be taken to trigger a corresponding `RunnableEntity` that in turn takes care of calling the respective APIs for writing the data.] (RS_SWCT_03225)

This aspect is depicted in Figure 11.6.

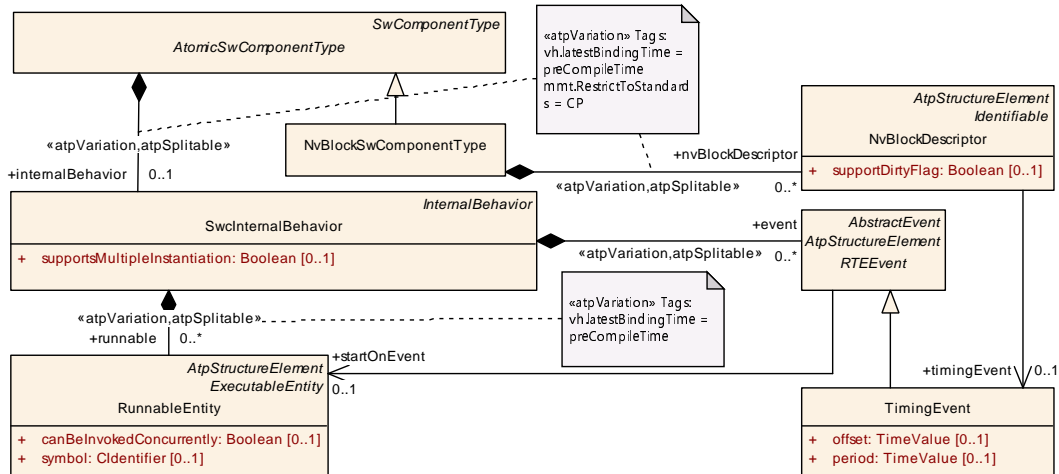

Figure 11.6: How to model a cyclic writing strategy for *nv data*

[TPS_SWCT_01588] DataReceivedEvent for storing *nv data* immediately [The approach to store data immediately after reception by an `NvBlockSwComponentType` requires the activation of a `RunnableEntity` by a `DataReceivedEvent`.] ([RS_SWCT_03225](#))

This approach is depicted in Figure 11.7.

[TPS_SWCT_01589] Implementation of emergency storing of *nv data* [The use case for `storeEmergency` can only be implemented by means of a `Complex Driver`.

In particular, the `Complex Driver` is responsible for the detection of an ECU failure. If a relevant error occurs the `Complex Driver` should call the `NvM` write block operation for the emergency blocks directly.] ([RS_SWCT_03225](#))

This consequently means that the `NvM` shall react to write operations coming from the `Complex Driver` by giving them the highest priority (re-queuing of `NvM` write block requests).

Please note that the behavior described in [TPS_SWCT_01587] in general is supported by AUTOSAR by requiring that `NVRAM Blocks` shall have to be configured with “immediate priority”. The technical implications are explained in the respective SWS [36], e.g. in [SWS_NvM_00182] and [SWS_NvM_00300].

[TPS_SWCT_01590] Combination of writing strategies for *nv data* is possible [AUTOSAR positively supports the configuration of a combination of writing strategies for *nv data*.] ([RS_SWCT_03225](#))

In other words, in consequence of [TPS_SWCT_01590] it is possible that (for example) both `NvBlockDescriptor.nvBlockNeeds.storeImmediate` and `NvBlockDescriptor.nvBlockNeeds.storeCyclic` may exist and set to `true` in the context of the same `NvBlockNeeds`.

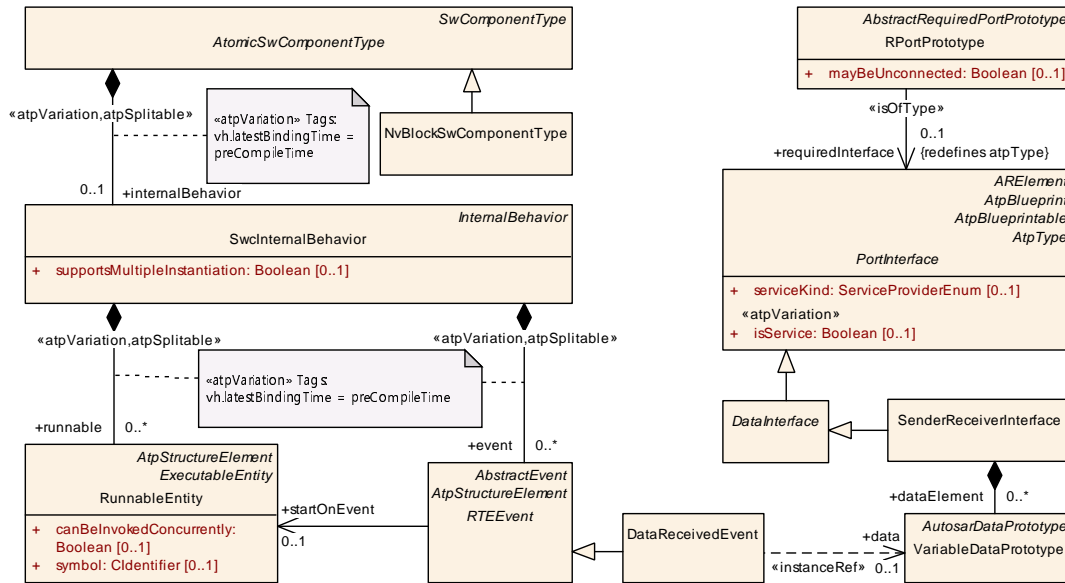

Figure 11.7: How to model an immediate writing strategy for *nv data*

[TPS_SWCT_01665] Usage of *SwcModeSwitchEvent* for triggering a write procedure of *nv data* [The approach to manage data of an *NvBlockSwComponentType* in response to a mode switch notification received from a mode manager requires the activation of a *RunnableEntity* by a *SwcModeSwitchEvent*.] ([RS_SWCT_03225](#))

[TPS_SWCT_01666] Semantics of *ModeSwitchEventTriggeredActivity.role* [If the role *ModeSwitchEventTriggeredActivity.role* is set to the value *WriteBlock* then *NvM* gets requested to write the *nv data* block after the corresponding *SwcModeSwitchEvents* occurs.] ([RS_SWCT_03225](#))

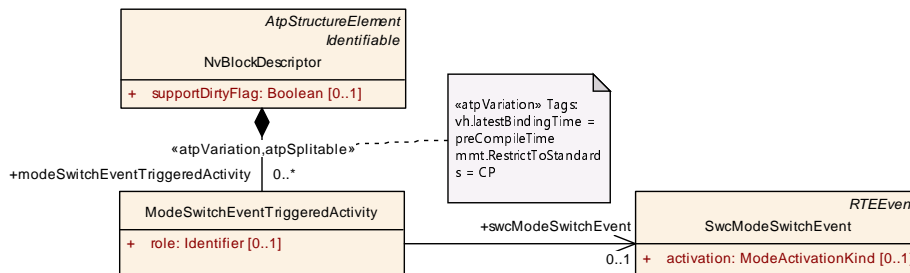

Figure 11.8: Usage of mode switch notification for the activation of a write-procedure of *nv data*

[constr_1415] Supported values of *ModeSwitchEventTriggeredActivity.role* [The only supported value of *ModeSwitchEventTriggeredActivity.role* at the time when the *RTE* is generated is *WriteBlock*.] ()

Class	ModeSwitchEventTriggeredActivity			
Package	M2::AUTOSARTemplates::SWComponentTemplate::NvBlockComponent			
Note	This meta-class defines an activity of the NvBlockSwComponentType for a specific NvBlock which is triggered by a ModeSwitchEvent.			
Base	ARObject

Attribute	Type	Mult.	Kind	Note
role	Identifier	0..1	attr	This attribute indicates which service of the NvM for the NvBlock shall be requested.
swcModeSwitchEvent	SwcModeSwitchEvent	0..1	ref	This reference identifies the SwcModeSwitchEvent that triggers the activity.

Table 11.7: ModeSwitchEventTriggeredActivity

[constr_1982] Existence of attribute ModeSwitchEventTriggeredActivity.role [For each ModeSwitchEventTriggeredActivity, attribute role shall exist at the time when the RTE is generated.]()

[constr_1983] Existence of attribute ModeSwitchEventTriggeredActivity.swcModeSwitchEvent [For each ModeSwitchEventTriggeredActivity, attribute swcModeSwitchEvent shall exist at the time when the RTE is generated.]()

11.4.5.1.1 Existence of multiple event-driven Writing Strategies

A use case might exist where (potentially in addition to a cyclic writing strategy) multiple event-based writing strategies to NvRam exist at the same time.

Writing strategies are typically implemented by means of different RunnableEntities that need to be triggered by the arrival of data at the NvBlockSwComponentType. In this case, however, it is necessary to be able to assign the relation between incoming data and the RunnableEntity that applies the fitting writing strategy.

Example 11.1

In the example scenario depicted in Figure 11.9, two dataElements are received by the NvBlockSwComponentType. One dataElement shall be associated with the writing strategy to store at shutdown and the other dataElement shall be associated with an immediate storage.

Two DataReceivedEvents exist that can be taken to trigger RunnableEntities. But without further formal specification, it is up to speculation which DataReceivedEvent shall be associated with which RunnableEntity.

To remove the degree of uncertainty sketched in Example 11.1, it is possible to use standardized values for the attribute RoleBasedDataAssignment.role and let the RoleBasedDataAssignment itself refer to the respective dataElement.

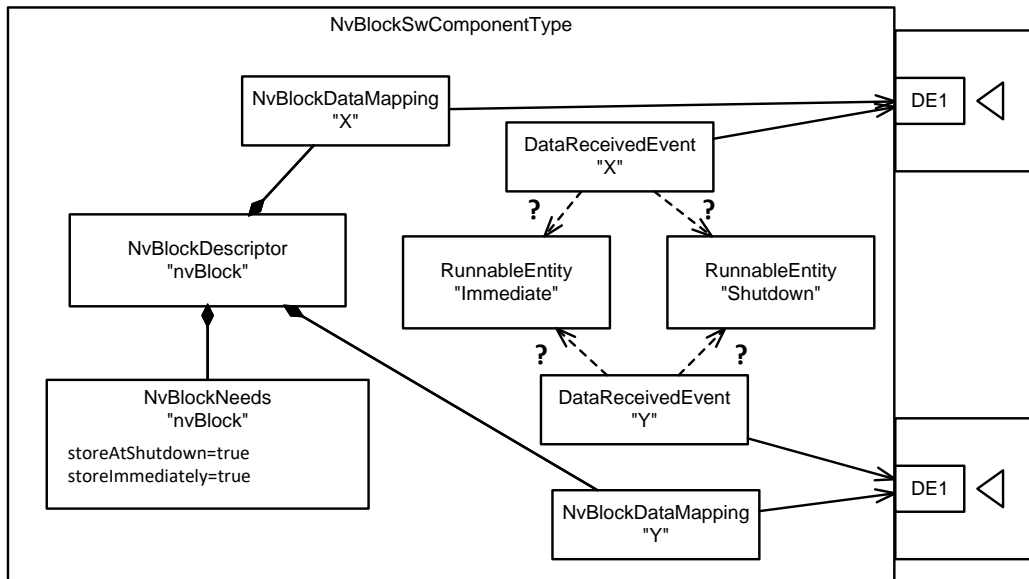

Figure 11.9: Existence of several event-based writing strategies for the same `NvBlockDescriptor`

The approach is sketched in Figure 11.10 and its application to the depicted scenario is sketched in Figure 11.11.

Figure 11.10: Modeling of `RoleBasedDataAssignment` in the context of `NvBlockDescriptor`

[TPS_SWCT_01795] Further specification to facilitate the association of writing strategies to the corresponding `RunnableEntity` [`NvBlockDescriptor` may aggregate `RoleBasedDataAssignment` in the role `writingStrategy` and the attribute `NvBlockDescriptor.writingStrategy.role` can be used to assign a writing strategy to an `AutosarDataPrototype` (referenced by means of `NvBlockDescriptor.writingStrategy.usedDataElement`) in the context of a `PortPrototype`.] (*RS_SWCT_03225*)

[constr_1713] `NvBlockDescriptor.writingStrategy.usedDataElement` shall refer to `AutosarDataPrototype` [The reference `NvBlockDescriptor.writingStrategy.usedDataElement` shall **only** refer to an `AutosarDataPrototype` at the time when the RTE is generated.] ()

Rationale: the activation of a `RunnableEntity` that implements the respective writing strategy is triggered by the reception of an entire `AutosarDataPrototype`. The ability to refer to a `DataPrototype` inside the `AutosarDataPrototype` might give a false impression.

[constr_1714] **AutosarDataPrototype** shall only be referenced by a single **NvBlockDescriptor.writingStrategy** [If an **AutosarDataPrototype** in the context of a **PortPrototype** is referenced from a **NvBlockDescriptor.writingStrategy** then this **AutosarDataPrototype** shall not be referenced from any other **NvBlockDescriptor.writingStrategy**.

This rule shall be imposed **at the time when the RTE is generated.**]()

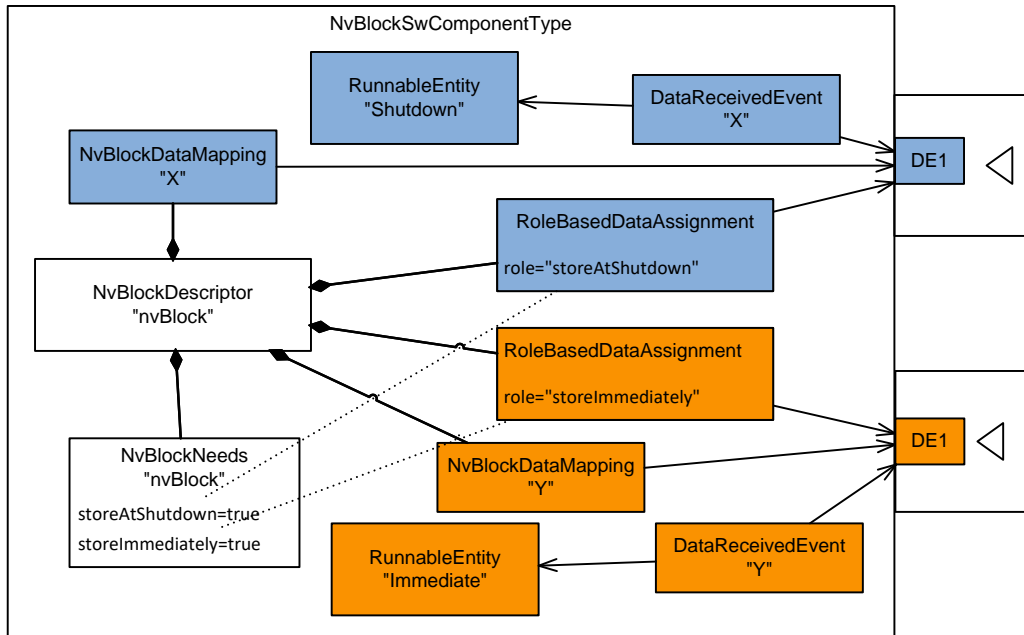

Figure 11.11: Solution for the existence of several event-based writing strategies for the same **NvBlockDescriptor**

[constr_1715] Possible values of attribute **NvBlockDescriptor.writingStrategy.role** [The attribute **NvBlockDescriptor.writingStrategy.role** shall only have one of the following values **at the time when the RTE is generated** (see [TPS_SWCT_01586]):

- **storeAtShutdown**
- **storeImmediate**
- **storeOnChange**

]()

[constr_1716] Consistency of attribute **NvBlockDescriptor.writingStrategy.role** set to **storeAtShutdown** [The existence of **NvBlockDescriptor.writingStrategy** where attribute `role` is set to `storeAtShutdown` is only supported if **NvBlockDescriptor.nvBlockNeeds.storeAtShutdown** exists and is set to `true` **at the time when the RTE is generated.**]()

[constr_1717] Consistency of attribute `NvBlockDescriptor.writingStrategy.role` set to `storeImmediate` [The existence of `NvBlockDescriptor.writingStrategy` where attribute `role` is set to `storeImmediate` is only supported if `NvBlockDescriptor.nvBlockNeeds.storeImmediate` exists and is set to `true` at the time when the RTE is generated.]()

[constr_10074] Consistency of attribute `NvBlockDescriptor.writingStrategy.role` set to `storeOnChange` [The existence of `NvBlockDescriptor.writingStrategy` where attribute `role` is set to `storeOnChange` is only supported if `NvBlockDescriptor.nvBlockNeeds.storeOnChange` exists and is set to `true` at the time when the RTE is generated.]()

11.4.5.2 NvBlockNeeds

The requested NVRAM Block configuration of the *NVRAM Manager* is described by the `NvBlockNeeds` of the `NvBlockDescriptor`.

This information can be evaluated during ECU configuration similar to the `NvBlockNeeds` of an atomic software component or a BSW module. For further details see section 13.

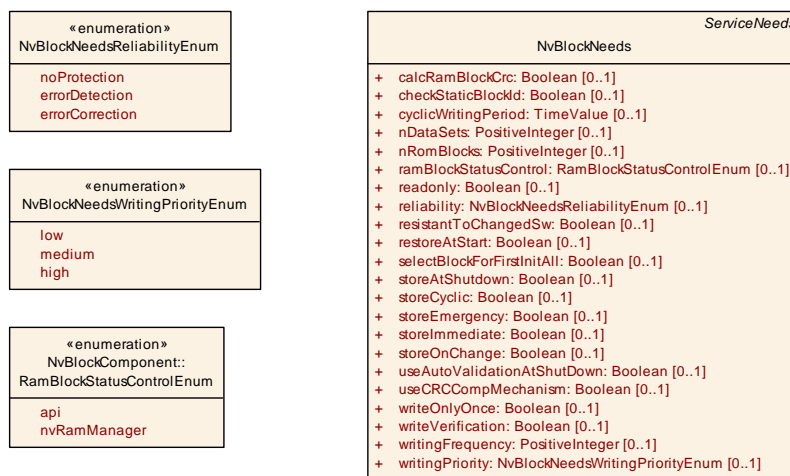

Figure 11.12: `NvBlockNeeds`

[constr_1310] Existence of attributes of meta-class `NvBlockNeeds` [If in the context of an `ApplicationSwComponentType` the attribute `SwcServiceDependency.serviceNeeds` is implemented by an `NvBlockNeeds` then the following attributes

- `NvBlockNeeds.storeCyclic`
- `NvBlockNeeds.cyclicWritingPeriod`
- `NvBlockNeeds.storeEmergency`
- `NvBlockNeeds.storeImmediate`
- `NvBlockNeeds.storeOnChange`

shall only exist if in the context of the same `SwcServiceDependency` a `SwcServiceDependency.assignedPort` exists that has the attribute `role` set to the value `NvDataPort`.

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1308] Existence of `NvBlockNeeds.cyclicWritingPeriod` [The attribute `NvBlockNeeds.cyclicWritingPeriod` shall exist if and only if the attribute `NvBlockNeeds.storeCyclic` exists and its value is set to `true`.

This rule shall be imposed **at the time when the RTE is generated.**]()

cyclicWritingPeriod	TimeValue	0..1	attr	This represents the period for cyclic writing of NvData to store the associated RAM Block.
nDataSets	PositiveInteger	0..1	attr	Number of data sets to be provided by the NVRAM manager for this block. This is the total number of ROM Blocks and RAM Blocks.
nRomBlocks	PositiveInteger	0..1	attr	Number of ROM Blocks to be provided by the NVRAM manager for this block. Please note that these multiple ROM Blocks are given in a contiguous area.
ramBlockStatusControl	RamBlockStatusControlEnum	0..1	attr	This attribute defines how the management of the RAM Block status is controlled.
readonly	Boolean	0..1	attr	true: data of this NVRAM Block are write protected for normal operation (but protection can be disabled) false: no restriction
reliability	NvBlockNeedsReliabilityEnum	0..1	attr	Reliability against data loss on the non-volatile medium.
resistantToChangedSw	Boolean	0..1	attr	Defines whether an NVRAM Block shall be treated resistant to configuration changes (true) or not (false). For details how to handle initialization in the latter case, please refer to the NVRAM specification.
restoreAtStart	Boolean	0..1	attr	Defines whether the associated RAM Block shall be implicitly restored during startup by the basic software.
selectBlockForFirstInitAll	Boolean	0..1	attr	If this attribute is set to true the NvM shall process this block in the <code>NvM_FirstInitAll()</code> function.
storeAtShutdown	Boolean	0..1	attr	Defines whether or not the associated RAM Block shall be implicitly stored during shutdown by the basic software.
storeCyclic	Boolean	0..1	attr	Defines whether or not the associated RAM Block shall be implicitly stored periodically by the basic software.
storeEmergency	Boolean	0..1	attr	Defines whether or not the associated RAM Block shall be implicitly stored in case of ECU failure (e.g. loss of power) by the basic software. If the attribute <code>storeEmergency</code> is set to true the associated RAM Block shall be configured to have immediate priority.

Class	NvBlockNeeds			
storeImmediate	Boolean	0..1	attr	Defines whether or not the associated RAM Block shall be implicitly stored immediately during or after execution of the according SW-C RunnableEntity by the basic software.
storeOnChange	Boolean	0..1	attr	This attribute defines whether the associated RAM Block shall be stored immediately if the written value is different to the value stored in the associated RAM Block(s) during or after execution of the according SW-C RunnableEntity.
useAutoValidationAtShutDown	Boolean	0..1	attr	If set to true the RAM Block shall be auto validated during shutdown phase.
useCRCCompMechanism	Boolean	0..1	attr	If set to true the CRC of the RAM Block shall be compared during a write job with the CRC which was calculated during the last successful read or write job in order to skip unnecessary NVRAM writings.
writeOnlyOnce	Boolean	0..1	attr	Defines write protection after first write: true: This block is prevented from being changed/erased or being replaced with the default ROM data after first initialization by the software-component. false: No such restriction.
writeVerification	Boolean	0..1	attr	Defines if Write Verification shall be enabled for this NVRAM Block.
writingFrequency	PositiveInteger	0..1	attr	Provides the amount of updates to this block from the application point of view. It has to be provided in "number of write access per year".
writingPriority	NvBlockNeedsWritingPriorityEnum	0..1	attr	Requires the priority of writing this block in case of concurrent requests to write other blocks.

Table 11.8: NvBlockNeeds

Enumeration	NvBlockNeedsWritingPriorityEnum
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds
Note	Specifies the priority of writing this block in case of concurrent requests to write other blocks.
Aggregated by	NvBlockNeeds.writingPriority
Literal	Description
high	Writing priority is high. Tags: atp.EnumerationLiteralIndex=0
low	Writing priority is low. Tags: atp.EnumerationLiteralIndex=1
medium	Writing priority is medium. Tags: atp.EnumerationLiteralIndex=2

Table 11.9: NvBlockNeedsWritingPriorityEnum

Enumeration	NvBlockNeedsReliabilityEnum
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds
Note	Reliability against data loss on the non-volatile medium. These requirements give only a relative indication, for example on the required degree of redundancy for storage. They do, however, not specify by which means (e.g. software or hardware) the reliability is actually achieved.

Enumeration	NvBlockNeedsReliabilityEnum
Aggregated by	NvBlockNeeds.reliability
Literal	Description
errorCorrection	Errors shall be corrected Tags: atp.EnumerationLiteralIndex=0
errorDetection	Errors shall be detected Tags: atp.EnumerationLiteralIndex=1
noProtection	Data need not to be handled with protection Tags: atp.EnumerationLiteralIndex=2

11.4.5.3 RAM Block and ROM Block

[TPS_SWCT_01145] [ramBlock](#) and the [romBlock](#) are described by a [VariableDataPrototype](#) and a [ParameterDataPrototype](#) [The [ramBlock](#) and the [romBlock](#) are described by a [VariableDataPrototype](#) and a [ParameterDataPrototype](#) which are typed by an [AutosarDataType](#).]()

[TPS_SWCT_01146] [romBlock](#) is optional [The [romBlock](#) is optional. If a [romBlock](#) is configured, the RTE copies the [romBlock](#) constants into the `RAM Block` in case of a block initialization notification ([NvMNotifyInitBlock](#)).]()

[TPS_SWCT_01147] No [romBlock](#) is configured [If there is no [romBlock](#) configured the connected software components are either required to offer this functionality by a proper implementation of block initialization notification or the `NVRAM Block` has to be configured, that no `ROM Block` is needed.]()

As a mitigation against a failed read operation from NV memory, it is recommended to always define a [romBlock](#) with suitable initial values to ensure the proper initialization of the corresponding [ramBlock](#).

In particular, for software-components that don't define a [PortPrototype](#) typed by the [ClientServerInterface](#) with the standardized `shortName` `NotifyInitBlock` [36] it may happen that the [ramBlock](#) might not be properly initialized in case of failure.

[constr_2012] Compatibility of [ImplementationDataTypes](#) used for [ramBlock](#) and [romBlock](#) [The [ramBlock](#) and the [romBlock](#) shall have compatible [ImplementationDataTypes](#) to ensure **at the time when the RTE is generated**, that the `NVRAM Block` default values in the `ROM Block` can be copied into the `RAM Block`.]()

[TPS_SWCT_01848] Semantics of [NvBlockDescriptor.instantiationDataDefProps](#) [It is possible that [NvBlockDescriptor.romBlock](#) and [NvBlockDescriptor.romBlock](#) shall be able to be calibrated or measured.

This represents another use case for overwriting existing `SwDataDefProps` (defined on data type level) in the context of `NvBlockDescriptor.instantiation-DataDefProps` to fine-tune the respective MCD-information.]()

11.4.5.4 NvBlockDataMapping

[TPS_SWCT_01148] **NvBlockDataMapping** [The meta-class `NvBlockDataMapping` specifies the mapping of (bits of) `DataPrototypes` of the `NvBlockSwComponentType`'s `PPortPrototypes` resp. `RPortPrototypes` to (bits of) `DataPrototypes` inside the `RAM Block`.]()

This ensures a flexible but deterministic `NVRAM Block` memory structure given by the `ImplementationDataType` of the `ramBlock` and `romBlock` and its association to the `PortPrototypes` of the `NvBlockSwComponentType`.

[constr_2013] **Compatibility of ImplementationDataTypes for NvBlockDataMapping** [Unless both the attribute `bitfieldTextTableMaskNvBlockDescriptor` and attribute `bitfieldTextTableMaskPortPrototype` is defined in the context of a given `NvBlockDataMapping`, the `NvBlockDataMapping` is only valid if the `ImplementationDataType` of the referenced `VariableDataPrototype` or `ImplementationDataTypeElement` in the role `nvRamBlockElement` is compatible to the `ImplementationDataType` used to type the `DataPrototype` aggregated by `NvBlockDataMapping` in the role `writtenNvData`, `writtenReadNvData`, or `readNvData`.

This rule shall be imposed **at the time when the RTE is generated**.]()

[constr_1285] **Applicability of roles vs. PortPrototypes** [The aggregation of `AutosarVariableRef` aggregated by `NvBlockDataMapping` in the roles `writtenNvData`, `writtenReadNvData`, or `readNvData` is subject to limitation **at the time when the RTE is generated**, depending on the applicable subclass of `PortPrototype`:

- The role `writtenNvData` shall only be used if the corresponding `PortPrototype` is a `RPortPrototype`
- The role `writtenReadNvData` shall only be used if the corresponding `PortPrototype` is a `PRPortPrototype`
- The role `readNvData` shall only be used if the corresponding `PortPrototype` is a `PPortPrototype`

]()

But nevertheless it is valid, that not all `ImplementationDataTypeElements` within the `VariableDataPrototype` aggregated by `NvBlockDescriptor` in the role `ramBlock` are mapped to a `VariableDataPrototype` located in a `PortPrototype`.

This enables to have fill elements or logistic data in the NVRAM Block which are not accessed by software components. This is exemplified by the element *x* in Figure 11.13.

Please note that the `VariableDataPrototype` located in the `PortPrototype`, in the vast majority of cases, will be typed by an `ApplicationDataType` which in turn (at least before the actual code generation starts) finally shall have a mapping to an `ImplementationDataType`. This aspect is explained in chapter 5.2.2.

[TPS_SWCT_01659] Mapping of `VariableDataPrototype` to a `NvBlockDescriptor` [There are three ways to map a `VariableDataPrototype` (i.e. `NvDataInterface.nvData` in the context of a specific `PortPrototype`) to either an `NvBlockDescriptor.ramBlock` or a *sub-element* thereof:

- `NvDataInterface.nvData` is directly and completely mapped, i.e. `AutosarVariableRef.autosarVariable` shall exist and `autosarVariable.targetDataPrototype` shall refer to the `NvDataInterface.nvData`.
- **Every leaf** element of `NvDataInterface.nvData` is mapped individually. This means that either
 - `AutosarVariableRef.autosarVariableInImplDatatype` shall exist and `autosarVariableInImplDatatype.targetDataPrototype` shall refer to the respective *leaf* element of `NvDataInterface.nvData`.
 - `AutosarVariableRef.autosarVariable` shall exist and `autosarVariable.targetDataPrototype` shall refer to the respective *leaf* element of `NvDataInterface.nvData`.

In other words: the mapping shall be defined either via the used `ImplementationDataType` or else via the used `ApplicationDataType`.

- A *sub-element* of `NvDataInterface.nvData` - which is **not** a *leaf* element - may be directly mapped and consequently **all** the *leaf* elements of the respective *sub-element* of `NvDataInterface.nvData` are **indirectly mapped** as well. This means that
 - `AutosarVariableRef.autosarVariableInImplDatatype` shall exist and `autosarVariableInImplDatatype.targetDataPrototype` shall refer to the *sub-element* element of `NvDataInterface.nvData`.
 - `AutosarVariableRef.autosarVariable` shall exist and `autosarVariable.targetDataPrototype` shall refer to the *sub-element* element of `NvDataInterface.nvData`.

In other words: the mapping shall be defined either via the used `ImplementationDataType` or else via the used `ApplicationDataType`.

]0

Please note that a mixing of **mutually exclusive** mappings for entire *sub-elements* or *leaf* elements as described by [TPS_SWCT_01659] is positively supported (see Figure 11.13).

[constr_1395] NvBlockDataMapping shall be complete [If an NvBlockDataMapping refers to *sub-elements* or *leaf* elements of the NvDataInterface.nvData in the context of a particular PortPrototype, then **all remaining sub-elements** or *leaf* elements **shall effectively be mapped** according to [TPS_SWCT_01659] by means of a collection of NvBlockDataMappings **at the time when the RTE is generated.**]()

[constr_1403] NvBlockDataMappings to a given nvData shall be unambiguous [If an NvBlockDataMapping exists that **directly** and **completely** maps a specific NvDataInterface.nvData in the context of a particular PortPrototype, then **no** other NvBlockDataMapping which maps sub-elements of the NvDataInterface.nvData shall exist **at the time when the RTE is generated.**]()

The interaction with AUTOSAR services is centrally defined in the context of the Swc-ServiceDependency. The latter gathers a collection of PortPrototypes by means of RoleBasedPortAssignments that implement a closely related service functionality.

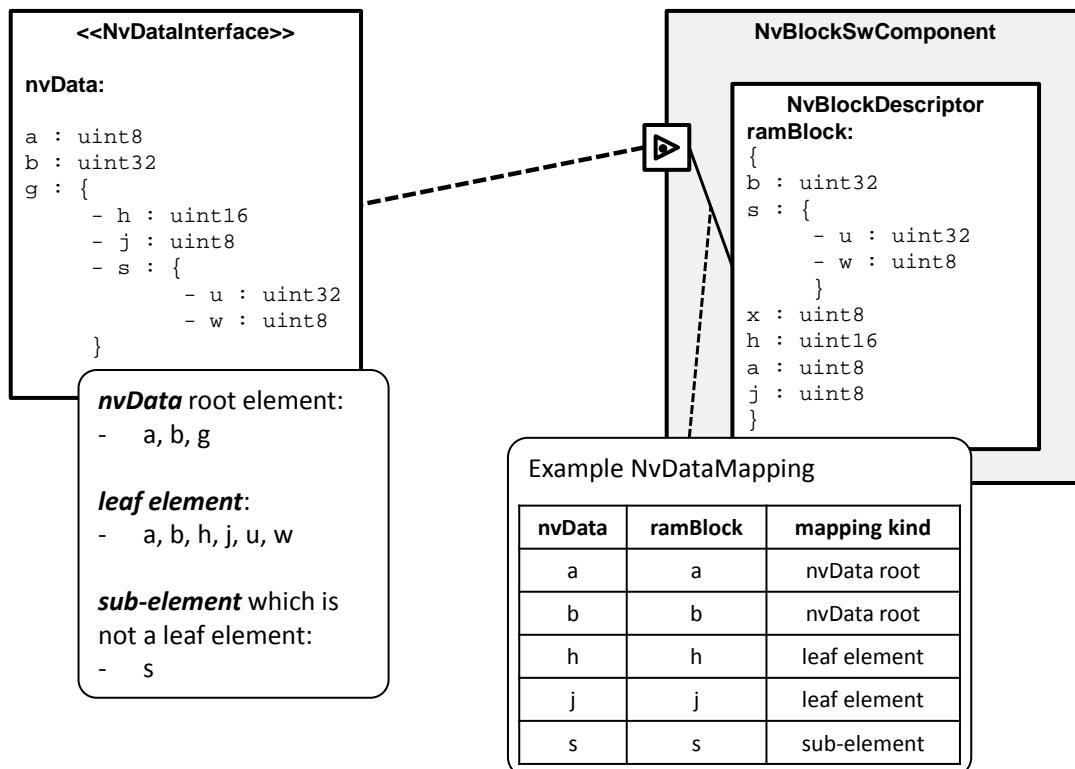

Figure 11.13: Sample NvBlockDataMapping to explain the three ways to map a VariableDataPrototype to either an NvBlockDescriptor.ramBlock or a sub-element thereof

In the specific case of interaction between `AtomicSwComponentType` and `NvBlockSwComponentType` (as described by [TPS_SWCT_02503]), there are `PortPrototypes` referenced by a `RoleBasedPortAssignment` with attribute `RoleBasedPortAssignment.role` set to `NvDataPort`. These `PortPrototypes` contain the collected `Nv Data` of the service use case.

Furthermore, there is the possibility to receive notifications when the writing of the mapped NV Block to the `NvRam` is finished.

Figure 11.14: Visualization of the statement made by [constr_1404]

[TPS_SWCT_01863] Existence of `VariableInAtomicSWCTypeInstanceRef.rootVariableDataPrototype` in the context of `NvBlockDataMapping.nvRamBlockElement` [In the context of `NvBlockDataMapping.nvRamBlockElement`, the reference in the `VariableInAtomicSWCTypeInstanceRef.rootVariableDataPrototype` is redundant because the information carried by this reference is already conveyed by the aggregation `NvBlockDescriptor.ramBlock`.

Therefore, `VariableInAtomicSWCTypeInstanceRef.rootVariableDataPrototype` shall be ignored in the context of `NvBlockDataMapping.nvRamBlockElement`.]()

In order to be able to properly assign such a notification to the content of the related `Nv Data PortPrototypes` in the scope of the same `SwcServiceDependency` it is necessary that the `Nv Data` of **all** these `PortPrototypes` is mapped to the **same** `Nv Block` (because the notifications are created **per block**).

This aspect represents one motivation for the existence of [constr_1404]:

[constr_1404] All `NvDataInterface.nvData` of `PortPrototypes` in the context of a specific `SwcServiceDependency` shall be mapped to the same `NvBlockDescriptor` [In the context of a given `SwcServiceDependency` (which, in turn, is owned by an `AtomicSwComponentType`), **all** `NvDataInterface.nvData` of `PortPrototypes` referenced by a `RoleBasedPortAssignment` with attribute `RoleBasedPortAssignment.role` set to `NvDataPort` shall be connected (either directly or via the definition of suitable `PortInterfaceMappings`) to `NvDataInterface.nvData` (on the side of the `NvBlockSwComponentType`) that are **completely mapped** (via `NvBlockDataMappings`) to the identical `NvBlockDescriptor.ramBlock`.

This rule shall be imposed **at the time when the RTE is generated.**]()

The statement made by [constr_1404] is visualized in Figure 11.14. The context-defining model elements, i.e. `SwcServiceDependency` owned by the `AtomicSwComponentType` as well as `NvBlockDescriptor` owned by the `NvBlockSwComponentType`, are colored in light orange.

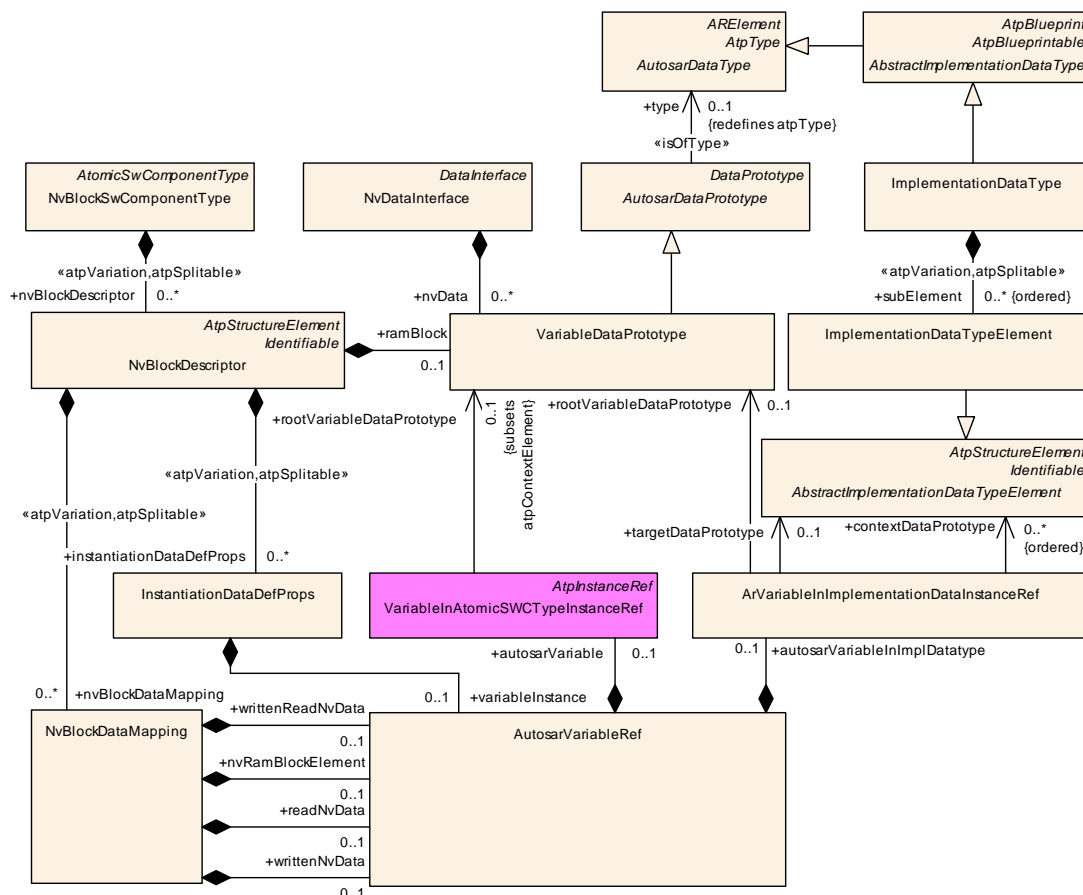

Figure 11.15: `NvBlockDataMapping` and `InstantiationDataDefProps`

The diagram is focused on the `NvBlockDescriptor.ramBlock`. As stressed by [constr_1404], all `Nv Data` provided by the `PortPrototypes` referenced by the specific `SwcServiceDependency` finally ends up in the one depicted `ramBlock` (colored in blue).

Please note that the graphical representation of the `NvBlockDataMapping` in Figure 11.14 has been simplified for the sake of clarity.

In summary, there is in fact a whole list of motivations that lead to the creation of [constr_1404]:

- The handling of the dirty-flag within the RTE is done in the context of a `Port-Prototype`.
- The currently implemented approach allows for an easy understanding of the relation of data in the application to data in NV-RAM.
- All data in the context of one `SwcServiceDependency` have the identical storage life cycle.
- Jobs triggered in the NvM via operations in the `NvMService` (see [SWS_NvM_00734]) interface belong to exactly one `NvBlockDescriptor`.
- As already mentioned, notifications of the NvM towards software components (e.g. `NvMNotifyJobFinished` as described in [SWS_NvM_00735] or `NvMNotifyInitBlock`, see [SWS_NvM_00736]) belong to exactly one `NvBlockDescriptor`.

[constr_1984] **Existence of instance reference `NvBlockDataMapping.nvRamBlockElement`** [For each `NvBlockDataMapping`, the instance reference to `ModuleDeclaration` in the role `nvRamBlockElement` shall exist **at the time when the RTE is generated.**]()

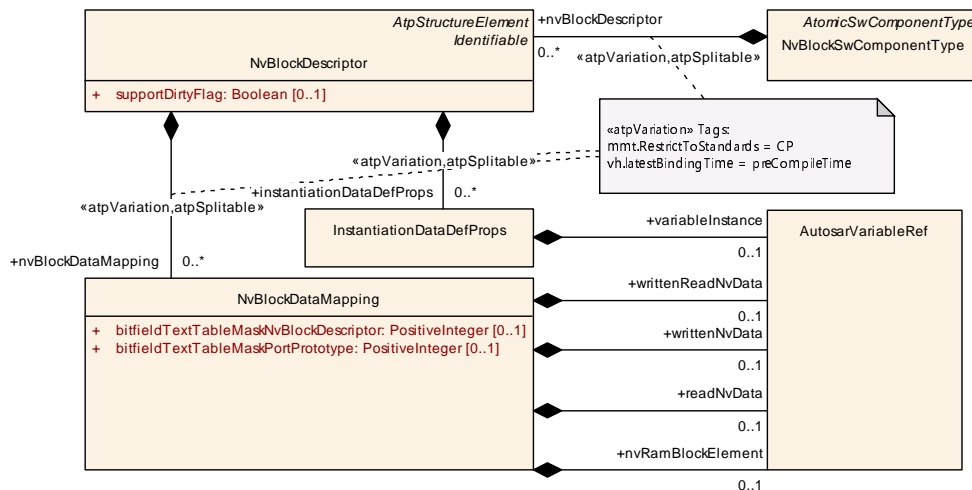

Figure 11.16: Attributes of `NvBlockDataMapping`

Please note that there are use cases for numerous fine-grained (e.g. single bits) data in non-volatile RAM. For this purpose, it would be very inefficient to copy the value of a whole `DataPrototype` that is at least 8 bits long into the non-volatile RAM.

A much better approach is to allow for the mapping of single bits or bit-fields inside a `DataPrototype` in a `PortPrototype` to the `ramBlock` of an `NvBlockDescriptor` directly.

For this purpose the `NvBlockDataMapping` provides the attributes `bitfieldTextTableMaskNvBlockDescriptor` and `bitfieldTextTableMaskPortPrototype`⁴.

[TPS_SWCT_01799] Mapping of bit-fields between `NvBlockDescriptor` and `PortPrototype` [It is possible to map a bitfield contained in the `DataPrototype` representing the `ramBlock` to a bitfield contained in a `DataPrototype` defined in the context of a `PortPrototype` on the surface of the enclosing `NvBlockSwComponentType` by means of the definition of attributes `NvBlockDataMapping.bitfieldTextTableMaskNvBlockDescriptor` and `NvBlockDataMapping.bitfieldTextTableMaskPortPrototype`.

In this case [constr_2013] is not applicable.]()

The general approach for mapping bit-fields onto each other in the context of an `NvBlockSwComponentType` is sketched in Figure 11.17.

Figure 11.17: Visualization of the approach to map bit-fields inside an `NvBlockSwComponentType`

Class	NvBlockDataMapping			
Package	M2::AUTOSARTemplates::SWComponentTemplate::NvBlockComponent			
Note	Defines the mapping between the VariableDataPrototypes in the NvBlockComponents ports and the VariableDataPrototypes of the RAM Block. The data types of the referenced VariableDataPrototypes in the ports and the referenced sub-element (inside a CompositeDataType) of the VariableDataPrototype representing the RAM Block shall be compatible.			
Base	ARObject			
Aggregated by	BulkNvDataDescriptor.nvBlockDataMapping, NvBlockDescriptor.nvBlockDataMapping			
Attribute	Type	Mult.	Kind	Note

⁴The alternative to this approach would have been to shift this "distillation process" into the connection between e.g. an `ApplicationSwComponentType` and an `NvBlockSwComponentType`.

Such an approach comes with considerably heavier side effects and complexity (usage in `DelegationSwConnectors` or as part of a network connection) and is therefore not supported.

Class	NvBlockDataMapping			
bitfieldTextTable MaskNvBlock Descriptor	PositiveInteger	0..1	attr	This attribute identifies the applicable bit mask on the side of the Nv Block.
bitfieldTextTable MaskPort Prototype	PositiveInteger	0..1	attr	This attribute identifies the applicable bit mask on the side of the PortPrototype.
nvRamBlock Element	AutosarVariableRef	0..1	aggr	Reference to a VariableDataPrototype of a RAM Block.
readNvData	AutosarVariableRef	0..1	aggr	Reference to a VariableDataPrototype of a pPort of the NvBlockComponent providing read access to the RAM Block. If there is no PortPrototype providing read access (write-only) the reference can be omitted.
writtenNvData	AutosarVariableRef	0..1	aggr	Reference to a VariableDataPrototype of a rPort of the NvBlockComponent providing write access to the RAM Block. If there is no port providing write access (read-only) the reference can be omitted.
writtenReadNv Data	AutosarVariableRef	0..1	aggr	Reference to a VariableDataPrototype of a PRPort Prototype of the NvBlockSwComponentType providing write and read access to the RAM Block.

Table 11.11: NvBlockDataMapping

11.4.5.5 Client Server Ports

[TPS_SWCT_01149] [RoleBasedPortAssignment of NvBlockDescriptor](#) [The [clientServerPort](#) of the [NvBlockDescriptor](#) describes which client/server [PortPrototype](#) of the [NvBlockSwComponentType](#) serves for which purpose. The [role](#) specifies if the port serves for block-related services, administrative services or notification.]()

[constr_2014] [Limitation of NvBlockDescriptor.clientServerPort.role](#) [The value of attribute [NvBlockDescriptor.clientServerPort.role](#) shall be set to a valid name of one of the Standardized AUTOSAR (client/server) Interfaces used for the NVRAM Manager, as described by [TPS_SWCT_02501], [TPS_SWCT_02502], [TPS_SWCT_02503] and [TPS_SWCT_02504].]()

Rationale for the existence of [constr_2014]: the job of the [NvBlockDescriptor.clientServerPort](#) is to qualify the [PortPrototypes](#) on the [NvBlockSwComponentType](#) that interact with the [PortPrototypes](#) described by the service use cases documented in [TPS_SWCT_02501], [TPS_SWCT_02502], [TPS_SWCT_02503] and [TPS_SWCT_02504].

In case of notifications one common callback function is provided by the RTE for each individual kind of notification defined by the attribute [role](#).

The [PPortPrototypes](#) related to a given [NvBlockDescriptor](#) need to be provided with the same value for a [PortDefinedArgumentValue](#) in order to make the software work correctly. The provision of the [PortDefinedArgumentValue](#) is heuristic, but with a further “trick” the reliability of this operation can be much improved.

For all `NvBlockDescriptor.clientServerPort` of a given `NvBlockDescriptor` where attribute `role` is set to the value `NvMService` or `NvMAdmin` collect the `PortPrototype` if it is a `PPortPrototype`. The resulting collection of `PortPrototypes` need to be provided with the same value (of `PortDefinedArgumentValue`).

In this case it is no longer necessary to explicitly model the existence of `PortDefinedArgumentValues` for these `PortPrototypes` since the applicable id value of the NvM can be derived by RTE configuration.

To make this approach work the role value needs to be standardized, see [constr_2014].

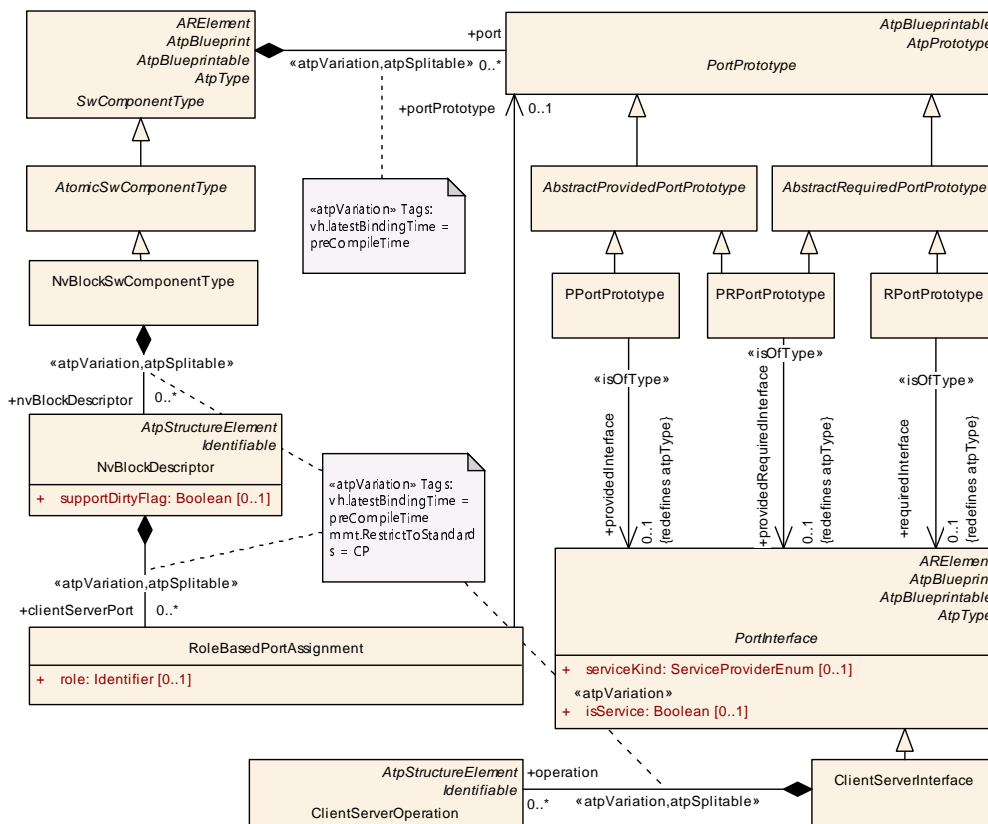

Figure 11.18: NvBlockNotification

11.4.6 BulkNvDataDescriptor

There is a strong use case where application software gets read-only access to data of significant size located in non-volatile memory. The actual data is created or updated e.g. at the end of the production line or maybe during maintenance in a garage.

If such a scenario were to be implemented using an `NvBlockDescriptor` then the creation of a RAM mirror of the data in the non-volatile memory would be obligatory. But as described before, the existence of a **RAM mirror would not be necessary at all** in this use case and would only waste a significant amount of precious resources.

It is therefore necessary to be clearly separate the use case for utilizing an `NvBlockDescriptor` from the direct read-only access to non-volatile memory in the meta-model.

For this purpose, model support is provided by the existence of meta-class `BulkNvDataDescriptor`, aggregated at `NvBlockSwComponentType` in the role `bulkNvDataDescriptor`. This modeling is depicted in Figure 11.19.

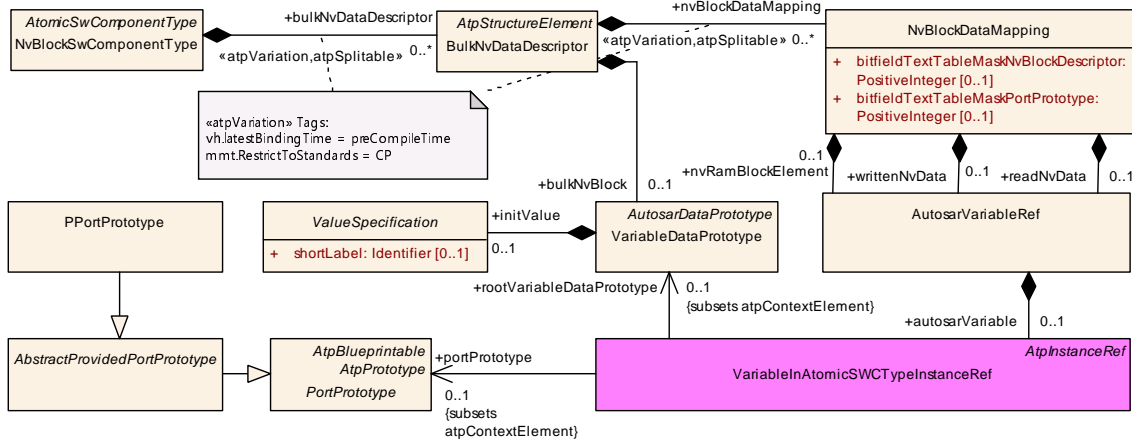

Figure 11.19: `NvBlockSwComponentType` and `BulkNvDataDescriptor`

[TPS_SWCT_01805] **Semantics of the aggregation `NvBlockSwComponentType.bulkNvDataDescriptor`** [The existence of an aggregation at meta-class `NvBlockSwComponentType` in the role `bulkNvDataDescriptor` indicates that read-only access to a block of data in non-volatile memory shall be provided.

Access to this block of data is **provided directly from non-volatile memory** as opposed to via a RAM mirror.](RS_SWCT_03225)

[TPS_SWCT_01806] **Simultaneous aggregation of `NvBlockSwComponentType.bulkNvDataDescriptor` and `NvBlockSwComponentType.nvBlockDescriptor`** [The simultaneous existence of aggregations in the roles `bulkNvDataDescriptor` and `nvBlockDescriptor` in the context of the same `NvBlockSwComponentType` is positively supported.](RS_SWCT_03225)

[TPS_SWCT_01807] **Application of `NvBlockDataMapping` on `BulkNvDataDescriptor`** [Via the aggregation of `NvBlockDataMapping` in the role `nvBlockDataMapping` it is possible to make the content of the `BulkNvDataDescriptor` available to a `PPortPrototype` on the surface of the enclosing `NvBlockSwComponentType`.

It is also supported to make only a subset of the content of the `BulkNvDataDescriptor` available at the `PPortPrototype`.](RS_SWCT_03225)

[constr_1735] **Limitation of the aggregation of `AutosarVariableRef` in the context of an `NvBlockDataMapping` owned by a `BulkNvDataDescriptor`** [Any `NvBlockDataMapping` owned by a `BulkNvDataDescriptor` shall only aggregate an `AutosarVariableRef` in the role `readNvData` and `nvRamBlockElement` (that

in turn refers to the `BulkNvDataDescriptor.bulkNvBlock`) **at the time when the RTE is generated.**]()

Of course, [`constr_1285`] also applies for the usage of `BulkNvDataDescriptor`.

Class	BulkNvDataDescriptor			
Package	M2::AUTOSARTemplates::SWComponentTemplate::NvBlockComponent			
Note	This meta-class represents one bulk NV Data Block that is read-only for the application software. The purpose of a bulk NV Data Block is to provide access to information uploaded to the vehicle at e.g. the end of the production line.

Table 11.12: BulkNvDataDescriptor

11.4.7 SwcInternalBehavior of an NvBlockSwComponentType

[`TPS_SWCT_01150`] **InternalBehavior of a NvBlockSwComponentType to enable access to the NVRAM Block management API** [In general, the `InternalBehavior` of a `NvBlockSwComponentType` is only used for a limited scope.

The main use case is that the `NvBlockSwComponentType` defines `PPortPrototypes` typed by a `ClientServerInterface` to enable access to the NVRAM Block management API.

To enable the configuration of the server invocation in the RTE's ECU configuration, the `NvBlockSwComponentType` needs to provide the following model elements:

- `OperationInvokedEvents`
- server `RunnableEntity`
- `PortDefinedArgumentValues` to define the NVRAM Block ID which has to be passed to the NvM

In addition to the above list further model elements may qualify; the details are explained in [`TPS_SWCT_01584`].]()

[TPS_SWCT_01152] **InternalBehavior** does not have further attributes [It is not expected, that such **InternalBehavior** do have further attributes like **ExclusiveAreas**, per-instance memory or inter-runnable variables, etc.]()

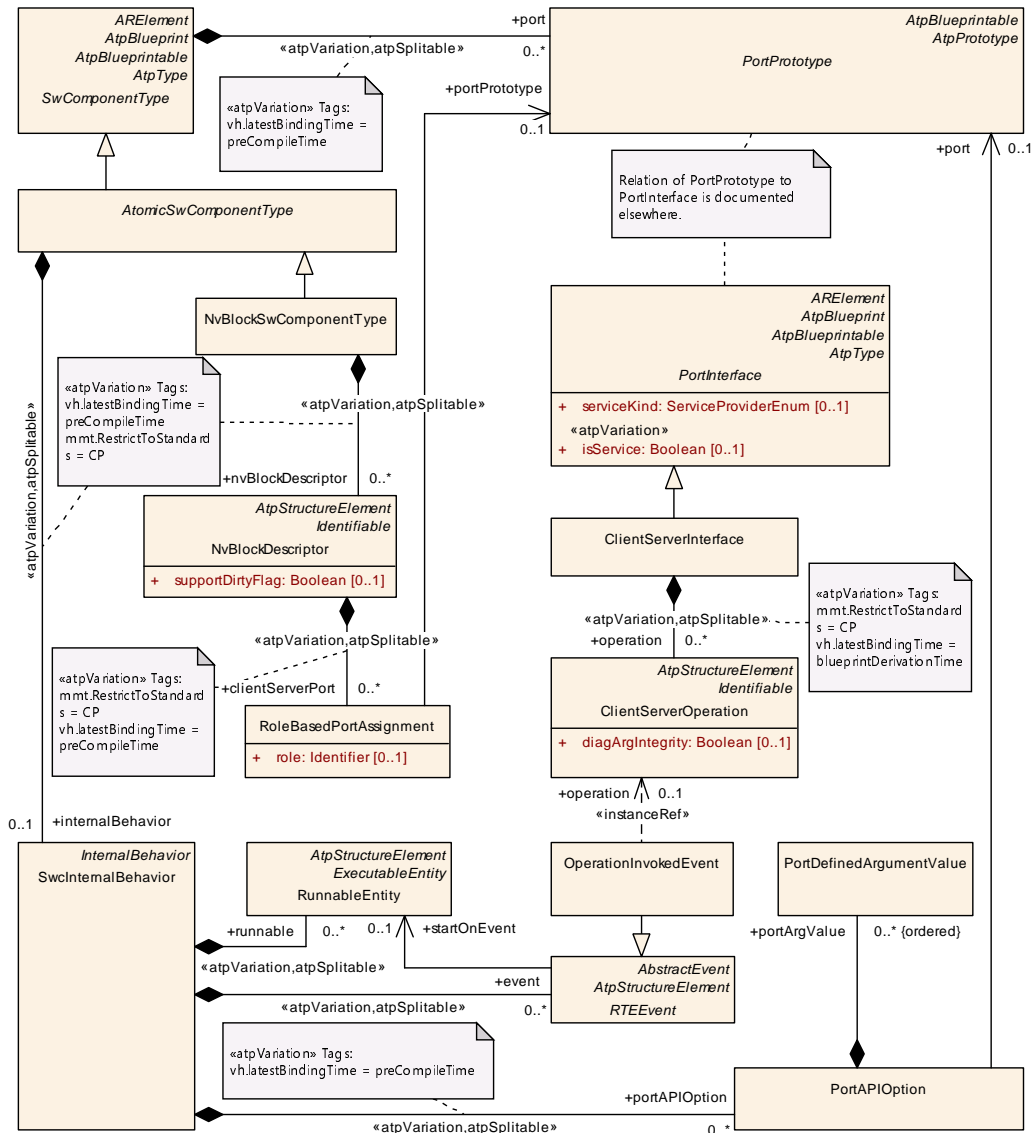

Figure 11.20: **NvBlockSwComponentType** and **SwcInternalBehavior**

[TPS_SWCT_01584] **InternalBehavior** of a **NvBlockSwComponentType** for implementing a writing strategy [For the use case that **NvBlockDescriptors** exists that aggregate **NvBlockNeeds** which, in turn, define particular NV data writing strategies (by defining any of the attributes **storeAtShutdown**, **storeImmediate**, **storeEmergency**, or **storeCyclic**) the **InternalBehavior** of a **NvBlockSwComponentType** needs to support further model elements.

Particularly, In addition to the model elements listed in [TPS_SWCT_01150], the following list of model elements can be used in the **InternalBehavior** of a **NvBlockSwComponentType** for implementing writing strategies:

- `TimingEvents` (which may include references to `ModeDeclarations` in the role `disabledMode`)
- `DataReceivedEvents` (which may include references to `ModeDeclarations` in the role `disabledMode`)
- `SwcModeSwitchEvents`
- `RunnableEntities`

]([RS_SWCT_03225](#))

[TPS_SWCT_01151] `RunnableEntities` do not have further attributes [The same condition exists for the `RunnableEntities` of such `InternalBehavior` which shall not define further attributes, e.g. data access points (implemented by means of references from `SwcInternalBehavior` to `VariableAccess`) or `ServerCallPoints`.]()

[constr_1234] Value of `RunnableEntity.symbol` [The value of a `RunnableEntity.symbol` owned by an `NvBlockSwComponentType` that is triggered by an `OperationInvokedEvent` shall only be taken from the set of API names associated with the `NvM`.

This rule shall be imposed **at the time when the RTE is generated.**]()

For example, `RunnableEntity.symbol` owned by an `NvBlockSwComponentType` could rightfully be set to `NvM_ReadBlock` [36] but an arbitrary value like `ReadThisBlock` is not permitted.

The rationale for [constr_1234] is that the `RunnableEntities` that are triggered by an `OperationInvokedEvent` are not existing as such but are mapped to the respective function calls of the `NvM`. For more details of how this mapping can be achieved please refer to [6].

Please note that no restriction applies for the value of attribute `RunnableEntity.symbol` of any `RunnableEntity` owned by an `NvBlockSwComponentType` that is triggered by an `RTEEvent` other than `OperationInvokedEvent`.

[constr_2015] Limitation of `SwcInternalBehavior` of a `NvBlockSwComponentType` [The `SwcInternalBehavior` of a `NvBlockSwComponentType` is only permitted to define

- `OperationInvokedEvents`
- `RunnableEntities` triggered by `OperationInvokedEvents` (server `RunnableEntities`)
- `RunnableEntities` which defines only the mandatory attributes `symbol` and `canBeInvokedConcurrently`
- `PortAPIOptions` defining `PortDefinedArgumentValues`

- `TimingEvents` (which may include references to `ModeDeclarations` in the role `disabledMode`)
- `DataReceivedEvents` (which may include references to `ModeDeclarations` in the role `disabledMode`)
- `SwcModeSwitchEvents`
- `RunnableEntitys` triggered by `TimingEvents`
- `RunnableEntitys` triggered by `DataReceivedEvents`
- `RunnableEntitys` triggered by `SwcModeSwitchEvents`
- `DataTypeMappingSet`

This rule shall be imposed **at the time when the RTE is generated.**]()

[constr_1309] Existence of `NvBlockDescriptor.timingEvent` [The attribute `NvBlockDescriptor.timingEvent` shall exist **at the time when the RTE is generated** if and only if the `NvBlockDescriptor.nvBlockNeeds.storeCyclic` exists and is set to the value `true`.]()

Note that there is a conceptual connection between the values of the two attributes `NvBlockDescriptor.timingEvent.period` and `SwcServiceDependency.serviceNeeds.cyclicWritingPeriod`.

Specifically, the `SwcServiceDependency.serviceNeeds.cyclicWritingPeriod` represents a requirement and the `NvBlockDescriptor.timingEvent.period` is supposed to fulfill the requirement.

[TPS_SWCT_01585] Relevance of `NvBlockDescriptor.timingEvent.period` [For any given `NvBlockDescriptor`, the value of the attribute `NvBlockDescriptor.nvBlockNeeds.cyclicWritingPeriod` shall be ignored and the value of `NvBlockDescriptor.timingEvent.period` shall be taken to specify the effective writing frequency for cyclic storage.](*RS_SWCT_03225*)

[TPS_SWCT_01662] Applicability of `DataTypeMappingSets` inside an `NvBlock-SwComponentType` [The `DataTypeMappingSets` to be applied for a given `NvBlockDescriptor` is the superset of `NvBlockDescriptor.dataTypeMapping` and `InternalBehavior.dataTypeMapping`.](*RS_SWCT_03225*)

12 Software Component Documentation

AUTOSAR supports documentation of software component types by adopting the principles of ASAM-FSX [37] Standard to AUTOSAR.

With AUTOSAR Release 4.0, the AUTOSAR XML schema provides support for integrated and well-structured documentation.

More details about the AUTOSAR Documentation Support Concept can be found in the AUTOSAR Generic Structure Template [11].

[TPS_SWCT_01062] Documentation of software-components [The documentation of a `SwComponentType` is composed of several `Chapters`.

Some `Chapters` are predefined, describing the component from the perspective of different activities performed on the component, like:

- testing it (`swTestDesc`)
- maintaining it (`swMaintenanceNotes`)
- calibrating it (`swCalibrationNotes`)
- performing diagnostic (`swDiagnosticsNotes`)

|(`RS_SWCT_02110`, `RS_SWCT_03230`)

The documentation of a `SwComponentType` is shown in figure 12.1.

Two other predefined `Chapters` describe the component (`swFeatureDesc`) and define its physical functionality (`swFeatureDef`).

In order to describe additional aspects of a software component, an arbitrary number of free `Chapters` can be defined.

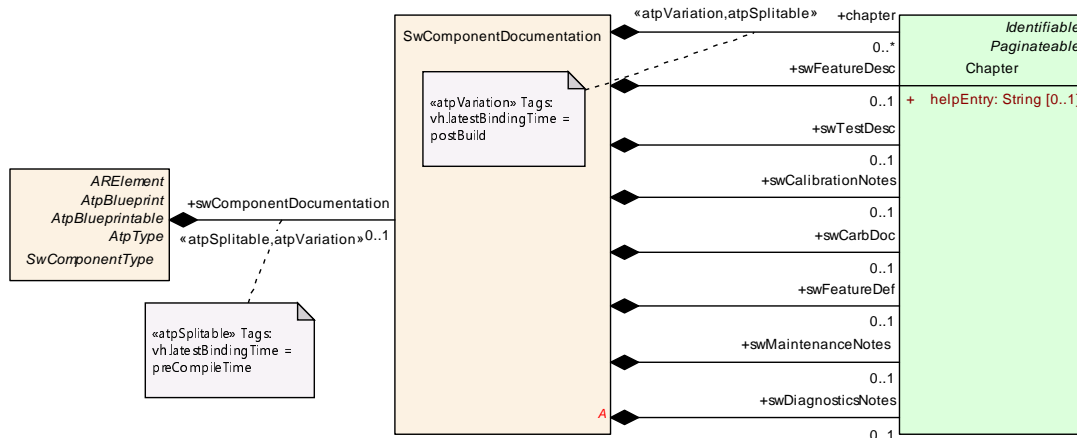

Figure 12.1: Software component documentation

The predefined `Chapters` typically provide informal guideline (e.g. recommendation) or documentation.

Formal information can be captured using special data groups [11] or annotating documentation construct with semantic information. This could be used to extend the predefined [Chapters](#) or in separate free [Chapters](#).

Note that the documentation of a software component can be stored in a different file than the component itself (i.e., it is `<<atpSplitable>>` from the component).

Each of the predefined and free [Chapters](#) follows the `<<atpVariation>>` stereotype to support variant handling (see [11]) on the documentation at the [Chapter](#) level.

These [VariationPoints](#) set the latest binding time to the value `AdditionalBindingTimeEnum.postBuild` because the decision to include or exclude a [Chapter](#) as well as the decision which variant of this [Chapter](#) should be included can be made when the component has been built.

13 Service Dependencies and Service Use Cases

13.1 Overview

Meta-class `SwcServiceDependency` represents a powerful concept to describe the service-related capabilities of an `AtomicSwComponentType`.

It is still required to understand how to configure `SwcServiceDependency` and related meta-classes for specific service use cases.

This chapter contains a detailed description of the meta-classes related to `SwcServiceDependency` in the context of specific service use cases, as well as modeling hints for the configuration of the respective service use cases.

13.2 NvM Service Dependencies

The meta-class `NvBlockNeeds` is used to define requirements to configure the NVRAM Manager Service. In addition, it may define requirements how the RTE shall implement writing strategies of an `NvBlockSwComponentType`.

An `SwcInternalBehavior` may provide several `SwcServiceDependencies` that in turn aggregate an `NvBlockNeeds` element where each defines the requirements from one NVRAM Block (for more information on the AUTOSAR NVRAM Manager see [36]).

A diagram that explains the modeling of `ServiceNeeds` for the NVRAM Manager Service can be found in Figure 11.12.

There are several use cases how a software-component can interact with the NVRAM Manager service. Each use case is discussed in a separate sub-chapter.

Enumeration	RamBlockStatusControlEnum
Package	M2::AUTOSARTemplates::SWComponentTemplate::NvBlockComponent
Note	This enumeration type defines options for how the management of the ramBlock status is controlled.
Aggregated by	<code>NvBlockNeeds.ramBlockStatusControl</code>
Literal	Description
api	The ramBlock status is controlled via service interface by usage of the SetRamBlockStatus operation. Tags: atp.EnumerationLiteralIndex=0
nvRamManager	The ramBlock status is controlled exclusively by the Nv Ram Manager. Tags: atp.EnumerationLiteralIndex=1

Table 13.1: RamBlockStatusControlEnum

13.2.1 Nvm Use Case: Permanent RAM Block

Scenario: a `AtomicSwComponentType` is using an NVRAM Block with a Permanent RAM Block implemented by a `PerInstanceMemory` section or a `VariableDataPrototype` in the role `arTypedPerInstanceMemory`. In either case, the required memory for the Permanent RAM Block is allocated by the RTE during ECU Configuration.

In this case the following rules apply:

[TPS_SWCT_02501] Setup for Nvm Use Case: Permanent RAM Block [

RoleBasedPortAssignment

For every used `ClientServerInterface` provided by the NvM it is necessary to create a `RoleBasedPortAssignment` and set the value of the attribute `role` of the `RoleBasedPortAssignment` to the name of the used standardized `ClientServerInterface`. The following `ClientServerInterfaces` shall (i.e. lower multiplicity > 0) or can (lower multiplicity = 0) be used in this context:

- `NvmService` [0 .. 1]
- `NvMNotifyJobFinished` [0 .. 1]
- `NvMNotifyInitBlock` [0 .. 1]
- `NvMAdmin` [0 .. 1]

RoleBasedDataAssignment

`RoleBasedDataAssignment` shall be created that refers to either the `PerInstanceMemory` in the role `usedPim` or to the `VariableDataPrototype` in the role `usedDataElement`. The value of the attribute `role` of the `RoleBasedDataAssignment` shall be set to `ramBlock`.

Optionally, it is possible to create an additional `RoleBasedDataAssignment` to a `ParameterDataPrototype` in the role `usedParameterElement`. The value of the `ParameterDataPrototype` is then taken as the initial or default value for the NVRAM Block. In this case the value of the attribute `role` of the `RoleBasedDataAssignment` shall be set to `defaultValue`.

Therefore, the following roles are applicable:

- `ramBlock` [1]
- `defaultValue` [0 .. 1]

RepresentedPortGroup

N/A

]([RS_SWCT_03225](#))

For more information please refer to [SWS_NvM_00734], [SWS_NvM_00735], [SWS_NvM_00736], and [SWS_NvM_00737].

The same mechanism (see description of scenario) applies also for an `NvBlock-SwComponentType`. For each NVRAM Block the NVRAM Manager can be configured (with the help of `SwcServiceDependency.assignedData`) to use the same Permanent RAM Block.

It is the responsibility of the NVRAM Manager to provide the content of the NVRAM Block in this Permanent RAM Block during startup or on explicit request and to write back the content to the storage medium during shut-down or on explicit request.

13.2.2 Nvm Use Case: Temporary RAM Block

Scenario: an `AtomicSwComponentType` is using some NVRAM Block with a Temporary RAM Block.

In this case the `AtomicSwComponentType` is responsible for allocating the allocation of sufficient memory. In other words, the `AtomicSwComponentType` shall provide a memory area that is available to the API call to the NVRAM Manager for storage of the NV data.

[TPS_SWCT_02502] Setup for Nvm Use Case: Temporary RAM Block [

RoleBasedPortAssignment

This is mandatory for the described scenario. For every used `ClientServerInterface` provided by the Nvm it is necessary to create a `RoleBasedPortAssignment` and set the value of the attribute `role` of the `RoleBasedPortAssignment` to the name of the used `ClientServerInterface`. The following `ClientServerInterfaces` shall (i.e. lower multiplicity > 0) or can (lower multiplicity = 0) be used in this context:

- `NvmService` [1]
- `NvMNotifyJobFinished` [0 .. 1]
- `NvMNotifyInitBlock` [0 .. 1]
- `NvMAdmin` [0 .. 1]

RoleBasedDataAssignment

The usage of a `RoleBasedDataAssignment` with attribute `role` set to `defaultValue` is optional and depends on whether an initial value is required.

- `defaultValue` [0..1]

RoleBasedDataTypeAssignment

By this means it is possible to define the data-type of a Temporary RAM Block. The data type information can be used to calculate the NVRAM Block size. [constr_1301] applies.

- `temporaryRamBlock` [0..1]

RepresentedPortGroup

N/A

](RS_SWCT_03225)

[constr_1301] Existence of RoleBasedDataTypeAssignment.role vs. RoleBasedDataAssignment.role [The usage of a `RoleBasedDataTypeAssignment` with attribute `role` set to the value `temporaryRamBlock` is only allowed if no `RoleBasedDataAssignment` defined with attribute `role` set to value `defaultValue` exists in the owning `SwcServiceDependency`.

This rule shall be imposed **at the time when the RTE is generated.**]()

The rationale for [constr_1301] is that the existence of a `RoleBasedDataAssignment` would already provide sufficient information for the intended purpose. The parallel existence of a `RoleBasedDataTypeAssignment` is therefore fully redundant and could only lead to potential inconsistencies.

For more information please refer to [SWS_NvM_00734], [SWS_NvM_00735], [SWS_NvM_00736], and [SWS_NvM_00737].

13.2.3 Nvm Use Case: RAM Block with explicit synchronization using Mirror Interfaces

Scenario: an `AtomicSwComponentType` is using an `NVRAM Block` where the `RAM Block` uses explicit synchronization by means of mirror interfaces. In this case the `RAM Block` does not necessarily have to be formally described by means of a `PerInstanceMemory` or a `VariableDataPrototype` in the role `arTypedPerInstanceMemory`.

Consequently, the software-component itself is responsible for the allocation of memory. On the other hand, this can also mean that the software-component can use several `RAM Blocks` instead of just one `RAM Block`.

[TPS_SWCT_02504] Setup for Nvm Use Case: RAM Block with explicit synchronization using Mirror Interfaces [

RoleBasedPortAssignment

This is mandatory for the described scenario. For every used `ClientServerInterface` provided by the `Nvm` it is necessary to create a `RoleBasedPortAssignment` and set the value of the attribute `role` of the `RoleBasedPortAssignment` to the name of the used `ClientServerInterface`. The following `ClientServerInterfaces` shall (i.e. lower multiplicity > 0) or can (lower multiplicity = 0) be used in this context:

- `NvMService` [0..1]
- `NvMNotifyJobFinished` [0..1]
- `NvMNotifyInitBlock` [0..1]

- NvMAdmin [0..1]
- NvMMirror [1]

RoleBasedDataAssignment

In this scenario the existence of a `RoleBasedDataAssignment` is optional. The `RoleBasedDataAssignment` needs to reference a `ParameterDataPrototype` aggregated by the enclosing `SwcInternalBehavior` in the role `perInstanceParameter` or `sharedParameter`.

- `defaultValue` [0..1]

RoleBasedDataTypeAssignment

By this means it is possible to define the data-type of a temporary RAM Block and used internal data structure in case of explicit synchronization with NvMMirror interface respectively. The data type information can be used to calculate the NVRAM Block size and minimum Permanent RAM Block size. [\[constr_1301\]](#) applies.

- `temporaryRamBlock` [0..1]

RepresentedPortGroup

N/A

]([RS_SWCT_03225](#))

For more information please refer to [\[SWS_NvM_00734\]](#), [\[SWS_NvM_00735\]](#), [\[SWS_NvM_00736\]](#), [\[SWS_NvM_00737\]](#), and [\[SWS_NvM_00738\]](#).

13.2.4 NVM Use Case: Software-Components using Nv Data provided by NvBlockSwComponentType (not ServiceSwComponent of NvM)

Scenario: an `AtomicSwComponentType` is using an NVRAM Block managed by an `NvBlockSwComponentType` (see section [11.4.2](#), as opposed to an NVRAM Block provided by a `ServiceSwComponentType`). Constraints [\[constr_1148\]](#), [\[constr_1149\]](#), and [\[constr_2011\]](#) apply.

[TPS_SWCT_02503] Setup for NVM Use Case: Software-Components using Nv Data provided by NvBlockSwComponentType [

RoleBasedPortAssignment

This is mandatory for the described scenario. For every used `ClientServerInterface` provided by the NvM it is necessary to create a `RoleBasedPortAssignment` and set the value of the attribute `role` of the `RoleBasedPortAssignment` to the name of the used `ClientServerInterface`. The following `ClientServerInterfaces` shall (i.e. lower multiplicity > 0) or can (lower multiplicity = 0) be used in this context:

- NvMService [0..1]

- NvMNotifyJobFinished [0..1]
- NvMNotifyInitBlock [0..1]
- NvMAdmin [0..1]

For every `PortPrototype` of a software-component typed by an `NvDataInterface` defining a `SwcServiceDependency` it is necessary to create a `RoleBasedPortAssignment` and set the value of the attribute `role` of the attribute `assignedPort` to the value `NvDataPort`:

- `NvDataPort` [1..*]

RoleBasedDataAssignment

N/A

RepresentedPortGroup

N/A

For supporting this use case the value of attribute `SwcServiceDependency.category` shall be set to `NV_BLOCK_COMPONENT`.] ([RS_SWCT_03225](#))

For more information please refer to [SWS_NvM_00734], [SWS_NvM_00735], [SWS_NvM_00736], and [SWS_NvM_00737]. Note that `NvBlockNeeds` (described in Chapter 11.4.5) is not in the scope of this use case.

13.3 Watchdog Service Dependencies

The meta-class `SupervisedEntityNeeds` is used to define requirements to configure the Watchdog Service. For the terms related to the AUTOSAR Watchdog Manager see [38].

13.3.1 Watchdog Service use Case: Local Supervision

The service interaction with the *Watchdog Manager* consists of two aspects:

- supervised entity
- checkpoint

For each of the two aspects a separated `ServiceNeeds` is defined. However, the `SwcServiceDependencies` that own these `ServiceNeeds` are semantically bound and cannot be used independently of each other.

In other words, the usage of two kinds of `SwcServiceDependency` in concert creates a higher-level semantics. Of course, in order to express this higher-level semantics a reference between the `SwcServiceDependencies` has to be available.

However, since the `SwcServiceDependency` represents a generic concept the actual reference needs to be implemented on the level of specific subclass of `ServiceNeeds`, in this case the `SupervisedEntityNeeds` and the `SupervisedEntityCheckpointNeeds`.

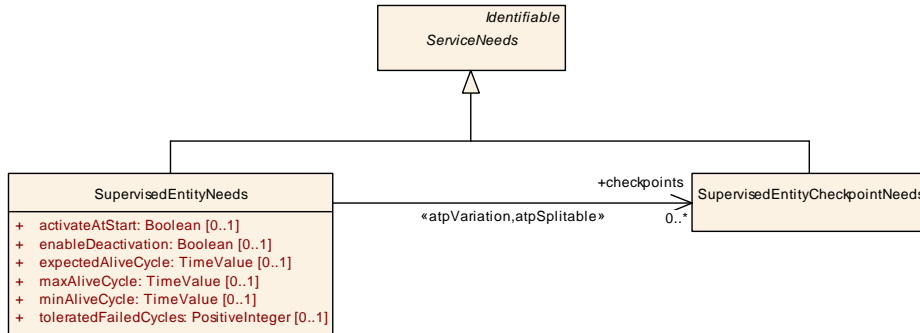

Figure 13.1: Modeling of `ServiceNeeds` for the watchdog

The former refers to the latter in order to express the relation of a supervised entity to its checkpoints.

Class	SupervisedEntityNeeds

13.3.3 Watchdog Service use Case: Control global supervision or get global supervision status

Scenario: an [AtomicSwComponentType](#) either controls the global operation of the watchdog manager or gets information about the current operation status, requiring at least one of the following use cases:

- Set the current mode of Watchdog Manager
- Get the current mode of the Watchdog Manager
- Get the global supervision status of the Watchdog Manager
- Identifier of the supervised entity that first reached the expired state
- Instruct the Watchdog Manager to cause a watchdog reset

For instance, the software-component sets the current mode of the Watchdog Manager according to the operational state of the ECU or polls the global supervision status.

In this case the following setup applies:

[TPS_SWCT_01703] Setup for [AtomicSwComponentType](#) which sets or gets the Global Supervision Status [

Please note that this scenario covers the reporting of a single checkpoint. In many cases, several checkpoints are reported in the context of a given supervised entity.

For more information please refer to [SWS_WdgM_00333].

13.4 COM Manager Service Needs

The meta-class `ComMgrUserNeeds` is used to define requirements to configure the ComM Service.

An `SwcInternalBehavior` may provide several `ComMgrUserNeeds` elements where each defines the requirements from one “user” of the ComM Service. Especially, it defines which `PortGroup` is associated with this “user”.

Class	ComMgrUserNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	Specifies the abstract needs on the configuration of the Communication Manager for one "user".

](RS_SWCT_03200)

For clarification, the difference between the two service use case descriptions [TPS_SWCT_01019] and [TPS_SWCT_01811] is that the latter reads the ComM mode in the context of a PNC definition while the former does not consider partial networking.

13.5 ECU State Manager Service Needs

The meta-class `EcuStateMgrUserNeeds` is used to define the requirements to configure the ECU State Manager Service.

An `SwcInternalBehavior` may provide several `EcuStateMgrUserNeeds` elements where each defines the requirements from one “user” of the EcuM Service (for the terms related to the AUTOSAR ECU State Manager see [39]).

Class	EcuStateMgrUserNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	Specifies the abstract needs on the configuration of the ECU State Manager for one "user". This class currently contains no attributes. Its name can be regarded as a symbol identifying the user from the viewpoint of the component or module which owns this class.

13.6 BswM

All use cases for interaction of an application software-component with the `BswM` require the aggregation in the role `serviceNeeds` of `BswMgrNeeds`, a subclass of `ServiceNeeds`, at `SwcServiceDependency`.

Class	BswMgrNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	Specifies the abstract needs on the configuration of the Basic Software Manager for one "user".			
Base	<code>ARObject</code> , <code>Identifiable</code> , <code>MultilanguageReferrable</code> , <code>Referrable</code> , <code>ServiceNeeds</code>			
Aggregated by	<code>BswServiceDependency.serviceNeeds</code> , <code>SwcServiceDependency.serviceNeeds</code>			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table 13.8: BswMgrNeeds

13.6.1 Partial Networking

One specific use case for the existence of a `SwcServiceDependency` with respect to the interaction with the `BswM` is the support for partial networking, in particular the association of a `PortGroup` and the associated `PortPrototypes` that act as *VFC control ports* and *VFC status ports*.

For more details please refer to section 4.8.

In this case the following rules apply:

[TPS_SWCT_01126] Access to partial networking via BswM [

RoleBasedPortAssignment valid roles:

- `control` [0 .. 1]
- `status` [0 .. 1]

RoleBasedDataAssignment

N/A

RepresentedPortGroup

Reference to the applicable `PortGroup` associated with the particular partial network.

]([RS_SWCT_03200](#), [RS_SWCT_03201](#))

The multiplicities of the `RoleBasedPortAssignments` for this case have been defined under the assumption that a given software-component may or may not have a *VFC control port*. Also, it may have a *VFC status port*. Technically, there could be several *VFC status ports* per software-component but most likely there is only one *VFC status port*.

13.6.2 Mode Manager

A software-component that acts as a mode manager exposes a `PPortPrototype` typed by a `ModeSwitchInterface`. By this means the mode manager communicates changes of the particular mode to the connected mode users.

On the side of the `BswM`, an `RPortPrototype` typed by an `ModeSwitchInterface` used to receive notifications of mode switches will have to be established (for more details, please refer to [SWS_BswM_00200]).

In this case the following rules apply:

[TPS_SWCT_01552] Software-component acts as a mode manager [

ServiceNeeds kind `BswMgrNeeds`

RoleBasedPortAssignment valid roles:

- `AppModeInterface` [1]

RoleBasedDataAssignment

N/A

RepresentedPortGroup

none

|(RS_SWCT_03110, RS_SWCT_03200, RS_SWCT_03203)

A slight variation of this use case exists if the Application Mode Manager serves mode users that consist of both the BswM and other [ApplicationSwComponentTypes](#).

[TPS_SWCT_01572] Application Mode Manager interacts with both BswM and other [ApplicationSwComponentTypes](#) [If an Application Mode Manager interacts with both BswM and other [ApplicationSwComponentTypes](#) the following requirements on the modeling of this scenario shall be taken into account:

Mode Request For the configuration of mode requests two separate [AbstractRequiredPortPrototypes](#) shall exist:

- One [AbstractRequiredPortPrototype](#) shall be typed by a [SenderReceiverInterface](#) with attribute `isService` set to `true`. This [AbstractRequiredPortPrototype](#) shall be connected to the [SwComponentPrototype](#) typed by a [ServiceSwComponentType](#) representing the BswM.
- One [AbstractRequiredPortPrototype](#) shall be typed by a [SenderReceiverInterface](#) with attribute `isService` set to `false`. This [AbstractRequiredPortPrototype](#) shall be connected to [SwComponentPrototypes](#) typed by [ApplicationSwComponentTypes](#) that request mode changes.

Mode Switch Notification An Application Mode Manager that sends mode switch notifications to both BswM and other [ApplicationSwComponentTypes](#) shall expose a single [AbstractProvidedPortPrototype](#) for sending the mode switch notification to both the BswM and [ApplicationSwComponentTypes](#).

The value of the attribute [ModeSwitchInterface.isService](#) shall be set to `false`).

|(RS_SWCT_03200, RS_SWCT_03202)

Rationale for [TPS_SWCT_01572]: technically, the existence of two separate [AbstractProvidedPortPrototype](#) for sending the mode switch notification to both the BswM and [ApplicationSwComponentTypes](#) would end up in two separate mode machines in the RTE and it would be a tough challenge to keep both mode machines perfectly synchronized.

Therefore, the exception regarding the usage of the attribute `isService` is justified to mitigate this effect.

On the mode request side, however, the situation is entirely different because the mode requests need arbitration by the Application Mode Manager anyway. This is completely in the scope of the implementation of the Application Mode Manager and AUTOSAR has no stakes in further standardizing this aspect.

Therefore, there is no motivation for a further exception with respect to the value of `isService`.

[TPS_SWCT_01664] BswM acts as a mode requester towards an application mode manager [The [SwcServiceDependency](#) that covers this use case shall refer to an [RPortPrototype](#) for the reception of the mode request and optionally to a [PPortPrototype](#) for the sending of the mode switch notification.

ServiceNeeds kind [BswMgrNeeds](#)

]([RS_SWCT_03110](#), [RS_SWCT_03200](#), [RS_SWCT_03203](#))

[constr_1680] Existence of attribute [RoleBasedDataAssignment.usedDataElement.localVariable](#) for [RoleBasedDataAssignment.role = AppModeRequestInterface](#) [If the attribute [RoleBasedDataAssignment.role](#) is set to the value [AppModeRequestInterface](#), then the reference [RoleBasedDataAssignment.usedDataElement.localVariable](#) shall not exist **at the time when the RTE is generated.**](/)

For explanation of the existence of [[constr_1680](#)], it is not intended to provide access to local variables inside the [SwcInternalBehavior](#).

13.6.3 Mode User

A software-component that acts as a mode user exposes an [RPortPrototype](#) typed by a [ModeSwitchInterface](#). By this means the software-component can be notified by mode switches executed at the mode manager (in this case the [BswM](#)).

On the side of the [BswM](#), a [PPortPrototype](#) typed by an [ModeSwitchInterface](#) used to send out notifications of mode switches will have to be established (for more details, please refer to [[SWS_BswM_00202](#)]).

In this case the following rules apply:

[TPS_SWCT_01553] Software-component acts as a mode user [

ServiceNeeds kind [BswMgrNeeds](#)

RoleBasedPortAssignment valid roles:

- [AppModeInterface](#) [1]

RoleBasedDataAssignment

N/A

RepresentedPortGroup

none

|(RS_SWCT_03110, RS_SWCT_03200, RS_SWCT_03203)

13.6.4 Mode Requester

A software-component that acts as a mode requester exposes an `PPortPrototype` typed by a `SenderReceiverInterface`. By this means the software-component can send mode requests towards the mode manager (in this case the `BswM`).

On the side of the `BswM`, an `RPortPrototype` typed by an `SenderReceiverInterface` used to requests for mode switches will have to be established (for more details, please refer to [SWS_BswM_00201]).

In this case the following rules apply:

[TPS_SWCT_01554] Software-component acts as a mode requester [

ServiceNeeds kind `BswMgrNeeds`

Please note that [constr_1680] applies for this service use case.

13.6.5 Service Oriented Use Cases

Support for service oriented communication is represented by a set of service use cases utilizing `SwcServiceDependency` in the interaction with the `BswM`. Specifically the interaction of application software-components with `ServiceDiscovery` (via the `BswM`) is handled in this section.

The AUTOSAR `ServiceDiscovery` can be configured to run autonomously (without the need of application software-components to initiate the `ServiceDiscovery`) during the startup of the ECU. In such cases there is no need to define any service oriented use cases at the respective application software-components.

This approach has the advantage that the `ServiceDiscovery` is performed without knowledge of the application software-components. But it has the disadvantage that all

the `ServiceDiscovery` is performed at startup, even if some application software-components might not require that service functionality right after startup.

Providing the application software-components with the possibility to individually control the `ServiceDiscovery` only when the functionality actually needs that information may allow a fine grained control of communication amount.

Whether a specific service instance is controlled autonomously or whether there is a dedicated application interaction to control the availability or subscription of a service can be defined individually per service instance in the TPS System Template [10] (`ProvidedServiceInstance.autoAvailable`, `ConsumedServiceInstance.autoRequire`, and `ConsumedEventGroup.autoRequire`).

Figure 13.2: General interaction of Application - BswM - ServiceDiscovery

13.6.5.1 `PortGroup` supports Relation between Software-Component and service Instance

A service can be composed of an arbitrary number of

- `SenderReceiverInterfaces` representing events, field notifiers, and fire-and-forget methods
- `ClientServerInterfaces` representing methods, field getters, and field setters
- `TriggerInterfaces` representing fire-and-forget methods without arguments.

The TPS System Template [10] provides means to define which `SenderReceiverInterfaces` and `ClientServerInterfaces` eventually build up the service in section titled "Description of Service Discovery Services in Classic Platform".

This definition applies to the `PortInterface` level, thus it is not focusing on individual `PortPrototypes`.

If an application software-component would like to consume two instances of the same service, it would not be possible to identify which set of `PortPrototypes` belongs to one service instance and which set of `PortPrototypes` belongs to the other service instance.

The relation between `PortPrototypes` and service instances is defined using a `PortGroup`.

Example 13.1

In the example depicted in Figure 13.3, a server software-component provides two `PortPrototypes`, an event and a method. A `PortGroup` is used to group these two `PortPrototypes`.

Service use cases described later in this section utilize the `SwcServiceDependency.representedPortGroup` reference to define for which `PortGroup` (service instance) a dedicated service use case applies.

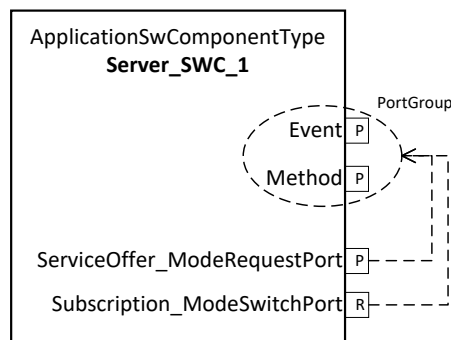

Figure 13.3: Usage of `PortGroup` to define which `PortPrototypes` belong to a service instance

The TPS System Template [10] also provides means for defining event groups (`ProvidedServiceInstance.eventHandler` and `ConsumedServiceInstance.consumedEventGroup`).

Those event groups are not directly related to the `PortGroups` discussed in this section. They may be defined in a consistent way, but it is also possible that the event groups are defined in a different way that the `PortGroups` of a specific service instance.

It is the duty of the `BswM` configuration to define one or more adequate `BswMRules` to associate the event groups to the respective events collected in the `PortGroups`.

13.6.5.2 General Server interaction

The server has 2 use cases defined for the interaction with service discovery:

- service offer (section 13.6.5.5)
- subscription status for events (section 13.6.5.6).

The service offer makes this service instance available in the system.

As soon as the service offer has been made, every client can directly call the methods offered by this service instance. There is no way to place a dedicated subscription for calling the methods (including fire-and-forget methods).

The server may be interested in the information about the subscription of events (or groups of events) by any client. The granularity of the status information can be defined by the server application software-component.

Example 13.2

The servers depicted in the example in Figure 13.4 illustrate some aspects of the server service discovery approach:

The server *Server_SWC_1* is simple and just provides two events and one method. One *PPortPrototype* has been defined to offer this service and another *RPortPrototype* is used to receive information about the subscription status .

The server *Server_SWC_2* has some more features, it also provides two events and one method, and additionally receives a “call” of a fire-and-forget method. One *PPortPrototype* offers this service and two *RPortPrototypes* are used to receive information about the subscription status.

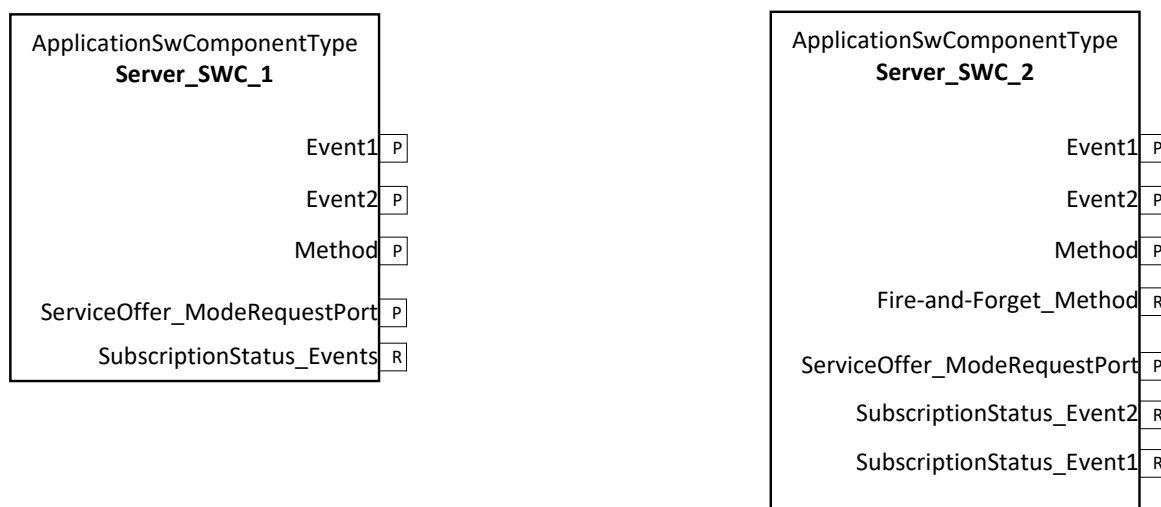

Figure 13.4: Server examples

13.6.5.3 General Client interaction

The client has several use cases defined for the interaction with service discovery:

- event (and method) subscription (section 13.6.5.7)
- event (and method) subscription status (section 13.6.5.8)

The service discovery for clients in AUTOSAR is specified to consist of two steps from the clients perspective:

- *finding* a service instance and
- *subscribing* to an event (group).

On the level of application software-components and service definitions, the event groups are not visible. Event groups get introduced in the system description (see TPS System Template [10]) in the context of definition of the communication matrix.

The event subscription in the service use cases are defined on the level of events. It is the duty of the `BswM` configuration to define one or more adequate `BswMRules` to derive the corresponding event groups out of the individual service instance events for subscriptions in the service discovery.

The application software-components on the *AUTOSAR classic Platform* do not have any means to influence the choice on the offered service instances during the service discovery *find*. This is the reason why there is no explicit *find* service use case defined in this section. The *find* is included in the respective subscription use cases.

From the client's perspective, there is no difference between subscribing to an event or "subscribing" to a method. The use case defined in section 13.6.5.7 does not distinguish whether there are just

- events,
- events and methods,
- or just methods

involved. It is again the `BswM` which is configured to represent the corresponding actions for the service discovery.

Example 13.3

The example clients in figure 13.5 illustrate some aspects of the client service discovery approach:

The exemplary client *Client_SWC_1* is simple and just consumes two events and one method. One `PPortPrototype` is defined to subscribe for all of the events and methods of this service.

One `RPortPrototype` is used to inform the client whether the subscription to the whole service was successful. This means: if there is a service instance *found* (this enables the usage of the method) **and** the *subscription* to **both** events is successful, then the `RPortPrototype` indicates that the subscription is successful.

This also means, that if the *subscription* to at least one of the events is not successful, the indication for the whole service is not successful.

The client *Client_SWC_2* has some more features: it requires two events and one method, and additionally sends a fire-and-forget method. One `PPortPrototype` is

defined to subscribe to this service's events and a second `PPortPrototype` exists to "subscribe" to the service's methods. Two `RPortPrototypes` are defined to receive the subscription status of the events and methods.

For the `PPortPrototype`, to "subscribe" to this service's methods means that (if not already performed by the other subscription to this service) a *find* is issued to the service discovery. If the *find* is successful, the notification on the *subscription* status at the `RPortPrototype` for the methods is performed with a successful indication. Thus the application software-component can start calling the methods of that service.

For the `PPortPrototype`, to subscribe to this service's events means that (if not already performed by the other subscription to this service) a *find* is issued to the service discovery.

If the *find* is successful, the *subscription* to the events is issued to the service discovery. If then the *subscription* to **both** events is successful, the notification on the *subscription* status at the `RPortPrototype` for the events is performed with a successful indication.

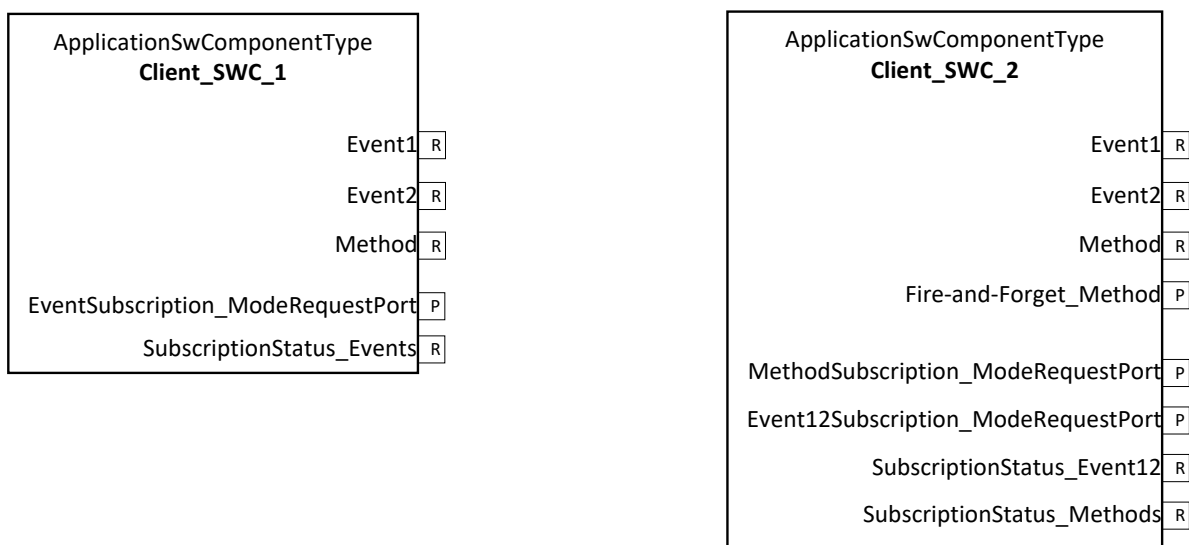

Figure 13.5: Client examples

Another example of the client interaction is given in figure 13.8.

13.6.5.4 Event Reception Without Subscription

A side effect, which needs to be taken into account by the application software-components, arises from the separate handling of service discovery mode requests and the event communication.

As soon as an event is subscribed by one application software-component inside the ECU, this event is forwarded to all receivers on that ECU, regardless whether they actually have subscribed to that event or not.

The communication path is not restricted by the service discovery or the `BswM`. Thus, there is no way to prevent the reception of events that have not been subscribed to by each individual receiving application software-component.

Example 13.4

One cause for the unintended reception of events is sketched in figure 13.6. Two independent application software-components are interested in the same event of the same service instance.

Each application software-component has an `RPortPrototype` to actually receive the event. Each of the application software-components has a `PPortPrototype` to initiate the subscription to that event and an `RPortPrototype` to get notification on the event subscription status.

When one of the application software-component starts the subscription of the event (e.g. `Client_SWC_1`), then the `BswM` will forward the subscription request to the service discovery.

When the service discovery eventually receives the subscription acknowledgement the `BswM` gets notified and forwards that subscription status notification to **all** application software-component which have a corresponding event subscription status notification `RPortPrototype` defined.

Thus, `Client_SWC_1` gets a notification on the successful subscription of the event. But **also** `Client_SWC_2` get a notification on the successful subscription of that event, although `Client_SWC_2` didn't subscribe to that event!

Now, when the event messages actually arrive at that ECU, the events are indicated to be received to **all** the application software-components which have an `RPortPrototype` to receive the event. Thus `Client_SWC_1` will receive that event but also `Client_SWC_2` will receive the event.

One possible solution to that issue is to guard any subscription status notification and event reception with the application software-component own event subscription request: Only if the application software-component actually did subscribe to that event, then incoming subscription status notifications and event receptions will be considered by the application software-component.

Another approach might be to use `RTEEvent.disabledMode` configuration to disable the notification in a specific mode.

Another source of unintended event reception may be the definition of the communication matrix and the assignments of events to event groups.

If two events on the client application software-component are handled via two separate `PortPrototypes` for the subscription of these events, but the events are defined to be part of the same event group in the communication matrix, then both events will be received by the application software-component, even it asked only for the subscription of one event.

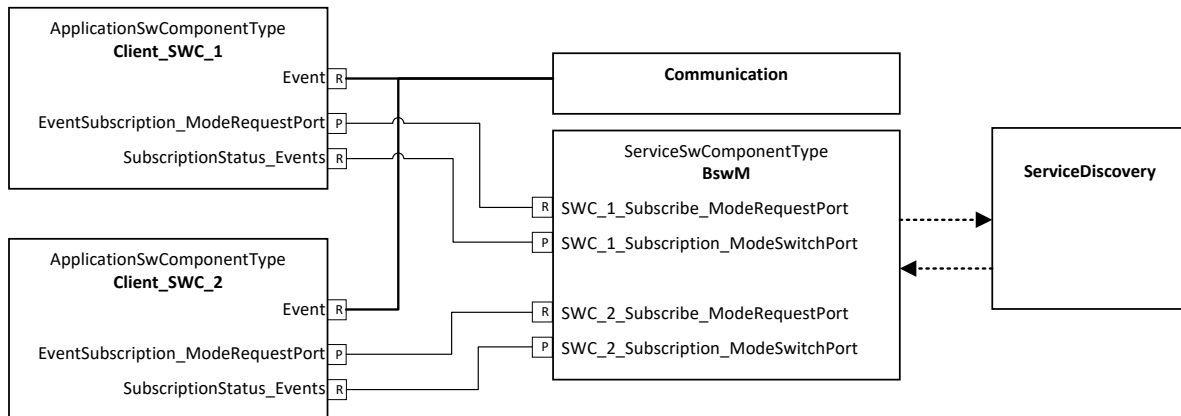

Figure 13.6: Unintended event reception

13.6.5.5 Use Case: Server Service Offer

A software-component that implements the server functionality acts as a mode requester and exposes a `PortPrototype` typed by a `SenderReceiverInterface`. By this means, the software-component can send mode requests towards the `BswM` in order to *offer* and *stop offer* that service instance.

On the side of the `BswM`, a `PortPrototype` typed by the same `SenderReceiverInterface` is used to requests for mode switches.

In this case the following rule applies:

[TPS_SWCT_03502] Software-component acts as a server and offers the service

ServiceNeeds kind `BswMgrNeeds`

RoleBasedPortAssignment

N/A

RoleBasedDataAssignment valid roles:

- `ServerServiceOffer` [1]

RepresentedPortGroup

Reference to the service instance `PortGroup` representing this server's `PortPrototypes` [1]

](`RS_SWCT_03110`, `RS_SWCT_03200`, `RS_SWCT_03202`)

[constr_3688] Existence of attribute `RoleBasedDataAssignment.usedDataElement.localVariable` for `RoleBasedDataAssignment.role = ServerServiceOffer` [If the attribute `RoleBasedDataAssignment.role` is set to the value `ServerServiceOffer`, then the reference `RoleBasedDataAssignment.usedDataElement.localVariable` shall not exist **at the time when the RTE is generated.**]()

For explanation of the existence of **[constr_3688]**, it is not intended to provide access to local variables inside the `SwcInternalBehavior`.

13.6.5.6 Use Case: Server Service Subscription Status

A server instance sending events or field notifications might not need to produce and send those events if there are no subscriptions for that server instance events.

In order to notify the server instance whether there is at least one subscriber interested in the server's events a `ModeSwitchInterface` is available to receive the subscription notifications.

A software-component that acts as a server and is interested in the subscription status for the service instance events exposes an `RPortPrototype` typed by a `ModeSwitchInterface`. By this means, the software-component can be notified by the `BswM` on subscription changes.

On the side of the `BswM`, a `PPortPrototype` typed by the `ModeSwitchInterface` is used to send out notifications.

In this case, the following rules apply:

[TPS_SWCT_03503] Software-component receives notification on server event subscription status changes [

ServiceNeeds kind `BswMgrNeeds`

RoleBasedPortAssignment valid roles:

- `ServerEventSubscriptionStatus` [1]

RoleBasedDataAssignment

N/A

RepresentedPortGroup

Reference to the service instance `PortGroup` representing this server's `Port-Prototypes` (or the subset relevant for this notification) [1]

] (*[RS_SWCT_03110](#), [RS_SWCT_03200](#), [RS_SWCT_03203](#)*)

The granularity of the referenced `representedPortGroup PortGroup` may vary depending on the desired notification granularity.

One approach can be to use one `PortGroup` for the entire service instance. This may be the same `PortGroup` which is also used for the service offer in [TPS_SWCT_03502].

In this case any included `PortPrototypes` typed by a `ClientServerInterface` or `TriggerInterface` are ignored, as they do not participate in the subscription of events. This approach is sketched in the example `Service_SWC_1` in figure 13.7.

Another approach can be to group one or some `PortPrototypes` in separate `PortGroups` and define a dedicated `SwcServiceDependency` for each of these `PortGroups`.

Example 13.5

This approach is illustrated in the example `Service_SWC_2` in Figure 13.7, where the `Service_SWC_2` has two `RPortPrototypes` to receive individual notification for `PortGroup1` and `PortGroup2`.

It is the duty of the `BswM` configuration to define one or more adequate `BswMRules`, which take the subscription status from the `ServiceDiscovery` and combine them to get the status which represents the subscription status of the events included in the specific `PortGroup`.

Figure 13.7: Service subscription notification examples

The server event subscription status use case ([TPS_SWCT_03503]) is not limited to servers where the offer is controlled by the application software-component. It is also possible to get subscription status information on a server's events where the server is autonomously offered.

13.6.5.7 Use Case: Client Event / Method Subscription

A software-component that implements the client functionality acts as a mode requester and exposes a `PPortPrototype` typed by a `SenderReceiverInterface`.

By this means, the software-component can send mode requests towards the `BswM` in order to *subscribe* and *stop subscribe* of dedicated events and methods.

On the side of the `BswM`, an `RPortPrototype` typed by the same `SenderReceiverInterface` is used to requests for mode switches.

In this case the following rule applies:

[TPS_SWCT_03504] Software-component acts as a client and subscribe to events and methods [

ServiceNeeds kind `BswMgrNeeds`

RoleBasedPortAssignment

N/A

RoleBasedDataAssignment valid roles:

- `ClientEventSubscription` [1]

RepresentedPortGroup

Reference to the service instance `PortGroup` representing this client's `PortPrototypes` (or the subset relevant for this notification) [1]

](`RS_SWCT_03110`, `RS_SWCT_03200`, `RS_SWCT_03202`)

[constr_3689] Existence of attribute `RoleBasedDataAssignment.usedDataElement.localVariable` for `RoleBasedDataAssignment.role = ClientEventSubscription` [If the attribute `RoleBasedDataAssignment.role` is set to the value `ClientEventSubscription`, then the reference `RoleBasedDataAssignment.usedDataElement.localVariable` shall not exist **at the time when the RTE is generated.**](/)

For explanation of the existence of [constr_3689], it is not intended to provide access to local variables inside the `SwcInternalBehavior`.

13.6.5.8 Use Case: Client Event and Method Subscription Status

A software-component that acts as a client and is interested in the subscription status for the events and methods exposes an `RPortPrototype` typed by a `ModeSwitchInterface`. By this means the software-component can be notified by the `BswM` whether subscription was successful.

On the side of the `BswM`, a `PPortPrototype` typed by the `ModeSwitchInterface` is used to send out notifications.

In this case the following rules apply:

[TPS_SWCT_03505] Software-component receives notification on client event and method subscription status changes [

ServiceNeeds kind `BswMgrNeeds`

RoleBasedPortAssignment valid roles:

- ClientEventSubscriptionStatus [1]

RoleBasedDataAssignment

N/A

RepresentedPortGroup

Reference to the service instance `PortGroup` representing this client's `PortPrototypes` (or the subset relevant for this notification) [1]

|(RS_SWCT_03110, RS_SWCT_03200, RS_SWCT_03203)

Generally, it is up to the definition of the `PortGroups` which `PortPrototypes` are included in the event status notification use case. A different definition of `PortGroups` for the subscription status notification from the definition of `PortGroups` for the subscription itself is possible.

Figure 13.8 shows two setups for the event subscription status notification of the same client service instance which consists of two events and one method.

In the illustrative `Client_SWC_1`, the `SubscriptionStatus_EventMethod` uses a `PortGroup` to include both events and the method in one status notification.

This setup might be a good approach for the client subscription (see section 13.6.5.7), as it requests the two events and the method to become available in one go.

But for the status notification this results in a combined notification status: Only when both events **and** the method are subscribed the notification will result in a successful subscription.

The method could be already called when the first part of the service discovery (the service instance *find*) was successful. If this information is required by the application software-component, an alternative definition of subscription notifications and `PortGroups` could be more suitable:

In the illustrative `Client_SWC_2`, two notifications have been defined: one `SubscriptionStatus_Events` and one `SubscriptionStatus_Method`.

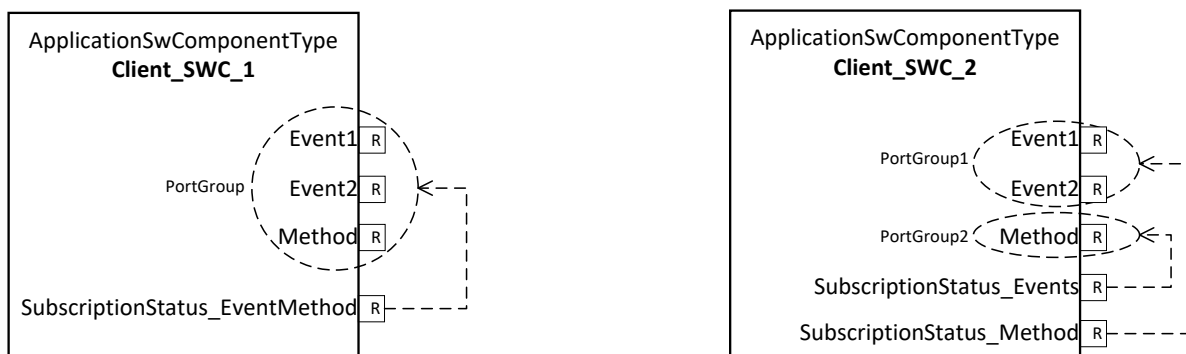

Figure 13.8: Event and Method subscription notification examples

While the notification for *SubscriptionStatus_Events* still has to wait until there is a successful subscription acknowledgement for both events available, the notification on the availability of the method can already be given when the service instance *find* was successful. Thus the method can be called already even though the events are not yet available.

13.7 Crypto Service Dependencies

13.7.1 Overview

The meta-classes [CryptoServiceNeeds](#) and [CryptoServiceJobNeeds](#) are used to define requirements for the configuration of the [CryptoServiceManager](#) respectively the crypto stack.

The usage of meta-class [CryptoKeyManagementNeeds](#) is described in section [13.7.4](#).

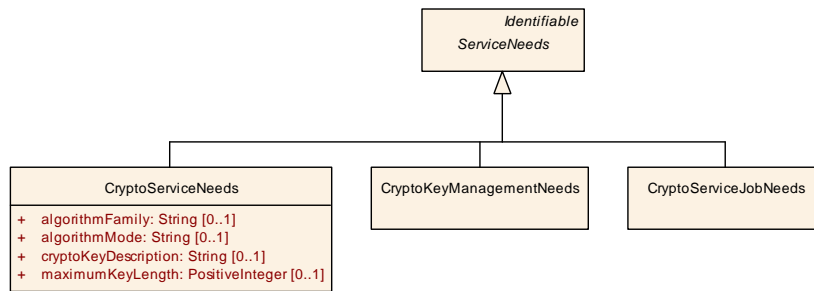

Figure 13.9: Modeling of subclasses of [ServiceNeeds](#) for cryptographic use cases

Please note that there are cryptographic APIs that build upon the creation of jobs that run asynchronously. The reason for this policy is that cryptographic operations - in many cases by design - tend to run for comparatively long time for each call. This behavior is visualized in [Figure 13.10](#).

Figure 13.10: Cryptographic operation that requires a too-long execution time

Execution of these operations synchronously in the main function would block the respective module intolerably and therefore the job API is an important measure to keep the execution of software manageable. This behavior is visualized in [Figure 13.11](#).

Figure 13.11: Execution of cryptographic operation using the job API

It is important to note that the asynchronous character of the execution is implemented on the server side and has nothing to do with asynchronous calling behavior on the client side (for more explanation about client-side calling behavior, please refer to section 7.5.2.1).

Class	CryptoServiceNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	Specifies the needs on the configuration of the CryptoServiceManager for one ConfigID (see Specification AUTOSAR_SWS_CSM.doc). An instance of this class is used to find out which ports of a software-component belong to this ConfigID.			
Base	ARObject, Identifiable, MultilanguageReferrable, Referrable, ServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds, SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
algorithmFamily	String	0..1	attr	This attribute represents a description of the family (e.g. AES) of crypto algorithm implemented by the crypto service use case.
algorithmMode	String	0..1	attr	This meta-class has the ability to represent a crypto service use case.
cryptoKey Description	String	0..1	attr	This attribute allows for a verbal description of the applicable cryptographic key. The goal is to pass a hint for the integrator about how to treat the corresponding service use case.
maximumKey Length	PositiveInteger	0..1	attr	The maximum length of a cryptographic key, that is used by the software-component or module for this configuration. Unit: bit.

Table 13.9: CryptoServiceNeeds

Class	CryptoServiceJobNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	This meta-class shall be taken to indicate that the service use case modeled with this kind of Service Needs assumes the usage of the crypto job API.			
Base	ARObject, Identifiable, MultilanguageReferrable, Referrable, ServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds, SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note

13.8 Diagnostic Service Dependency

This chapter describes the usage of the specific diagnostic meta-classes derived from `ServiceNeeds` within an atomic software-component. An overview of common diagnostic service needs has already been introduced in figure 7.38 and can be divided into four main parts:

- Function Inhibition Needs in chapter 13.8.2
- Diagnostic Event Needs in chapter 13.8.3
- Diagnostic Communication Needs in chapter 13.8.4
- Service Needs to fulfill the OBD related requirements in chapter 13.8.5

Please note that for the described use cases of the Diagnostic Services the following rule applies:

[TPS_SWCT_01129] Express diagnostic capabilities [For every used `ClientServerInterface` it is necessary to create a `RoleBasedPortAssignment`. Thereby the value of the attribute `role` of the `RoleBasedPortAssignment` has to be set to the name of the used standardized `ClientServerInterface`.

The possible role attribute values and the multiplicity of the related `PortPrototypes` are listed at the use case descriptions in the paragraph **RoleBasedPortAssignment.**] (*RS_SWCT_00170, RS_SWCT_03190*)

[constr_1640] No use of Optional Element Structure for interaction with the diagnostic stack [An `SwcServiceDependency` that aggregates a diagnostic-related subclass of `ServiceNeeds` shall not refer to any `PortPrototype` by means of either a `RoleBasedPortAssignment` or `RoleBasedDataAssignment` where the respective `PortInterface` contains any `DataPrototype` typed by an `Optional Element Structure`.

This rule shall be imposed **at the time when the RTE is generated.**]()

13.8.1 Development Approach

AUTOSAR supports in many cases the implementation of a bottom-up or top-down configuration for various aspects of the development workflow.

Before the advent of the `Diagnostic Extract` [23], AUTOSAR officially supported a modeling approach where the configuration of an `ApplicationSwComponentType`

might contain contributions to the external configuration of the diagnostic stack. This was considered an approach to implement a top-down configuration approach for diagnostics.

However, the development approach introduced with the [Diagnostic Extract](#) turned out to be superior and less prone to mistakes and limitations in comparison to the configuration that each developer contributed without necessarily having the knowledge about the greater scope of diagnostic configuration.

Therefore, the usage of the [Diagnostic Extract](#) has become the canonical approach to the configuration of the external behavior of the AUTOSAR diagnostic stack and the respective configuration attributes available in the scope of `SwcServiceDependency` have been removed from the AUTOSAR methodology in order to reduce potential confusion in the audience.

In particular, a top-down approach using a [Diagnostic Extract](#) can be implemented if the [Diagnostic Extract](#) also provides the mappings between diagnostic elements and elements of the application model. If the mappings are not wanted or not available, it is also possible to use the [Diagnostic Extract](#) to derive a bottom-up configuration of the diagnostic stack without the relations to application software.

13.8.2 Function Inhibition Needs

The meta-class [FunctionInhibitionNeeds](#) is used to define requirements in order to configure the Diagnostic Event Manager Service.

An [SwcInternalBehavior](#) may provide [FunctionInhibitionNeeds](#) as well as [FunctionInhibitionAvailabilityNeeds](#) elements in the context of an [SwcServiceDependency](#). Each [FunctionInhibitionNeeds](#) and [FunctionInhibitionAvailabilityNeeds](#) defines the requirements related to one function inhibition ID (for the terms related to the AUTOSAR Function Inhibition Manager, see [40]).

Class	FunctionInhibitionNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	Specifies the abstract needs on the configuration of the Function Inhibition Manager for one Function Identifier (FID). This class currently contains no attributes. Its name can be regarded as a symbol identifying the FID from the viewpoint of the component or module which owns this class.

N/A

|(RS_SWCT_00170, RS_SWCT_03190)

Note: for variant coding `ClientServerInterface` `ControlFunctionAvailable` is used to deactivate a certain functionality (e.g. to set the FID to not available).

For more information, please refer to [SWS_Fim_00107].

13.8.3 Diagnostic Event Needs

The meta-classes `DiagnosticEventManagerNeeds` is used to define requirements in order to configure the Diagnostic Event Manager Service.

An `SwcInternalBehavior` may provide several `DiagnosticEventManagerNeeds` elements that define the mappings for the general diagnostic event manager behavior (for the terms related to the AUTOSAR Diagnostic Event Manager see [41]).

The meta-class `DiagnosticCapabilityElement` is used to provide generic information about diagnostic capabilities. Further on, the usage of `DiagnosticCapabilityElement` indicates that all `ServiceNeeds` which inherit from `DiagnosticCapabilityElement` express the following intentions:

- Need to interact with AUTOSAR Service `Dem` or `Dcm`.
- Provide services for the on-board diagnostics.

Figure 13.13: General diagnostic event-handling related [ServiceNeeds](#)

supplier	The object is relevant for the ECU-supplier aftermarket organization. Tags: atp.EnumerationLiteralIndex=5

Table 13.17: DiagnosticAudienceEnum

The meta-classes [DiagnosticEventNeeds](#) is used to define requirements to configure the Diagnostic Event Manager Service.

An [SwcInternalBehavior](#) may provide several [DiagnosticEventNeeds](#) elements where each defines all the requirements related to one diagnostic event (for the terms related to the AUTOSAR Diagnostic Event Manager see [41]).

In addition, `ObdPidServiceNeeds` and `ObdRatioServiceNeeds` are required in order to specify the needs for OBD diagnostic service calls.

The `diagEventDebounceAlgorithm` attribute defines the kind of expected debouncing by the Diagnostic Event Manager or defines that the debouncing is implemented by the software component.

The class `DiagEventDebounceAlgorithm` inherits from `Identifiable` in order to allow further documentation of the debouncing algorithm as well as non formalized description or non standardized description by the means of `Sdg` on expected configuration of the `DiagEventDebounceAlgorithm` in the Diagnostic Event Manager.

[constr_1138] `SwcServiceDependency.assignedPort` and `DiagEventDebounceMonitorInternal` [If a `SwcServiceDependency` aggregates `DiagnosticEventNeeds` in the role `serviceNeeds`, then an `assignedPort` with attribute `role` set to the value `CallbackGetFaultDetectCounter` shall only exist if the monitor implements internal debouncing, i.e. concrete subclass `DiagEventDebounceMonitorInternal` is aggregated in the role `DiagnosticEventNeeds.diagEventDebounceAlgorithm`.

This rule shall be imposed **at the time when the RTE is generated.**]()

Rationale for the existence of [constr_1138]: the *fault detect counter* is typically an internal state of the Dem, i.e. if the debouncing is executed in the Dem internally.

If, on the other hand, the debouncing is implemented in the monitor software-component, it may happen that a diagnostic tester requests the value of the *fault detect counter*.

In this case, the Dem will request the value of the fault detect counter via the `PortPrototype` to which the `assignedPort` with attribute `role` set to the value `CallbackGetFaultDetectCounter` refers to.

If the monitor does not implement the debouncing, then this `PortPrototype` shall not exist.

[constr_10104] `RoleBasedPortAssignment` where attribute `role` is set to `CallbackGetFaultDetectCounter` shall refer to a `PPortPrototype` in the role `portPrototype` [If a `SwcServiceDependency` aggregates both

- a `DiagnosticEventNeeds` that in turn aggregates `DiagEventDebounceMonitorInternal` in the role `diagEventDebounceAlgorithm` and
- a `RoleBasedPortAssignment` in the role `assignedPort` where attribute `role` is set to `CallbackGetFaultDetectCounter`,

then the target of the reference `SwcServiceDependency.assignedPort.portPrototype` shall be a `PPortPrototype`.

This rule shall be imposed **at the time when the RTE is generated.**]()

Class	DiagnosticEventNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	<p>Specifies the abstract needs on the configuration of the Diagnostic Event Manager for one diagnostic event. Its shortName can be regarded as a symbol identifying the diagnostic event from the viewpoint of the component or module which owns this element.</p> <p>In case the diagnostic event specifies a production error, the shortName shall be the name of the production error.</p>			
Base	ARObject, DiagnosticCapabilityElement , Identifiable , MultilanguageReferrable , Referrable , ServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds , SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
deferringFid	FunctionInhibitionNeeds	*	ref	This reference contains the link to a function identifier within the FiM which is used by the monitor before delivering a result.
diagEventDebounceAlgorithm	DiagEventDebounceAlgorithm	0..1	aggr	Specifies the abstract need on the Debounce Algorithm applied by the Diagnostic Event Manager.
inhibitingFid	FunctionInhibitionNeeds	0..1	ref	This represents the primary Function Inhibition Identifier used for inhibition of the diagnostic monitor. The FID might either inhibit the monitoring of a symptom or the reporting of detected faults.
inhibitingSecondaryFid	FunctionInhibitionNeeds	*	ref	This represents the secondary Function Inhibition Identifier used for inhibition of the diagnostic monitor. Any of the FID inhibitions leads to an inhibition of the monitoring of a symptom or the reporting of detected faults.
prestoredFreezeFrameStoredInNvm	Boolean	0..1	attr	If the Event uses a prestored freeze-frame (using the operations <code>PrestoreFreezeFrame</code> and <code>ClearPrestoredFreezeFrame</code> of the service interface <code>DiagnosticMonitor</code>) this attribute indicates if the Event requires the data to be stored in non-volatile memory. TRUE = Dem shall store the prestored data in non-volatile memory, FALSE = Data can be lost at shutdown (not stored in Nvm).
usesMonitorData	Boolean	0..1	attr	This attribute defines whether additional monitor data shall be added to the reporting of events.

Table 13.22: DiagEventDebounceMonitorInternal

The figure 13.14 shows the relationship of the class [DiagnosticEventNeeds](#). The given M2 structure support to express following properties of a diagnostic monitor in addition to the basic set of attributes provided by [DiagnosticCapabilityElement](#):

The used [PortPrototype](#) which has to be connected to the Function Inhibition Managers is determined by the [RoleBasedPortAssignment](#) of the related [FunctionInhibitionNeeds](#) instance on M1.

The reference from a M1 instance of an [ObdRatioServiceNeeds](#) to an M1 instance of a [DiagnosticEventNeeds](#) specifies that the related Diagnostic Monitor supports Rate Based Monitoring. For further details see section 13.8.5.

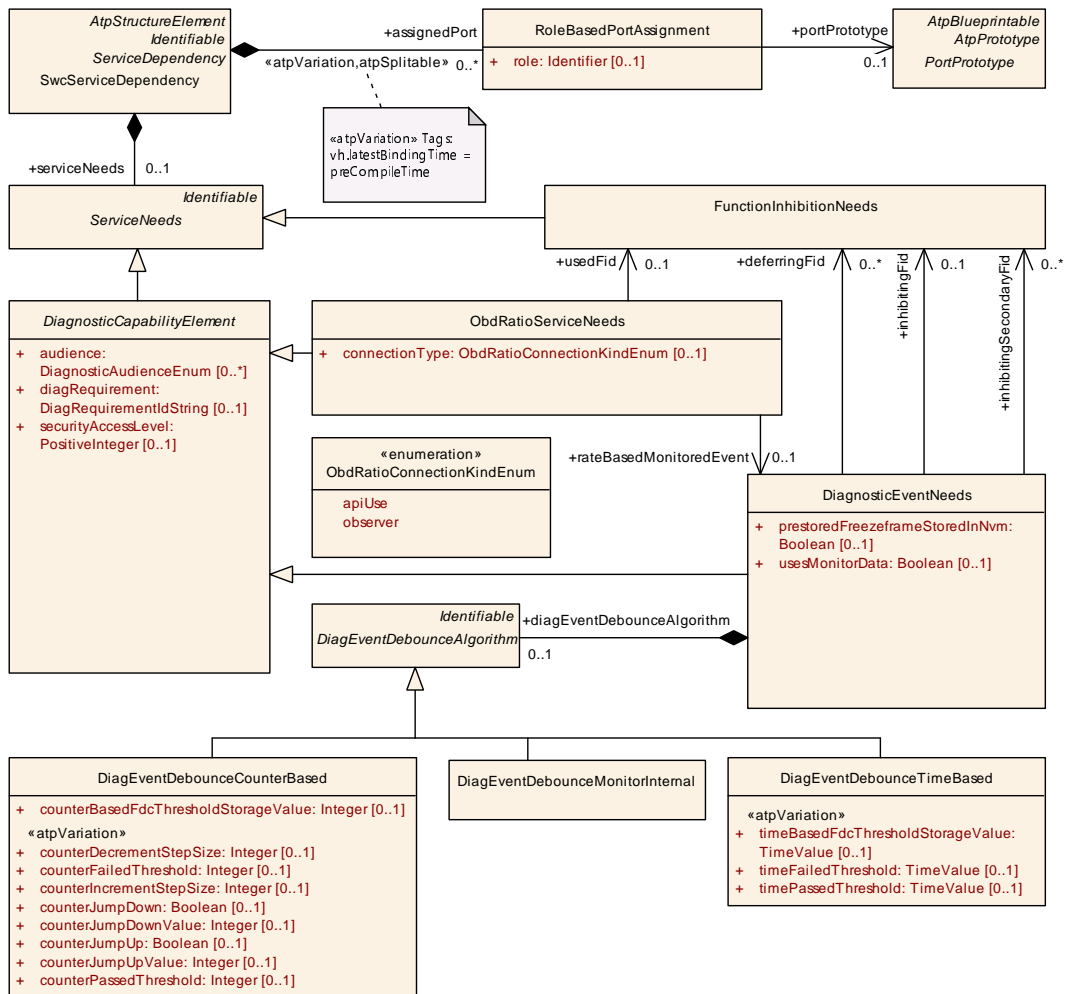

Figure 13.14: Relationship of DiagnosticEventNeeds and FunctionInhibitionNeeds

[TPS_SWCT_01864] Semantics of `DiagnosticEventNeeds.inhibitingFid` and `DiagnosticEventNeeds.inhibitingSecondaryFid` [Diagnostic monitor implementations use Function Identifiers (FID) to acquire permission from FiM before executing the fault detection.

Typically, the permission is not granted by FiM if other diagnostic events have already been reported as FAILED, which would lead to a double-detection of the same failure.

These Function Inhibitions are specified by means of the references in the roles `DiagnosticEventNeeds.inhibitingFid` and `DiagnosticEventNeeds.inhibitingSecondaryFid`.

Semantically, there is no difference between `DiagnosticEventNeeds.inhibitingFid` and `DiagnosticEventNeeds.inhibitingSecondaryFid`, i.e. the collections of relevant references in the "inhibiting" role is created out of the merged content of `DiagnosticEventNeeds.inhibitingFid` and `DiagnosticEventNeeds.inhibitingSecondaryFid`.]()

This relationship describes the implementation of the software-component. Through this formal reference, the implementer of the software-component can make this information available for later process steps.

Example 13.6

Certification documentation requires a description of the inhibitions.

Example 13.7

If a Ratio is added to the ECU-configuration at a later step for a `DemEvent` (not requested through a `ServiceDependency` with `ObdRatioServiceNeeds`), the configurator can derive the related FIDs for the ratio from the inhibiting/deferring FIDs of the `DemEvent` itself.

[TPS_SWCT_01582] Semantics of `DiagnosticEventNeeds.deferringFid`
[Diagnostic monitor implementations use *Function Identifiers* (FID) to acquire permission from `FIM` before executing the fault detection.

Typically, the permission is not granted by `FIM` if other *Events* have already been reported as *FAILED*, which would lead to a double-detection of the same failure.

In some cases (see [40]), diagnostic monitor implementations do not only shut down completely in case of “no permission”, but fully compute their result and do just not deliver it to `Dem` before further conditions are fulfilled.

Typically, such diagnostics can detect a coarse failure quickly. But it avoids reporting *FAIL* early to give other *Events* a chance to deliver a more precise *FAIL*.

In such cases, the delivery of the result is only allowed when `FIM` grants a permission, with inhibitions on `NOT_TESTED` of other *Events*. These *Function Inhibitions* are specified by means of the attribute `DiagnosticEventNeeds.deferringFid`.

|(RS_SWCT_00170, RS_SWCT_03190)

As a corresponding concept to `DiagnosticEventNeeds`, the `DiagnosticEventInfoNeeds` represents the needs to a given software-component that is interested to get information about specific DTCs.

Please note that the clearing of the DTC is done via the `ClientServerOperation` named `ClearDTC`, which requires a prior call to the `ClientServerOperation` named `SelectDTC` that is part of the `ClientServerInterface` named `ClearDTC` to get the respective DTC in the focus of the workflow.

For more information please refer to [SWS_Dem_01253].

13.8.4 Diagnostic Communication Needs

The meta-class `DiagnosticCommunicationManagerNeeds` is used to define requirements in order to configure the Diagnostic Communication Manager Service.

An `SwcInternalBehavior` may provide a `DiagnosticCommunicationManagerNeeds` element which defines the mappings for the general diagnostic communication (for the terms related to the AUTOSAR Diagnostic Communication Manager see [42]).

The meta-class `DiagnosticRoutineNeeds` is used to define requirements to configure the Diagnostic Communication Manager Service. A `PPortPrototype` typed by a `ClientServerInterface`¹ may provide `ClientServerOperations` (for example, “start”, “stop”, and “RequestResults”).

The `PPortPrototype` corresponds to the diagnostic service `RoutineControl`. Within the `SwcInternalBehavior` up to three `RunnableEntitys` are defined for implementing the `ClientServerOperations` mentioned before.

The enumeration parameter `DiagnosticRoutineTypeEnum` is used to define whether the diagnostic server or client is responsible for stopping the routine.

Please note that [constr_1340] and [constr_1341] apply for the application of `DiagnosticRoutineNeeds`. These constraints are part of the specification of the `Diagnostic Extract`.

¹where `isService` shall be set to true

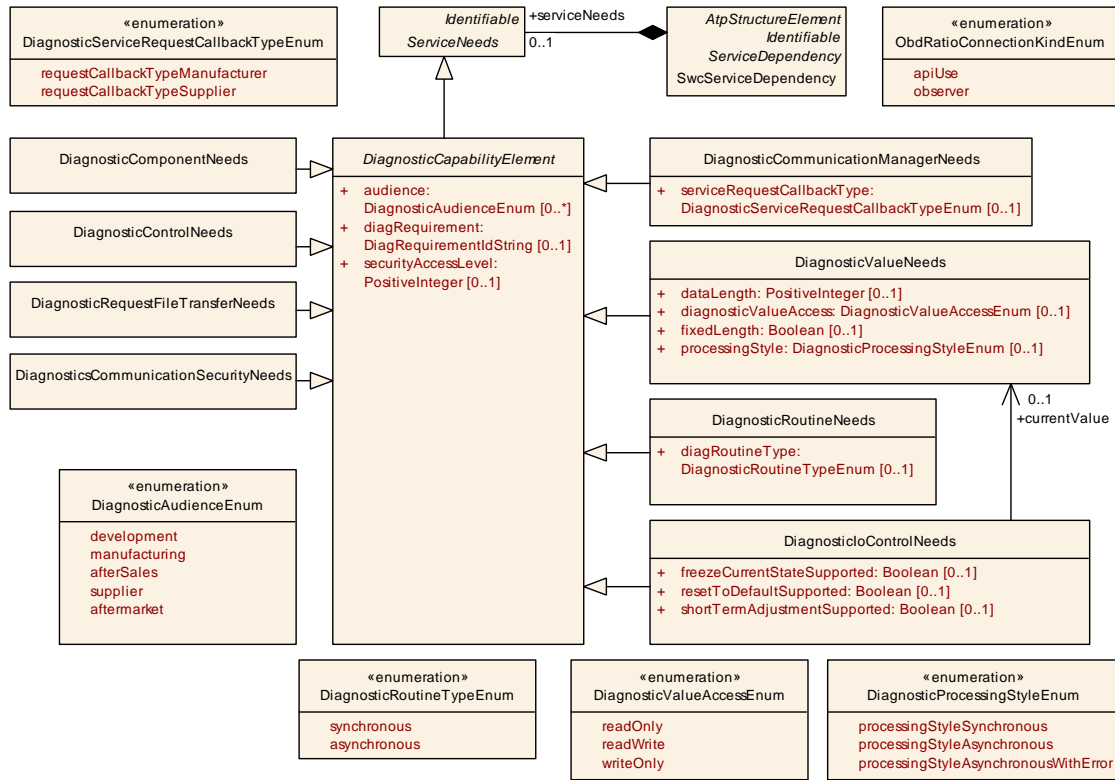

Figure 13.16: General diagnostic service-related **ServiceNeeds**

synchronous	This indicates that the diagnostic routine blocks the diagnostic server in the ECU while the routine is running. Tags: atp.EnumerationLiteralIndex=1

Table 13.37: DiagnosticRoutineTypeEnum

The meta-class [DiagnosticIoControlNeeds](#) is used to define requirements to configure the Diagnostic Communication Manager Service. The [PPortPrototype](#) corresponds to the diagnostic service [InputOutputControlByIdentifier](#). Within the [SwcInternalBehavior](#) up to three [RunnableEntities](#) are defined for implementing the [ClientServerOperations](#) mentioned before.

Class	DiagnosticControlNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	Specifies the general needs on the configuration of the Diagnostic Communication Manager (DCM) which are not related to a particular item (e.g. a PID). The main use case is the mapping of service ports to the Dcm which are not related to a particular item.			
Base	<i>ARObject</i> , <i>DiagnosticCapabilityElement</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i> , <i>ServiceNeeds</i>			
Aggregated by	BswServiceDependency.serviceNeeds , SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
currentValue	DiagnosticValueNeeds	0..1	ref	Reference to the DiagnosticValueNeeds indicating the access to the current value via signalBasedDiagnostics .
freezeCurrentStateSupported	Boolean	0..1	attr	This attribute determines, if the referenced port supports temporary freezing of I/O value. The temporary freeze is not supported if the enclosing DiagnosticControlNeeds is aggregated by a SwcServiceDependency , see [constr_1364] .
resetToDefaultSupported	Boolean	0..1	attr	This represents a flag for the existence of the ResetToDefault operation in the service interface.
shortTermAdjustmentSupported	Boolean	0..1	attr	This attribute determines, if the referenced port supports temporarily setting of I/O value to a specific value provided by the diagnostic tester. The short term adjustment is not supported if the enclosing DiagnosticControlNeeds is aggregated by a SwcServiceDependency , see [constr_1364] .

Table 13.38: DiagnosticControlNeeds

The meta-class [DiagnosticValueNeeds](#) is used to define requirements in order to configure the Diagnostic Communication Manager Service as well as the Diagnostic Event Manager Service.

The DCM can access either local values via a [ClientServerInterface](#) or it may access [dataElements](#) in a [PPortPrototype](#) typed by a [SenderReceiverInterface](#). For this purpose, the [DiagnosticValueNeeds](#) require associations to local values (i.e. inside [InternalBehavior](#)) or respectively [dataElements](#).

The attribute [DiagnosticValueNeeds.diagnosticValueAccess](#) of type [DiagnosticValueAccessEnum](#) allows for distinguishing between current values to read diagnostic information (readOnly) and data elements which are additionally classified as configurable (readWrite).

[constr_1363] Existence of attributes of [DiagnosticValueNeeds](#) [if [DiagnosticValueNeeds](#) is aggregated by a [SwcServiceDependency](#) in the role [serviceNeeds](#) then the attributes

- [DiagnosticValueNeeds.diagnosticValueAccess](#)
- [DiagnosticValueNeeds.dataLength](#)

shall **not** exist **at the time when the contract phase generation is executed.**]()

[constr_1364] Existence of attributes of **DiagnosticIoControlNeeds** [if **DiagnosticIoControlNeeds** is aggregated by a **SwcServiceDependency** in the role **serviceNeeds** then the attributes

- **DiagnosticIoControlNeeds.freezeCurrentStateSupported**
- **DiagnosticIoControlNeeds.shortTermAdjustmentSupported**

shall **not** exist **at the time when the contract phase generation is executed.**]()

For all intents and purposes, the statement made by [constr_1363] and [constr_1364] boils down to the fact that these attributes can only be reasonably used in the context of a **BswServiceDependency**.

Class	DiagnosticValueNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	<p>Specifies the general needs on the configuration of the Diagnostic Communication Manager (DCM) which are not related to a particular item (e.g. a PID). The main use case is the mapping of service ports to the DCM which are not related to a particular item.</p> <p>In the case of using a sender receiver communicated value, the related value shall be taken via assigned Data in the role "signalBasedDiagnostics".</p> <p>In case of using a client/server communicated value, the related value shall be communicated via the port referenced by assignedPort. The details of this communication (e.g. appropriate naming conventions) are specified in the related software specifications (SWS).</p>			
Base	<i>ARObject</i> , <i>DiagnosticCapabilityElement</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i> , <i>Service Needs</i>			
Aggregated by	BswServiceDependency.serviceNeeds , SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
dataLength	PositiveInteger	0..1	attr	This attribute is applicable only if the DiagnosticValue Needs is aggregated within a BswModuleDependency. This attribute represents the length of data (in bytes) provided for this particular PID signal.
diagnosticValue Access	DiagnosticValueAccess Enum	0..1	attr	This attribute is applicable only if the DiagnosticValue Needs is aggregated within a BswModuleDependency. This attribute controls whether the data can be read and written or whether it is to be handled read-only.
fixedLength	Boolean	0..1	attr	This attribute is applicable only if the DiagnosticValue Needs is aggregated within a BswModuleDependency. This attribute controls whether the data length of the data is fixed.
processingStyle	DiagnosticProcessing StyleEnum	0..1	attr	This attribute controls whether interaction requires the software-component to react synchronously on a request or whether it processes the request in background but still the DCM has to issue the call again to eventually obtain the result of the request.

Table 13.39: DiagnosticValueNeeds

Enumeration	DiagnosticValueAccessEnum
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds
Note	Defines the access of the configured diagnostic current values which will be used by the Dem or Dcm module.

Enumeration	DiagnosticValueAccessEnum
Aggregated by	DiagnosticValueNeeds.diagnosticValueAccess
Literal	Description
readOnly	The access to the data element is limited to read-only. This is typically used to read-out diagnostic information (e.g. current values). Tags: atp.EnumerationLiteralIndex=0
readWrite	The value of the diagnostic data element is classified as configurable (read and write access is possible). Tags: atp.EnumerationLiteralIndex=1
writeOnly	The access to the data element is limited to write-only. This supports the use case where the Dcm just writes data to the application software without the intention to read it back, Tags: atp.EnumerationLiteralIndex=2

For more information please refer to [SWS_Dcm_00769].

13.8.4.3 Dcm Service Use Case: read/write current values by Sender Receiver Interface or Nv Data Interface

Scenario: an `AtomicSwComponentType` offers `PortPrototypes` typed by `SenderReceiverInterfaces` or `NvDataInterfaces` to read/write current values via diagnostic services (e.g. measurements, variant coding) that correspond to elements of a DID (as opposed to the entire DID at once, which is described in [TPS_SWCT_01853]).

This is mainly used for data which are available at ports anyhow used for other communication purpose.

Note: this scenario can be implemented as a regular sender/receiver communication without the necessity to use a `SwcServiceDependency`. The description of a `SwcServiceDependency` (even if it is technically not required) may help to advertise the special role of the corresponding `dataElement` with respect to diagnostics.

[TPS_SWCT_02003] `AtomicSwComponentType` offers `PortPrototypes` typed by `SenderReceiverInterfaces` or `NvDataInterfaces` to read/write current values via diagnostic services [

For more information please refer to [SWS_Dcm_00686].

13.8.4.7 Dcm Service Use Case: IO control by Sender Receiver Interface

This use case represents an alternative to the use case described in chapter 13.8.4.6, i.e. for the same purpose it is also possible to utilize a `SenderReceiverInterface`.

The essential idea behind the existence of I/O `PortPrototypes` typed by `SenderReceiverInterface` is the possibility to have quick access to the `dataElements` currently under control.

Especially cases where access to `dataElements` is required from different partitions (for example in multi core systems) can benefit from this approach.

Scenario: an `AtomicSwComponentType` offers an `RPortPrototype` typed by a `SenderReceiverInterface` (in particular: `IOControlRequest`) to adjust the I/O

signal via diagnostic services and offers a `PortPrototype` typed by a `SenderReceiverInterface` (in particular: `IOControlResponse`) to provide the IO “operation response”.

In case of using `IOControlRequest` (which owns **three** `dataElements`) and `IOControlResponse` the whole `PortPrototype` is related to **exactly one** IO control and needs to be consistent.

Therefore, the usage of `RoleBasedPortAssignment` (instead of the `RoleBasedDataAssignment`, which would otherwise typically be used for a sender/receiver-based scenario) is required for avoiding modeling overhead.

[TPS_SWCT_01654] `AtomicSwComponentType` offers `PortPrototypes` typed by `SenderReceiverInterfaces` to adjust the IO signal via diagnostic services

ServiceNeeds kind `DiagnosticIoControlNeeds`

RoleBasedPortAssignment valid roles:

- `IOControlRequest` [1]
- `IOControlResponse` [1]

RoleBasedDataAssignment

N/A

RepresentedPortGroups

N/A

]([RS_SWCT_00170](#), [RS_SWCT_03190](#))

The `IOControl` service requires in its diagnostic response the current value of the IO-DID, which is identical to the current value represented by `DiagnosticValueNeeds` of the `ReadDataByIdentifier` response.

[TPS_SWCT_01655] Reference from `DiagnosticIoControlNeeds` to `DiagnosticValueNeeds` [In the scenario described by [TPS_SWCT_01654], the `DiagnosticIoControlNeeds` shall reference the `DiagnosticValueNeeds` which relates to the access of the current value via diagnostic services (see [TPS_SWCT_02003]).] ([RS_SWCT_00170](#), [RS_SWCT_03190](#))

[TPS_SWCT_01656] Suffix used for the resulting name of the `PortInterface` for `IOControlRequest` and `IOControlResponse` [The *suffix* used for the resulting name of the `PortInterface` for the `IOControlRequest_{Data}` and `IOControlResponse_{Data}` shall be taken from the `shortName` of the applicable `SwcServiceDependency`.] ([RS_SWCT_00170](#), [RS_SWCT_03190](#))

The service use case is visualized in Figure 13.17. The `SwComponentPrototype` contains two `SwcServiceDependencies`, one for the I/O Control, and one for the access of the `dataElement` with the `shortName` “IOx” by the Dcm.

Please note that, in this example, the `SenderReceiverInterface` used on the `RPortPrototype` of the `ApplicationSwComponentType` has several `dataElement`s (where the `dataElement` with the `shortName` „IOx“ is one of them). This is a perfectly valid configuration.

On the other hand, the `SenderReceiverInterface` used on the `RPortPrototype` of the `ServiceSwComponentType` representing the Dcm can only have **one** `dataElement`. This single `dataElement` shall (as far as the example is concerned) be given the `shortName` „IOx“.

Note the reference from the `DiagnosticIoControlNeeds` to the `DiagnosticValueNeeds`. this reference explicitly expresses that access to a DID is combined with the usage of I/O control.

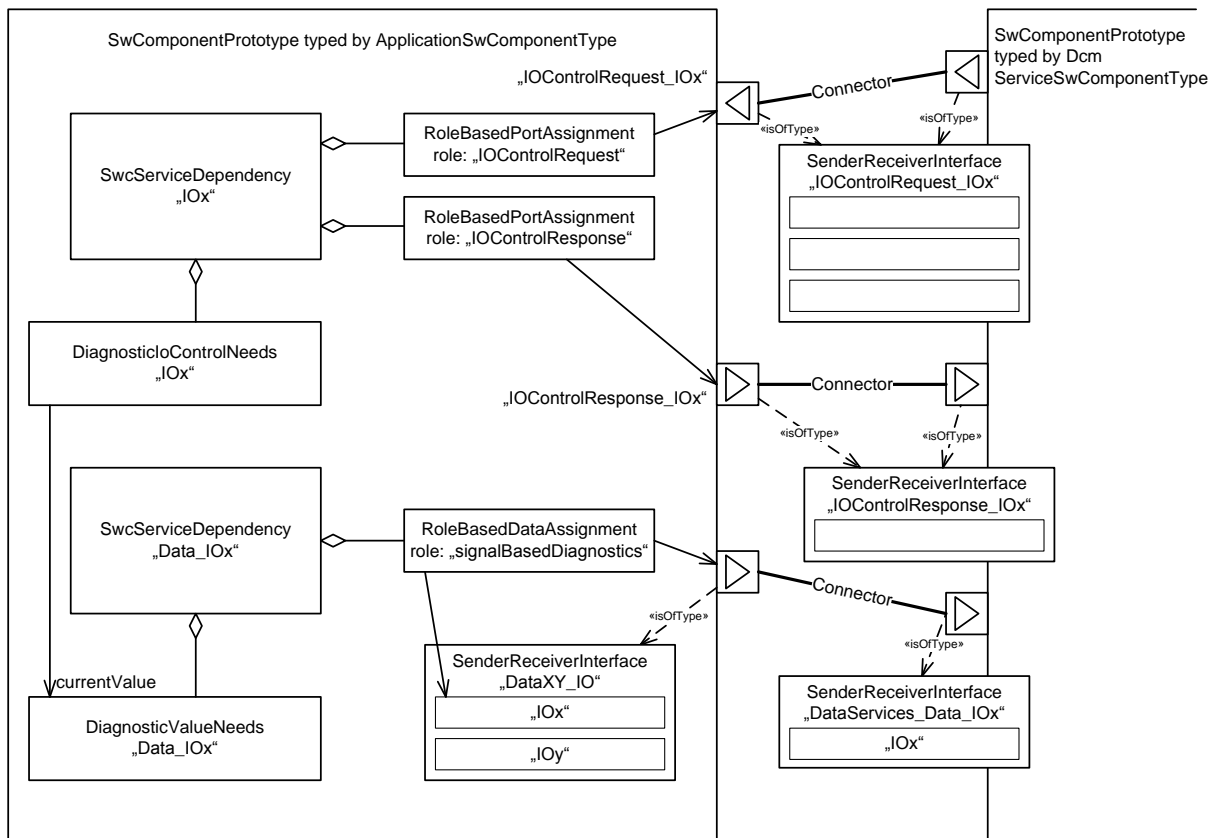

Figure 13.17: Visualization of the service use case

[TPS_SWCT_01657] NamingRule for `RPortPrototype` referenced by a `RoleBasedPortAssignment` with attribute `role` set to “IOControlRequest” [The `shortName` of a `RPortPrototype` referenced by a `RoleBasedPortAssignment` with attribute `role` set to “IOControlRequest” shall be created by concatenating the prefix “IOControlRequest” and the `SwcServiceDependency.shortName`, separated by a single underscore character (i.e. “_”).] (*RS_SWCT_00170, RS_SWCT_03190*)

For more information please refer to [SWS_Dcm_01308] and [SWS_Dcm_01309].

[constr_1741] Restriction to explicit sending semantics for the usage of DataServices in the context of a SwcServiceDependency that aggregates DiagnosticValueNeeds that in turn is referenced by a DiagnosticIoControlNeeds [A dataElement

- that is referenced by a RoleBasedDataAssignment (where the attribute `role` is set to `signalBasedDiagnostics`) owned by a SwcServiceDependency that aggregates DiagnosticValueNeeds that in turn is referenced by a DiagnosticIoControlNeeds
- **shall also be referenced** by a VariableAccess aggregated in the role `dataSendPoint` by a given RunnableEntity that in turn belongs to the enclosing SwcInternalBehavior.
- **shall not be referenced** by a VariableAccess aggregated in the role `dataWriteAccess` by a given RunnableEntity that in turn belongs to the enclosing SwcInternalBehavior.

This rule shall be imposed **at the time when the RTE is generated.**]()

In other words, the data handled by the diagnostics transformer shall only be sent explicitly. The usage of **implicit sending of these data is not supported.**

13.8.4.8 Dcm Service Use Case: Access to protocol, session and security information

Scenario: an AtomicSwComponentType offers a server port to get protocol, session and security information or to request a Reset to Default Session.

|(RS_SWCT_00170, RS_SWCT_03190)

Please note that a very similar modeling exists in the form of `DiagnosticTestResult.updateKind` in the context of the TPS Diagnostic Extract.

The implementer of the software-component is aware of the way the software-component uses debouncing and how it calls the Dem.

The implementer of the software-component has all the information needed to set a proper value for the attribute `ObdMonitorServiceNeeds.updateKind`.

The author of the DEXT, on the other end, might notice that a diagnostics software-component is broken, and might use the DEXT as work-around to fix a wrong setting of `ObdMonitorServiceNeeds.updateKind` by means of `DiagnosticTestResult.updateKind`.

–	–	–	–	–

Table 13.57: DolpPowerModeStatusNeeds

Class	DolpRoutingActivationAuthenticationNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	DoIPRoutingActivationAuthenticationNeeds indicates that the software-component owning this ServiceNeeds will have an authentication required for a DoIP routing activation service (0x0005) according to ISO 13400-2:2012.			
Base	ARObject , DolpServiceNeeds , Identifiable , MultilanguageReferrable , Referrable , ServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds , SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
dataLength Request	PositiveInteger	0..1	attr	Describes the length in byte of the additional information for RA authentication that is needed by the software entity. If the software entity is a software-component the attribute does not need to exist as the information is available via the length of the uint8 Array type. Otherwise (i.e the software entity is a Complex Driver) this attribute needs to be filled out if additional information is needed.
dataLength Response	PositiveInteger	0..1	attr	Describes the length in byte of the additional information for RA authentication that is provided by the software entity. If the software entity is a software-component the attribute does not need to exist as the information is available via the length of the uint8 Array type. Otherwise (i.e the software entity is a Complex Driver) this attribute needs to be filled in if additional information is provided.
routing ActivationType	NameToken	0..1	attr	Describes the ISO 13400-2:2012 "routing activation request activation type" which is received via DoIP service 0x0005. 0x00 is DEFAULT, 0x01 is WWH-OBD. If neither of the specified values (0x00 or 0x01) is needed the token shall contain RA_ + hex value representation of the integer value shall be used (i.e: RA_0xE1).

Table 13.58: DolpRoutingActivationAuthenticationNeeds

Class	DolpRoutingActivationConfirmationNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	DolpRoutingActivationConfirmationNeeds indicates that the software-component that owns this Service Needs will have a confirmation required for a DoIP routing activation service (0x0005) according to ISO 13400-2:2012.			
Base	ARObject, DolpServiceNeeds , Identifiable , MultilanguageReferrable , Referrable , ServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds , SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
dataLength Request	PositiveInteger	0..1	attr	Describes the length in byte of the additional information for RA confirmation that is needed by the software entity. If the software entity is a software-component the attribute does not need to exist as the information is available via the length of the uint8 Array type. Otherwise (i.e the software entity is a Complex Driver) this attribute needs to be filled out if additional information is needed.
dataLength Response	PositiveInteger	0..1	attr	Describes the length in byte of the additional information for RA confirmation that is provided by the software entity. If the software entity is a software-component the attribute does not need to exist as the information is available via the length of the uint8 Array type. Otherwise (i.e the software entity is a Complex Driver) this attribute needs to be filled out if additional information is provided.
routing ActivationType	NameToken	0..1	attr	Describes the ISO 13400-2:2012 "routing activation request activation type" which is received via DoIP service 0x0005. 0x00 is DEFAULT, 0x01 is WWH-OBDD. If neither of the specified values (0x00 or 0x01) is needed the token shall contain RA_ + hex value representation of the integer value shall be used (i.e: RA_0xE1).

Table 13.59: DolpRoutingActivationConfirmationNeeds

Class	DolpActivationLineNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	A DoIP entity needs to be informed when an external tester is attached or activated. The DolpActivation ServiceNeeds specifies the trigger for such an event. Examples would be a Pdu via a regular communication bus, a PWM signal, or an I/O. For details please refer to the ISO 13400.			
Base	ARObject, DolpServiceNeeds , Identifiable , MultilanguageReferrable , Referrable , ServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds , SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note

13.8.6.6 Service Use Case: Set and reset Warning Indicator Request bit

Scenario: In some cases (e.g. controlling a failsafe reaction in application) the “Warning Indicator Request”-bit of a corresponding event in Dem shall be set/reset by a special “failsafe software-component”.

The failsafe software-component has to ensure a proper status of the “Warning Indicator Request”-bit (e.g. regarding ISO14229-1 or manufacture specific requirements).

Therefore, the failsafe SW-C can use existing Dem mechanism to get the information about status changes of events in Dem (e.g. `Callback EventStatusChanged`).

For this purpose, the applicable `ServiceSwComponentType` is supposed to provide a `PPortPrototype` typed by the `ClientServerInterface` named `EventStatus` towards the application.

To trigger the existence of the `PPortPrototype`, `WarningIndicatorRequestedBitNeeds` shall be defined.

]([RS_SWCT_00030](#))

For more information please refer to [SWS_Dlt_00495], [SWS_Dlt_00496], and [SWS_Dlt_00498].

In this case the software-component has to provide one Client Port (DLTService) in order to register and de-register the context and to send log or trace messages.

13.10 Synchronized Time-Base Manager Dependency

The meta-class [SyncTimeBaseMgrUserNeeds](#) is used together with the [SwcServiceDependency](#) to define requirements in order to configure the Synchronized Time-Base Manager module (for the terms related to the AUTOSAR Specification of Module [StbM](#) see [45]).

Class	SyncTimeBaseMgrUserNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	Specifies the needs on the configuration of the Synchronized Time-base Manager for one time-base. This class currently contains no attributes. An instance of this class is used to find out which ports of a software-component belong to this time-base in order to group the request and response ports of the same time-base. The actual time-base value is stored in the PortDefinedArgumentValue of the respective port specification.			
Base	ARObject , Identifiable , MultilanguageReferrable , Referrable , ServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds , SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table 13.67: SyncTimeBaseMgrUserNeeds

Please note that for the described use cases of the [StbM](#) Service following rule applies:

For every used `ClientServerInterface` it is necessary to create a `RoleBasedPortAssignment`.

Thereby the value of the attribute `role` of the `RoleBasedPortAssignment` has to be set to the name of the used standardized `ClientServerInterface`.

The possible role attribute values and the multiplicity of the related `PortPrototypes` are listed at the use case descriptions in the paragraph **RoleBasedPortAssignment**.

The general idea behind the time synchronization concept is that the role of global time master and global time slave are partly implemented in the application software.

For this purpose, the application software provides `PortPrototypes` typed by the standardized `PortInterfaces` `GlobalTime_Master` and `GlobalTime_Slave`.

In many cases both `PortInterfaces` `GlobalTime_Master` and `GlobalTime_Slave` will be used by the application software of one ECU. This means that the ECU is a global time slave on one domain and a global time master on another domain.

In terms of modeling, a given global time domain is represented by a `SwcServiceDependency`.

If one software-component has to deal with different global time domains (e.g. because it represents a slave in one domain and a master in another) then the corresponding `SwcInternalBehavior` needs to define one `SwcServiceDependency` per global time domain.

13.10.1 StbM Use Case: start timer and potentially get notified about its expiration

Scenario: a software-component wants to wind up a timer in the `StbM` with a given expiration time. The software-component may want to receive a notification when the timer expires. In this case the following setup applies:

[TPS_SWCT_01678] StbM use Case: start timer and potentially get notified about its expiration [

ServiceNeeds Kind : `SyncTimeBaseMgrUserNeeds`

RoleBasedPortAssignment valid roles:

- `StartTimer` [1]
- `TimeNotification` [0..1]

RoleBasedDataAssignment

The cloning of a time base is subject to certain pre-conditions. For more information, please refer to [SWS_StbM_00530]. Please note that regarding the determination of the “{Name}” suffix [TPS_SWCT_01743] applies.

13.11 Secure On-Board Communication

The meta-class `SecureOnBoardCommunicationNeeds` is used together with the `SwcServiceDependency` to define requirements in order to configure the Secure On-Board Communication module (for the terms related to the AUTOSAR Specification of Module `SecOc`, see [46]).

Class	SecureOnBoardCommunicationNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	Specifies the need for the existence of the SecOc module on the respective ECU. This class currently contains no attributes. An instance of this class is used to find out which ports of a software-component deal with the administration of secure communication in order to group the request and response ports.			
Base	ARObject , Identifiable , MultilanguageReferrable , Referrable , ServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds , SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
verificationStatusIndicationMode	VerificationStatusIndicationModeEnum	0..1	attr	This attribute provides the ability to control the mode in which the application software is notified about the result of authentication attempts.

Table 13.68: SecureOnBoardCommunicationNeeds

Enumeration	VerificationStatusIndicationModeEnum		
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds		
Note	This enumeration provides options for setting the mode of a verification status indication.		
Aggregated by	SecureOnBoardCommunicationNeeds.verificationStatusIndicationMode		
Literal	Description		
failureAndSuccess	Verification attempts that came out "false" or "true" shall be forwarded to the application software. Tags: atp.EnumerationLiteralIndex=1		
failureOnly	Only verification attempts that came out "false" shall be forwarded to the application software. Tags: atp.EnumerationLiteralIndex=0		

Table 13.69: VerificationStatusIndicationModeEnum

13.11.1 SecOc Use Case: obtain the verification status of secure communication

In this scenario, the `ApplicationSwComponentType` wants to obtain the status of secure communication.

It is not interested in the details (and would not be able to help anyway even if the details were available).

The `SwcServiceDependency` shall aggregate a `SecureOnBoardCommunicationNeeds`.

[TPS_SWCT_01668] SecOc Use Case: obtain the verification status of secure communication [

RoleBasedPortAssignment valid roles:

n/a

]([RS_SWCT_00030](#))

13.11.7 SecOc Use Case: Receive notification about an authentication attempt

Scenario: a software-component wants to receive a notification about the status of an authentication attempt.

Such a notification can be used to continuously monitor the number of failed verification attempts with the goal to set up a security management system/intrusion detection system that is able to detect an attack that consists of a flood of authentication requests and react with adequate dynamic counter-measures.

For this purpose, the software-component exposes a `PPortPrototype` that implements the notification handler. The handler may be interested in only *failed* attempts **or** *failed and passed* attempts.

This aspect can be configured by means of attribute `SecureOnBoardCommunicationNeeds.verificationStatusIndicationMode`.

[TPS_SWCT_01832] SecOc Use Case: Receive notification about an authentication attempt

Table 13.78: V2xMUserNeeds

Please note that for the described use cases of the V2xFac Service following rule applies:

For every used [ClientServerInterface](#) it is necessary to create a [RoleBasedPortAssignment](#).

Thereby the value of the attribute [role](#) of the [RoleBasedPortAssignment](#) has to be set to the name of the used standardized [ClientServerInterface](#).

The possible role attribute values and the multiplicity of the related [PortPrototypes](#) are listed at the use case descriptions in the paragraph **RoleBasedPortAssignment**.

13.15.1 V2xM Use Case: Application software component provides Vehicle specific data to the V2X-Stack for Position and Time information

Scenario: an [AtomicSwComponentType](#) autonomously calls the V2X Manager, providing vehicle data collected via the in-vehicle networks in the module. In this case the following setup applies:

[TPS_SWCT_01731] V2xM Use Case: Application software component provides Vehicle specific data to the V2X-Stack for Position and Time information [

RoleBasedPortAssignment valid roles:

- [V2xM_Vdp](#) [1]

RoleBasedDataAssignment

N/A

]([RS_SWCT_00030](#))

In this case the software component has to provide one Client [PortPrototype](#) (typed by the standardized [ClientServerInterface](#) [V2xM_Vdp](#)) to

- access the current time of the V2X-Stack, based on the system clock
- access the earliest date of expiration of a Long Term Certificate
- access the earliest date of expiration of a Pseudonym Certificate

13.15.3 V2xM Use Case: Application software component has soft-control over Pseudonym-Change within V2X Manager

Scenario: an [AtomicSwComponentType](#) autonomously calls the V2X Manager, setting the locked or unlocked state for pseudonym change. In this case the following setup applies:

[TPS_SWCT_01733] V2xM Use Case: Application software component has soft-control over Pseudonym-Change within V2X Manager [

RoleBasedPortAssignment valid roles:

- [V2xM_PseudonymChange](#) [1]

](RS_SWCT_00030)

In this case the software component has to provide one Client `PortPrototype` (typed by the standardized `ClientServerInterface V2xM_GeoMath`) to

- calculate the distance between two location tuples (latitude, longitude)
- calculate an allowed tolerance value between two heading values

13.16 Vehicle-2-X DataManager

The V2X `DataManager` receives V2X messages and has the ability to pick dedicated portions out of the incoming messages and forward them over a `PPortPrototype`

owned by the respective `SwComponentPrototype` typed by the V2X DM's `ServiceSwComponentType` to other communication participants.

[TPS_SWCT_01867] Communication Use case of the V2X Data Manager where `isService = true` [In this communication scenario, the V2X Data Manager sends the data to a `SwComponentPrototype` on the same `EcuInstance`. In this case it is foreseen to use a standardized `SenderReceiverInterface` that set the attribute `isService` to `true` and define a `SwcServiceDependency` that aggregates a `V2xDataManagerNeeds`.

In this case, the connection between `PPortPrototype` owned by the `SwComponentType` representing the V2X DM's service component and the `AbstractRequiredPortPrototype` owned by the `SwComponentType` typed by an `ApplicationSwComponentType` is established by an `AssemblySwConnector`.]()

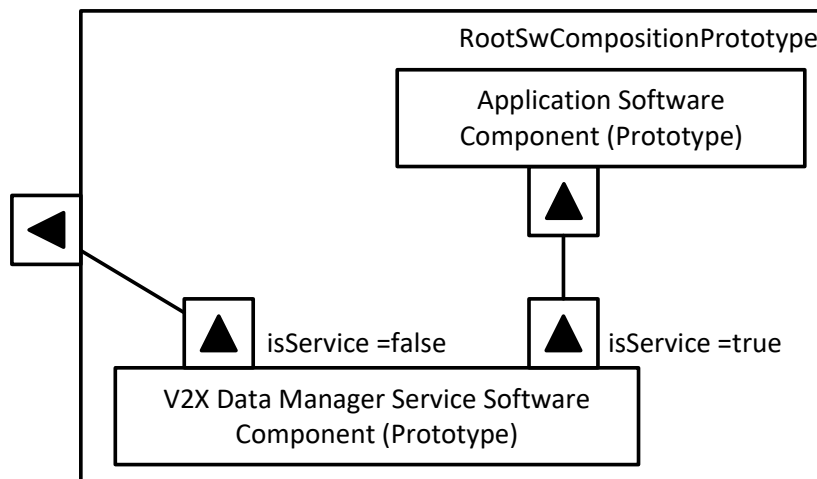

Figure 13.25: V2X DM communication use cases

[TPS_SWCT_01868] Communication Use case of the V2X Data Manager where `isService = false` [In this communication scenario, the V2X Data Manager sends the data to another `PPortPrototype` that is typed by a compatible `SenderReceiverInterface` and is owned by the `RootSwCompositionPrototype`.

Thus, the connection between the `PPortPrototype` owned by the `SwComponentType` representing the V2X DM's service component and the `PPortPrototype` owned by the `RootSwCompositionPrototype` is established by means of an `DelegationSwConnector`.]()

The use cases mentioned in [TPS_SWCT_01867] (send data to a local software-component) and [TPS_SWCT_01868] (send data to a different ECU) are illustrated in Figure 13.25.

14 Rapid Prototyping Scenarios

14.1 Definition of Rapid Prototyping Scenario

A Rapid Prototyping Scenario consist out of two main aspects: The description of the `byPassPoints` (see Figure 14.1) and the relation to a `rptHook` (see Figure 14.2).

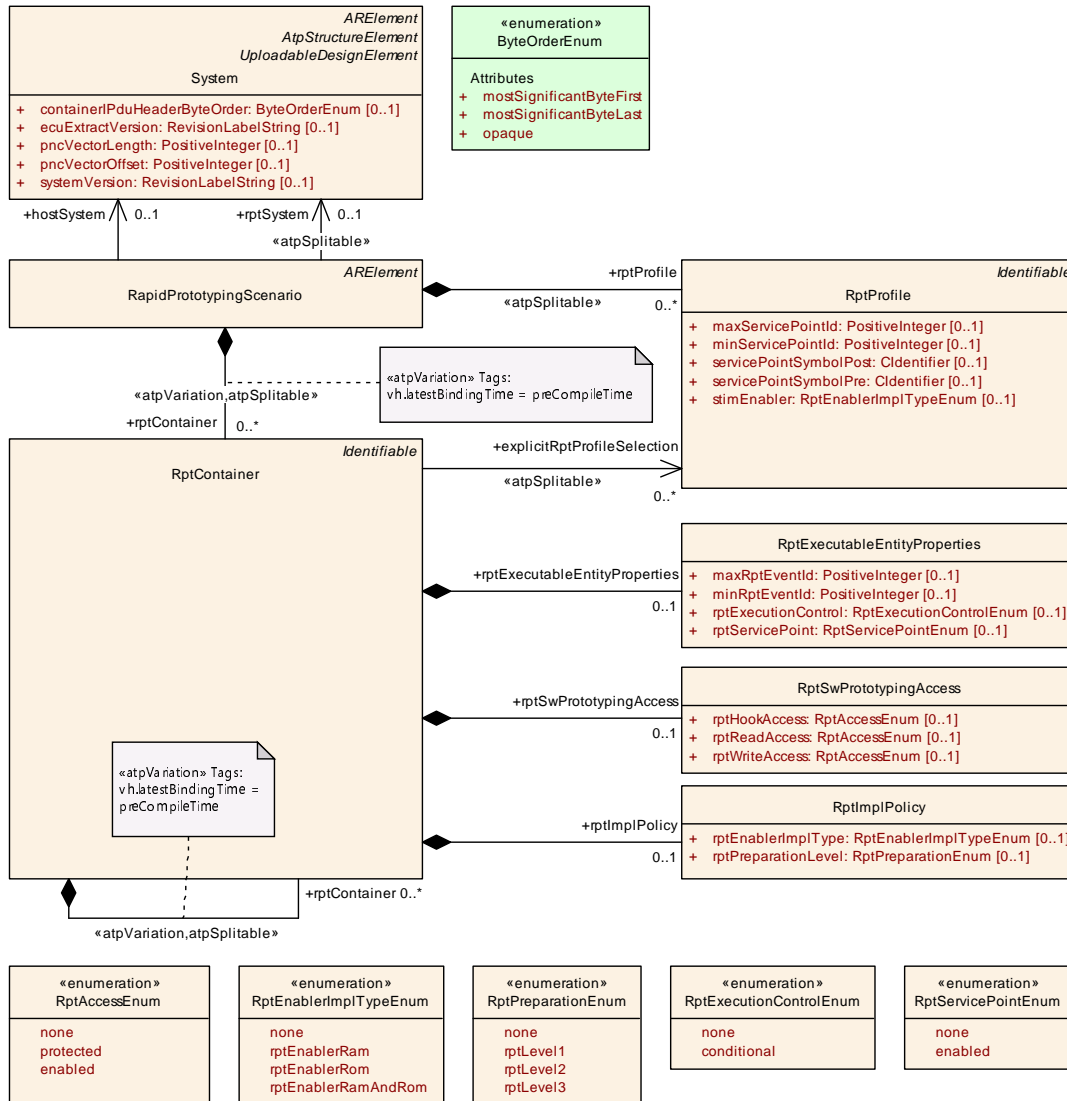

Figure 14.1: Rapid Prototyping Scenario

A Rapid Prototyping Scenario is structured by means of `RptContainers`. The correct usage of `RptContainer` structure is described in 14.2.

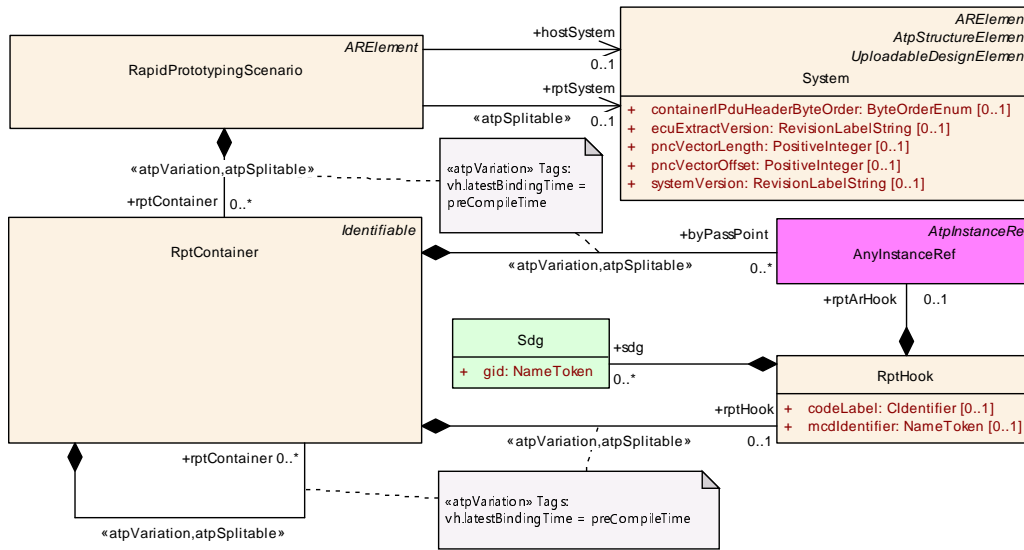

Figure 14.2: Rapid Prototyping Hooks

Class	RapidPrototypingScenario			
Package	M2::AUTOSARTemplates::SWComponentTemplate::RPTScenario			
Note	This meta-class provides the ability to describe a Rapid Prototyping Scenario. Such a Rapid Prototyping Scenario consist out of two main aspects, the description of the byPassPoints and the relation to an rpt Hook. Tags: atp.recommendedPackage=RapidPrototypingScenarios			
Base	ARElement , ARObject , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element

Table 14.2: RptContainer

Class	RptHook			
Package	M2::AUTOSARTemplates::SWComponentTemplate::RPTScenario			
Note	This meta-class provide the ability to describe a rapid prototyping hook. This can either be described by an other AUTOSAR system with the category RPT_SYSTEM or as a non AUTOSAR software.			
Base	ARObject			
Aggregated by	RptContainer.rptHook			
Attribute	Type	Mult.	Kind	Note
codeLabel	CIdentifier	0..1	attr	This attribute provides a code label which is used in the implementation of the hook. For example this can be an C function name or the name of data definition.
mcdIdentifier	NameToken	0..1	attr	This attribute provides an identifier which shall be used in a MCD System to display the Rpt Hook.
rptArHook	AtpFeature	0..1	iref	This describes the hook with the means of another AUTOSAR system. InstanceRef implemented by: AnyInstanceRef
sdg	Sdg	*	aggr	This property allows to keep special data which is not represented by the standard model. It can be utilized to keep e.g. tool specific data.

Table 14.3: RptHook

[TPS_SWCT_02046] [byPassPoint](#) specifies the rapid prototyping capability
 [The [byPassPoints](#) are used to describe the preparation of the host ECU. At the [byPassPoints](#) the host ECU shall be capable to communicate with an RPT System in order to support the execution of the rapid prototyping algorithms with the original data calculated by the host system and to replace dedicated results of the host system by the results of the rapid prototyping algorithm.] ([RS_SWCT_03280](#), [RS_SWCT_03282](#))

[TPS_SWCT_02047] [RptHook](#) specifies the link to rapid prototyping algorithm
 [The [rptHook](#) describes the link between the [byPassPoint](#) and the rapid prototyping algorithm. If the rapid prototyping algorithm is described as an AUTOSAR Software Component the [rptArHook](#) reference is applicable. Otherwise, the definition of a [codeLabel](#) and optionally [mcdIdentifier](#) shall be used.] ([RS_SWCT_03280](#), [RS_SWCT_03281](#), [RS_SWCT_03282](#))

In order to describe an RPT system as AUTOSAR software component a [System](#) with the [category](#) RPT_SYSTEM shall be defined.

[constr_2054] Valid targets of [rptSystem](#) [The [System](#) referenced in the role [rptSystem](#) shall be of [category](#) RPT_SYSTEM.

This rule shall be imposed **at the time when the RTE is generated.**]()

14.2 Usage of RptContainers on M1

The [RptContainer](#) structure on M1 shall follow the M1 structure of the Software Component Descriptions. The [category](#) attribute denotes which level of the Software Component Description is annotated.

The following values of the attribute `category` are predefined by the AUTOSAR standard:

[constr_2055] Valid targets of `byPassPoint` and `rptHook` reference, depending on the value of attribute `category` [

Category	Meaning	Specific properties
<code>SW_COMPONENT_PROTOTYPE</code>	Adds one <code>SwComponentPrototype</code> to an Rapid Prototyping Scenario.	The <code>byPassPoint</code> and <code>rptArHook</code> shall reference a <code>SwComponentPrototypes</code> .
<code>DATA_PROTOTYPE</code>	Adds one instance of a <code>DataPrototype</code> to an Rapid Prototyping Scenario.	The <code>byPassPoint</code> and <code>rptArHook</code> shall reference a <code>DataPrototype</code> instances in <code>PortPrototypes</code> .
<code>RUNNABLE_ENTITY</code>	Adds one <code>RunnableEntity</code> to an Rapid Prototyping Scenario.	The <code>byPassPoint</code> and <code>rptArHook</code> shall reference a <code>RunnableEntity</code> instances.
<code>ACCESS_POINTS</code>	Adds one <code>VariableAccess</code> , <code>ParameterAccess</code> , <code>ServerCallPoint</code> , <code>AsynchronousServerCallResultPoint</code> , <code>InternalTriggeringPoint</code> , <code>ModeSwitchPoint</code> , <code>ModeAccessPoint</code> or <code>ExternalTriggeringPoint</code> to a Rapid Prototyping Scenario.	The <code>byPassPoint</code> and <code>rptArHook</code> shall reference a <code>VariableAccess</code> , <code>ParameterAccess</code> , <code>ServerCallPoint</code> , <code>AsynchronousServerCallResultPoint</code> , <code>InternalTriggeringPoint</code> , <code>ModeSwitchPoint</code> , <code>ModeAccessPoint</code> or <code>ExternalTriggeringPoint</code> instances.

This rule shall be imposed **at the time when the RTE is generated**.

]()

Hereby, the following semantic applies:

[TPS_SWCT_02048] Implicit `SwComponentPrototype` selection for Rapid Prototyping Scenario [If a `SwComponentPrototype` is referenced in the role `byPassPoint` by a `RptContainer` without further “Sub” `rptContainer`, all RTE Interfaces of the `AtomicSwComponentType` shall be able to support a connection to a `rptHook`.] (*RS_SWCT_03280*)

[TPS_SWCT_02049] Implicit `RunnableEntity` selection for Rapid Prototyping Scenario [If a `RunnableEntity` is referenced in the role `byPassPoint` by a `RptContainer` without further “Sub” `rptContainer`, all RTE Interfaces of the `RunnableEntity` shall be able to support a connection to a `rptHook`.] (*RS_SWCT_03280*)

[TPS_SWCT_02050] Explicit selection of access points for Rapid Prototyping Scenario [If a `VariableAccess`, `ParameterAccess`, `ServerCallPoint`, `AsynchronousServerCallResultPoint`, `InternalTriggeringPoint`, `ModeSwitchPoint`, `ModeAccessPoint` or `ExternalTriggeringPoint` is referenced in the role `byPassPoint` by a `RptContainer`, only RTE Interfaces related to the specific access point are required be able to support a connection to a `rptHook`.] (*RS_SWCT_03280*)

[TPS_SWCT_02051] Explicit `DataPrototype` selection for Rapid Prototyping Scenario [If a `DataPrototype` instances in a `PortPrototypes` is referenced in the role `byPassPoint` by a `RptContainer`, only RTE Interfaces related to the specific `DataPrototype` are required be able to support a connection to a `rptHook`.] (*RS_SWCT_03280*)

[constr_2056] Consistency of `RapidPrototypingScenario` with respect to `rptSystem` and `rptArHook` references [Within one `RapidPrototypingScenario` all `rptSystem` references shall point to instances in one and only one `System`, and if existent, all `rptArHook` shall point to instances in one other and only one other `System`.

This rule shall be imposed **at the time when the RTE is generated.**]()

14.3 Usage of `atpSplitable` for `RptContainers` on M1

In order to support the later definition of the `RptHooks`, which may require as well the detailed specification `byPassPoints`, the aggregation of `RptContainer` and `RptHook` is `<<atpSplitable>>`.

[TPS_SWCT_02052] Definition of Rapid Prototyping Scenario is splittable [The aggregations in the roles `rptContainer`, `byPassPoint`, `explicitRptProfileSelection`, and `rptHook` at `RptContainer` are decorated by stereotype `<<atpSplitable>>`. By this means, it is possible to specify aspects of `RptContainers` in a later process step.] (*RS_SWCT_03280*)

Please note that the later specification of `RptHooks` may require additional `byPassPoints` as well to show their relationship to lower level elements in a component description, such as `VariableAccess`, where in contrast the `byPassPoints` may only be specified on higher level elements such as `SwComponentPrototypes` in a first step.

14.4 Modifications of the Meta-Model for supporting the RPT scenario

The implementation of the rapid-prototyping scenario implies the definition of *access points* (see [constr_2055]). To be able to fulfill this role, the *access points* shall be represented by meta-classes derived from `Referrable`.

Most candidates for becoming *access points* are already inheriting from `Referrable` and therefore do not require further treatment (see Figure 14.3). Two meta-classes in this collection, however, are not derived from `Referrable`:

- `ExternalTriggeringPoint`
- `ModeAccessPoint`

It is not feasible to fix this issue by simply letting the two meta-classes inherit from `Referrable` because this would break the backwards compatibility of the AUTOSAR XML Schema¹.

¹Because in this case the `shortName` becomes mandatory.

Therefore, a different approach (as sketched in Figure 14.3) has been implemented.

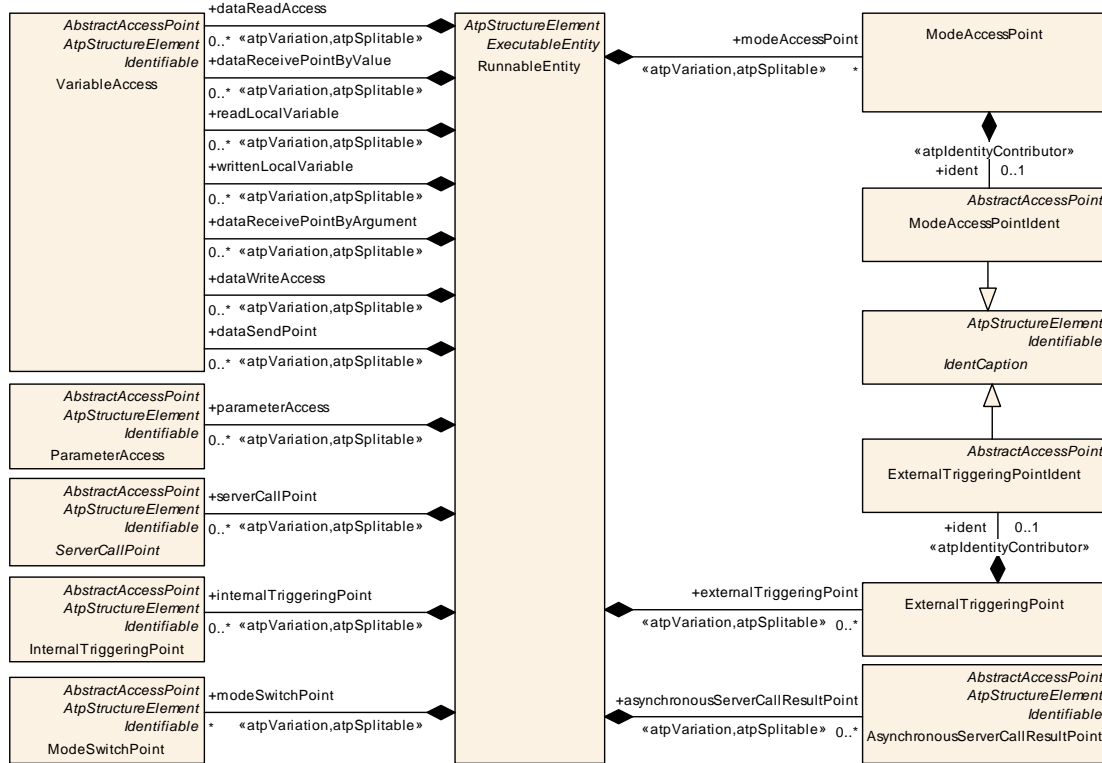

Figure 14.3: Access Points used in the context of the Rapid Prototyping Scenario

A new meta-class `IdentCaption` is created that introduces the capabilities of the meta-class `Identifiable` (that, in turn, inherits from `Referrable`) to its subclasses, `ModeAccessPointIdent` and `ExternalTriggeringPointIdent`.

These, in turn, are **optionally**² aggregated in the role `ident` by `ModeAccessPoint`, or in the role `ident` by meta-class `ExternalTriggeringPoint`.

Class	<i>IdentCaption</i> (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::RPTScenario			
Note	This meta-class represents the caption. This allows having some meta-classes optionally identifiable.			
Base	<i>ARObject</i> , <i>AtpClassifier</i> , <i>AtpFeature</i> , <i>AtpStructureElement</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>			
Subclasses	BswServiceDependencyIdent, DiagnosticParameterIdent, <i>ExternalTriggeringPointIdent</i> , <i>ModeAccessPointIdent</i>			
Aggregated by	<i>AtpClassifier</i> .atpFeature			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table 14.4: IdentCaption

²Again, the optional aggregation is a necessary prerequisite to not break the backwards compatibility of the AUTOSAR XML schema.

Class	ModeAccessPointIdent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::RPTScenario			
Note	This meta-class has been created to introduce the ability to become referenced into the meta-class Mode AccessPoint without breaking backwards compatibility.			
Base	ARObject, AbstractAccessPoint , AtpClassifier , AtpFeature , AtpStructureElement , IdentCaption , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	AtpClassifier.atpFeature , ModeAccessPoint.ident			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table 14.5: ModeAccessPointIdent

Class	ExternalTriggeringPointIdent			
Package	M2::AUTOSARTemplates::SWComponentTemplate::RPTScenario			
Note	This meta-class has been created to introduce the ability to become referenced into the meta-class ExternalTriggeringPoint without breaking backwards compatibility.			
Base	ARObject, AbstractAccessPoint , AtpClassifier , AtpFeature , AtpStructureElement , IdentCaption , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	AtpClassifier.atpFeature , ExternalTriggeringPoint.ident			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table 14.6: ExternalTriggeringPointIdent

An example of the definition of a [RapidPrototypingScenario](#) can be found in Appendix [B.6.1](#).

14.5 Extended Buffer Access Method

The Extended Buffer Access method enhances the support for rapid prototyping (RP) to support the bypass use case where the RTE cannot be regenerated by the bypass user.

The goal is to ensure that all [VariableDataPrototypes](#) that are communicated via RTE APIs are written to and read back from an RP [global buffer](#) that can be modified by rapid prototyping tools (RPT).

The method applies to all RTE APIs and not just those for implicit access and hence is termed the *extended* buffer access method.

Within the Extended buffer access method, a [VariableDataPrototype](#) can be flagged for rapid prototyping at one of three levels depending on whether post-build hooking is used. “Level 1” is intended for use by post-build hooking tools and “Level 2” and “Level 3” by non post-build hooking.

Additional RP buffers and RP flags are created when using “Level 2” and “Level 3” and the Extended Buffer Access method includes mechanisms for describing their creation and use to RP tooling.

- RP global buffer – A buffer read/written by RP. The `RP global buffer` is conceptually separated from the RTE managed buffer holding the variable data prototype value.
- RP global measurement buffer – A buffer used by RP to store the original variable data prototype value for subsequent measurement purposes before replacement by the RP generated value.
- RP enabler flag – A Boolean flag to permit run-time enabling/disabling bypass.

14.5.1 RP Preparation

The Extended Buffer Access method of Rapid Prototyping requires the definition of *preparation level* (see [\[constr_2055\]](#)) to enable RPT-related code generation.

The `RptProfile` of category `EXTENDED_BUFFER_ACCESS` provides the common attributes to implement the RPT support in the code.

An ECU may have to support multiple `RptProfiles` in parallel – for example, to support in one ECU the RPT tools of different suppliers.

Nevertheless, not all components might need to support all possible methods, for instance an XCP based RPT method might not be applicable for hard real-time critical functions, and therefore the `RptProfile` can be selected.

[TPS_SWCT_01719] Selection of applicable `RptProfiles` [The reference `RptContainer.explicitRptProfileSelection` provides a list of `RptProfiles` which needs to be applied when the RPT support is implemented.

If the `explicitRptProfileSelection` is not defined, all `RptProfiles` defined in the owing `RapidPrototypingScenario` are applicable.] ([RS_SWCT_03280](#))

Class	RptProfile			
Package	M2::AUTOSARTemplates::SWComponentTemplate::RPTScenario			
Note	The RptProfile describes the common properties of a Rapid Prototyping method.			
Base	<i>ARObject</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>			
Aggregated by	RapidPrototypingScenario.rptProfile			
Attribute	Type	Mult.	Kind	Note
maxServicePointId	PositiveInteger	0..1	attr	Highest service point id useable for RTE generated service points.
minServicePointId	PositiveInteger	0..1	attr	Lowest service point id useable for RTE generated service points.
servicePointSymbolPost	CIdentifier	0..1	attr	Complete symbol of the function implementing the post service point. This symbol is used for post-build hooking purposes.
servicePointSymbolPre	CIdentifier	0..1	attr	Complete symbol of the function implementing the pre service point. This symbol is used for post-build hooking purposes.

Class	RptProfile			
stimEnabler	RptEnablerImplTypeEnum	0..1	attr	Defines if the service points support the stimulation enabler. If RptProfile.stimEnabler is "none" then no stimulation enabler is passed to the service function. Otherwise the stimulation enabler will be passed as a parameter.

Table 14.7: RptProfile

[constr_1988] Existence of attribute [RptProfile.maxServicePointId](#) [For each [RptProfile](#), attribute [maxServicePointId](#) shall exist **at the time when the RTE is generated.**]()

Enumeration	RptEnablerImplTypeEnum
Package	M2::AUTOSARTemplates::CommonStructure::MeasurementCalibrationSupport::RptSupport
Note	Describes the required / implemented usage of enabler flags for data access in the code.
Aggregated by	RptImplPolicy.rptEnablerImplType , RptProfile.stimEnabler
Literal	Description
none	No "RP enabler" is implemented. Tags: atp.EnumerationLiteralIndex=0
rptEnablerRam	"RP enabler" is implemented as a RAM variable Tags: atp.EnumerationLiteralIndex=1
rptEnablerRamAndRom	The RTE generator implements both the RAM and ROM "RP enabler". Tags: atp.EnumerationLiteralIndex=3
rptEnablerRom	"RP enabler" is implemented as a calibrateable ROM variable. Tags: atp.EnumerationLiteralIndex=2

Table 14.9: RptEnablerImplTypeEnum

Enumeration	RptPreparationEnum
Package	M2::AUTOSARTemplates::CommonStructure::MeasurementCalibrationSupport::RptSupport
Note	Determines the RP preparation level for access to VariableDataPrototypes within the generated RTE implementation.
Aggregated by	RptImplPolicy.rptPreparationLevel
Literal	Description
none	No RP preparation for VariableDataPrototype. Tags: atp.EnumerationLiteralIndex=0
rptLevel1	The RTE implementation uses an "RP global buffer" for measurement and post-build hooking purposes. Tags: atp.EnumerationLiteralIndex=1
rptLevel2	As rptLevel1 but the RTE implementation also uses both "RP enabler flag" to permit RP overwrite at run-time. Tags: atp.EnumerationLiteralIndex=2
rptLevel3	As rptLevel2 but the RTE implementation also uses "RP global measurement buffer" to record the original ECU-generated value in addition to the RP value. Tags: atp.EnumerationLiteralIndex=3

Table 14.10: RptPreparationEnum

[TPS_SWCT_01720] **Preparation Levels** [[RptImplPolicy.rptPreparationLevel](#)] supports three preparation levels:

- **Level 1** – If [RptImplPolicy.rptPreparationLevel](#) is set to [rptLevel1](#) then the generated RTE uses a specific memory access pattern (a write-read cycle within accessing code created by the RTE generator) suitable for access by post-build hooking tools patch writes to buffers.
- **Level 2** – If [RptImplPolicy.rptPreparationLevel](#) is set to [rptLevel2](#) then in addition to the use of an RP global buffer (as for [rptLevel1](#)) the generated code also includes an RP enabler flag that is used to make update of the RP global buffer conditional.

The RP enabler flag can be in either (calibratable) ROM or RAM based on `RptContainer.rptEnablerImplType`.

- **Level 3** – If `RptImplPolicy.rptPreparationLevel` is set to `rptLevel3` then in addition to the requirements of `rptLevel2`, the generated code also records the original ECU-generated value as well as the RP replacement value.

](RS_SWCT_03280)

[TPS_SWCT_01721] References from `RptContainer` [If `rptImplPolicy` of a `RptContainer` is used the `RptContainer` can reference:

- `VariableDataPrototype` – the preparation level applies to a single data item.
- `ArgumentDataPrototype` – the preparation level applies to a single operation argument.
- `ModeDeclarationGroupPrototype` – the preparation level applies to a single mode.
- `operation` – the preparation level applies to all operation `ArgumentDataPrototype`.
- `RunnableEntity` – the preparation level applies to all data items / arguments accessed by the `RunnableEntity`.
- `SwComponentPrototype` – the preparation level applies to all `RunnableEntity`s (and hence all accessed data items and arguments) in the software component.

](RS_SWCT_03280)

The generated RTE includes appropriate descriptions to enable RP tools to access the generated RP buffers and RP enabler flags.

Class	RptSwPrototypingAccess			
Package	M2::AUTOSARTemplates::CommonStructure::MeasurementCalibrationSupport::RptSupport			
Note	Describes the accessibility of data and modes by the rapid prototyping tooling.			
Base	<i>ARObject</i>

Literal	Description
enabled	The related data element is accessible by RP tool. Tags: atp.EnumerationLiteralIndex=0
none	The related data element is not accessible by RP tool. Tags: atp.EnumerationLiteralIndex=1
protected	The data element is known to the RP tool however its usage for RP can be restricted. Use case: limitation based on access rights Tags: atp.EnumerationLiteralIndex=2

Table 14.12: RptAccessEnum

14.5.2 Service Points

Access to the RP [global buffers](#) and RP [global measurement buffers](#) can be implemented by using a service based ECU interface in which an additional RP [Service Component](#), such as an “XCP on CAN” or “XCP on Ethernet” service, is added to the ECU application.

An RP [Service Component](#) is an AUTOSAR or vendor specific BSW module providing an RP service, e.g. “XCP on CAN” or “XCP on Ethernet”.

It provides one or more RP [Service Function](#) where data is sampled and/or stimulated at an RP [Service Point](#). Each RP [Service Function](#) call is passed an RP [Service Point](#) ID to identify the service point and enable different invocations to be distinguished.

The integration of the service can be performed pre-build by means of source code based integration, for example, by adding an XCP or custom BSW component, or post-build by patching the binary code of an already compiled ECU image.

In a service based scenario data is sampled and/or stimulated at RP [Service Points](#). During either sampling or stimulation the data is read and/or written from the

memory associated with the `VariableDataPrototype` to/from a local buffer during the execution of the `RP Service Point` and hence transferred to/from the RP tool.

Within the context of the RTE the data stimulated by the `RP Service Points` are the `RP global buffers` and `RP global measurement buffers` however any data that is measurable is potentially subject to reading.

[TPS_SWCT_01722] Semantics of `RP Service Point` [An `RP Service Point` is simply a call of an `RP Service Function` that is provided by the `RP Service Component`.] (*RS_SWCT_03280*)

[TPS_SWCT_01723] Semantics of `RP Service Function` [The `RP Service Function` is responsible for sampling (reading) and stimulating (writing) the bypass data. The action of sampling may then trigger the RP system to perform the bypass (this may involve the communication of the sampled data to an external system for computation) ready for reading when the stimulation occurs.] (*RS_SWCT_03280*)

Service points can be either “SWC Internal” (i.e. inserted by the SWC developer) or “RTE assigned”. SWC Internal service points are included in the SWC description (using `RapidPrototypingScenario`, see below) whereas RTE assigned are created by the RTE generator based on the specification of the SWC.

14.5.2.1 Service Functions

The `RP Service Function` is responsible for sampling the required data. The sampled data is not passed as parameters – the invocation of the `RP Service Function` passes an `RP Service Point ID` as the first parameter of the `RP Service Point` which is used by the `RP Service Component` to identify the service point.

[TPS_SWCT_01724] Semantics of `RapidPrototypingScenario` [A `RapidPrototypingScenario` aggregates one or more `RptContainers` and one or more `RptProfiles`:

- Each `RptContainer` instance specifies, by reference, one or more element(s) applicable to the service-based access.
- Each `RptProfile` instance specifies both the name of the `RP Service Function` (attributes `servicePointSymbolPre` and `servicePointSymbolPost`) and the applicable `RP Service Point IDs` (attributes `minServicePointId` and `maxServicePointId`).

] (*RS_SWCT_03280*)

The cross-product of the information from the `RptContainer` and `RptProfile` within a rapid prototyping scenario is used to construct the service function invocations.

Example: An `RapidPrototypingScenario` contains a single `RptContainer` that references an `RTEEvent` instance, and a single `RptProfile` with service point symbol attribute `MyServiceFunction`. As a result, the RTE generator then wraps invocations of the `RunnableEntity` started by the event with calls to service function `MyServiceFunction`.

Class	RptExecutableEntityProperties			
Package	M2::AUTOSARTemplates::SWComponentTemplate::RPTScenario			
Note	Describes the code preparation for rapid prototyping at ExecutableEntity invocation.			
Base	<i>ARObject</i>			
Aggregated by	RptContainer.rptExecutableEntityProperties , RptExecutableEntityEvent.rptExecutableEntityProperties			
Attribute	Type	Mult.	Kind	Note
maxRptEventId	PositiveInteger	0..1	attr	Highest RPT event id usable for RTE generated service points. This attribute is relevant, if dedicated id range shall be applied to the ExecutableEntitys of a software component or specific ExecutableEntitys.
minRptEventId	PositiveInteger	0..1	attr	Lowest RPT event id usable for RTE generated service points. This attribute is relevant, if dedicated id range shall be applied to the ExecutableEntitys of a software component or specific ExecutableEntitys.
rptExecutionControl	RptExecutionControlEnum	0..1	attr	This attribute specifies the rapid prototyping control of the executable
rptServicePoint	RptServicePointEnum	0..1	attr	Enables generation of service points by the RTE generator.

A Reference Material

This chapter contains some relevant reference material for this specification.

A.1 Abbreviations

The following table contains a list of abbreviations used in the scope of this document along with the spelled-out meaning of each of the abbreviations.

<i>Abbreviation</i>	<i>Meaning</i>
API	Application Programming Interface
BOM	Byte Order Mark
CAN	Controller Area Network
CSE	Codes for Scaling Units
DCM	Diagnostics Communication Manager
DCY	Driving Cycle
DEM	Diagnostics Event Manager
DID	Diagnostic Identifier
DTC	Diagnostic Trouble Code
Dolp	Diagnostics over IP
ECU	Electrical Control Unit
EPROM	Erasable Programmable Read-Only Memory
EEPROM	Electrically Erasable Programmable Read-Only Memory
FID	Function Identifier
GID	Group Identifier
ID	Identifier
IO	Input/Output
IP	Internet Protocol
IUMPR	In-Use Monitor Performance Ratio
ISO	International Standardization Organization
MAC	Message Authentication Code
MCAL	Micro-Controller Abstraction
LIN	Local Interconnect Network
MCD	Measurement, Calibration, Diagnostics
NM	Network Management
NV	Non-Volatile
OBD	On-Board Diagnostic
OEM	Original Equipment Manufacturer
OS	Operating System
PDU	Protocol Data Unit
PID	Parameter Identifier
PTO	Power Take Off
RA	Routing Activation
RAM	Random Access Memory
ROM	Read-Only Memory
RPT	Rapid Prototyping

Abbreviation	Meaning
RTE	Runtime Environment
SWC	Software Component
TID	Test Identifier
UDS	Unified Diagnostic Services
UML	Unified Modeling Language
VFB	Virtual Functional Bus
WWH-OBD	World-Wide Harmonized On-Board Diagnostics
XML	Extensible Markup Language
XSD	XML Schema Definition

Table A.1: Abbreviations used in the scope of this Document

A.2 Imposition Times of Constraints

The constraints formulated in this document have different *actual* imposition times which denote the steps in the workflow when the respective constraint has to be imposed.

Some imposition times “include” other imposition times, an example for this relation is discussed in the table [A.2](#).

The imposition times that are considered applicable in the scope of this document¹ are listed in Table [A.2](#).

Please note that the imposition times are intentionally rendered as technical terms such that it is possible to link back from each constraint to the definition of the affected imposition time in Table [A.2](#).

This document has been created to apply primarily for the *AUTOSAR classic platform* and therefore the discussed imposition times also apply exclusively to the *AUTOSAR classic platform*.

Some constraints, however, *may* also be meaningful in the context of other imposition times, applicable for other *AUTOSAR platforms*.

Imposition Time	Description
at the time when the contract phase generation is executed	This imposition time is aimed at the time when a software-component is ready for generating the contract phase header files such that the implementation of the software-component can be started.

¹Different imposition times may be defined in the context of other AUTOSAR standard documents

<p>at the time when the RTE is generated</p>	<p>This imposition time denotes the step in the workflow where the model is considered complete such that the generation of the RTE can be executed.</p> <p><i>At the time when the RTE is generated, all constraints that need to be imposed <i>at the time when the contract phase generation is executed</i> also need to be observed.</i></p> <p>In other words, a constraint that is imposed <i>at the time when the contract phase generation is executed</i> shall also be imposed <i>at the time when the RTE is generated</i>.</p>
<p>at the time when the creation of the CompositionSwComponentType is finished</p>	<p>This imposition time applies to the creation of compositions of software-components. This imposition time is considered <i>optional</i>.</p> <p>In other words, there may be use cases to deliver CompositionSwComponentTypes that violate constraints with this imposition time to another party.</p> <p>But it may also make sense in some cases to make sure, that a CompositionSwComponentType that is going to be delivered to another party fulfills the constraints associated with this binding time.</p>
<p>at the time when the ValueSpecification is applied</p>	<p>This imposition time is aimed at the point in time where a ValueSpecification is applied to data object and consistency requirements between the ValueSpecification and the data object can be checked.</p>

Table A.2: Imposition Times considered in the scope of this document

From the appearance of an imposition time that only applies to the *AUTOSAR classic platform* in the text of a constraint in this document, it **shall not be concluded that the constraint is exclusively applicable to the *AUTOSAR classic platform***.

A.3 Requirements Tracing

Requirements against this document are exclusively stated in the corresponding requirements document [51].

The following table references the requirements specified in [51] and provides information about individual specification items that fulfill a given requirement.

Requirement	Description	Satisfied by
[RS_SWCT_00010]	The Software Component Template shall support inter- and intra-ECU-communication mechanisms with high reliability	[TPS_SWCT_01025] [TPS_SWCT_01026] [TPS_SWCT_01027] [TPS_SWCT_01069] [TPS_SWCT_01070] [TPS_SWCT_01111] [TPS_SWCT_01516] [TPS_SWCT_01573]
[RS_SWCT_00020]	The Software Component Template shall provide open and standardized software interfaces for intra-ECU and inter-ECU communication	[TPS_SWCT_01002]
[RS_SWCT_00030]	The Software Component Template shall provide complete interfaces to application software and basic software modules	[TPS_SWCT_01002] [TPS_SWCT_01003] [TPS_SWCT_01004] [TPS_SWCT_01668] [TPS_SWCT_01672] [TPS_SWCT_01678] [TPS_SWCT_01679] [TPS_SWCT_01694] [TPS_SWCT_01703] [TPS_SWCT_01704] [TPS_SWCT_01705] [TPS_SWCT_01716] [TPS_SWCT_01717] [TPS_SWCT_01718] [TPS_SWCT_01726] [TPS_SWCT_01728] [TPS_SWCT_01730] [TPS_SWCT_01731] [TPS_SWCT_01732] [TPS_SWCT_01733] [TPS_SWCT_01735] [TPS_SWCT_01740] [TPS_SWCT_01741] [TPS_SWCT_01742] [TPS_SWCT_01743] [TPS_SWCT_01745] [TPS_SWCT_01763] [TPS_SWCT_01776] [TPS_SWCT_01777] [TPS_SWCT_01778] [TPS_SWCT_01779] [TPS_SWCT_01780] [TPS_SWCT_01781] [TPS_SWCT_01782] [TPS_SWCT_01783] [TPS_SWCT_01784] [TPS_SWCT_01810] [TPS_SWCT_01813] [TPS_SWCT_01814] [TPS_SWCT_01815] [TPS_SWCT_01816] [TPS_SWCT_01817] [TPS_SWCT_01818] [TPS_SWCT_01819] [TPS_SWCT_01826] [TPS_SWCT_01827] [TPS_SWCT_01829] [TPS_SWCT_01830] [TPS_SWCT_01832] [TPS_SWCT_01854] [TPS_SWCT_01869] [TPS_SWCT_02019] [TPS_SWCT_02020] [TPS_SWCT_02021] [TPS_SWCT_02022] [TPS_SWCT_02024] [TPS_SWCT_02025] [TPS_SWCT_02026] [TPS_SWCT_02027] [TPS_SWCT_02028] [TPS_SWCT_02031] [TPS_SWCT_02032] [TPS_SWCT_02506]
[RS_SWCT_00070]	The Software Component Template shall provide an abstraction of the application software from hardware	[TPS_SWCT_01030] [TPS_SWCT_01097] [TPS_SWCT_01098]
[RS_SWCT_00080]	The Software Component Template shall provide an independence of application software from in-vehicle communication technologies	[TPS_SWCT_01025] [TPS_SWCT_01026] [TPS_SWCT_01027] [TPS_SWCT_01069] [TPS_SWCT_01070] [TPS_SWCT_01516]
[RS_SWCT_00090]	The Software Component Template should provide an independence of application software from operating systems	[TPS_SWCT_01030] [TPS_SWCT_01097] [TPS_SWCT_01098]
[RS_SWCT_00110]	The Software Component Template shall provide a functional interface view of the entire system	[TPS_SWCT_01025] [TPS_SWCT_01026] [TPS_SWCT_01027] [TPS_SWCT_01069] [TPS_SWCT_01070] [TPS_SWCT_01516]
[RS_SWCT_00120]	The Software Component Template shall provide protection/unlock mechanisms for software through appropriate services in the infrastructure	[TPS_SWCT_01031] [TPS_SWCT_01049] [TPS_SWCT_01050] [TPS_SWCT_01051] [TPS_SWCT_01052] [TPS_SWCT_01053] [TPS_SWCT_01054] [TPS_SWCT_01055] [TPS_SWCT_01321] [TPS_SWCT_01592] [TPS_SWCT_01713] [TPS_SWCT_01714]
[RS_SWCT_00150]	The Software Component Template shall provide means to protect SW-Components from malicious SW-Components	[TPS_SWCT_01002]
[RS_SWCT_00160]	The Software Component Template shall provide means to achieve compositionality	[TPS_SWCT_01002]

Requirement	Description	Satisfied by
[RS_SWCT_00170]	The Software Component Template shall provide diagnostics means during runtime, for production and services purposes	[TPS_SWCT_01028] [TPS_SWCT_01029] [TPS_SWCT_01129] [TPS_SWCT_01132] [TPS_SWCT_01134] [TPS_SWCT_01135] [TPS_SWCT_01136] [TPS_SWCT_01137] [TPS_SWCT_01138] [TPS_SWCT_01139] [TPS_SWCT_01140] [TPS_SWCT_01425] [TPS_SWCT_01426] [TPS_SWCT_01427] [TPS_SWCT_01453] [TPS_SWCT_01582] [TPS_SWCT_01627] [TPS_SWCT_01628] [TPS_SWCT_01629] [TPS_SWCT_01630] [TPS_SWCT_01631] [TPS_SWCT_01632] [TPS_SWCT_01633] [TPS_SWCT_01634] [TPS_SWCT_01639] [TPS_SWCT_01640] [TPS_SWCT_01654] [TPS_SWCT_01655] [TPS_SWCT_01656] [TPS_SWCT_01657] [TPS_SWCT_01690] [TPS_SWCT_01691] [TPS_SWCT_01706] [TPS_SWCT_01707] [TPS_SWCT_01708] [TPS_SWCT_01709] [TPS_SWCT_01711] [TPS_SWCT_01712] [TPS_SWCT_01715] [TPS_SWCT_01739] [TPS_SWCT_01765] [TPS_SWCT_01766] [TPS_SWCT_01767] [TPS_SWCT_01789] [TPS_SWCT_01790] [TPS_SWCT_01791] [TPS_SWCT_01808] [TPS_SWCT_01853] [TPS_SWCT_01862] [TPS_SWCT_01870] [TPS_SWCT_01879] [TPS_SWCT_01880] [TPS_SWCT_02002] [TPS_SWCT_02003] [TPS_SWCT_02004] [TPS_SWCT_02005] [TPS_SWCT_02007] [TPS_SWCT_02008] [TPS_SWCT_02009] [TPS_SWCT_02010] [TPS_SWCT_02011] [TPS_SWCT_02012] [TPS_SWCT_02013] [TPS_SWCT_02015] [TPS_SWCT_02016] [TPS_SWCT_02505]
[RS_SWCT_00190]	The Software Component Template shall support hierarchical design methods	[TPS_SWCT_01032] [TPS_SWCT_01033] [TPS_SWCT_01034] [TPS_SWCT_01035] [TPS_SWCT_01036] [TPS_SWCT_01037]
[RS_SWCT_00200]	Definitions of relations between SW components are exhaustive and formal	[TPS_SWCT_01002] [TPS_SWCT_01322] [TPS_SWCT_01323] [TPS_SWCT_01325] [TPS_SWCT_01326] [TPS_SWCT_01328] [TPS_SWCT_01329] [TPS_SWCT_01330] [TPS_SWCT_01331] [TPS_SWCT_01333] [TPS_SWCT_01334] [TPS_SWCT_01335] [TPS_SWCT_01336] [TPS_SWCT_01337] [TPS_SWCT_01338] [TPS_SWCT_01339] [TPS_SWCT_01340] [TPS_SWCT_01341] [TPS_SWCT_01342] [TPS_SWCT_01343] [TPS_SWCT_01345] [TPS_SWCT_01346] [TPS_SWCT_01347] [TPS_SWCT_01348] [TPS_SWCT_01349] [TPS_SWCT_01350] [TPS_SWCT_01351] [TPS_SWCT_01352] [TPS_SWCT_01353] [TPS_SWCT_01557] [TPS_SWCT_01558] [TPS_SWCT_01567] [TPS_SWCT_01663]
[RS_SWCT_00210]	SW components are protected from illegal access	[TPS_SWCT_01002]
[RS_SWCT_00220]	The Software Component Template shall support management of vehicle diversity	[TPS_SWCT_01038] [TPS_SWCT_01040] [TPS_SWCT_01041] [TPS_SWCT_01042] [TPS_SWCT_01447]
[RS_SWCT_00230]	The Software Component Template shall provide the ability to define naming conventions for public symbols	[TPS_SWCT_01000] [TPS_SWCT_01001] [TPS_SWCT_01635]
[RS_SWCT_02000]	The Software Component Template shall support a top-down hierarchical design	[TPS_SWCT_01032] [TPS_SWCT_01033] [TPS_SWCT_01034] [TPS_SWCT_01035] [TPS_SWCT_01036] [TPS_SWCT_01037]
[RS_SWCT_02010]	Interfaces of atomic software-components shall be supported	[TPS_SWCT_01002]
[RS_SWCT_02020]	Bottom-up design of CompositionTypes shall be supported	[TPS_SWCT_01032] [TPS_SWCT_01033] [TPS_SWCT_01034] [TPS_SWCT_01035] [TPS_SWCT_01036] [TPS_SWCT_01037]

Requirement	Description	Satisfied by
[RS_SWCT_02030]	Specification of Communications shall be supported	[TPS_SWCT_01002] [TPS_SWCT_01025] [TPS_SWCT_01026] [TPS_SWCT_01027] [TPS_SWCT_01087] [TPS_SWCT_01106] [TPS_SWCT_01114] [TPS_SWCT_01115] [TPS_SWCT_01116] [TPS_SWCT_01117] [TPS_SWCT_01118] [TPS_SWCT_01119] [TPS_SWCT_01120] [TPS_SWCT_01121] [TPS_SWCT_01122] [TPS_SWCT_01124] [TPS_SWCT_01196] [TPS_SWCT_01198] [TPS_SWCT_01218] [TPS_SWCT_01454] [TPS_SWCT_01516] [TPS_SWCT_01801]
[RS_SWCT_02060]	Interaction with basic software shall be considered	[TPS_SWCT_01005] [TPS_SWCT_01043] [TPS_SWCT_01044] [TPS_SWCT_01045] [TPS_SWCT_01046] [TPS_SWCT_01556] [TPS_SWCT_01660] [TPS_SWCT_01661] [TPS_SWCT_01689] [TPS_SWCT_01693] [TPS_SWCT_01833]
[RS_SWCT_02080]	Designing a Sensor Actuator Component shall be supported	[TPS_SWCT_01047] [TPS_SWCT_01048]
[RS_SWCT_02090]	Data-consistency for communication among RunnableEntities shall be supported	[TPS_SWCT_01031] [TPS_SWCT_01049] [TPS_SWCT_01050] [TPS_SWCT_01051] [TPS_SWCT_01052] [TPS_SWCT_01053] [TPS_SWCT_01054] [TPS_SWCT_01055] [TPS_SWCT_01637] [TPS_SWCT_01713] [TPS_SWCT_01714]
[RS_SWCT_02100]	Definition of physical units shall be supported	[TPS_SWCT_01056] [TPS_SWCT_01057] [TPS_SWCT_01058] [TPS_SWCT_01059] [TPS_SWCT_01060] [TPS_SWCT_01061] [TPS_SWCT_01068] [TPS_SWCT_01736] [TPS_SWCT_01737]
[RS_SWCT_02110]	Definition of comments shall be supported	[TPS_SWCT_01062] [TPS_SWCT_01203] [TPS_SWCT_01204] [TPS_SWCT_01205] [TPS_SWCT_01206] [TPS_SWCT_01207] [TPS_SWCT_01208] [TPS_SWCT_01209] [TPS_SWCT_01211] [TPS_SWCT_01212] [TPS_SWCT_01214] [TPS_SWCT_01215] [TPS_SWCT_01216] [TPS_SWCT_01217] [TPS_SWCT_01524]
[RS_SWCT_03000]	The SW-Component template shall support compositions	[TPS_SWCT_01032] [TPS_SWCT_01033] [TPS_SWCT_01034] [TPS_SWCT_01035] [TPS_SWCT_01036] [TPS_SWCT_01037]
[RS_SWCT_03010]	The SW-Component template shall support interfaces	[TPS_SWCT_01025] [TPS_SWCT_01026] [TPS_SWCT_01069] [TPS_SWCT_01070] [TPS_SWCT_01516]
[RS_SWCT_03040]	The SW-Component template shall support description of the behavior	[TPS_SWCT_01022] [TPS_SWCT_01030] [TPS_SWCT_01075] [TPS_SWCT_01098] [TPS_SWCT_01108] [TPS_SWCT_01153] [TPS_SWCT_01154] [TPS_SWCT_01155] [TPS_SWCT_01156] [TPS_SWCT_01157] [TPS_SWCT_01302] [TPS_SWCT_01303] [TPS_SWCT_01304] [TPS_SWCT_01305] [TPS_SWCT_01306] [TPS_SWCT_01307] [TPS_SWCT_01309] [TPS_SWCT_01310] [TPS_SWCT_01312] [TPS_SWCT_01313] [TPS_SWCT_01314] [TPS_SWCT_01315] [TPS_SWCT_01317] [TPS_SWCT_01318] [TPS_SWCT_01320] [TPS_SWCT_01324] [TPS_SWCT_01354] [TPS_SWCT_01355] [TPS_SWCT_01356] [TPS_SWCT_01357] [TPS_SWCT_01358] [TPS_SWCT_01359] [TPS_SWCT_01360] [TPS_SWCT_01361] [TPS_SWCT_01363] [TPS_SWCT_01366] [TPS_SWCT_01367] [TPS_SWCT_01368] [TPS_SWCT_01369] [TPS_SWCT_01469] [TPS_SWCT_01483] [TPS_SWCT_01519] [TPS_SWCT_01520] [TPS_SWCT_01521] [TPS_SWCT_01522] [TPS_SWCT_01523] [TPS_SWCT_01687] [TPS_SWCT_01849] [TPS_SWCT_03500] [TPS_SWCT_03501]
[RS_SWCT_03045]	The SW-Component template shall allow enabling of RTE-Feature to get the activating RTE-Event of Runnable Entity	[TPS_SWCT_01469]
[RS_SWCT_03046]	The SW-Component template shall support instance specific RTE-Events	[TPS_SWCT_02507]
[RS_SWCT_03050]	The SW-Component template shall support the definition of schedulability	[TPS_SWCT_01030] [TPS_SWCT_01097] [TPS_SWCT_01098]

Requirement	Description	Satisfied by
[RS_SWCT_03055]	The SW-Component template shall support optional configuration of ExclusiveArea usage within RunnableEntities	[TPS_SWCT_01457] [TPS_SWCT_01458] [TPS_SWCT_01459] [TPS_SWCT_01460]
[RS_SWCT_03065]	The Software Component Template shall support the definition of implicit communication behavior	[TPS_SWCT_01466] [TPS_SWCT_01470] [TPS_SWCT_01471] [TPS_SWCT_01472] [TPS_SWCT_01473] [TPS_SWCT_01474] [TPS_SWCT_01475] [TPS_SWCT_01476] [TPS_SWCT_01479] [TPS_SWCT_01480] [TPS_SWCT_01481] [TPS_SWCT_01482] [TPS_SWCT_01509] [TPS_SWCT_01625]
[RS_SWCT_03090]	The SW-Component template shall support the definition of needed and usable sensors and actuators	[TPS_SWCT_01047] [TPS_SWCT_01048]
[RS_SWCT_03100]	The SW-Component template shall support variant handling	[TPS_SWCT_01040] [TPS_SWCT_01041] [TPS_SWCT_01042] [TPS_SWCT_01370] [TPS_SWCT_01371] [TPS_SWCT_01372] [TPS_SWCT_01373] [TPS_SWCT_01448] [TPS_SWCT_01858]
[RS_SWCT_03110]	The SW-Component template shall support modes	[TPS_SWCT_01071] [TPS_SWCT_01153] [TPS_SWCT_01154] [TPS_SWCT_01190] [TPS_SWCT_01376] [TPS_SWCT_01377] [TPS_SWCT_01378] [TPS_SWCT_01379] [TPS_SWCT_01380] [TPS_SWCT_01381] [TPS_SWCT_01382] [TPS_SWCT_01383] [TPS_SWCT_01384] [TPS_SWCT_01385] [TPS_SWCT_01388] [TPS_SWCT_01530] [TPS_SWCT_01531] [TPS_SWCT_01532] [TPS_SWCT_01533] [TPS_SWCT_01534] [TPS_SWCT_01535] [TPS_SWCT_01536] [TPS_SWCT_01541] [TPS_SWCT_01542] [TPS_SWCT_01552] [TPS_SWCT_01553] [TPS_SWCT_01554] [TPS_SWCT_01555] [TPS_SWCT_01581] [TPS_SWCT_01664] [TPS_SWCT_03502] [TPS_SWCT_03503] [TPS_SWCT_03504] [TPS_SWCT_03505]
[RS_SWCT_03115]	The SW-Component template shall support mapping of mode declarations	[TPS_SWCT_01464] [TPS_SWCT_01465] [TPS_SWCT_01545]
[RS_SWCT_03120]	The SW-Component template shall support dependency on modes	[TPS_SWCT_01077]
[RS_SWCT_03130]	The SW-Component template shall support connections between PortInterfaces	[TPS_SWCT_01079] [TPS_SWCT_01080] [TPS_SWCT_01081] [TPS_SWCT_01082] [TPS_SWCT_01083] [TPS_SWCT_01084] [TPS_SWCT_01113] [TPS_SWCT_01507] [TPS_SWCT_01515] [TPS_SWCT_01573] [TPS_SWCT_01843]
[RS_SWCT_03135]	The SW-Component template shall support record type subsetting	[TPS_SWCT_01023] [TPS_SWCT_01024] [TPS_SWCT_01551]
[RS_SWCT_03136]	The SW-Component template shall support record type subsetting with primitive types	[TPS_SWCT_01195]
[RS_SWCT_03140]	The SW-Component template shall support conditional existence of PortPrototypes	[TPS_SWCT_01038]
[RS_SWCT_03141]	The SW-Component template shall support the conditional existence of data element prototypes, operation prototypes, parameter prototypes in an interface	[TPS_SWCT_01106]
[RS_SWCT_03142]	The SW-Component template shall support the conditional existence of Component Prototypes	[TPS_SWCT_01038]

Requirement	Description	Satisfied by
[RS_SWCT_03143]	The SW-Component template shall support the conditional existence of Connector Prototypes	[TPS_SWCT_01040]
[RS_SWCT_03144]	The SW-Component template shall support a configurable size of arrays	[TPS_SWCT_01076] [TPS_SWCT_01078]
[RS_SWCT_03148]	Attributes swMinAxisPoints and swMaxAxisPoints shall be adjustable by an System Constant Definition	[TPS_SWCT_01107] [TPS_SWCT_01181] [TPS_SWCT_01839]
[RS_SWCT_03149]	The SW-Component template shall support the conditional existence of RunnableEntitys	[TPS_SWCT_01085]
[RS_SWCT_03150]	The SW-Component template shall support the conditional existence of RTEEvents	[TPS_SWCT_01085]
[RS_SWCT_03151]	The SW-Component template shall support the conditional existence of InterRunnable Variables	[TPS_SWCT_01085]
[RS_SWCT_03152]	The SW-Component template shall support the conditional accessibility for measurement	[TPS_SWCT_01130]
[RS_SWCT_03153]	The SW-Component template shall support the conditional existence of parameter prototypes	[TPS_SWCT_01085]
[RS_SWCT_03154]	The SW-Component template shall support conditional ports for software components	[TPS_SWCT_01038]
[RS_SWCT_03155]	The SW-Component template shall support interfaces with different resolutions	[TPS_SWCT_01099] [TPS_SWCT_01100] [TPS_SWCT_01101] [TPS_SWCT_01102] [TPS_SWCT_01103] [TPS_SWCT_01104] [TPS_SWCT_01105]
[RS_SWCT_03170]	The SW-Component template shall support fixed data exchange	[TPS_SWCT_01102] [TPS_SWCT_01103] [TPS_SWCT_01104]
[RS_SWCT_03175]	The SW-Component template shall support the definition of calibration datasets	[TPS_SWCT_01177] [TPS_SWCT_01178] [TPS_SWCT_01188] [TPS_SWCT_01793] [TPS_SWCT_01794]
[RS_SWCT_03180]	The SW-Component template shall support SAE J1939 Protocol Features	[TPS_SWCT_01076] [TPS_SWCT_01673] [TPS_SWCT_01674] [TPS_SWCT_01809]
[RS_SWCT_03181]	The SW-Component template shall support arrays of variable number of elements within the maximum size	[TPS_SWCT_01076] [TPS_SWCT_01127] [TPS_SWCT_01495] [TPS_SWCT_01601] [TPS_SWCT_01602] [TPS_SWCT_01604] [TPS_SWCT_01605] [TPS_SWCT_01606] [TPS_SWCT_01607] [TPS_SWCT_01608] [TPS_SWCT_01610] [TPS_SWCT_01612] [TPS_SWCT_01613] [TPS_SWCT_01614] [TPS_SWCT_01615] [TPS_SWCT_01617] [TPS_SWCT_01618] [TPS_SWCT_01619] [TPS_SWCT_01620] [TPS_SWCT_01621] [TPS_SWCT_01622] [TPS_SWCT_01623] [TPS_SWCT_01636] [TPS_SWCT_01641] [TPS_SWCT_01642] [TPS_SWCT_01644] [TPS_SWCT_01645] [TPS_SWCT_01647] [TPS_SWCT_01648] [TPS_SWCT_01649] [TPS_SWCT_01650] [TPS_SWCT_01793] [TPS_SWCT_01794]
[RS_SWCT_03182]	The SW-Component template shall support byte arrays of variable number of elements	[TPS_SWCT_01127]

Requirement	Description	Satisfied by
[RS_SWCT_03190]	The SW-Component template shall support the ability to publish/specify the diagnostic capabilities and its resources of an SWC	[TPS_SWCT_01028] [TPS_SWCT_01029] [TPS_SWCT_01129] [TPS_SWCT_01132] [TPS_SWCT_01134] [TPS_SWCT_01135] [TPS_SWCT_01136] [TPS_SWCT_01137] [TPS_SWCT_01138] [TPS_SWCT_01139] [TPS_SWCT_01140] [TPS_SWCT_01421] [TPS_SWCT_01422] [TPS_SWCT_01425] [TPS_SWCT_01426] [TPS_SWCT_01427] [TPS_SWCT_01453] [TPS_SWCT_01537] [TPS_SWCT_01538] [TPS_SWCT_01539] [TPS_SWCT_01540] [TPS_SWCT_01544] [TPS_SWCT_01546] [TPS_SWCT_01547] [TPS_SWCT_01577] [TPS_SWCT_01578] [TPS_SWCT_01582] [TPS_SWCT_01627] [TPS_SWCT_01628] [TPS_SWCT_01629] [TPS_SWCT_01630] [TPS_SWCT_01631] [TPS_SWCT_01632] [TPS_SWCT_01633] [TPS_SWCT_01634] [TPS_SWCT_01639] [TPS_SWCT_01640] [TPS_SWCT_01654] [TPS_SWCT_01655] [TPS_SWCT_01656] [TPS_SWCT_01657] [TPS_SWCT_01680] [TPS_SWCT_01690] [TPS_SWCT_01691] [TPS_SWCT_01706] [TPS_SWCT_01707] [TPS_SWCT_01708] [TPS_SWCT_01709] [TPS_SWCT_01711] [TPS_SWCT_01712] [TPS_SWCT_01715] [TPS_SWCT_01739] [TPS_SWCT_01746] [TPS_SWCT_01765] [TPS_SWCT_01766] [TPS_SWCT_01767] [TPS_SWCT_01769] [TPS_SWCT_01789] [TPS_SWCT_01790] [TPS_SWCT_01791] [TPS_SWCT_01808] [TPS_SWCT_01853] [TPS_SWCT_01862] [TPS_SWCT_01870] [TPS_SWCT_01879] [TPS_SWCT_01880] [TPS_SWCT_02002] [TPS_SWCT_02003] [TPS_SWCT_02004] [TPS_SWCT_02005] [TPS_SWCT_02007] [TPS_SWCT_02008] [TPS_SWCT_02009] [TPS_SWCT_02010] [TPS_SWCT_02011] [TPS_SWCT_02012] [TPS_SWCT_02013] [TPS_SWCT_02015] [TPS_SWCT_02016] [TPS_SWCT_02505]
[RS_SWCT_03200]	The SW-Component template shall support vehicle and application mode management	[TPS_SWCT_01008] [TPS_SWCT_01009] [TPS_SWCT_01010] [TPS_SWCT_01011] [TPS_SWCT_01016] [TPS_SWCT_01017] [TPS_SWCT_01018] [TPS_SWCT_01019] [TPS_SWCT_01020] [TPS_SWCT_01021] [TPS_SWCT_01063] [TPS_SWCT_01064] [TPS_SWCT_01065] [TPS_SWCT_01066] [TPS_SWCT_01067] [TPS_SWCT_01071] [TPS_SWCT_01126] [TPS_SWCT_01450] [TPS_SWCT_01451] [TPS_SWCT_01552] [TPS_SWCT_01553] [TPS_SWCT_01554] [TPS_SWCT_01572] [TPS_SWCT_01581] [TPS_SWCT_01664] [TPS_SWCT_01811] [TPS_SWCT_03502] [TPS_SWCT_03503] [TPS_SWCT_03504] [TPS_SWCT_03505]
[RS_SWCT_03201]	The SW-Component template shall support Portgroups	[TPS_SWCT_01063] [TPS_SWCT_01064] [TPS_SWCT_01065] [TPS_SWCT_01066] [TPS_SWCT_01096] [TPS_SWCT_01126] [TPS_SWCT_01169] [TPS_SWCT_01173] [TPS_SWCT_01174]
[RS_SWCT_03202]	The SW-Component template shall support enabling SWCs to request dedicated modes	[TPS_SWCT_01086] [TPS_SWCT_01201] [TPS_SWCT_01353] [TPS_SWCT_01554] [TPS_SWCT_01572] [TPS_SWCT_03502] [TPS_SWCT_03504]
[RS_SWCT_03203]	The SW-Component template shall support propagation of mode information	[TPS_SWCT_01086] [TPS_SWCT_01087] [TPS_SWCT_01200] [TPS_SWCT_01201] [TPS_SWCT_01202] [TPS_SWCT_01552] [TPS_SWCT_01553] [TPS_SWCT_01566] [TPS_SWCT_01664] [TPS_SWCT_03503] [TPS_SWCT_03505]

Table A.3: Requirements Tracing

B Examples

This section contains a collection of examples for **select modeling aspects** discussed in this document.

Please note that it is not foreseen to create examples for every single aspect of using the model elements discussed in this document.

B.1 Examples of Data Types

This section contains a compilation of examples for the definition of data types. Note that the purpose of the section is to highlight specific and notable aspects of the modeling of data types.

There is no intention to create a comprehensive example for the creation of any possible data type that the AUTOSAR methodology may support.

B.1.1 Definition of a String Data Type

This sub-section describes an example of the definition of a string data type, including the definition of the `SwRecordLayout`¹ that applies to `ApplicationPrimitiveDataType` of category `STRING`.

On the level of `ImplementationDataType`, The string data type is implemented as a structured data type that consists of:

1. the **size** of an instance of the string data type in terms of the number of characters plus
2. an **array** that can be used to store the individual characters contained in an instance of the string data type.

```
<APPLICATION-PRIMITIVE-DATA-TYPE>

</SW-DATA-DEF-PROPS-CONDITIONAL>
</SW-DATA-DEF-PROPS-VARIANTS>
</SW-DATA-DEF-PROPS>
</APPLICATION-PRIMITIVE-DATA-TYPE>
    
```

Listing B.1: Example for the definition of a string `ApplicationPrimitiveDataType`

Depending on the used encoding, the **array** may need to be bigger (in terms of the number of elements) than the corresponding value of the **size**.

Furthermore, the definition of the `SwRecordLayout` already takes into account that the implementation of an array data type by means of an `ImplementationDataType` requires the definition of an `ImplementationDataTypeElement`.

The meaning of the standardized values of `SwRecordLayoutV.swRecordLayoutVProp` are documented in [TPS_SWCT_01489]. In the scope of this example the values `COUNT` and `VALUE` are used.

The fact that the `swRecordLayoutGroupTo` contains the value `-1` means that the iteration ends at the last element of the array.

Please note further that the discussed example of an `ApplicationPrimitiveDataType` of `category STRING` also contains the definition of an `invalidValue` for the string data type.

The next step is the definition of an `ImplementationDataType` that represents the string type on the implementation level.

The definition of the `ImplementationDataType` can be derived from the definition of the applicable `SwRecordLayout`.

```

<SW-RECORD-LAYOUT>
    <SHORT-NAME>StringDescriptor</SHORT-NAME>

Listing B.4: Example for the definition of a string [ImplementationDataType](#)

As mentioned in [TPS_SWCT_01487], the consistency of the `invalidValue` defined in the scope of the `ApplicationPrimitiveDataType` of category `STRING` and the `invalidValue` defined in the scope of the corresponding `ImplementationDataType` cannot formally be checked.

The `ImplementationDataType` with the `shortName` `MyImplementationStringType` (as exemplified in Listing B.4) represents a variable-size string, i.e. the number of characters may change at run-time. Of course, it is also possible to model a fixed-size string, but in that case a size-indicator is not required.

Please note further that the size of the payload array in the definition of the `ImplementationDataType` in Listing B.4 has been set to the value 200 in order to accommodate for the definition of `swMaxTextSize` in the definition of the corresponding `ApplicationDataType` in combination with the fact that the value of `baseTypeEncoding` has been set to `UTF-8`.

For background, the value of attribute `SwTextProps.swMaxTextSize` shall be specified as the number of *code points* in the string.

Each *code point* will be encoded by a sequence of bytes, depending on the applicable encoding. In the case of `UTF-8`, for example, each *code point* will be encoded by up to four bytes.

On the level of `ImplementationDataType`, an array designed to hold a string consisting of *code points* encoded using `UTF-8` needs to be big enough to carry the number of *code points* (which may have been described by `SwTextProps.swMaxTextSize`) times 4 bytes.

The interesting part about this definition is the fact that on the implementation level, it was (driven by the definition of the `SwRecordLayout`) decided to implement the string as a structure of a size element (that goes by the `shortName` “size”) and a value element (that goes by the `shortName` “string”).

The value element is defined as an array data type and therefore has a sub-element that goes by the `shortName` “character”.

```
<SW-BASE-TYPE>
  <SHORT-NAME>MyTextBaseType</SHORT-NAME>
  <CATEGORY>FIXED_LENGTH</CATEGORY>
  <BASE-TYPE-SIZE>8</BASE-TYPE-SIZE>
  <BASE-TYPE-ENCODING>UTF-8</BASE-TYPE-ENCODING>
</SW-BASE-TYPE>
<SW-BASE-TYPE>
  <SHORT-NAME>uint8BT</SHORT-NAME>
  <CATEGORY>FIXED_LENGTH</CATEGORY>
  <BASE-TYPE-SIZE>8</BASE-TYPE-SIZE>
</SW-BASE-TYPE>
```

Listing B.5: Example for the definition of a string `SwBaseType`

The latter references (in the role `swDataDefProps.implementationDataType`) the `Platform DataType` “uint8” (that, according to the rules of `Platform Data Types`, is realized by an `ImplementationDataType` “uint8”).

Please note that the `ApplicationPrimitiveDataType` named “MyApplicationStringType” references the `SwBaseType` named “MyTextBaseType” which is defined in the following XML fragment:

The contribution of this definition of `SwBaseType` to the overall definition of a string data type is represented by the definition of the character encoding (which is set to UTF-8).

```
<DATA-TYPE-MAPPING-SET>
  <SHORT-NAME>theExample</SHORT-NAME>
  <DATA-TYPE-MAPS>
    <DATA-TYPE-MAP>
      <APPLICATION-DATA-TYPE-REF BASE="default" DEST="APPLICATION-PRIMITIVE-
        -DATA-TYPE">ApplicationDataTypes/MyApplicationStringType</
        APPLICATION-DATA-TYPE-REF>
      <IMPLEMENTATION-DATA-TYPE-REF BASE="default" DEST="IMPLEMENTATION-
        -DATA-TYPE">ImplementationDataTypes/MyImplementationStringType</
        IMPLEMENTATION-DATA-TYPE-REF>
    </DATA-TYPE-MAP>
  </DATA-TYPE-MAPS>
</DATA-TYPE-MAPPING-SET>
```

Listing B.6: Example for the definition of the applicable `DataTypeMappingSet`

However, there is still one important part missing, i.e. the definition of the mapping of `ApplicationPrimitiveDataType` to `ImplementationDataType` (and vice versa, see Listing B.6).

As mentioned before, the definition of an `ImplementationDataType` that corresponds to an `ApplicationPrimitiveDataType` of category `STRING` can be to some extent derived from the `ApplicationPrimitiveDataType.swDataDefProps.swRecordLayout`.

B.1.2 Definition of an Index Data Type

The following (see Listing B.7) example shows a simplified and stripped-down (e.g. without the `SwDataDefProps` required to make the model complete) model of a so-called index data type. For more information, please refer to section 5.2.4.2.1.3.

```
<APPLICATION-ARRAY-DATA-TYPE>
  <SHORT-NAME>CylinderArray</SHORT-NAME>
  <ELEMENT>
    <SHORT-NAME>CylinderArrayElement</SHORT-NAME>
    <ARRAY-SIZE-SEMANTICS>FIXED-SIZE</ARRAY-SIZE-SEMANTICS>
    <INDEX-DATA-TYPE-REF DEST="APPLICATION-PRIMITIVE-DATA-TYPE">
      myIndexDataType</INDEX-DATA-TYPE-REF>
    </ELEMENT>
  </APPLICATION-ARRAY-DATA-TYPE>
<APPLICATION-PRIMITIVE-DATA-TYPE>
  <SHORT-NAME>myIndexDataType</SHORT-NAME>
  <SW-DATA-DEF-PROPS>
    <SW-DATA-DEF-PROPS-VARIANTS>
    <SW-DATA-DEF-PROPS-CONDITIONAL>
```

```

        <COMPU-METHOD-REF DEST="COMPU-METHOD">cylinders</COMPU-METHOD-REF>
    </SW-DATA-DEF-PROPS-CONDITIONAL>
</SW-DATA-DEF-PROPS-VARIANTS>
</SW-DATA-DEF-PROPS>
</APPLICATION-PRIMITIVE-DATA-TYPE>
    
```

Listing B.7: Example for array index data type

Listing B.8 contains an example of a `CompuMethod` eligible for an `indexDataType`.

```

<COMPU-METHOD>
  <SHORT-NAME>cylinders</SHORT-NAME>
  <CATEGORY>TEXTTABLE</CATEGORY>
  <COMPU-INTERNAL-TO-PHYS>
    <COMPU-SCALES>
      <COMPU-SCALE>
        <LOWER-LIMIT INTERVAL-TYPE="CLOSED">0</LOWER-LIMIT>

B.1.3 Definition of variable-size Arrays

This section contains some modeling examples for the definition of variable-size arrays (see sections 2.7, 5.2.4.2.1.1 and 5.2.5.5.2) and its four defined use cases: Linear, square, rectangular and fully flexible.

All of these examples can be realized only using `ImplementationDataTypes` or, as shown here, starting with the definition of `ApplicationDataTypes` with corresponding `ImplementationDataTypes`.

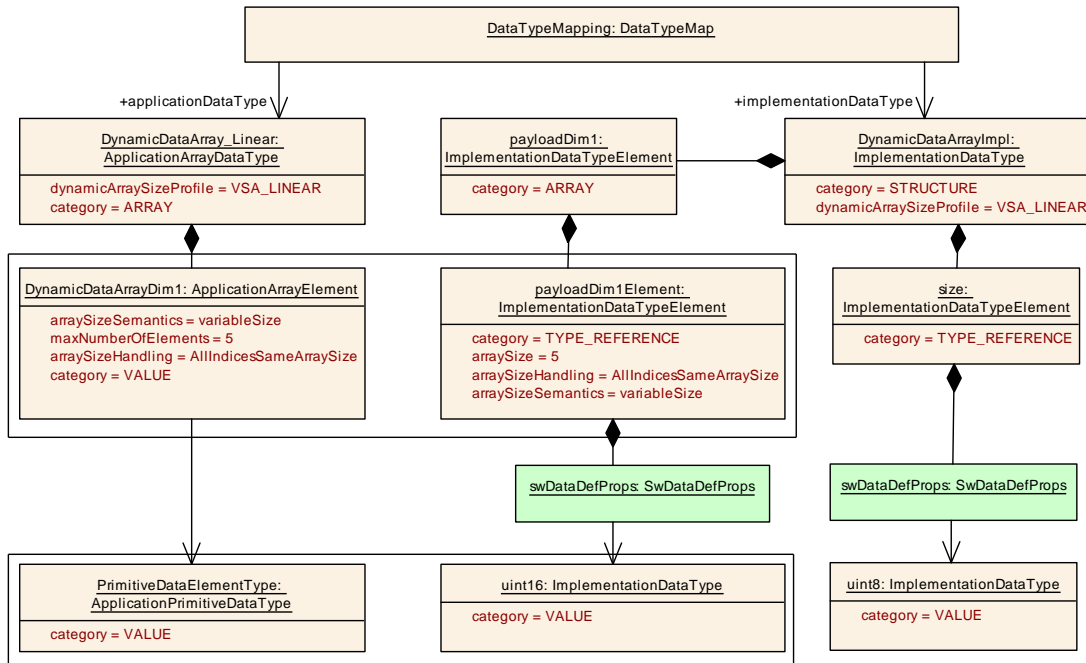

Figure B.1: Example of a linear variable size array

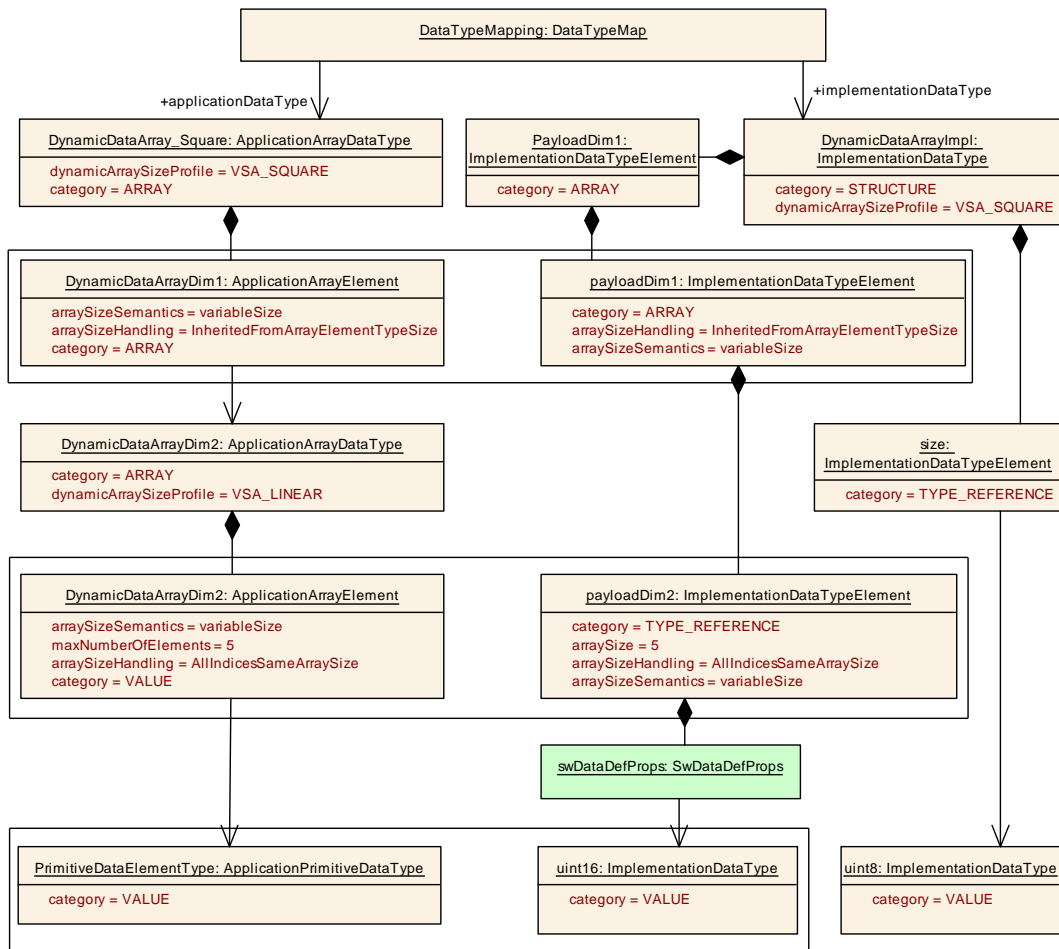

Figure B.2: Example of a square variable size array

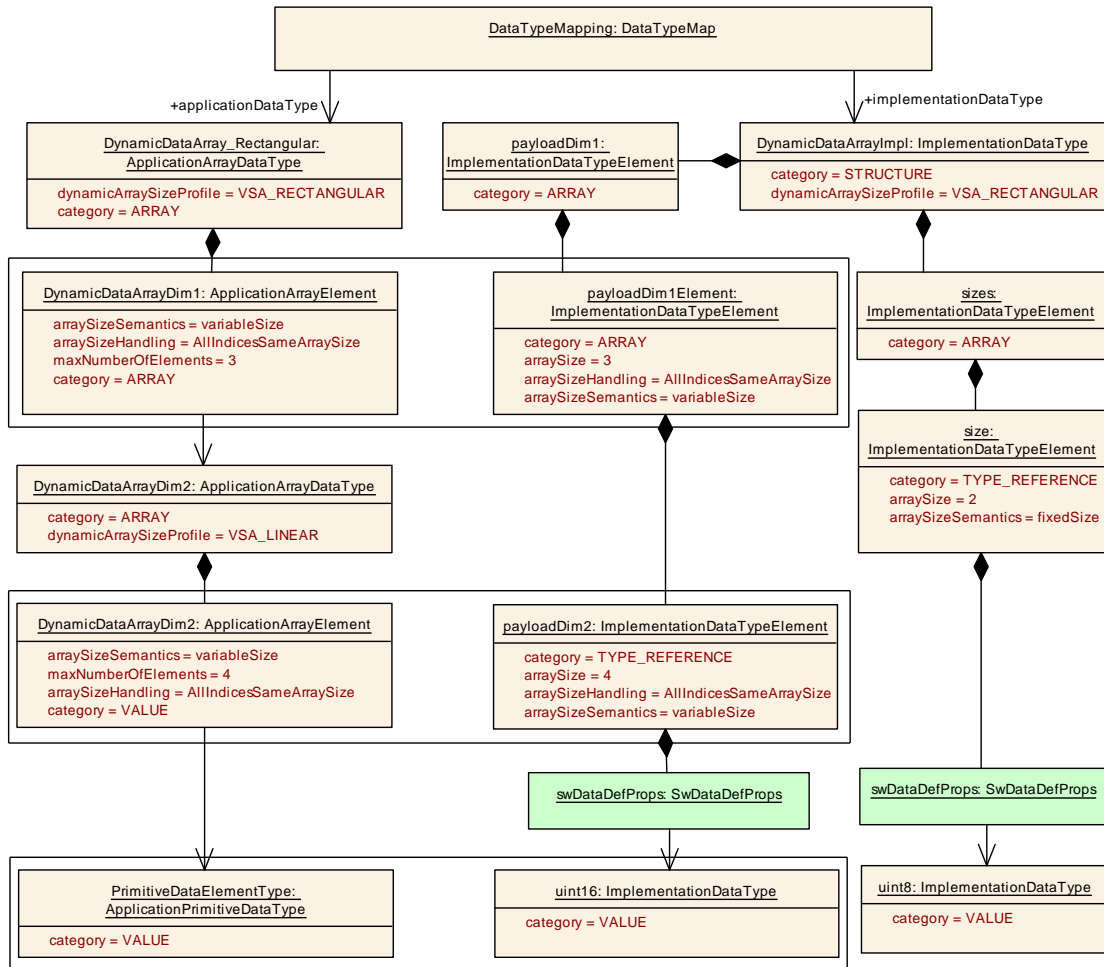

Figure B.3: Example of a rectangular variable size array

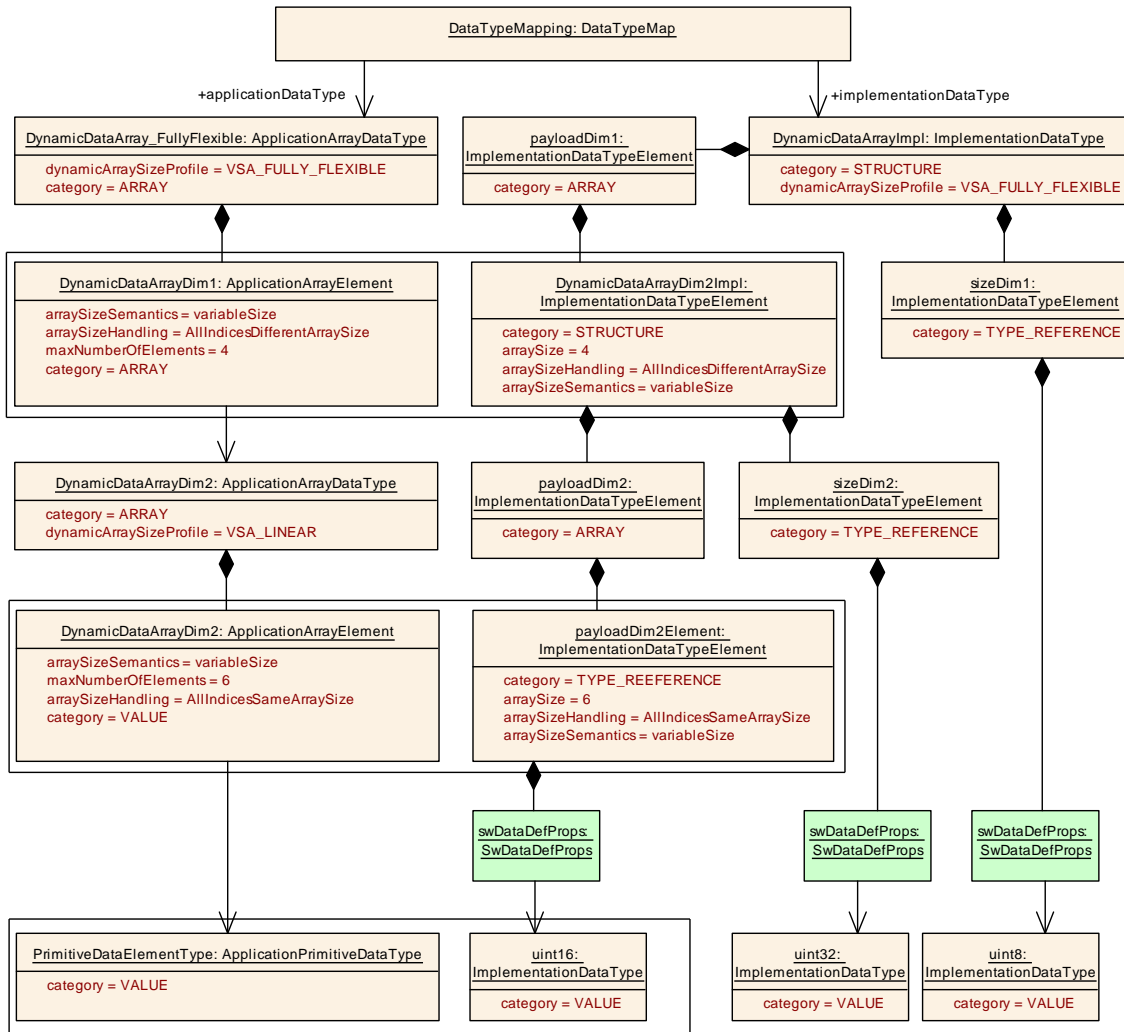

Figure B.4: Example of a fully flexible variable size array

B.1.4 Definition of a Wrapped Union Data Type

The following Listing B.9 represents a simple example of the modeling of a **Wrapped Union Data Type** according to [TPS_SWCT_01700]/[TPS_SWCT_01701].

```

```

Listing B.9: Simplified example of a [Wrapped Union Data Type](#)

B.1.5 Definition of an Multi-Dimensional Array Data Type

Figure B.5 shows a three-dimensional array described with a set of [ApplicationArrayDataTypes](#) on the left-hand side. The array element is typed by an [ApplicationPrimitiveDataType](#) of category `BOOLEAN`.

On the right-hand side the implementation of the three-dimensional array is described with an [ImplementationDataType](#) which contains three nested [ImplementationDataTypeElements](#).

Matching [ApplicationArrayElements](#) and [ImplementationDataTypeElements](#) are shown on the same layer.

For the sake of clarity correlating `maxNumberOfElements` and `arraySize` attributes are described with the identical instance of a `SwSystemconst` instead of a value. Further details of variant rich M1 models are not in the scope of this example.

The data type of the array element is described by the [ApplicationArrayDataType](#) with the means of a [ApplicationPrimitiveDataType](#) of category `BOOLEAN`. In order to fulfill [\[constr_1152\]](#), the category of [ApplicationArrayElement](#) “Dim3” is set to `BOOLEAN`.

This [ApplicationPrimitiveDataType](#) “BOOLEAN” correlates to the [ImplementationDataType](#) “boolean” of category `VALUE` which is typically the boolean type of the AUTOSAR Platform Types. Please note here [\[constr_1063\]](#).

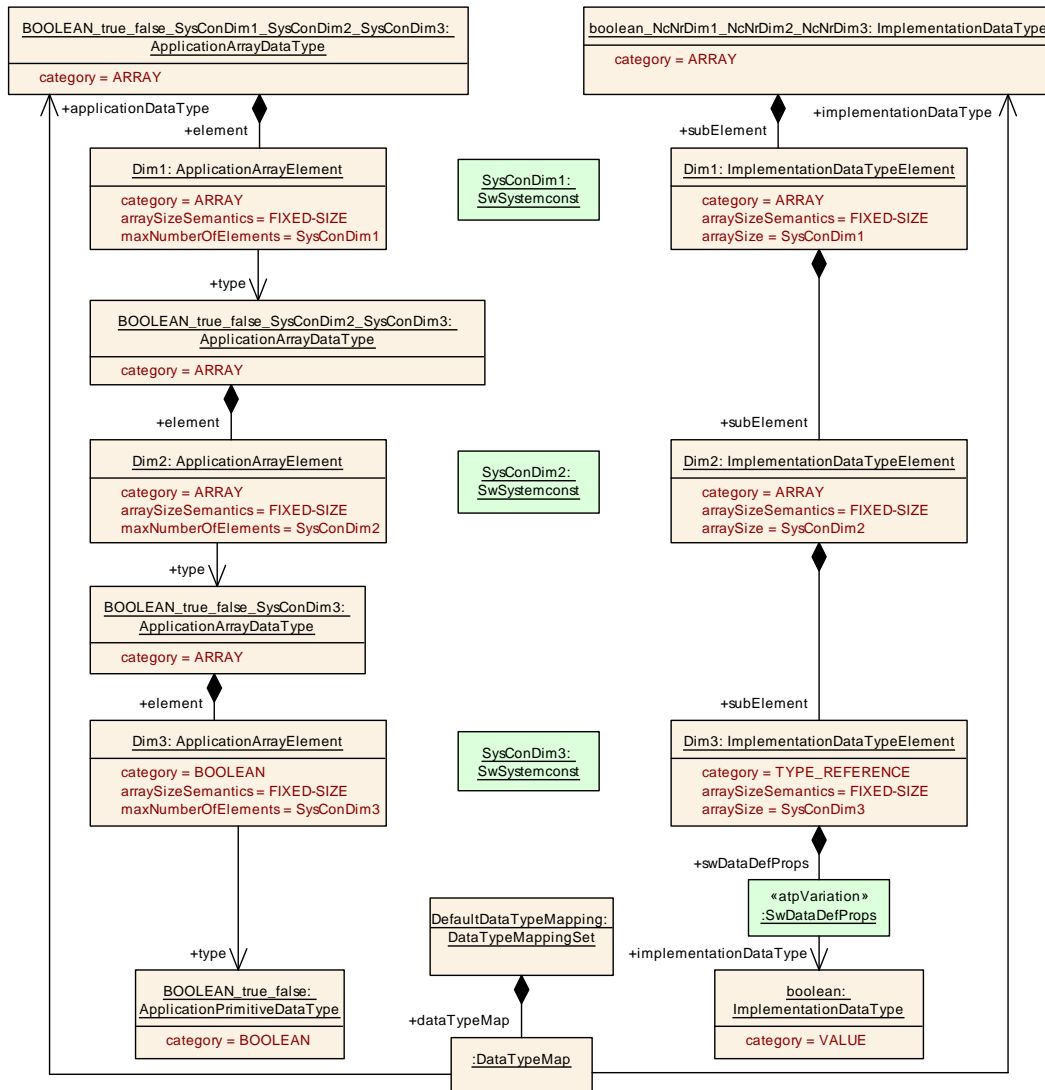

Figure B.5: Example of a three-dimensional array type

B.1.6 Definition of “Typedefs”

The examples in this section exemplify the modeling aspects described in section 5.2.5.6. For primitive data types, the creation of the “typedefs” mentioned in the examples happens according to [SWS_Rte_07104] in the SWS RTE [2].

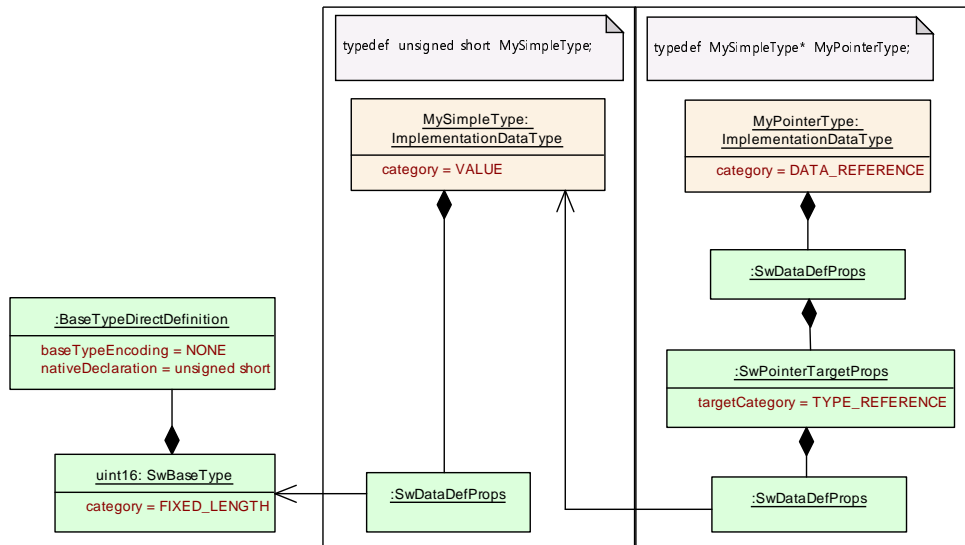

Figure B.6: Example (1) for TypeDefs

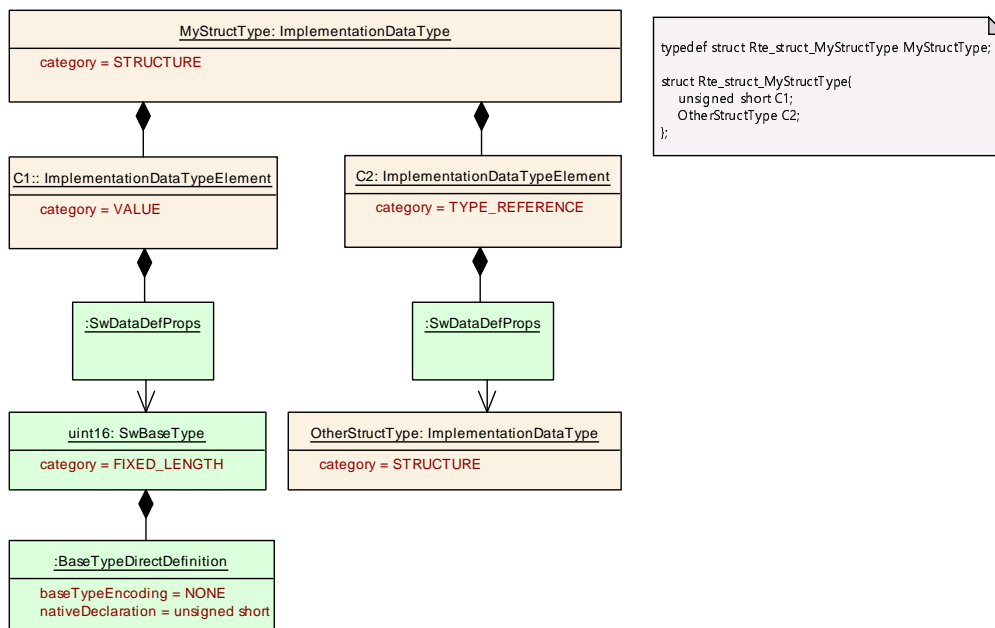

Figure B.7: Example (2) for TypeDefs

The examples depicted in Figure B.8 are backed by [SWS_Rte_07148] ff. in the SWS RTE [2].

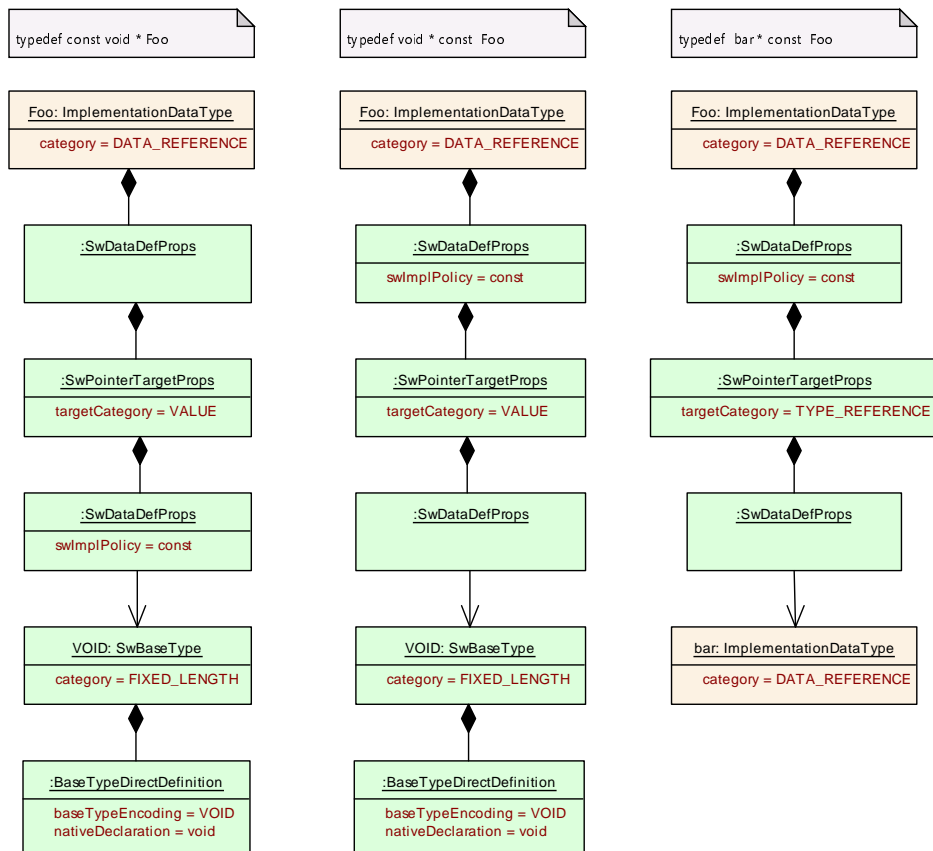

Figure B.8: Example (3) for TypeDefs

B.1.7 Definition of Base Type for Arrays

The value of attribute `baseTypeSize` (see section 5.2.6.4) in the context of the definition of an `ImplementationDataType` where attribute `category` is set to the value `ARRAY` is modeled as part of the `ImplementationDataTypeElement`, see Listing B.10.

```

<IMPLEMENTATION-DATA-TYPE>
  <SHORT-NAME>MyImplDataType</SHORT-NAME>
  <CATEGORY>ARRAY</CATEGORY>
  <SUB-ELEMENTS>
    <IMPLEMENTATION-DATA-TYPE-ELEMENT>
      <SHORT-NAME>MyArrayElement</SHORT-NAME>
      <CATEGORY>VALUE</CATEGORY>
      <ARRAY-SIZE>6</ARRAY-SIZE>
      <ARRAY-SIZE-SEMANTICS>FIXED-SIZE</ARRAY-SIZE-SEMANTICS>
      <SW-DATA-DEF-PROPS>
        <SW-DATA-DEF-PROPS-VARIANTS>
          <SW-DATA-DEF-PROPS-CONDITIONAL>
            <BASE-TYPE-REF DEST="SW-BASE-TYPE">/SwBaseTypes/MyBaseType</
              BASE-TYPE-REF>
          </SW-DATA-DEF-PROPS-CONDITIONAL>
        </SW-DATA-DEF-PROPS-VARIANTS>
      </SW-DATA-DEF-PROPS>
    </IMPLEMENTATION-DATA-TYPE-ELEMENT>
  </SUB-ELEMENTS>
</IMPLEMENTATION-DATA-TYPE>
    
```

```

</IMPLEMENTATION-DATA-TYPE-ELEMENT>
</SUB-ELEMENTS>
</IMPLEMENTATION-DATA-TYPE>
    
```

Listing B.10: Definition of an `ImplementationDataType` that represents an array

The referenced `SwBaseType` is sketched in Listing B.11.

```

<SW-BASE-TYPE>
  <SHORT-NAME>MyBaseType</SHORT-NAME>
  <BASE-TYPE-SIZE>32</BASE-TYPE-SIZE>
  <BASE-TYPE-ENCODING>NONE</BASE-TYPE-ENCODING>
</SW-BASE-TYPE>
    
```

Listing B.11: Definition of `SwBaseType` of an elements of an `ImplementationDataType` that represents an array

Because the value of `baseTypeSize` is defined in the context of the `SwDataDef-Props` referenced by the `ImplementationDataTypeElement`, it should be clear that this value is **not supposed to determine the size of the entire array in bits**. Instead, it is clearly dedicated to specify the **size of a primitive element of the array in bits**.

In the case of the example presented in Listings B.10 and B.11, the size of an element of the array is 32 bits. Thus, the entire array occupies $32 * 6 = 192$ bits.

B.1.8 Definition of Optional Elements and the Availability Bitfield

The statement made by [TPS_SWCT_01881] is depicted in Figure B.9.

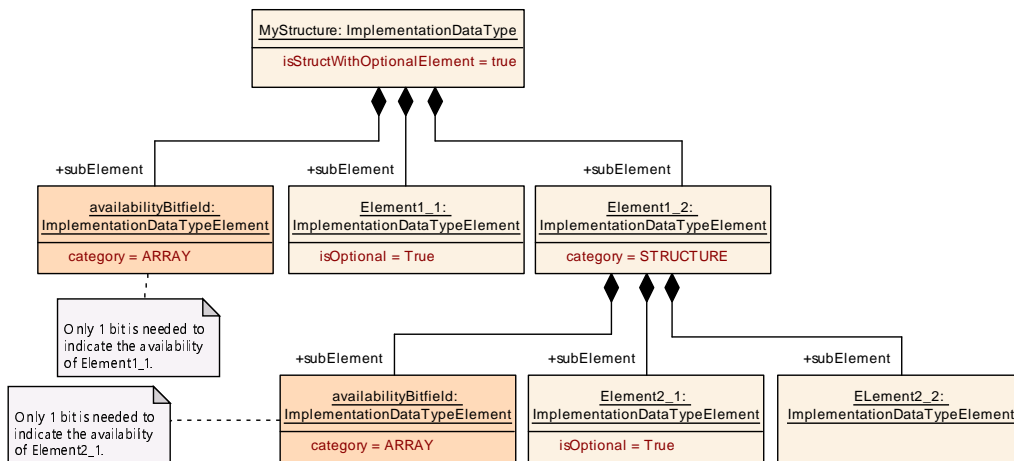

Figure B.9: Modeling of of the `availabilityBitfield`

As formalized in [constr_1639], by using the `category TYPE_REFERENCE` it is assured that a separate `ImplementationDataType` of `category STRUCTURE` is generated for the sub-structure. Figure B.10 shows an example for the statement made in [constr_1639]:

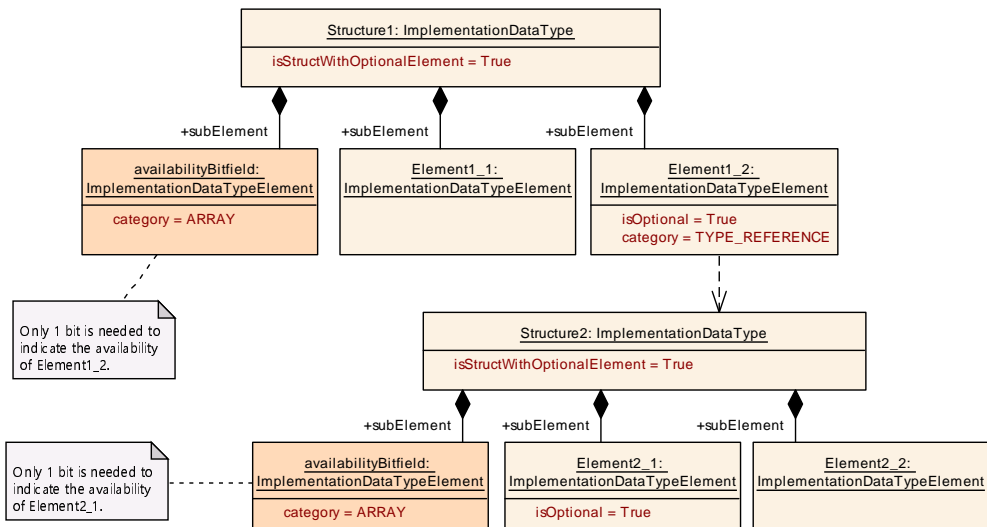

Figure B.10: Example of a structure with an optional element using a separate `ImplementationDataType`

B.1.9 Usage of `ArVariableInImplementationDataInstanceRef`

Figure B.11 contains an example of a nested `ImplementationDataType` along with the application of `ArVariableInImplementationDataInstanceRef`. The example contains both cases for the definition of a `contextDataPrototype` mentioned in [constr_1423].

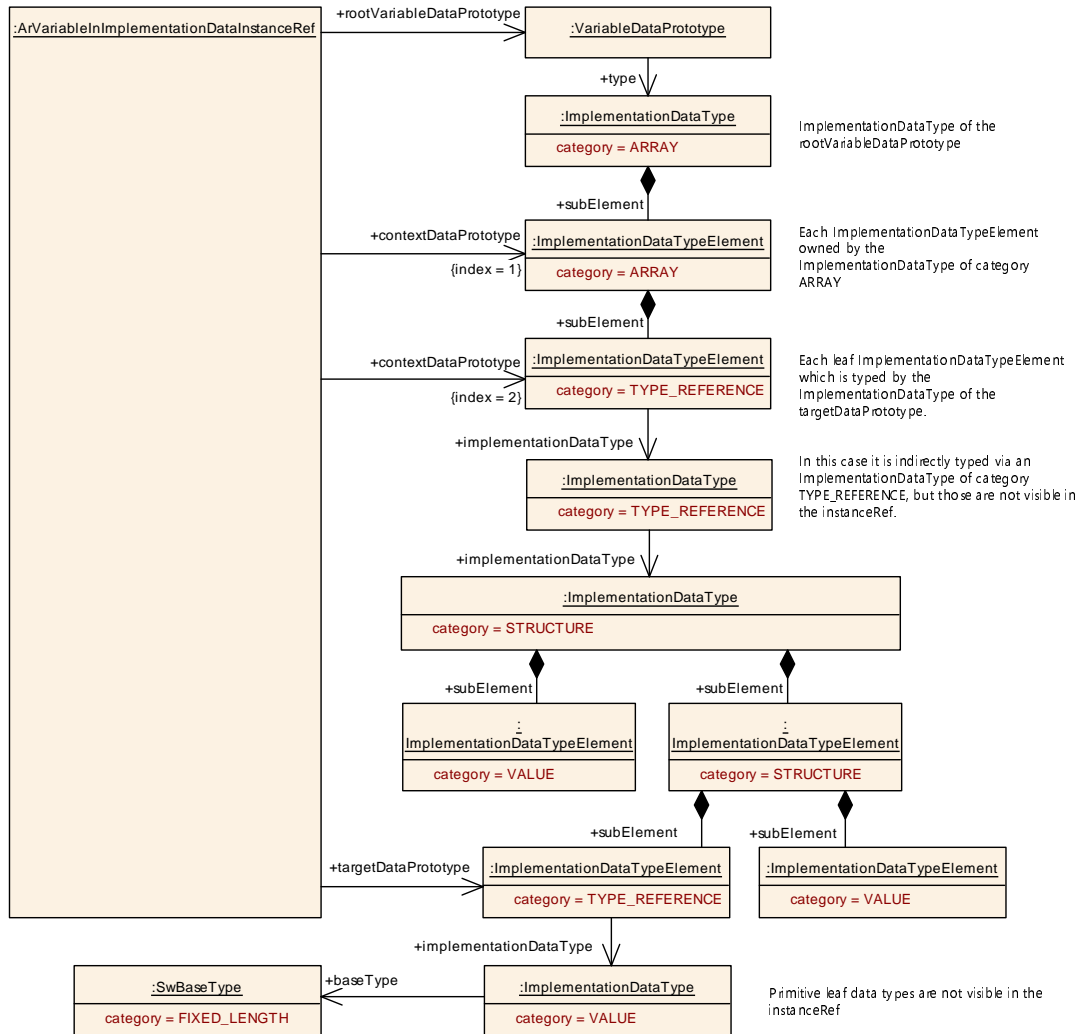

Figure B.11: Example for the usage of `ArVariableInImplementationDataInstanceRef`

B.2 Examples of Data Properties

B.2.1 Definition of a Data Dependency

The following Listing B.12 exemplifies the definition of a data dependency. Please find more information of about the nature of a data dependency in section 5.4.7.

B.2.2 Definition of Unit and Physical Dimension

In the following example for the usage of `Unit` (see section 5.5.3) and `PhysicalDimension` (see section 5.5.2), the units “km” and “m” and their physical dimension named “Len1” are specified. The SI base unit is “m” (Meter).

The default value of attribute `Unit.offsetSiToUnit` is 0, the default of `Unit.factorSiToUnit` is 1 (see [TPS_SWCT_01492]).

Given the equality $1 \text{ km} == 1000 \text{ m}$, the following equation applies:

$$x[km] := y * [m] * 0.001[km/m] + 0[km]$$

This correlation is reflected in the example ARXML contained in Listing B.13.

```

<UNIT>
  <SHORT-NAME>KiloMtr</SHORT-NAME>
  <LONG-NAME>
    <L-4 L="EN">Kilo Meter</L-4>
  </LONG-NAME>
  <DISPLAY-NAME>km</DISPLAY-NAME>

  </LONG-NAME>  
  <LENGTH-EXP>1</LENGTH-EXP>  
</PHYSICAL-DIMENSION>
```

Listing B.13: Example for `Unit` and `PhysicalDimension`

B.2.3 Definition of Record Layout

Figures [B.13](#), [B.12](#), [B.14](#), [B.15](#), and [B.16](#) illustrate how data types can be derived from `SwRecordLayouts`. Please note that the figures simplify some aspects of the actual modeling. In particular, aggregations of `SwDataDefProps` as well as aggregations of `SwRecordLayoutGroup` on the top-level are left out for the sake of visual clarity.

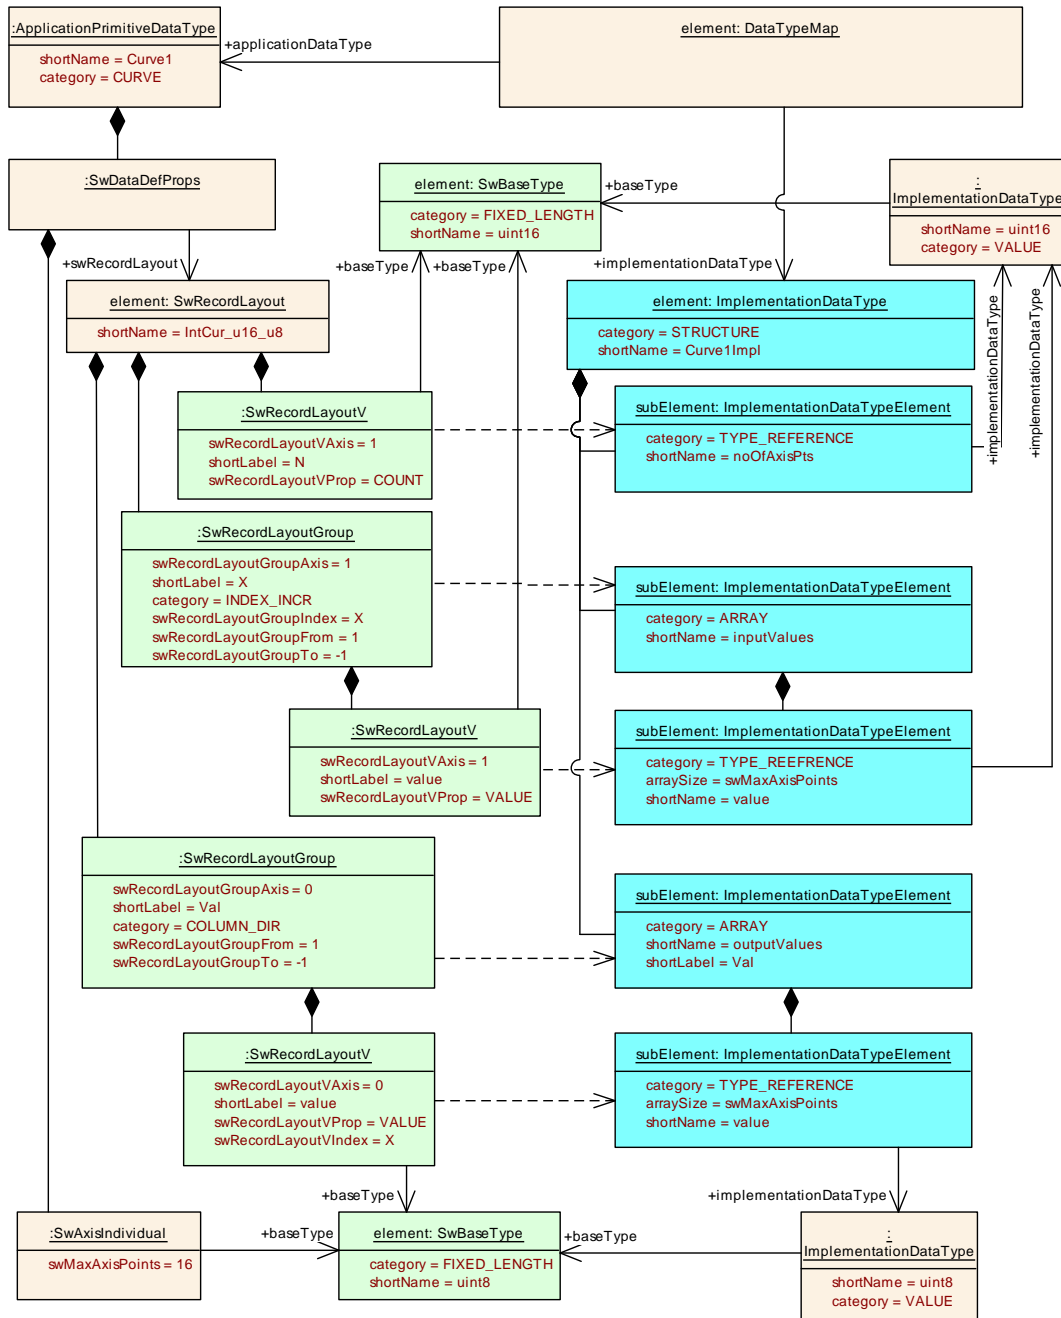

Figure B.13: Curve implemented as two consecutive arrays

Note that in each of these diagrams, the “blue” data types are derived from the record layout.

These diagrams illustrate in particular the fact that on the level of `Application-DataType` even complex entities such as curves and maps appear primitive data types. The inner details of such entities are handled e.g. by service libraries.

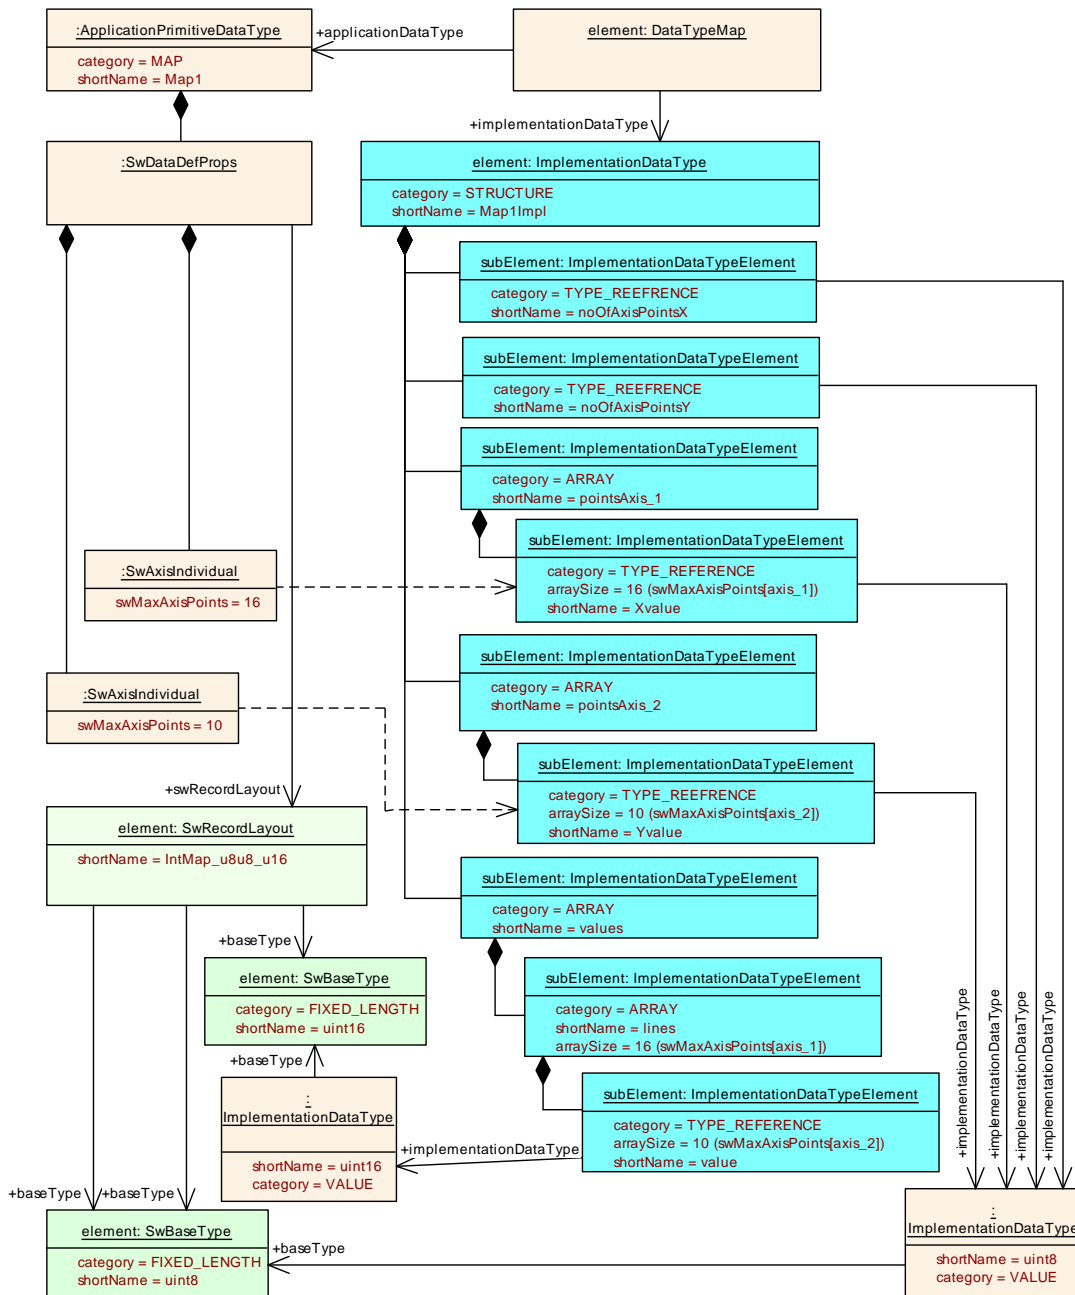

Figure B.14: Record layout and data type for a map

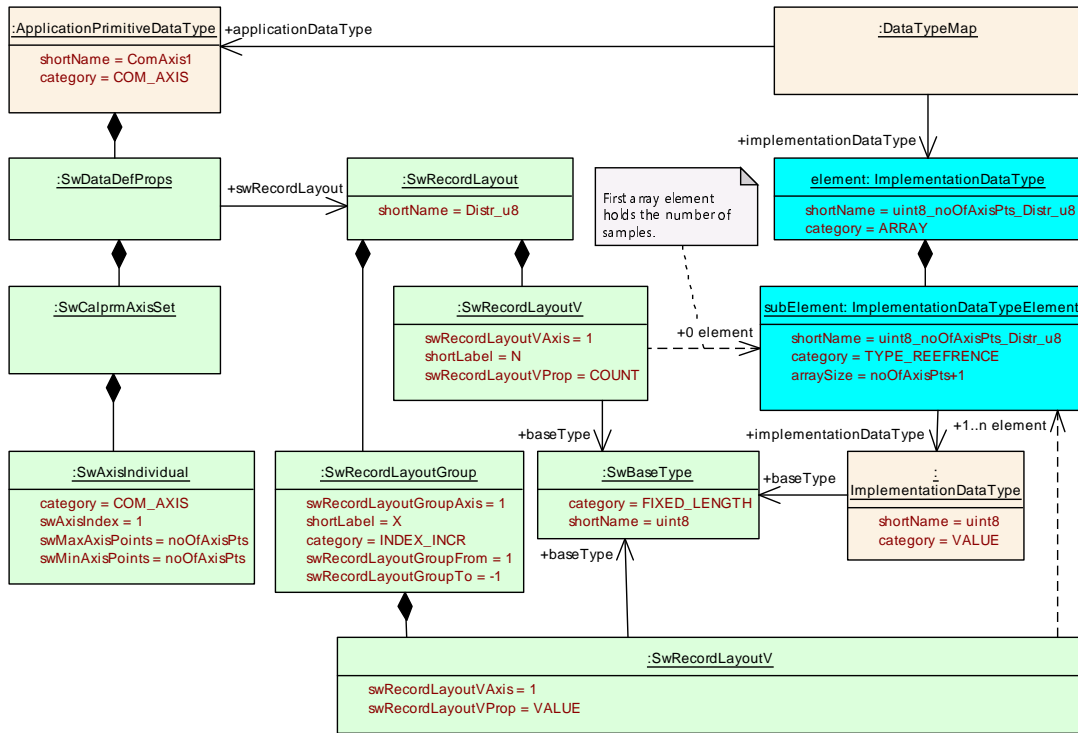

Figure B.15: Record layout for the definition of a group axis

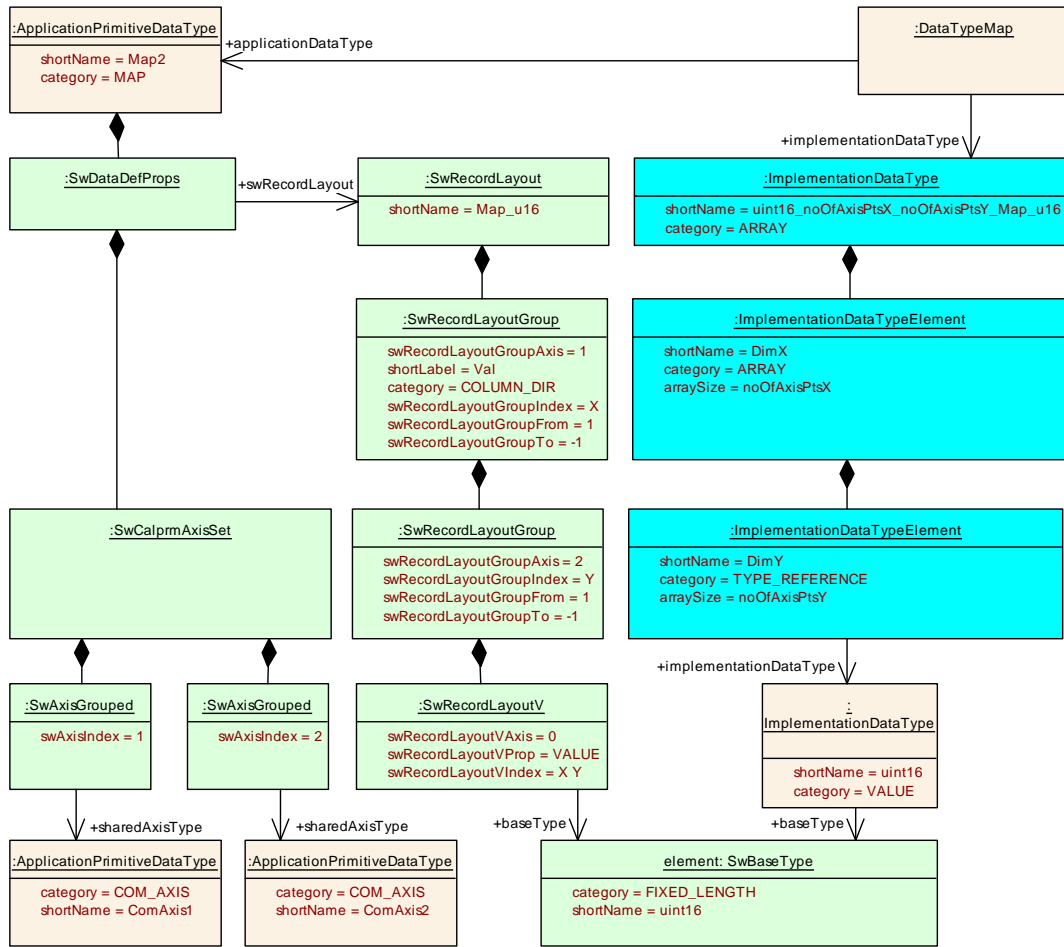

Figure B.16: Record layout for the definition of a map implemented by an array data type

Please note that more examples of the application of record layouts can be found in the document TR General Blueprint Supplement [12].

B.2.4 Definition of Record Layout of a Curve

The following XML fragment provides an example for a `SwRecordLayout` for a curve. Note that in this case recognizing the patterns represented by the A2L-Keywords (shown in XML-Comment) is pretty straight forward, even if the keywords were not provided in the `SwRecordLayoutGroup.category`.

```

<SW-RECORD-LAYOUT>
  <SHORT-NAME>RecordLayoutCurve</SHORT-NAME>
  <SW-RECORD-LAYOUT-GROUP>
    <SW-RECORD-LAYOUT-V><!-- NO_AXIS_PTS_X -->
      <SHORT-LABEL>noOfAxisPts</SHORT-LABEL>
      <SW-RECORD-LAYOUT-V-PROP>COUNT</SW-RECORD-LAYOUT-V-PROP>
      <SW-RECORD-LAYOUT-V-INDEX>1</SW-RECORD-LAYOUT-V-INDEX>
    </SW-RECORD-LAYOUT-V>
    <SW-RECORD-LAYOUT-GROUP><!-- AXIS_PTS_X -->
      <SHORT-LABEL>xPts</SHORT-LABEL>
      <CATEGORY>INDEX_INCR</CATEGORY>
    </SW-RECORD-LAYOUT-GROUP>
  </SW-RECORD-LAYOUT-GROUP>
</SW-RECORD-LAYOUT>

```

```

<SW-RECORD-LAYOUT-GROUP-AXIS>1</SW-RECORD-LAYOUT-GROUP-AXIS>
<SW-RECORD-LAYOUT-GROUP-FROM>1</SW-RECORD-LAYOUT-GROUP-FROM>
<SW-RECORD-LAYOUT-GROUP-TO>-1</SW-RECORD-LAYOUT-GROUP-TO>
<SW-RECORD-LAYOUT-V>
  <SHORT-LABEL>xPt</SHORT-LABEL>
  <SW-RECORD-LAYOUT-V-AXIS>1</SW-RECORD-LAYOUT-V-AXIS> <!--
    AXIS_PTS_X -->
  <SW-RECORD-LAYOUT-V-PROP>VALUE</SW-RECORD-LAYOUT-V-PROP>
</SW-RECORD-LAYOUT-V>
</SW-RECORD-LAYOUT-GROUP>
<SW-RECORD-LAYOUT-GROUP>
  <SHORT-LABEL>values</SHORT-LABEL><!-- FNC_VALUES -->
  <CATEGORY>COLUMN_DIR</CATEGORY>
  <SW-RECORD-LAYOUT-GROUP-AXIS>0</SW-RECORD-LAYOUT-GROUP-AXIS>
  <SW-RECORD-LAYOUT-GROUP-FROM>1</SW-RECORD-LAYOUT-GROUP-FROM>
  <SW-RECORD-LAYOUT-GROUP-TO>-1</SW-RECORD-LAYOUT-GROUP-TO>
  <SW-RECORD-LAYOUT-V>
    <SHORT-LABEL>value</SHORT-LABEL>
    <SW-RECORD-LAYOUT-V-AXIS>0</SW-RECORD-LAYOUT-V-AXIS><!-- FNC_VALUES
      -->
    <SW-RECORD-LAYOUT-V-PROP>VALUE</SW-RECORD-LAYOUT-V-PROP>
  </SW-RECORD-LAYOUT-V>
</SW-RECORD-LAYOUT-GROUP>
</SW-RECORD-LAYOUT-GROUP>
</SW-RECORD-LAYOUT>
    
```

Listing B.14: Example for RecordLayout of a curve

B.2.5 Definition of Fix Axis

The modeling of an axis of category `FIX_AXIS_PAR` is sketched in the following example model (Figure B.17).

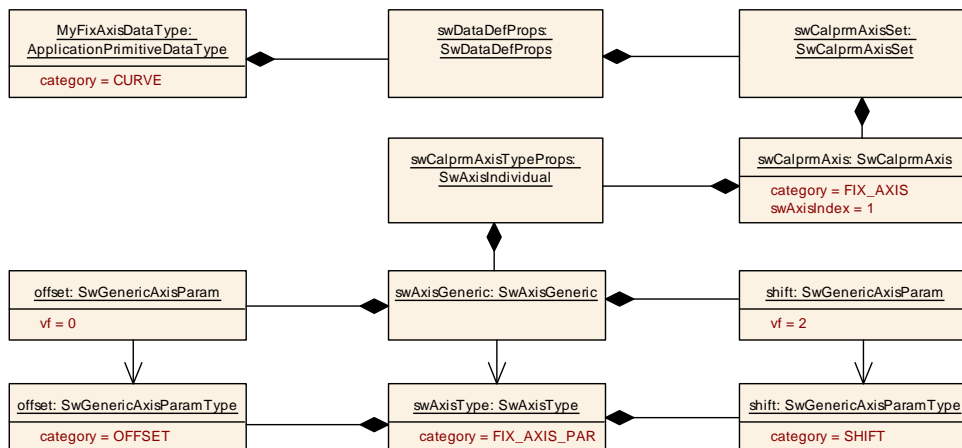

Figure B.17: Modeling of a fix axis of category `FIX_AXIS_PAR`

The modeling of an axis of category `FIX_AXIS_PAR_DIST` is sketched in the following example model (Figure B.18).

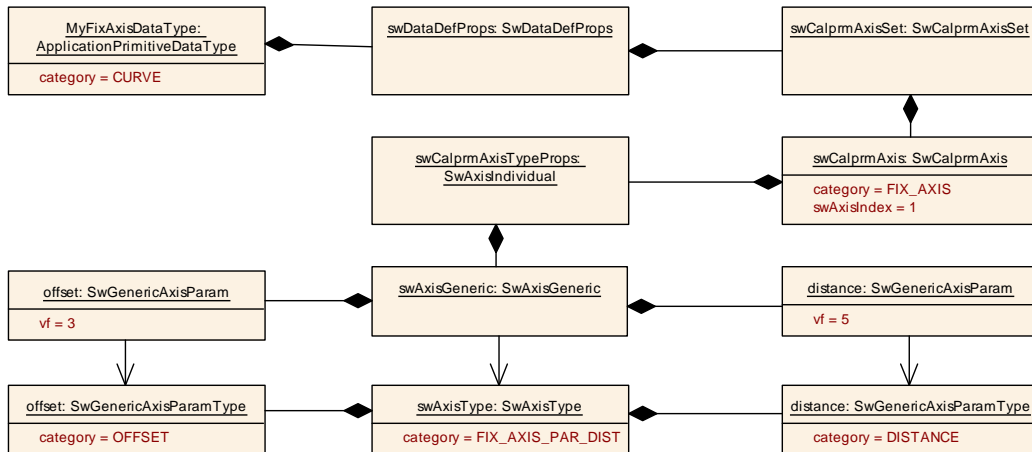

Figure B.18: Modeling of a fix axis of category `FIX_AXIS_PAR_DIST`

The modeling of an axis of category `FIX_AXIS_PAR_LIST` is sketched in the following example model (Figure B.19).

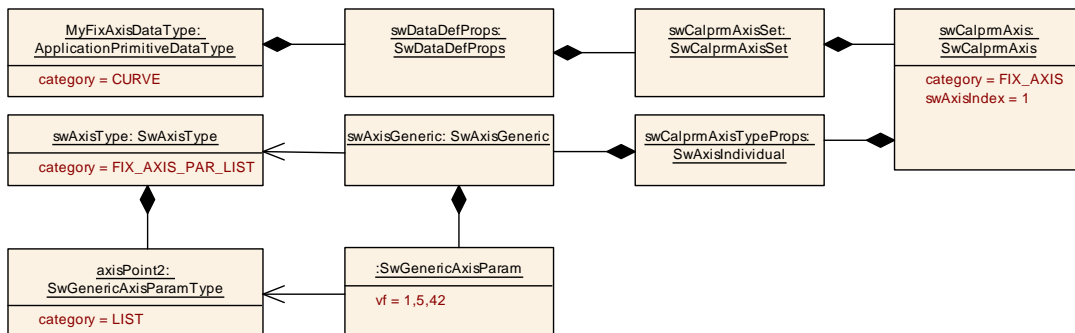

Figure B.19: Modeling of a fix axis of category `FIX_AXIS_PAR_LIST`

B.3 Examples for the specification of constant Values

This section contains select examples for the modeling of constant values.

B.3.1 Constant Specification for category CURVE

The following example illustrates how a `ConstantSpecification` is specified for a `CURVE`. Please note, that in this example the `vf` attribute is used for the `swArraysize` as well as for the `swValuesPhys`.

The basic intention of `vf` is the usage for variant rich models but it is valid as well if `vf` contains invariant values.

Class	CompuConstFormulaContent			
Package	M2::MSR::AsamHdo::ComputationMethod			
Note	This meta-class represents the fact that the constant value of the computation method is represented by a variation point. This difference is due to compatibility with ASAM HDO.			
Base	ARObject, CompuConstContent			
Aggregated by	CompuConst.compuConstContentType			
Attribute	Type	Mult.	Kind	Note
vf	Numerical	1	attr	<p>Value calculated via a system constant. This element is included in every case where parameters should be generated from numerical values during compile time (not runtime!).</p> <p>Thus for example, the influence of the cylinder number on conversion formulae can be introduced in a repeatable manner.</p> <p>Stereotypes: atpVariation Tags: vh.latestBindingTime=codeGenerationTime xml.sequenceOffset=30</p>

Table B.1: CompuConstFormulaContent

Applicable constraints, such as [\[constr_2050\]](#), [\[constr_2051\]](#), and [\[constr_2052\]](#) can be found in section 5.6.5.

</VALUE-SPEC>
</CONSTANT-SPECIFICATION>

```

Listing B.15: Example for Constant Specification for CURVE

B.3.2 Constant Specification for category MAP

The following example illustrates how an `ConstantSpecification` is specified for a MAP. In this case one axis of the MAP is a `STD_AXIS` and the second one is a `COM_AXIS`.

Please note that in this example the `v` attribute is used for the `swArraysize` as well as for the `swValuesPhys`.

This is possible because the example contains only invariant values.

```

Listing B.16: Example for Constant Specification for MAP

B.3.3 Constant Specification for category MAP with two STD_AXIS

The example contained in this sub-chapter illustrates the creation of the `ConstantSpecification` for a MAP that (in contrast to the previous example sketched in Listing B.16) consists of two `STD_AXIS`.

Like in the previous example, the `v` attribute is used for the `swArraysize` as well as for the `swValuesPhys`.

Listing B.20: Example for the definition of a [TextValueSpecification](#) for [BITFIELD_TEXTTABLE](#)

B.3.6 Value specification for MAP depending on Record Layout

The observation made by [\[constr_10503\]](#) and [\[constr_10504\]](#) shall be rationalized by the example discussed in section titled “Record Layout: IntMap 3 x 4” in the TR GeneralBlueprintsSupplement [\[12\]](#).

The underlying principles of indexing are described in the sections titled “Definition of Indexing” and “Transform Logical View in Memory Representation” of the same document.

From the perspective of the definition of a [Compound Primitive Data Type](#), it can be concluded that the specification of an [ApplicationValueSpecification](#) may also be defined with the same mindset and this means that the consideration of the [SwRecordLayout](#) for the definition of the [ApplicationValueSpecification](#) is expected by the target audience.

[1,1]	[1,2]	[1,3]	[1,4]
[2,1]	[2,2]	[2,3]	[2,4]
[3,1]	[3,2]	[3,3]	[3,4]

Figure B.20: Visualization of the value axis of a MAP

The above picture shows how the values of a 3 by 4 map are arranged. The storage of these values in the computer memory can be done in two orthogonal ways:

- **row-first** (indicated by setting the value of the respective [SwRecordLayoutGroup.category](#) to the value [ROW_DIR](#)) and
- **column-first** (indicated by setting the value of the respective [SwRecordLayoutGroup.category](#) to the value [COLUMN_DIR](#)).

A concrete example of the two orthogonal ways is discussed in section [B.3.6.1](#) and section [B.3.6.2](#).

Please note that the difference only shows up in the definition of the [SwValueCont](#). The definition of the [SwAxisCont](#) is only broadly sketched in the example, but it is identical for both cases.

B.3.6.1 Row-First

If the `ROW_DIR` scenario is followed, then first value is the element [1,1], followed by [1,2], and so on.

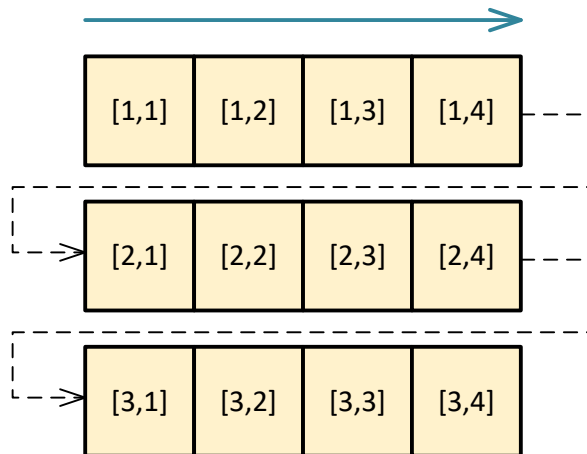

Figure B.21: Visualization of the value axis of a MAP in a `ROW_DIR` layout

In ARXML, a corresponding `ApplicationValueSpecification` would look like the following sketch:

```
<APPLICATION-VALUE-SPECIFICATION>

Listing B.22: Value specification for a MAP in a `COLUMN_DIR` layout

In memory, the layout if the entire map (example layouts for the x and y-axis are only included for the sake of complexity) looks like the following sketch:

Figure B.24: Visualization of the memory layout of the MAP in a `COLUMN_DIR` layout

B.3.7 Rule-based Value Specification

The modeling of a `RuleBasedValueSpecification` depends on the data type used for modeling the elements of the array for which the `RuleBasedValueSpecification` is supposed to be applied.

This section contains examples for the creation of a [RuleBasedValueSpecification](#) depending on the complexity of the element data type of the array.

B.3.8 Rule-based Value Specification for Elements of primitive Data Type

As an example for the application of a [RuleBasedValueSpecification](#) for a primitive array element data type, consider the following scenario:

Figure B.25: Value specification for a simple array

The sketched array depicted in Figure B.25 corresponds to the modeling exemplified in Listing B.23.

```
<ARRAY-VALUE-SPECIFICATION>

      </SW-VALUE-CONT>
    </APPLICATION-RULE-BASED-VALUE-SPECIFICATION>
  </ELEMENTS>
</ARRAY-VALUE-SPECIFICATION>
```

Listing B.23: Value specification for a simple array

B.3.9 Rule-based Value Specification for Elements of composite Data Type

As an example of how the rule-based initialization of composite data structures works, please consider the composite structure sketched in Figure B.26.

In simple terms, it describes an array consisting of elements that themselves are typed by a structure of two primitive elements.

Figure B.26: Example for the explanation of rule-based composite value-specification

In this example, the element “a” of the first structure shall be initialized with the value 1, the corresponding “b” element shall be assigned a 10. All other values in all following elements shall be set to 0. This is also indicated by the numbers in ellipses in Figure B.26.

The implementation of the example in ARXML is illustrated in Listing B.24. As already explained before, the last (in the order of appearance) *ValueSpecification* in the context of an *AbstractRuleBasedValueSpecification* is taken to execute the rule (as described above).

Listing B.24: Example for composite rule-based value specification

A more complicated example is sketched in Figure B.27. Here, a deeply nested composite data structure is described: an array of structures that in turn contain an array.

To keep the ARXML listing as simple as possible, the example assumes that **all** (as opposed to the initialization of the first, and then of all other elements) “struct” elements shall be initialized with the same value.

Figure B.27: Value specification for a deeply nested array

The deeply nested “array” is initialized by means of an [ApplicationRuleBased-ValueSpecification](#).

```

</ELEMENTS>
</ARRAY-VALUE-SPECIFICATION>

```

Listing B.25: Value specification for a deeply nested array

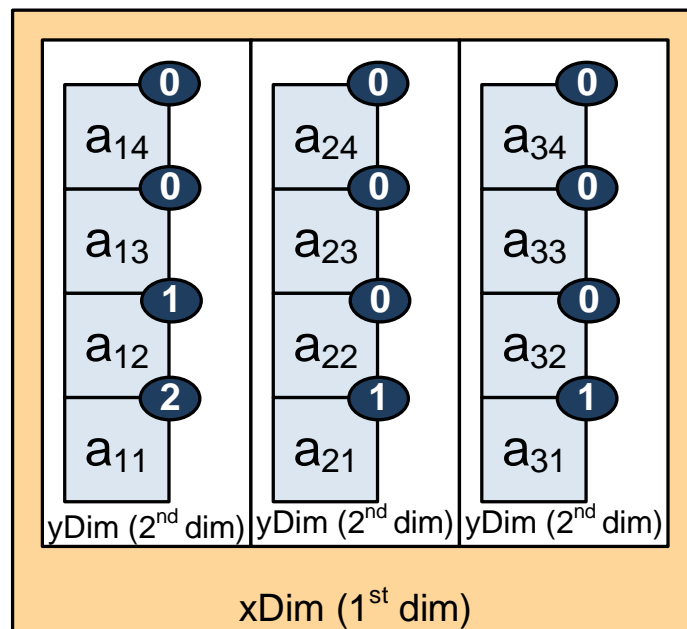

Figure B.28: Rule-based Value specification for a 2-dimensional array

As another variation of the theme, the rule-based initialization of multi-dimensional arrays shall be discussed.

Consequently, the following example extends the one-dimensional rule-based Value-Specification (see Figure B.25) to a second dimension. The general layout is sketched in the following figure:

For the sake of clarity, the picture has been drawn to align the first dimension (the *x-axis*) of the two-dimensional array with the horizontal direction and the second dimension (the *y-axis*) with the vertical direction.

The direction index values of each array element are visible as subscript on the bottom right of the element, i.e. a_{12} indicates that the element is part of the first element on the *x-axis* and represents the second element of the *y-axis*. The initial value of element a_{12} shall be 1.

As indicated by the sketch in Figure B.28, the second element (i.e. the “vertical” array, i.e. everything from a_{21} to a_{24}) and all following (i.e. everything from a_{31} to a_{34}) shall have the identical initial values. The first element deviates from the second in terms of initial values.

The creation of the `ArrayValueSpecification` for this example is based on the definition of a `CompositeRuleBasedValueSpecification` with two arguments:

- an `ArrayValueSpecification` that carries an `ApplicationRuleBasedValueSpecification` for the first element (that itself is an array) on the *x*-dimension and
- an `ArrayValueSpecification` that carries an `ApplicationRuleBasedValueSpecification` for each of the remaining elements (that itself are arrays) on the *x*-dimension.

Listing B.26: Value specification for a 2-dimensional array

The next example adds one dimension to the array structure, i.e. it describes a three-dimensional array, as sketched in Figure B.29.

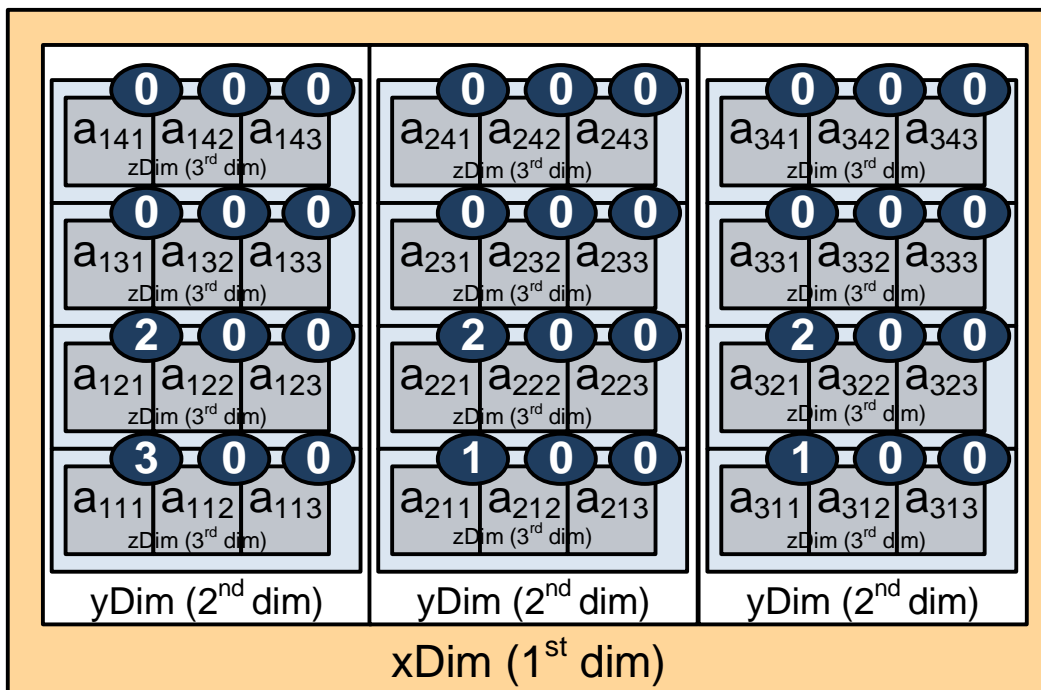

Figure B.29: Rule-based Value specification for a 3-dimensional array

In this case the *x-axis* has again been aligned in the horizontal direction, why the *y-axis* is drawn vertically. The *z-axis*, finally, goes horizontal again.

The principal structure of this example is similar to the previous example.

The first array element in the x-dimension (which includes everything from a_{111} to a_{143}) defines a different initial value than the other elements.

Please note that the initial values of the second and third element in x-direction are identical.

Listing B.27: Value specification for a 3-dimensional array

B.3.10 Rule-based Value Specification for an Array of compound primitive Objects

The purpose of the following example for the definition of a `CompositeRuleBasedValueSpecification` (see also section 5.6.9.2) is to show how an "array of curves" is initialized by means of a `CompositeRuleBasedValueSpecification`.

Before the definition of the `CompositeRuleBasedValueSpecification` can be started, it is necessary to define the structure of the curve.

Therefore, the example starts with the definition of the data type for the input value for the curve see Listing B.28. This data type is used for the definition of the actual curve data type in Listing B.30.

```

<APPLICATION-PRIMITIVE-DATA-TYPE>
    <SHORT-NAME>axisInputType</SHORT-NAME>
    <CATEGORY>VALUE</CATEGORY>
    <SW-DATA-DEF-PROPS>
        <SW-DATA-DEF-PROPS-VARIANTS>
            <SW-DATA-DEF-PROPS-CONDITIONAL>
                <SW-CALIBRATION-ACCESS>READ-ONLY</SW-CALIBRATION-ACCESS>
            </SW-DATA-DEF-PROPS-CONDITIONAL>
        </SW-DATA-DEF-PROPS-VARIANTS>
    </SW-DATA-DEF-PROPS>

```

```

    </SW-DATA-DEF-PROPS-CONDITIONAL>
  </SW-DATA-DEF-PROPS-VARIANTS>
</SW-DATA-DEF-PROPS>
</APPLICATION-PRIMITIVE-DATA-TYPE>

```

Listing B.28: Definition of curve input value data type

The next step is the definition of the data type for the result of the interpolation. This part is sketched in Listing B.29. This data type is used for the definition of the actual curve data type in Listing B.30.

```

<APPLICATION-PRIMITIVE-DATA-TYPE>
  <SHORT-NAME>curveType</SHORT-NAME>
  <CATEGORY>VALUE</CATEGORY>
  <SW-DATA-DEF-PROPS>
    <SW-DATA-DEF-PROPS-VARIANTS>
      <SW-DATA-DEF-PROPS-CONDITIONAL>
        <SW-CALIBRATION-ACCESS>READ-ONLY</SW-CALIBRATION-ACCESS>
      </SW-DATA-DEF-PROPS-CONDITIONAL>
    </SW-DATA-DEF-PROPS-VARIANTS>
  </SW-DATA-DEF-PROPS>
</APPLICATION-PRIMITIVE-DATA-TYPE>

```

Listing B.29: Definition of data type for the result of the interpolation

Finally, the data type for the actual curve is defined, see Listing B.30.

```

<APPLICATION-PRIMITIVE-DATA-TYPE>
  <SHORT-NAME>MyTable</SHORT-NAME>
  <CATEGORY>CURVE</CATEGORY>
  <SW-DATA-DEF-PROPS>
    <SW-DATA-DEF-PROPS-VARIANTS>
      <SW-DATA-DEF-PROPS-CONDITIONAL>
        <SW-CALIBRATION-ACCESS>READ-ONLY</SW-CALIBRATION-ACCESS>
        <SW-CALPRM-AXIS-SET>
          <SW-CALPRM-AXIS>
            <SW-AXIS-INDEX>1</SW-AXIS-INDEX>
            <CATEGORY>STD_AXIS</CATEGORY>
            <SW-AXIS-INDIVIDUAL>
              <INPUT-VARIABLE-TYPE-REF DEST="APPLICATION-PRIMITIVE-DATA-
                TYPE"/>ApplicationDataTypes/axisInputType</INPUT-VARIABLE-
                TYPE-REF>
              <SW-MAX-AXIS-POINTS>10</SW-MAX-AXIS-POINTS>
              <SW-MIN-AXIS-POINTS>0</SW-MIN-AXIS-POINTS>
            </SW-AXIS-INDIVIDUAL>
            <SW-CALIBRATION-ACCESS>READ-ONLY</SW-CALIBRATION-ACCESS>
          </SW-CALPRM-AXIS>
        </SW-CALPRM-AXIS-SET>
        <VALUE-AXIS-DATA-TYPE-REF DEST="APPLICATION-PRIMITIVE-DATA-TYPE"/>
          ApplicationDataTypes/curveType</VALUE-AXIS-DATA-TYPE-REF>
      </SW-DATA-DEF-PROPS-CONDITIONAL>
    </SW-DATA-DEF-PROPS-VARIANTS>
  </SW-DATA-DEF-PROPS>
</APPLICATION-PRIMITIVE-DATA-TYPE>

```

Listing B.30: Definition of curve data type

As already mentioned, the `ApplicationPrimitiveDataType` of category `CURVE` defined in the listing above may be used as the **element data type** (`ApplicationArrayElement.type`) of an `ApplicationArrayDataType`.

The definition of this array data type may look like the sketch contained in Listing B.31.

```

<APPLICATION-ARRAY-DATA-TYPE>
  <SHORT-NAME>MyCurveArrayType</SHORT-NAME>
  <CATEGORY>ARRAY</CATEGORY>
  <ELEMENT>
    <SHORT-NAME>element</SHORT-NAME>
    <CATEGORY>CURVE</CATEGORY>
    <TYPE-TREF DEST="APPLICATION-PRIMITIVE-DATA-TYPE"/>/ApplicationDataTypes
    /MyTable</TYPE-TREF>
    <ARRAY-SIZE-SEMANTICS>FIXED-SIZE</ARRAY-SIZE-SEMANTICS>
    <MAX-NUMBER-OF-ELEMENTS>3</MAX-NUMBER-OF-ELEMENTS>
  </ELEMENT>
</APPLICATION-ARRAY-DATA-TYPE>
    
```

Listing B.31: Definition of array data type

In this example, the intention is to fill the array with "dummy" elements where the axis points (defined by `swAxisCont`) are defined as a sequence from "1" to "10" and the value array (defined by `swValueCont`) is entirely set to "0", as sketched in Figure B.30.

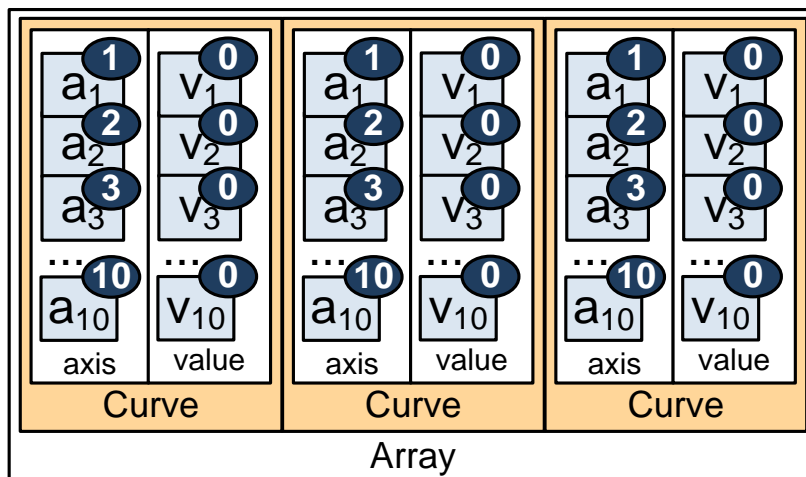

Figure B.30: Example of the initialization of an array of curve

The initialization of a `DataPrototype` typed by such an `ApplicationArrayDataType` is sketched in Listing B.32 below:

```

B.4 Examples of Compu Methods

This section presents some select examples for the definition of [CompuMethods](#). The explanation of the concept of a [CompuMethod](#) can be found in section [5.5.1](#).

B.4.1 Compu Method representing an Enumeration

The following example illustrates how an enumeration (see section 5.2.4.1.2) can be specified using the definition of a [CompuMethod](#).

```

<COMPU-METHOD>
  <SHORT-NAME>boolean</SHORT-NAME>
  <CATEGORY>TEXTTABLE</CATEGORY>
  <COMPU-INTERNAL-TO-PHYS>
    <COMPU-SCALES>
      <COMPU-SCALE>
        <LOWER-LIMIT INTERVAL-TYPE="CLOSED">0</LOWER-LIMIT>
        <UPPER-LIMIT INTERVAL-TYPE="CLOSED">0</UPPER-LIMIT>
        <COMPU-CONST>
          <VT>>false</VT>
        </COMPU-CONST>
      </COMPU-SCALE>
      <COMPU-SCALE>
        <LOWER-LIMIT INTERVAL-TYPE="CLOSED">1</LOWER-LIMIT>
        <UPPER-LIMIT INTERVAL-TYPE="CLOSED">1</UPPER-LIMIT>
        <COMPU-CONST>
          <VT>>true</VT>
        </COMPU-CONST>
      </COMPU-SCALE>
    </COMPU-SCALES>
  </COMPU-INTERNAL-TO-PHYS>
</COMPU-METHOD>
    
```

Listing B.33: example for enumeration

B.4.2 Compu Method representing a Linear Conversion

The following examples illustrate how a linear conversion is specified by means of the definition of a [CompuMethod](#).

$$F_{[km/h]} = 30_{[km/h]} + 2_{[km/h]} * x$$

```

<COMPU-METHOD>
  <SHORT-NAME>linear</SHORT-NAME>
  <CATEGORY>LINEAR</CATEGORY>
  <UNIT-REF DEST="UNIT">kmph</UNIT-REF>
  <COMPU-INTERNAL-TO-PHYS>
    <COMPU-SCALES>
      <COMPU-SCALE>
        <COMPU-RATIONAL-COEFFS>
          <COMPU-NUMERATOR>
            <V>30</V>
            <V>2</V>
          </COMPU-NUMERATOR>
          <COMPU-DENOMINATOR>
            <V>1</V>
          </COMPU-DENOMINATOR>
        </COMPU-RATIONAL-COEFFS>
      </COMPU-SCALE>
    </COMPU-SCALES>
  </COMPU-INTERNAL-TO-PHYS>
</COMPU-METHOD>
    
```

```

        </COMPU-RATIONAL-COEFFS>
    </COMPU-SCALE>
</COMPU-SCALES>
</COMPU-INTERNAL-TO-PHYS>
</COMPU-METHOD>
    
```

Listing B.34: example for linear [CompuMethod](#)

B.4.3 Compu Method representing a Linear Conversion with texttable

The following example illustrates how a combination of linear conversion with a text-table is specified by means of the definition of a [CompuMethod](#).

```

<COMPU-METHOD>
  <SHORT-NAME>linearAndTexttable</SHORT-NAME>
  <CATEGORY>SCALE_LINEAR_AND_TEXTTABLE</CATEGORY>
  <UNIT-REF DEST="UNIT">kmph</UNIT-REF>
  <COMPU-INTERNAL-TO-PHYS>
    <COMPU-SCALES>
      <COMPU-SCALE>
        <LOWER-LIMIT INTERVAL-TYPE="CLOSED">0</LOWER-LIMIT>
        <UPPER-LIMIT INTERVAL-TYPE="CLOSED">300</UPPER-LIMIT>
        <COMPU-RATIONAL-COEFFS>
          <COMPU-NUMERATOR>
            <V>30</V>
            <V>2</V>
          </COMPU-NUMERATOR>
          <COMPU-DENOMINATOR>
            <V>1</V>
          </COMPU-DENOMINATOR>
        </COMPU-RATIONAL-COEFFS>
      </COMPU-SCALE>
      <COMPU-SCALE>
        <LOWER-LIMIT INTERVAL-TYPE="CLOSED">350</LOWER-LIMIT>
        <UPPER-LIMIT INTERVAL-TYPE="CLOSED">350</UPPER-LIMIT>
        <COMPU-CONST>
          <VT>SensorError</VT>
        </COMPU-CONST>
      </COMPU-SCALE>
      <COMPU-SCALE>
        <LOWER-LIMIT INTERVAL-TYPE="CLOSED">351</LOWER-LIMIT>
        <UPPER-LIMIT INTERVAL-TYPE="CLOSED">351</UPPER-LIMIT>
        <COMPU-CONST>
          <VT>SignalNotAvailable</VT>
        </COMPU-CONST>
      </COMPU-SCALE>
    </COMPU-SCALES>
  </COMPU-INTERNAL-TO-PHYS>
</COMPU-METHOD>
    
```

Listing B.35: example for linear and text-table [CompuMethod](#)

B.4.4 Conversion specified by a rational function

As indicated by [TPS_SWCT_01283], the semantics of a rational function is described as:

$$Internal = \frac{v_0 * phys^0 + v_1 * phys^1 + v_2 * phys^2 + \dots}{v_0 * phys^0 + v_1 * phys^1 + v_2 * phys^2 + \dots}$$

The following example illustrates the concrete reciprocal conversion rendered below:

$$I = \frac{1000}{60 + 2_{[K-1]} * P_{[K]}}$$

```

<COMPU-METHOD>
  <SHORT-NAME>rational</SHORT-NAME>

Listing B.36: example for rational [CompuMethod](#)

B.4.5 Compu Method representing a BITFIELD_TEXTTABLE

The following scenario exemplifies the definition of a [CompuMethod](#) where attribute `category` is set to `BITFIELD_TEXTTABLE`. The example demonstrates how it is possible to encode independent, yet semantically related information into the individual bits of an `AutosarDataType` where attribute `category` is set to `VALUE`.

The encoding and semantics of information in parts of available bit range is summarized in Table [B.2](#).

Bit	Semantics	Values	ShortLabel	Mask
Bit 0	front left	0(0) = no 1(1) = yes	frontLeft	0b00000001
Bit 1	front right	0(0) = no 1(2) = yes	frontRight	0b00000010
Bit 2	rear left	0(0) = no 1(4) = yes	rearLeft	0b00000100
Bit 3	rear right	0(0) = no 1(8) = yes	rearRight	0b00001000
Bit 4-5	problem	00(00) = flat tire 01(16) = low pressure 10(32) = unbalanced 11(48) = unknown	problem	0b00110000
Bit 6	validity	0(0)=valid 1(64)=invalid	validity	0b01000000

Table B.2: Example Bitfield

The layout of information is therefore defined as depicted in Figure B.31:

Figure B.31: Visualization of the layout of the example bitfield

As exemplified by the bit layout documentation, it is not required that all available bits are used.

This means that in one object the information about the tire selection, problem, and validity is independently encoded and therefore has to be retrieved independently.

```

1  if (validity_valid == (tire_status & validity_BflMask)) && (
    problem_flat_tire == (tire_status & problem_BflMask)) && (
    rearRight_yes == (tire_status & rearRight_BflMask)) {
2      /* handle the situation that the rear right tire is flat */
3  }
    
```

Listing B.37: Access to element of a bitfield

The model of this [CompuMethod](#) is sketched in Listing B.38. Please note that although technically speaking (see [TPS_SWCT_01431]) only one of

- `symbol`
- `vt`
- `shortLabel`

is required to derive the C symbol of a `CompuScale`, the example defines both `symbol` and `shortLabel` because the provision of these model elements facilitates (see [SWS_Rte_07410], [SWS_Rte_07411], [SWS_Rte_07412]) the generation of macros for accessing the information.

Please note that since the example `CompuMethod` defines continuous and non-overlapping bit masks, it is perfectly possible to convert this `CompuMethod` to A2L.

Listing B.38: Example of a `CompuMethod` of category `BITFIELD_TEXTTABLE`

B.5 Compatibility Examples

This section provides some examples that may explain the compatibility of `PortPrototypes`, as defined in chapter 6.

B.5.1 Compatibility on Assembly Level

The rules for compatibility with respect to the connection of `dataElements` by means of `AssemblySwConnectors` are perhaps easier to digest than the delegation case but nonetheless it seems appropriate to provide a set of examples that illustrate the compatibility issue.

B.5.1.1 Legal Use

One of the less trivial examples of this kind is the case of sender/receiver n:1 communication. Figure B.32 sketches a case where both sender software-components provide the full set of `dataElements` that are required by the `RPortPrototype` of the receiving software-component.

Figure B.32: legal n:1 communication

The next case (exemplified by Figure B.33) implements a situation where one sender provides two `dataElements` {A, B} while the other sender provides only as subset of these, i.e. {B}.

As the `RPortPrototype` of the receiving software-component requires only the `dataElement {B}` compatibility issues will not occur because for every required `dataElement` a compatible `dataElement` is provided.

Figure B.33: legal n:1 communication

B.5.1.2 Illegal Use

One possible example for an illegal configuration of a sender/receiver communication is the scenario sketched in Figure B.34. Although the sender software-components in total provide the set of required `dataElements` the *individual* `AssemblySwConnectors` create incompatible connections between sender and receiver.

Figure B.34: illegal n:1 communication

B.5.2 Compatibility on Delegation Level

The rules for compatibility with respect to the delegation of `dataElements` perhaps require some explanation in terms of examples. The first example B.35 describes a legal situation where two `DelegationSwConnectors` split the `dataElements` contained in the `RPortPrototype` owned by a `CompositionSwComponentType`.

B.5.2.1 Legal Use

The examples explain the usage of `DelegationSwConnectors` in different configurations and different values of `DelegatedPortAnnotation`. Please note that the

`DelegatedPortAnnotation` is usually defined before the internal structure of a `CompositionSwComponentType` is fully clarified.

At a later point in time it has to be consistent or can be removed. Decorating the example with applicable values of `DelegatedPortAnnotation` should facilitate the understanding of the meaning of the `DelegatedPortAnnotation`.

Figure B.35: Legal split of delegation connector

All required `dataElements` are provided by the `DelegationSwConnectors` attached to the delegation `RPortPrototype`. The fact that `dataElement` D is not conveyed to any of the `RPortPrototypes` owned by the `SwComponentPrototypes` does not have any impact on the compatibility.

In other words: the `RPortPrototype` at the `CompositionSwComponentType` actually contains the superset of `dataElements` {A, B, C, D}. The two required inner `PortPrototypes` of the `SwComponentPrototypes` contain the subsets of `VariableDataPrototypes` {A, B} and {B, C}. In this case the resulting communication pattern on the VFB for B would be 1:n.

This requires the value of the attribute `signalFan` of `DelegatedPortAnnotation` to be set to the value `nfold`.

In the next example, the `RPortPrototype` of the `CompositionSwComponentType` contains the superset of `dataElements` {A, B}. The two `RPortPrototypes` of the `SwComponentPrototypes` contain *different* subsets, i.e. {A} and {B}.

Figure B.36: Legal split of delegation connector

In this case, the resulting communication pattern on the VFB would be n:1. In this case the value of the attribute `signalFan` of `DelegatedPortAnnotation` should be set to `single`.

The next example is about the merge of *DelegationSwConnectors*. The *PPortPrototype* owned by the *CompositionSwComponentType* contains a superset of *dataElements* {A, B}. The two *PPortPrototypes* of the *SwComponentPrototypes* contain a *disjoint* subset each, i.e. {A} and {B}.

Figure B.37: Legal merge of delegation connector

In this case, the resulting communication pattern on the VFB would be 1:x, with x taking values between 0 and n. In this case the value of the attribute *signalFan* of *DelegatedPortAnnotation* should be set to *single*. All *VariableDataPrototypes* of the provided outer *PortPrototypes* are provided by exactly one provided inner *PortPrototype*.

As a variation of this theme, the next example features a *PPortPrototype* owned by a *CompositionSwComponentType* that contains the superset of *dataElements* {A, B, C}.

The *PPortPrototypes* of the *SwComponentPrototypes* in turn contain subsets of *dataElements*, i.e. {A, B} and {B, C}. In this case the resulting communication pattern on the VFB for {B} would be n:1.

Figure B.38: Legal merge of delegation connector

This would require the value of the attribute *signalFan* of *DelegatedPortAnnotation* to be set to *ifold*. All *dataElements* of the delegation *PPortPrototype* are provided by at least one *PPortPrototype* of the *SwComponentPrototypes*. Therefore, the criteria of *entire delegation* defined in chapter 6.14 are fulfilled.

The next example looks very similar. However, the subtle difference is that the second *SwComponentPrototype* provides *dataElements* {C, D} rather than {B, C}.

Figure B.39: Legal merge of delegation connector

Although `dataElement` {D} does not appear in the delegation `PortPrototype`, the compatibility rules are fully satisfied with this scenario.

The next example shows a valid delegation of `SwConnectors` that goes end-to-end via `CompositionSwComponentTypes` to included `SwComponentPrototypes`.

Figure B.40: Valid delegation of SwConnectors that goes end-to-end

B.5.2.2 Illegal Use

The first example for an illegal use of splitting of `dataElements` suffers from the fact that not all `dataElements` owned by the `RPortPrototypes` of the `SwComponentPrototypes` are available from the connected `RPortPrototypes` owned by the `CompositionSwComponentType`.

Although `dataElements` the connections in total match ({A} and {B} are connected to a `PortPrototype` requiring {A, B}) the compatibility rules are not fulfilled because they apply separately for *each SwConnector*

Figure B.41: Illegal split of delegation connector

In the next example compatibility is also not fulfilled because the required `dataElement {E}` is not provided by the delegation `RPortPrototype`.

Figure B.42: Illegal split of delegation connector

An incompatible merge of `DelegationSwConnectors` is sketched in Figure B.43. In this case the `dataElement {E}` is *not* provided by one of the `PPortPrototypes` owned by the `SwComponentPrototypes` inside the `CompositionSwComponentType`.

Figure B.43: Illegal merge of delegation connector

The next example shows an invalid delegation of `SwConnectors` that goes end-to-end via `CompositionSwComponentTypes` to included `SwComponentPrototypes`.

Similar to the example sketched in Figure B.43, the `dataElement {E}` is *not* provided by one of the `PPortPrototypes` owned by the `SwComponentPrototypes` inside the `CompositionSwComponentType`.

Figure B.44: Invalid delegation of **SwConnectors** that goes end-to-end

B.5.3 Software-Components connected to NvBlockComponents

B.5.3.1 Invalid Connection according to constr_1417

The following examples depict scenarios that are considered illegal according to [constr_1417].

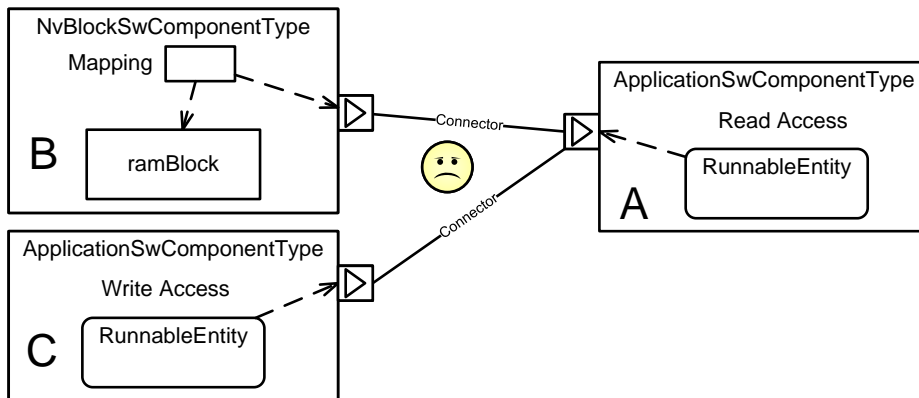

Figure B.45: Example invalid connection between software-components (a)

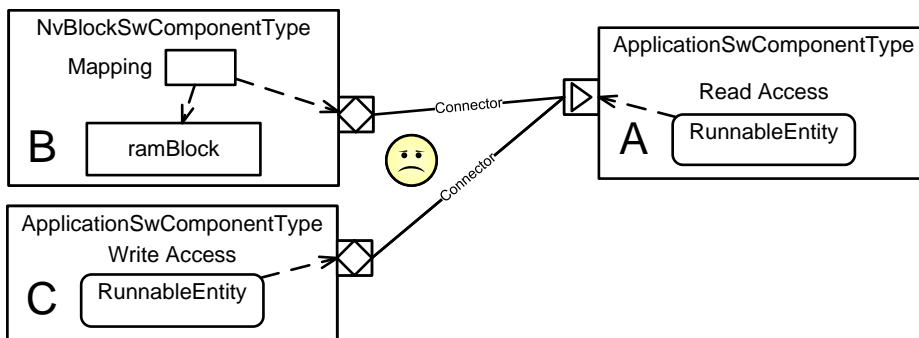

Figure B.46: Example invalid connection between software-components (b)

B.5.3.2 Invalid Connection according to constr_1418

The following example depicts a scenario that is considered illegal according to [constr_1418].

Figure B.47: Example invalid connection between software-components (c)

B.6 Rapid Prototyping Examples

B.6.1 Definition of Rapid Prototyping Scenario

This section contains an example for the modeling of rapid prototyping scenarios, as documented in chapter 14.

The following (simplified) listing B.39 sketches the usage of the meta-class `IdentCaption` for the purpose of effectively allowing references to a `ModeAccessPoint`.

Listing B.39: Example for the definition of an RPT scenario

C Supported Special Use Cases

C.1 Asymmetric Data Transformation between a Software-Component and a Complex Driver

C.1.1 Overview

In this scenario, a `SwComponentPrototype` typed by an `ApplicationSwComponentType` needs to communicate with a `SwComponentPrototype` typed by a `ComplexDeviceDriverSwComponentType`.

The communication itself is special insofar as it ends in an arbitrary structured data type on the side of the `ApplicationSwComponentType` and in a flat byte array on the side of the `ComplexDeviceDriverSwComponentType`.

The communication itself has a client-server nature, where the `ApplicationSwComponentType` mostly acts as the client and the `ComplexDeviceDriverSwComponentType` acts as the server.

As a consequence of this set-up, the structured data type somehow has to be serialized into a flat byte array for the call and from flat byte array to structure data type for the returning of the *out* and *inout* arguments as well as the return value.

For a justification of the use case, let's assume that the `ComplexDeviceDriverSwComponentType` implements an endpoint of a custom communication protocol that needs to interact with the "AUTOSAR world".

This is also the reason why the server implements `ClientServerOperations` with a flat byte array as the argument. The server (in this case, the `ComplexDeviceDriverSwComponentType`) itself is completely agnostic of the data, it just represents the endpoint that has to be able to deal with any given data structure.

This means that the `ComplexDeviceDriverSwComponentType` does not have to be updated and redeployed if the data structures on the side of the `ApplicationSwComponentType` undergo any changes.

For the `ApplicationSwComponentType`, on the other hand, there is little motivation to also model the respective data structures as a flat byte array. Usually, the respective data comes from a mixture of internal processing and communication with other software-components.

In other words, using a flat byte array on the side of the `ApplicationSwComponentType` would mean that the serialization has to be done anyway, potentially inside the implementation of the `ApplicationSwComponentType` itself.

Specifically, the conversion from the (structured) data type to a flat byte array and back needs to be implemented by a piece of software that is typically generated according to the structure of the data type. This software, however, is **very specific** and only fits to the corresponding data types.

One approach for data serialization in AUTOSAR is the generic concept of data transformation, in the specific case of this scenario a data transformer is needed that does a depth-first serialization over a complex data structure.

This approach is already supported in AUTOSAR by means of the so-called SOME/IP Transformer [52].

This existing concept can be taken over for the implementation of the scenario described in this chapter, albeit with some customizations. For example, the SOME/IP-specific protocol header generated by the SOME/IP Transformer is obviously not relevant for the scenario.

C.1.2 Modeling Aspects

The modeling of this use case shall be explained along a simple example sketched in Figure C.1:

- It is necessary to define two individual `ClientServerOperationMappings`.
 - One of these (in this example: CSOM1) shall reference a `DataTransformation` where attribute `dataTransformationKind` is set to the value `DataTransformationKindEnum.asymmetricToByteArray`.
 - The other (in this example: CSOM2) shall reference a `DataTransformation` where attribute `dataTransformationKind` is set to the value `DataTransformationKindEnum.asymmetricFromByteArray`.
- CSOM1 shall reference the `ClientServerOperation` Op1 (on the end of the `ApplicationSwComponentType`) in the role `firstOperation`.
- CSOM1 shall reference the `ClientServerOperation` Op2 (on the end of the `ComplexDeviceDriverSwComponentType`) in the role `secondOperation`.
- CSOM2 shall reference the `ClientServerOperation` Op1 (on the end of the `ApplicationSwComponentType`) in the role `secondOperation`.
- CSOM2 shall reference the `ClientServerOperation` Op2 (on the end of the `ComplexDeviceDriverSwComponentType`) in the role `firstOperation`.
- CSOM1 shall aggregate two `DataPrototypeMappings` in the role `argumentMapping`
 - The first `DataPrototypeMapping` shall reference (in the role `firstDataPrototype`) the `ArgumentDataPrototype` named `In1` of `ClientServerOperation` OP1 and (in the role `secondDataPrototype`) the `ArgumentDataPrototype` named `In` of `ClientServerOperation` OP2.
 - The second `DataPrototypeMapping` shall reference (in the role `firstDataPrototype`) the `ArgumentDataPrototype` named `In2` of

ClientServerOperation OP1 and (in the role secondDataPrototype) the ArgumentDataPrototype named In of ClientServerOperation OP2.

- CSOM2 shall aggregate two DataPrototypeMappings in the role argumentMapping
 - The first DataPrototypeMapping shall reference (in the role firstDataPrototype) the ArgumentDataPrototype named Out1 of ClientServerOperation OP1 and (in the role secondDataPrototype) the ArgumentDataPrototype named Out of ClientServerOperation OP2.
 - The second DataPrototypeMapping shall reference (in the role firstDataPrototype) the ArgumentDataPrototype named Out2 of ClientServerOperation OP1 and (in the role secondDataPrototype) the ArgumentDataPrototype named Out of ClientServerOperation OP2.

Figure C.1: Modeling of the data transformation use case

Please note that in Figure C.1 the role names of references from `DataPrototypeMapping` have been left out of the picture for reasons of simplicity.

D Modeling of InstanceRef

D.1 Introduction

The existence of so-called `InstanceRefs` is a direct consequence of the usage of the `type-prototype` pattern for modeling within AUTOSAR. When referencing a `prototype`, it is also necessary to include a reference to the `prototypes` typed by their corresponding `types` that in turn aggregate further `prototypes` to set up the context.

In other words, `InstanceRefs` are representing **structured references** that, on the one hand, consist of references to context `prototypes` (indicated by a subsetting or redefinition of `atpContextElement`) and finally a reference to the applicable target `prototype` (indicated by a redefinition of `atpTarget`).

Note that it is not uncommon to have more than a single context in the modeling of particular `InstanceRefs`.

For the reader of specifications, the modeling of `InstanceRefs` manifests as a UML dependency stereotyped `<<instanceRef>>` drawn from one meta-class to another. This is a simplified indication that the source of the dependency implements an `InstanceRef` to the meta-class at the target of the dependency.

Again, in most cases this is everything a reader needs to understand in order to figure out the modeling. The formal modeling of `InstanceRefs` is done by creating subclasses of the abstract meta-class `AtpInstanceRef`.

Wherever a more detailed understanding of the modeling is advised in the context of the specific chapter of this document, the modeling of a specific subclass of `AtpInstanceRef` is explained directly in the context of the corresponding chapter.

In all other cases, a deeper understanding of the modeling of particular subclasses of `AtpInstanceRefs` can be obtained from reading this chapter.

Class tables included in this chapter are not fully filled out in the sense that most of the notes inside the class tables are missing. The **primary** purpose of these class tables is to **provide information about the intended order in which `InstanceRefs` are serialized in M1 AUTOSAR models**.

In particular, the information about the order in serialized M1 models can be obtained from the value of the tag `xml.sequenceOffset` of each attribute of an `InstanceRef` meta-class.

For more information about the general concept of modeling `AtpInstanceRef` (e.g. the conceptual background of redefining or subsetting an association from a subclass of `AtpInstanceRef` to other meta-classes) please refer to [11].

contextPort	<code>PortPrototype</code>	0..1	ref	Stereotypes: <code>atpAbstract</code> Tags: <code>xml.sequenceOffset=20</code>

Table D.1: `VariableInAtomicSwcInstanceRef`

Please note the example of how the redefinition of the context association works, i.e. the association from `VariableInAtomicSwcInstanceRef` to `PortPrototype` in the role `contextPort` is **redefined** by the subclass `RVariableInAtomicSwcInstanceRef` by means of an association to `RPortPrototype` in the role `contextRPort`.

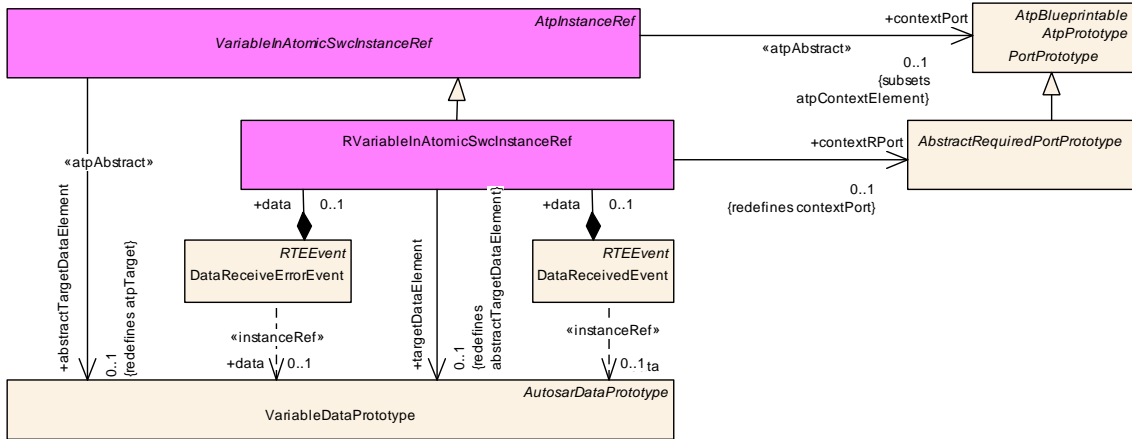

Figure D.2: Concrete modeling of references to `VariableDataPrototype` in the context of an `RPortPrototype`

The effect of this modeling is that the general relationship to `PortPrototype` is already established by `VariableInAtomicSwcInstanceRef` on an abstract level but actually it never makes the generated XML Schema because it is **redefined** by a subclass. In other words, the redefinition replaces the original association as far as the generation algorithm for the XML Schema is concerned.

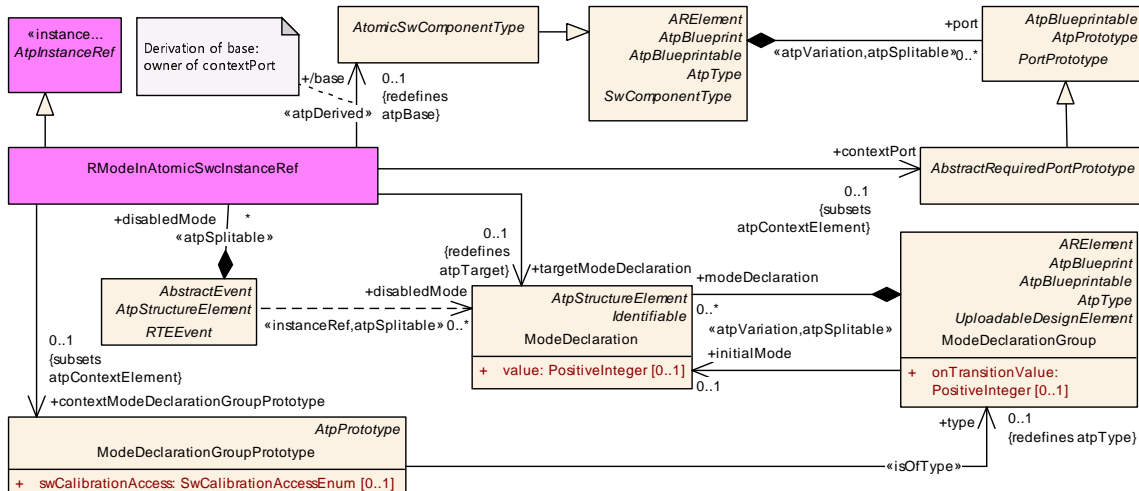

Figure D.3: Modeling of references to `ModeDeclarationGroupPrototype` in the context of an `RPortPrototype`

For clarification, the interpretation of the values of `xml.sequenceOffset` in this particular case is that in the generated XML Schema the `contextRPort` comes first, followed by `targetDataElement` which concludes the definition of the `InstanceRef` in the XML Schema.

Figure D.18: Modeling of references to DataPrototype in the context of an Atomic-SwComponentType

Class	VariableInAtomicSWCTypeInstanceRef			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::DataElements::InstanceRefs Usage			
Note				
Base	<i>ARObject</i> , <i>AtpInstanceRef</i>			
Aggregated by	AutosarVariableRef .autosarVariable			
Attribute	Type	Mult.	Kind	Note
base	AtomicSwComponentType	0..1	ref	Stereotypes: atpDerived Tags: xml.sequenceOffset=10
contextData Prototype (ordered)	ApplicationCompositeElementDataPrototype	*	ref	This is the context in a compositeData Type. Tags: xml.sequenceOffset=40
portPrototype	PortPrototype	0..1	ref	This is the port providing the parameter or the entry point to the parameter structure. Tags: xml.sequenceOffset=20
rootVariable DataPrototype	VariableDataPrototype	0..1	ref	Tags: xml.sequenceOffset=30

Class	VariableInAtomicSWCTypeInstanceRef			
targetData Prototype	DataPrototype	0..1	ref	This is the target of the instance ref. Note that it shall be one of ApplicationCompositeElementDataPrototype of VariableDataPrototype. Tags: xml.sequenceOffset=50

Table D.18: VariableInAtomicSWCTypeInstanceRef

D.2.2 Definition of implicit Communication Behavior

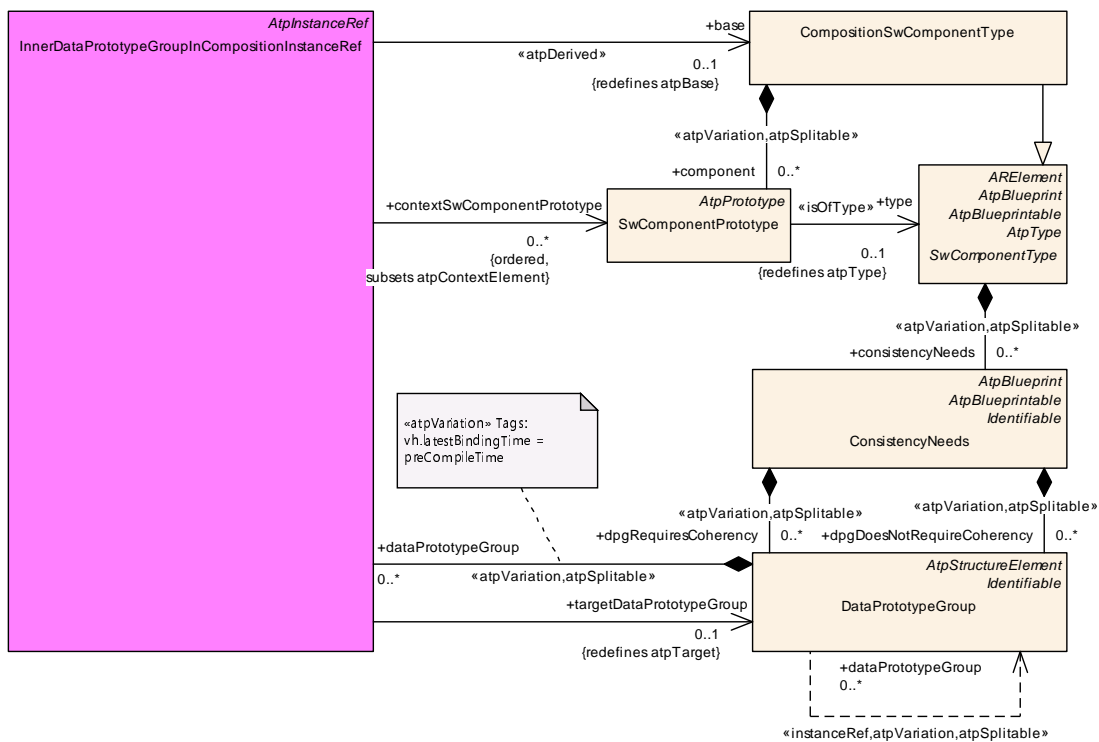

Figure D.19: Modeling of references to DataPrototypeGroup in the context of a CompositionSwComponentType

Class	InnerDataPrototypeGroupInCompositionInstanceRef			
Package	M2::AUTOSARTemplates::SWComponentTemplate::ImplicitCommunicationBehavior::InstanceRef			
Note	This meta-class represents the ability to define an InstanceRef to a nested DataPrototypeGroup			
Base	ARObject, AtpInstanceRef			
Aggregated by	DataPrototypeGroup.dataPrototypeGroup			
Attribute	Type	Mult.	Kind	Note
base	CompositionSwComponentType	0..1	ref	This represents the base of the instanceRef. Stereotypes: atpDerived Tags: xml.sequenceOffset=10

Class	InnerDataPrototypeGroupInCompositionInstanceRef			
contextSw Component Prototype (ordered)	SwComponent Prototype	*	ref	This represents the nested structure of SwComponent Prototypes. Tags: xml.sequenceOffset=20
targetData PrototypeGroup	DataPrototypeGroup	0..1	ref	This represents the target of the InstanceRef Tags: xml.sequenceOffset=30

Table D.19: InnerDataPrototypeGroupInCompositionInstanceRef

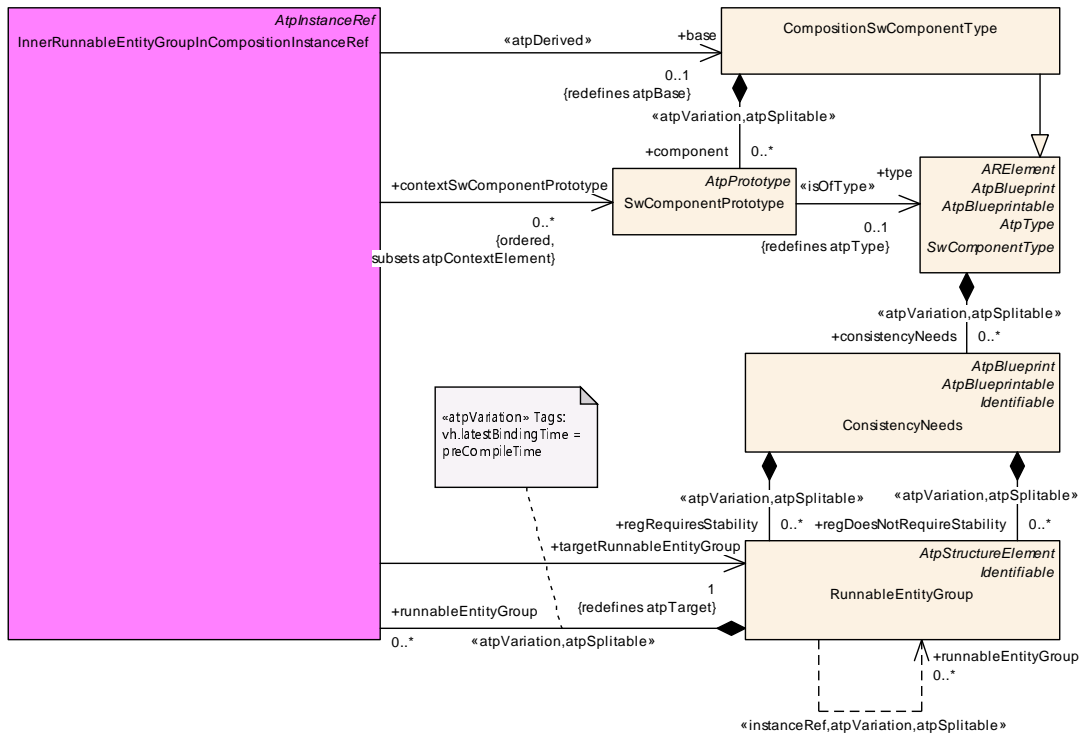

Figure D.20: Modeling of references to RunnableEntityGroup in the context of a CompositionSwComponentType

Class	InnerRunnableEntityGroupInCompositionInstanceRef			
Package	M2::AUTOSARTemplates::SWComponentTemplate::ImplicitCommunicationBehavior::InstanceRef			
Note	This meta-class represents the ability to define an InstanceRef to a nested RunnableEntityGroup.			
Base	<i>ARObject</i> , <i>AtpInstanceRef</i>			
Aggregated by	RunnableEntityGroup.runnableEntityGroup			
Attribute	Type	Mult.	Kind	Note
base	CompositionSwComponentType	0..1	ref	This represents the base of the InstanceRef. Stereotypes: atpDerived Tags: xml.sequenceOffset=10
contextSwComponentPrototype (ordered)	SwComponentPrototype	*	ref	This represents the nested structure of SwComponent Prototypes. Tags: xml.sequenceOffset=20
targetRunnableEntityGroup	RunnableEntityGroup	1	ref	This represents the target association of the InstanceRef. Tags: xml.sequenceOffset=30

Table D.20: InnerRunnableEntityGroupInCompositionInstanceRef

Class	RunnableEntityInCompositionInstanceRef			
Package	M2::AUTOSARTemplates::SWComponentTemplate::ImplicitCommunicationBehavior::InstanceRef			
Note	This meta-class represents the ability to define an InstanceRef to a RunnableEntity in the context of a CompositionSwComponentType.			
Base	<i>ARObject</i> , <i>AtpInstanceRef</i>			
Aggregated by	RunnableEntityGroup.runnableEntity			
Attribute	Type	Mult.	Kind	Note
base	CompositionSwComponentType	0..1	ref	This represents the base of the InstanceRef. Stereotypes: atpDerived Tags: xml.sequenceOffset=10
contextSwComponentPrototype (ordered)	SwComponentPrototype	*	ref	This represents the nested structure of SwComponent Prototypes. Tags: xml.sequenceOffset=20

E Mentioned Class Tables

For the sake of completeness, this chapter contains a set of class tables representing meta-classes mentioned in the context of this document but which are not contained directly in the scope of describing specific meta-model semantics.

Class	ARElement (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::ARPackage			
Note	An element that can be defined stand-alone, i.e. without being part of another element (except for packages of course).			
Base	ARObject , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Subclasses	AclObjectSet, AclOperation, AclPermission, AclRole, AliasNameSet, ApplicabilityInfoSet, Application Partition, AutosarDataType , BaseType , BlueprintMappingSet, BswEntryRelationshipSet, BswModuleDescription , BswModuleEntry , BuildActionManifest, CalibrationParameterValueSet , ClientIdDefinitionSet, ClientServerInterfaceToBswModuleEntryBlueprintMapping, Collection, CompuMethod , ConsistencyNeedsBlueprintSet, ConstantSpecification , ConstantSpecificationMappingSet , CpSoftwareCluster, CpSoftwareClusterBinaryManifestDescriptor, CpSoftwareClusterMappingSet, CpSoftwareClusterResourcePool, CryptoEllipticCurveProps, CryptoServiceCertificate, CryptoServiceKey, CryptoServicePrimitive, CryptoServiceQueue, CryptoSignatureScheme, DataConstr , DataExchangePoint, DataTransformationSet, DataTypeMappingSet , DdsCpConfig, DiagnosticCommonElement , DiagnosticConnection, DiagnosticContributionSet, DltContext, DltEcu, Documentation, E2EProfileCompatibilityProps , EcuDefinitionCollection, EcuDestinationUriDefSet, EcuModuleConfigurationValues, EcuModuleDef, EcuValueCollection, EndToEndProtectionSet , EthIpProps, EthTcplPcmpProps, EthTcplPProps, EvaluatedVariantSet, FMFeature, FMFeatureMap, FMFeatureModel, FMFeatureSelectionSet, FirewallRule, FlatMap, GeneralPurposeConnection, HwCategory, HwElement , HwType , IEEE1722TpConnection , IPsecConfigProps, IPv6ExtHeaderFilterSet, IdsCommonElement , IdsDesign, Implementation , ImpositionTimeDefinitionGroup, InterpolationRoutineMappingSet , J1939ControllerApplication, KeywordSet, LifecycleInfoSet, LifecycleStateDefinitionGroup, LogAndTraceMessageCollectionSet, MacSecGlobalKeyProps, MacSecParticipantSet, McFunction, McGroup, ModeDeclarationGroup , ModeDeclarationMappingSet , OsTaskProxy, PhysicalDimension , PhysicalDimensionMappingSet , PortInterface , PortInterfaceMappingSet , PortPrototypeBlueprint, PostBuildVariantCriterion , PostBuildVariantCriterionValueSet , PredefinedVariant, RapidPrototypingScenario , SdgDef, SignalServiceTranslationPropsSet, SomeipSdClientEventGroupTimingConfig, SomeipSdClientServiceInstanceConfig, SomeipSdServerEventGroupTimingConfig, SomeipSdServerServiceInstanceConfig, SwAddrMethod , SwAxisType , SwComponentMappingConstraints, SwComponentType , SwRecordLayout , SwSystemconst , SwSystemconstantValueSet , SwcBswMapping , System , SystemSignal , SystemSignalGroup, TDCpSoftwareClusterMappingSet, TcpOptionFilterSet, TimingExtension , TlsConnectionGroup, TivDataIdDefinitionSet, TransformationPropsSet, Unit , UnitGroup , UploadablePackageElement , ViewMapSet			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table E.1: ARElement

Class	ARPackage			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::ARPackage			
Note	AUTOSAR package, allowing to create top level packages to structure the contained ARElements. ARPackages are open sets. This means that in a file based description system multiple files can be used to partially describe the contents of a package. This is an extended version of MSR's SW-SYSTEM.			
Base	ARObject , AtpBlueprint , AtpBlueprintable , CollectableElement , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	ARPackage.arPackage , AUTOSAR.arPackage			
Attribute	Type	Mult.	Kind	Note

Class	ARPackage			
arPackage	ARPackage	*	aggr	This represents a sub package within an ARPackage, thus allowing for an unlimited package hierarchy. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=arPackage.shortName, arPackage.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime xml.sequenceOffset=30
element	PackageableElement	*	aggr	Elements that are part of this package Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=element.shortName, element.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=20
referenceBase	ReferenceBase	*	aggr	This denotes the reference bases for the package. This is the basis for all relative references within the package. The base needs to be selected according to the base attribute within the references. Stereotypes: atpSplitable Tags: atp.Splitkey=referenceBase.shortLabel xml.sequenceOffset=10

Table E.2: ARPackage

Class	AUTOSAR			
Package	M2::AUTOSARTemplates::AutosarTopLevelStructure			
Note	Root element of an AUTOSAR description, also the root element in corresponding XML documents. Tags: xml.globalElement=true			
Base	ARObject			
Attribute	Type	Mult.	Kind	Note
adminData	AdminData	0..1	aggr	This represents the administrative data of an Autosar file. Stereotypes: atpSplitable Tags: atp.Splitkey=adminData xml.sequenceOffset=10
arPackage	ARPackage	*	aggr	This is the top level package in an AUTOSAR model. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=arPackage.shortName, arPackage.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime xml.sequenceOffset=30
fileInfo Comment	FileInfoComment	0..1	aggr	This represents a possibility to provide a structured comment in an AUTOSAR file. Stereotypes: atpStructuredComment Tags: xml.roleElement=true xml.sequenceOffset=-10 xml.typeElement=false

Class	AUTOSAR			
introduction	DocumentationBlock	0..1	aggr	This represents an introduction on the Autosar file. It is intended for example to represent disclaimers and legal notes. Tags: xml.sequenceOffset=20

Table E.3: AUTOSAR

Class	<<atpMixedString>> AbstractNumericalVariationPoint (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling::AttributeValueVariationPoints			
Note	This is an abstract NumericalValueVariationPoint. It is introduced to support the case that additional attributes are required for particular purposes.			
Base	<i>ARObject</i> , AttributeValueVariationPoint , <i>FormulaExpression</i> , SwSystemconstDependentFormula			
Subclasses	LimitValueVariationPoint, NumericalValueVariationPoint			
Aggregated by	VariationPointProxy.valueAccess			
Attribute	Type	Mult.	Kind	Note
-	-	-	-	-

Table E.4: AbstractNumericalVariationPoint

Class	AdminData			
Package	M2::MSR::AsamHdo::AdminData			
Note	AdminData represents the ability to express administrative information and custom extensions for an element. This administration information is to be treated as meta-data such as revision id or state of the file. There are basically the following kinds of meta-data <ul style="list-style-type: none"> • The language and/or used languages. • Revision information covering e.g. revision number, state, release date, changes. Note that this information can be given in general as well as related to a particular company. • Document meta-data specific for a company Beside that a custom extension of model-data is possible by <ul style="list-style-type: none"> • Special data 			
Base	<i>ARObject</i>			
Aggregated by	AUTOSAR.adminData , Describable.adminData , Identifiable.adminData			
Attribute	Type	Mult.	Kind	Note
docRevision (ordered)	DocRevision	*	aggr	This allows to denote information about the current revision of the object. Note that information about previous revisions can also be logged here. The entries shall be sorted descendant by date in order to reflect the history. Therefore the most recent entry representing the current version is denoted first. Tags: xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=50 xml.typeElement=false xml.typeWrapperElement=false

Class	AdminData			
language	LEnum	0..1	attr	This attribute specifies the master language of the document or the document fragment. The master language is the one in which the document is maintained and from which the other languages are derived from. In particular in case of inconsistencies, the information in the master language is priority. Tags: xml.sequenceOffset=20
sdg	Sdg	*	aggr	This property allows to keep special data which is not represented by the standard model. It can be utilized to keep e.g. tool specific data. Stereotypes: atpSplittable Tags: atp.Splitkey=sdg.sdgCaption.shortName xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=60 xml.typeElement=false xml.typeWrapperElement=false
usedLanguages	MultiLanguagePlainText	0..1	aggr	This property specifies the languages which are provided in the document. Therefore it should only be specified in the top level admin data. For each language provided in the document there is one entry in MultilanguagePlainText. The content of each entry can be used for illustration of the language. The used language itself depends on the language attribute in the entry. Tags: xml.sequenceOffset=30

Table E.5: AdminData

Class	AnyInstanceRef			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::AnyInstanceRef			
Note	Describes a reference to any instance in an AUTOSAR model. This is the most generic form of an instance ref. Refer to the superclass notes for more details.			
Base	<i>ARObject</i> , AtpInstanceRef			
Aggregated by	Collection.collectedInstance, Collection.sourceInstance, DocumentationContext.feature, EcuInstanceReferenceValue.value, FlatInstanceDescriptor.ecuExtractReference , FlatInstanceDescriptor.upstreamReference , RptContainer.byPassPoint , RptHook.rptArHook , ViewMap.firstElementInstance, ViewMap.secondElementInstance			
Attribute	Type	Mult.	Kind	Note
base	AtpClassifier	1	ref	This is the base from which navigation path begins. Stereotypes: atpDerived
contextElement (ordered)	AtpFeature	*	ref	This is one step in the navigation path specified by the instance ref.
target	AtpFeature	1	ref	This is the target of the instance ref.

Table E.6: AnyInstanceRef

Class	AtpInstanceRef (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::AbstractStructure			
Note	<p>An M0 instance of a classifier may be represented as a tree rooted at that instance, where under each node come the sub-trees representing the instances which act as features under that node.</p> <p>An instance ref specifies a navigation path from any M0 tree-instance of the base (which is a classifier) to a leaf (which is an instance of the target).</p>			
Base	ARObject			
Subclasses	AnyInstanceRef , ApplicationCompositeElementInPortInterfaceInstanceRef , ComponentInCompositionInstanceRef , ComponentInSystemInstanceRef , DataPrototypeInPortInterfaceInstanceRef , DataPrototypeInSystemInstanceRef , InnerDataPrototypeGroupInCompositionInstanceRef , InnerPortGroupInCompositionInstanceRef , InnerRunnableEntityGroupInCompositionInstanceRef , InstanceEventInCompositionInstanceRef , ModeDeclarationGroupPrototypeInSystemInstanceRef , ModeGroupInAtomicSwcInstanceRef , ModelInBswModuleDescriptionInstanceRef , ModelInSwcInstanceRef , OperationArgumentInComponentInstanceRef , OperationInAtomicSwcInstanceRef , OperationInSystemInstanceRef , PModelInSystemInstanceRef , ParameterDataPrototypeInSystemInstanceRef , ParameterInAtomicSWCTypeInstanceRef , PortGroupInSystemInstanceRef , PortInCompositionTypeInstanceRef , RModelInAtomicSwcInstanceRef , RteEventInCompositionInstanceRef , RteEventInEcuInstanceRef , RteEventInSystemInstanceRef , RunnableEntityInCompositionInstanceRef , SwcServiceDependencyInSystemInstanceRef , TriggerInAtomicSwcInstanceRef , TriggerInSystemInstanceRef , VariableAccessInEcuInstanceRef , VariableDataPrototypeInCompositionInstanceRef , VariableDataPrototypeInSystemInstanceRef , VariableInAtomicSWCTypeInstanceRef , VariableInAtomicSwcInstanceRef , VariableInComponentInstanceRef			
Attribute	Type	Mult.	Kind	Note
atpBase	AtpClassifier	1	ref	This is the base from which the navigation path starts. Stereotypes: atpAbstract; atpDerived
atpContext Element (ordered)	AtpPrototype	*	ref	This is one particular step in the navigation path. Stereotypes: atpAbstract
atpTarget	AtpFeature	1	ref	This is the target of the instance ref. In other words it is the terminal of the navigation path. Stereotypes: atpAbstract

Table E.7: AtpInstanceRef

Enumeration	BindingTimeEnum
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling
Note	This enumerator specifies the applicable binding times for the pre build variation points.
Aggregated by	AttributeValueVariationPoint.bindingTime , ConditionByFormula.bindingTime , FMFeature.maximumIntendedBindingTime, FMFeature.minimumIntendedBindingTime, FMFeatureSelection.maximumSelectedBindingTime, FMFeatureSelection.minimumSelectedBindingTime
Literal	Description
codeGeneration Time	<ul style="list-style-type: none"> • Coding by hand, based on requirements document. • Tool based code generation, e.g. from a model. • The model may contain variants. • Only code for the selected variant(s) is actually generated. Tags: atp.EnumerationLiteralIndex=0
linkTime	Configure what is included in object code, and what is omitted Based on which variant(s) are selected E.g. for modules that are delivered as object code (as opposed to those that are delivered as source code) Tags: atp.EnumerationLiteralIndex=1

Enumeration	BindingTimeEnum
preCompileTime	This is typically the C-Preprocessor. Exclude parts of the code from the compilation process, e.g., because they are not required for the selected variant, because they are incompatible with the selected variant, because they require resources that are not present in the selected variant. Object code is only generated for the selected variant(s). The code that is excluded at this stage code will not be available at later stages. Tags: atp.EnumerationLiteralIndex=2
systemDesignTime	<ul style="list-style-type: none"> • Designing the VFB. • Software Component types (PortInterfaces). • SWC Prototypes and the Connections between SWCprototypes. • Designing the Topology • ECUs and interconnecting Networks • Designing the Communication Matrix and Data Mapping Tags: atp.EnumerationLiteralIndex=3

Table E.8: BindingTimeEnum

Class	BswCalledEntity			
Package	M2::AUTOSARTemplates::BswModuleTemplate::BswBehavior			
Note	BSW module entity which is designed to be called from another BSW module or cluster.			
Base	ARObject, BswModuleEntity, ExecutableEntity, Identifiable, MultilanguageReferrable, Referrable			
Aggregated by	BswInternalBehavior.entity			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table E.9: BswCalledEntity

Class	BswImplementation			
Package	M2::AUTOSARTemplates::BswModuleTemplate::BswImplementation			
Note	Contains the implementation specific information in addition to the generic specification (BswModule Description and BswBehavior). It is possible to have several different BswImplementations referring to the same BswBehavior. Tags: atp.recommendedPackage=BswImplementations			
Base	ARElement, ARObject, CollectableElement, Identifiable, Implementation, MultilanguageReferrable, PackageableElement, Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
arReleaseVersion	RevisionLabelString	0..1	attr	Version of the AUTOSAR Release on which this implementation is based. The numbering contains three levels (major, minor, revision) which are defined by AUTOSAR.
behavior	BswInternalBehavior	0..1	ref	The behavior of this implementation. This relation is made as an association because <ul style="list-style-type: none"> • it follows the pattern of the SWCT • since ARElement cannot be splitted, but we want supply the implementation later, the Bsw Implementation is not aggregated in BswBehavior

Class	BswImplementation			
preconfigured Configuration	EcucModule ConfigurationValues	*	ref	Reference to the set of preconfigured (i.e. fixed) configuration values for this BswImplementation. If the BswImplementation represents a cluster of several modules, more than one EcucModuleConfigurationValues element can be referred (at most one per module), otherwise at most one such element can be referred. Tags: xml.roleWrapperElement=true
recommended Configuration	EcucModule ConfigurationValues	*	ref	Reference to one or more sets of recommended configuration values for this module or module cluster.
vendorApiInfix	Identifier	0..1	attr	In driver modules which can be instantiated several times on a single ECU, SRS_BSW_00347 requires that the names of files, APIs, published parameters and memory allocation keywords are extended by the vendorId and a vendor specific name. This parameter is used to specify the vendor specific name. In total, the implementation specific API name is generated as follows: <Module Name>_<vendorId>_<vendorApiInfix>_<API name from SWS>. E.g. assuming that the vendorId of the implementer is 123 and the implementer chose a vendorApiInfix of "v11r456" an API name Can_Write defined in the SWS will translate to Can_123_v11r456_Write. This attribute is mandatory for all modules with upper multiplicity > 1. It shall not be used for modules with upper multiplicity =1. See also SWS_BSW_00102.
vendorSpecific ModuleDef	EcucModuleDef	*	ref	Reference to <ul style="list-style-type: none"> the vendor specific EcucModuleDef used in this Bsw Implementation if it represents a single module several EcucModuleDefs used in this Bsw Implementation if it represents a cluster of modules one or no EcucModuleDefs used in this Bsw Implementation if it represents a library Tags: xml.roleWrapperElement=true

Table E.10: BswImplementation

Class	BswModuleDescription			
Package	M2::AUTOSARTemplates::BswModuleTemplate::BswOverview			
Note	Root element for the description of a single BSW module or BSW cluster. In case it describes a BSW module, the short name of this element equals the name of the BSW module. Tags: atp.recommendedPackage=BswModuleDescriptions			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , AtpClassifier , AtpFeature , AtpStructureElement , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element , AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note

Class	BswModuleDescription			
bswModule Dependency	BswModuleDependency	*	aggr	Describes the dependency to another BSW module. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=bswModuleDependency.shortName, bsw ModuleDependency.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=20
bswModule Documentation	SwComponent Documentation	0..1	aggr	This adds a documentation to the BSW module. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=bswModuleDocumentation, bswModule Documentation.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=6
expectedEntry	BswModuleEntry	*	ref	Indicates an entry which is required by this module. Replacement of outgoingCallback / requiredEntry. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=expectedEntry.bswModuleEntry, expected Entry.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
implemented Entry	BswModuleEntry	*	ref	Specifies an entry provided by this module which can be called by other modules. This includes "main" functions, interrupt routines, and callbacks. Replacement of providedEntry / expectedCallback. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=implementedEntry.bswModuleEntry, implementedEntry.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
internalBehavior	BswInternalBehavior	*	aggr	The various BswInternalBehaviors associated with a Bsw ModuleDescription can be distributed over several physical files. Therefore the aggregation is <<atp Splitable>>. Stereotypes: atpSplitable Tags: atp.Splitkey=internalBehavior.shortName xml.sequenceOffset=65
moduleId	PositiveInteger	0..1	attr	Refers to the BSW Module Identifier defined by the AUTOSAR standard. For non-standardized modules, a proprietary identifier can be optionally chosen. Tags: xml.sequenceOffset=5
providedClient ServerEntry	BswModuleClientServer Entry	*	aggr	Specifies that this module provides a client server entry which can be called from another partition or core. This entry is declared locally to this context and will be connected to the requiredClientServerEntry of another or the same module via the configuration of the BSW Scheduler. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=providedClientServerEntry.shortName, providedClientServerEntry.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=45

Class	BswModuleDescription			
providedData	VariableDataPrototype	*	aggr	<p>Specifies a data prototype provided by this module in order to be read from another partition or core. The providedData is declared locally to this context and will be connected to the requiredData of another or the same module via the configuration of the BSW Scheduler.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=providedData.shortName, providedData.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=55</p>
providedMode Group	ModeDeclarationGroup Prototype	*	aggr	<p>A set of modes which is owned and provided by this module or cluster. It can be connected to the required ModeGroups of other modules or clusters via the configuration of the BswScheduler. It can also be synchronized with modes provided via ports by an associated ServiceSwComponentType, EcuAbstractionSwComponentType or ComplexDeviceDriverSwComponentType.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=providedModeGroup.shortName, providedModeGroup.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=25</p>
releasedTrigger	Trigger	*	aggr	<p>A Trigger released by this module or cluster. It can be connected to the requiredTriggers of other modules or clusters via the configuration of the BswScheduler. It can also be synchronized with Triggers provided via ports by an associated ServiceSwComponentType, EcuAbstractionSwComponentType or ComplexDeviceDriverSwComponentType.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=releasedTrigger.shortName, releasedTrigger.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=35</p>
requiredClient ServerEntry	BswModuleClientServer Entry	*	aggr	<p>Specifies that this module requires a client server entry which can be implemented on another partition or core. This entry is declared locally to this context and will be connected to the providedClientServerEntry of another or the same module via the configuration of the BSW Scheduler.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=requiredClientServerEntry.shortName, requiredClientServerEntry.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=50</p>

Class	BswModuleDescription			
requiredData	VariableDataPrototype	*	aggr	<p>Specifies a data prototype required by this module in order to be provided from another partition or core. The required Data is declared locally to this context and will be connected to the providedData of another or the same module via the configuration of the BswScheduler.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=requiredData.shortName, requiredData.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=60</p>
requiredMode Group	ModeDeclarationGroup Prototype	*	aggr	<p>Specifies that this module or cluster depends on a certain mode group. The requiredModeGroup is local to this context and will be connected to the providedModeGroup of another module or cluster via the configuration of the BswScheduler.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=requiredModeGroup.shortName, requiredModeGroup.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=30</p>
requiredTrigger	Trigger	*	aggr	<p>Specifies that this module or cluster reacts upon an external trigger. This requiredTrigger is declared locally to this context and will be connected to the providedTrigger of another module or cluster via the configuration of the BswScheduler.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=requiredTrigger.shortName, requiredTrigger.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=40</p>

Table E.11: BswModuleDescription

Class	BswModuleEntry			
Package	M2::AUTOSARTemplates::BswModuleTemplate::BswInterfaces			
Note	<p>This class represents a single API entry (C-function prototype) into the BSW module or cluster.</p> <p>The name of the C-function is equal to the short name of this element with one exception: In case of multiple instances of a module on the same CPU, special rules for "infixes" apply, see description of class BswImplementation.</p> <p>Tags: atp.recommendedPackage=BswModuleEntrys</p>			
Base	ARElement , ARObject , AtpBlueprint , AtpBlueprintable , CollectableElement , Identifiable , Multilanguage Referrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
argument (ordered)	SwServiceArg	*	aggr	<p>An argument belonging to this BswModuleEntry.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=argument.shortName, argument.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime xml.sequenceOffset=45</p>

Class	BswModuleEntry			
bswEntryKind	BswEntryKindEnum	0..1	attr	This describes whether the entry is concrete or abstract. If the attribute is missing the entry is considered as concrete. Tags: xml.sequenceOffset=40
callType	BswCallType	0..1	attr	The type of call associated with this service. Tags: xml.sequenceOffset=25
execution Context	BswExecutionContext	0..1	attr	Specifies the execution context which is required (in case of entries into this module) or guaranteed (in case of entries called from this module) for this service. Tags: xml.sequenceOffset=30
function Prototype Emitter	NameToken	0..1	attr	This attribute is used to control the generation of function prototypes. If set to "RTE", the RTE generates the function prototypes in the Module Interlink Header File.
isReentrant	Boolean	0..1	attr	Reentrancy from the viewpoint of function callers: <ul style="list-style-type: none"> • true: Enables the service to be invoked again, before the service has finished. • false: It is prohibited to invoke the service again before is has finished. Tags: xml.sequenceOffset=15
isSynchronous	Boolean	0..1	attr	Synchronicity from the viewpoint of function callers: <ul style="list-style-type: none"> • true: This calls a synchronous service, i.e. the service is completed when the call returns. • false: The service (on semantical level) may not be complete when the call returns. Tags: xml.sequenceOffset=20
return Type	SwServiceArg	0..1	aggr	The return type belonging to this bswModuleEntry. Tags: xml.sequenceOffset=40
role	Identifier	0..1	attr	Specifies the role of the entry in the given context. It shall be equal to the standardized name of the service call, especially in cases where no ServiceIdentifier is specified, e.g. for callbacks. Note that the ShortName is not always sufficient because it maybe vendor specific (e.g. for callbacks which can have more than one instance). Tags: xml.sequenceOffset=10
serviceId	PositiveInteger	0..1	attr	Refers to the service identifier of the Standardized Interfaces of AUTOSAR basic software. For non-standardized interfaces, it can optionally be used for proprietary identification. Tags: xml.sequenceOffset=5
swServiceImpl Policy	SwServiceImplPolicy Enum	0..1	attr	Denotes the implementation policy as a standard function call, inline function or macro. This has to be specified on interface level because it determines the signature of the call. Tags: xml.sequenceOffset=35

Table E.12: BswModuleEntry

Class	BswSchedulableEntity			
Package	M2::AUTOSARTemplates::BswModuleTemplate::BswBehavior			
Note	BSW module entity, which is designed for control by the BSW Scheduler. It may for example implement a so-called "main" function.			
Base	ARObject, BswModuleEntity, ExecutableEntity, Identifiable, MultilanguageReferrable, Referrable			
Aggregated by	BswInternalBehavior.entity			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table E.13: BswSchedulableEntity

Class	BswServiceDependency			
Package	M2::AUTOSARTemplates::BswModuleTemplate::BswBehavior			
Note	Specialization of ServiceDependency in the context of an BswInternalBehavior. It allows to associate BswModuleEntries and data defined for a BSW module or cluster to a given ServiceNeeds element.			
Base	ARObject, ServiceDependency			
Aggregated by	BswInternalBehavior.serviceDependency			
Attribute	Type	Mult.	Kind	Note
assignedData	RoleBasedData Assignment	*	aggr	Defines the role of an associated data object (owned by this module or cluster) in the context of the ServiceNeeds element. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=assignedData, assignedData.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
assignedEntry Role	RoleBasedBswModule EntryAssignment	*	aggr	Defines the role of an associated BswModuleEntry in the context of the ServiceNeeds element. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=assignedEntryRole, assignedEntryRole.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
ident	BswService DependencyIdent	0..1	aggr	This adds the ability to become referrable to BswService Dependency. Stereotypes: atpIdentityContributor Tags: xml.sequenceOffset=-100
serviceNeeds	ServiceNeeds	0..1	aggr	The associated ServiceNeeds.

Table E.14: BswServiceDependency

Class	ConsumedEventGroup			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances			
Note	This element represents an event-group to which the service consumer wants to subscribe.			
Base	ARObject, Identifiable, MultilanguageReferrable, Referrable			
Aggregated by	ConsumedServiceInstance.consumedEventGroup			
Attribute	Type	Mult.	Kind	Note
application Endpoint	ApplicationEndpoint	0..1	ref	Defines the application endpoint where the events of the event group are received in case of multicast reception. Tags: atp.Status=obsolete

Class	ConsumedEventGroup			
autoRequire	Boolean	0..1	attr	Defines that this ConsumedEventGroup shall be requested (subscribed) as soon as the corresponding ConsumedServiceInstance is requested. This could be at ECU start, if ConsumedServiceInstance.autoRequire is set to TRUE or as soon as the ConsumedServiceInstance is requested by the application, if ConsumedServiceInstance.autoRequire is set to FALSE.
eventGroup Identifier	PositiveInteger	0..1	attr	EventGroup ID. Shall be unique within one system to allow service discovery.
eventMulticast Address	ApplicationEndpoint	*	ref	<p>This reference defines the multicast address or a multicast address resource where the events of the event group are received.</p> <p>If the multicast address is determined via configuration and not at runtime via service discovery this reference points to the multicast address over which the events will be received.</p> <p>If the multicast address is determined at runtime via service discovery this reference shall be used to define the necessary local multicast address resources, i.e. RAM space in the TcpIp module in which the multicast address is stored at runtime. Please note that in this case the referenced address may be defined as ANY UDP port and ANY IP address since the multicast address will be received at runtime. If several multicast addresses are considered to be used the ConsumedEventGroup shall point to different ApplicationEndpoint objects to reserve the necessary resources in the configuration.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=eventMulticastAddress.applicationEndpoint, eventMulticastAddress.variationPoint.shortLabel vh.latestBindingTime=postBuild</p>
pduActivation RoutingGroup	PduActivationRouting Group	*	aggr	The ServiceDiscovery module is able to activate and deactivate the PDU routing for receiving events.
priority	PositiveInteger	0..1	attr	Defines the frame priority where values from 0 (best effort) to 7 (highest) are allowed.
routingGroup	SoAdRoutingGroup	*	ref	<p>The ServiceDiscovery module is able to activate and deactivate the PDU routing for receiving events.</p> <p>Tags: atp.Status=obsolete</p>
sdClientConfig	SdClientConfig	0..1	aggr	<p>The readiness to receive events is defined by the Service Discovery of the ConsumedEventGroup. The Event Handler shall know about this announcement to decide about the submission of events. Therefore the Event Handler may be configured with Service-Discovery Client attributes.</p> <p>Tags: atp.Status=obsolete</p>
sdClientTimer Config	SomeipSdClientEvent GroupTimingConfig	0..1	ref	<p>Client Timing configuration settings that are EventGroup specific.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=sdClientTimerConfig.someipSdClientEvent GroupTimingConfig, sdClientTimerConfig.variation Point.shortLabel vh.latestBindingTime=postBuild</p>

Table E.15: ConsumedEventGroup

Class	ConsumedServiceInstance			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances			
Note	Service instances that are consumed by the ECU that is connected via the ApplicationEndpoint to a CommunicationConnector.			
Base	<i>ARObject</i> , <i>AbstractServiceInstance</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>			
Aggregated by	ApplicationEndpoint.consumedServiceInstance, ServiceInstanceCollectionSet.serviceInstance			
Attribute	Type	Mult.	Kind	Note
allowedService Provider	NetworkEndpoint	*	ref	NetworkEndpoint on which the ProvidedServiceInstance that is communicating with this ConsumedServiceInstance is allowed to be located so that the ACL check in the ServiceDiscovery is successful and the connection is allowed to be established. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=allowedServiceProvider.networkEndpoint, allowedServiceProvider.variationPoint.shortLabel atp.Status=draft vh.latestBindingTime=postBuild
autoRequire	Boolean	0..1	attr	Defines that this ConsumedServiceInstance shall be required (searched for) by the service discovery at ECU start.
blocklisted Version	SomeipServiceVersion	*	aggr	Collection of blocklisted versions Tags: atp.Status=draft
consumedEvent Group	ConsumedEventGroup	*	aggr	Selection of event-groups the consumer wants to subscribe for. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=consumedEventGroup.shortName, consumedEventGroup.variationPoint.shortLabel vh.latestBindingTime=postBuild
eventMulticast Subscription Address	ApplicationEndpoint	0..1	ref	Multicast Address that is used by the client to subscribe to the server: This enables the multicast subscription feature. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=eventMulticastSubscriptionAddress.applicationEndpoint, eventMulticastSubscriptionAddress.variationPoint.shortLabel vh.latestBindingTime=postBuild
instance Identifier	AnyServiceInstanceId	0..1	attr	This attribute represents the ability to describe the required service instance ID.
localUnicast Address	ApplicationEndpoint	0..2	ref	The local address over which the CSI is consumed (udp, tcp or both). Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=localUnicastAddress.applicationEndpoint, localUnicastAddress.variationPoint.shortLabel vh.latestBindingTime=postBuild
minorVersion	AnyVersionString	0..1	attr	Minor Version of the ServiceInterface. Value can be set to a number that represents the Minor Version of the searched service or to ANY.
providedService Instance	ProvidedServiceInstance	0..1	ref	Reference to a providedServiceInstance to get the instanceIdentifier information from the ProvidedServiceInstance. Tags: atp.Status=obsolete

Class	ConsumedServiceInstance			
remoteUnicastAddress	ApplicationEndpoint	0..2	ref	This reference defines the remote address where the service provider is located. This reference shall ONLY be used if the remote address is determined from the configuration and not at runtime from the Service Discovery. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=remoteUnicastAddress.applicationEndpoint, remoteUnicastAddress.variationPoint.shortLabel vh.latestBindingTime=postBuild
sdClientConfig	SdClientConfig	0..1	aggr	Service Discovery Client configuration. Tags: atp.Status=obsolete
sdClientTimerConfig	SomeipSdClientServiceInstanceConfig	0..1	ref	Client specific configuration settings relevant for the SOME/IP service discovery. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=sdClientTimerConfig.someipSdClientServiceInstanceConfig, sdClientTimerConfig.variationPoint.shortLabel vh.latestBindingTime=postBuild
serviceIdentifier	PositiveInteger	0..1	attr	This attribute represents the ability to describe the SOME/IP service ID that is searched.
versionDrivenFindBehavior	ServiceVersionAcceptanceKindEnum	0..1	attr	Defines the service discovery find behavior. Tags: atp.Status=draft

Table E.16: ConsumedServiceInstance

Class	DataMapping (abstract)			
Package	M2::AUTOSARTemplates::SystemTemplate::DataMapping			
Note	Mapping of port elements (data elements and parameters) to frames and signals.			
Base	ARObject			
Subclasses	ClientServerToSignalMapping, SenderReceiverCompositeElementToSignalMapping, SenderReceiverToSignalGroupMapping, SenderReceiverToSignalMapping , TriggerToSignalMapping			
Aggregated by	SystemMapping.dataMapping			
Attribute	Type	Mult.	Kind	Note
introduction	DocumentationBlock	0..1	aggr	This represents introductory documentation about the data mapping.

Table E.17: DataMapping

Class	Describable (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable			
Note	This meta-class represents the ability to add a descriptive documentation to non identifiable elements.			
Base	ARObject			
Subclasses	CyclicTiming, EventControlledTiming, HwElementConnector, HwPinConnector, HwPinGroupConnector, I PduTiming, Ipv4DhcpServerConfiguration, Ipv6DhcpServerConfiguration, PncMapping, Socket Connection, TransformationComSpecProps , TransformationDescription , TransformationISignalProps			
Attribute	Type	Mult.	Kind	Note

Class	Describable (abstract)			
adminData	AdminData	0..1	aggr	This represents the administrative data for the describable object. Stereotypes: atpSplitable Tags: atp.Splitkey=adminData xml.sequenceOffset=-20
category	CategoryString	0..1	attr	The category is a keyword that specializes the semantics of the Describable. It affects the expected existence of attributes and the applicability of constraints. Tags: xml.sequenceOffset=-50
desc	MultiLanguageOverviewParagraph	0..1	aggr	This represents a general but brief (one paragraph) description what the object in question is about. It is only one paragraph! Desc is intended to be collected into overview tables. This property helps a human reader to identify the object in question. More elaborate documentation, (in particular how the object is built or used) should go to "introduction". Tags: xml.sequenceOffset=-60
introduction	DocumentationBlock	0..1	aggr	This represents more information about how the object in question is built or is used. Therefore it is a DocumentationBlock. Tags: xml.sequenceOffset=-30

Table E.18: Describable

Class	DiagnosticDataElement			
Package	M2::AUTOSARTemplates::DiagnosticExtract::CommonDiagnostics			
Note	This meta-class represents the ability to describe a concrete piece of data to be taken into account for diagnostic purposes.			
Base	<i>AObject</i> , <i>DiagnosticServiceMappingDiagTarget</i> , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	<i>DiagnosticAbstractParameter.dataElement</i>			
Attribute	Type	Mult.	Kind	Note
arraySizeSemantics	ArraySizeSemanticsEnum	0..1	attr	This attribute controls the meaning of the value of the array size.
maxNumberOfElements	PositiveInteger	0..1	attr	The existence of this attribute turns the data instance into an array of data. The attribute determines the size of the array in terms of how many elements the array can take.
scalingInfoSize	PositiveInteger	0..1	attr	Size in bytes of scaling information for the DiagnosticDataElement if used with DiagnosticReadScalingDataByIdentifier
swDataDefProps	SwDataDefProps	0..1	aggr	This property allows to specify data definition properties in order to support the definition of e.g. computation formulae and data constraints. Stereotypes: atpSplitable Tags: atp.Splitkey=swDataDefProps

Table E.19: DiagnosticDataElement

Class	DltArgument			
Package	M2::AUTOSARTemplates::LogAndTraceExtract			
Note	This element defines an Argument in a DltMessage.			
Base	<i>ARObject</i> , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	DltArgument.dltArgumentEntry , DltMessage.dltArgument			
Attribute	Type	Mult.	Kind	Note
dltArgumentEntry	DltArgument	*	aggr	This aggregation is used to describe subElements of a DltArgument that defines a Structure.
length	PositiveInteger	0..1	attr	Describes the DltArgument length in case of Arrays and Strings in number of BaseType.
networkRepresentation	SwDataDefProps	0..1	aggr	Definition of the networkRepresentation of the DltArgument. Stereotypes: atpSplitable Tags: atp.Splitkey=networkRepresentation
optional	Boolean	0..1	attr	This attribute defines whether the argument is optional or not. If set to true, the argument can be omitted from the payload of a DLT message.
predefinedText	Boolean	0..1	attr	This attribute defines whether the DltArgument is a predefinedText (Static Data).
variableLength	Boolean	0..1	attr	This attribute defines whether the length of the DltArgument is variable (determined at runtime) or not.

Table E.20: DltArgument

Class	<<atpMixed>> DocumentationBlock			
Package	M2::MSR::Documentation::BlockElements			
Note	This class represents a documentation block. It is made of basic text structure elements which can be displayed in a table cell.			
Base	<i>ARObject</i>			
Aggregated by	ApplicabilityInfo.remark, AUTOSAR.introduction , BlueprintGenerator.introduction , BlueprintPolicyModifiable.blueprintDerivationGuide , ClientServerOperationBlueprintMapping.blueprintMappingGuide , DataMapping.introduction , DefItem.def , Describable.introduction , EcucAddInfoParamValue.value , EcuResourceEstimation.introduction , Entry.entryContents , FrameMapping.introduction , GeneralAnnotation.annotationText , Identifiable.introduction , IPduMapping.introduction , ISignalMapping.introduction , Item.itemContents , LabeledItem.itemContents , LifeCycleInfo.remark , MappingConstraint.introduction , MsrQueryP2.msrQueryResultP2 , Note.noteText , PortDefinedArgumentBlueprint.blueprintMappingGuide , PrmChar.cond , PrmChar.remark , ScheduleTableEntry.introduction , SignalPathConstraint.introduction , StructuredReq.conflicts , StructuredReq.dependencies , StructuredReq.description , StructuredReq.rationale , StructuredReq.remark , StructuredReq.supportingMaterial , StructuredReq.useCase , SwAxisType.swGenericAxisDesc , TopicContent.blockLevelContent , TraceableText.text , VariationPoint.blueprintCondition			
Attribute	Type	Mult.	Kind	Note
defList	DefList	0..1	aggr	This represents a definition list in the documentation block. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=defList, defList.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=40
figure	MIFigure	0..1	aggr	This represents a figure in the documentation block. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=figure, figure.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=70

Class	<<atpMixed>> DocumentationBlock			
formula	MIFormula	0..1	aggr	<p>This is a formula in the definition block.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=formula, formula.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=60</p>
labeledList	LabeledList	0..1	aggr	<p>This represents a labeled list.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=labeledList, labeledList.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=50</p>
list	List	0..1	aggr	<p>This represents numbered or unnumbered list.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=list, list.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=30</p>
msrQueryP2	MsrQueryP2	0..1	aggr	<p>This represents automatically contributed contents provided by an msrquery in the context of Documentation Block.</p>
note	Note	0..1	aggr	<p>This represents a note in the text flow.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=note, note.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=80</p>
p	MultiLanguage Paragraph	0..1	aggr	<p>This is one particular paragraph.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=p, p.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=10</p>
structuredReq	StructuredReq	0..1	aggr	<p>This aggregation supports structured requirements embedded in a documentation block.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=structuredReq.shortName, structuredReq.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=100</p>
trace	TraceableText	0..1	aggr	<p>This represents traceable text in the documentation block. This allows to specify requirements/constraints in any documentation block.</p> <p>The kind of the trace is specified in the category.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=trace.shortName, trace.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=90</p>

Class	<<atpMixed>> DocumentationBlock			
verbatim	MultiLanguageVerbatim	0..1	aggr	This represents one particular verbatim text. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=verbatim, verbatim.variationPoint.shortLabel vh.latestBindingTime=postBuild xml.sequenceOffset=20

Table E.21: DocumentationBlock

Class	EcuInstance			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore::CoreTopology			
Note	ECUInstances are used to define the ECUs used in the topology. The type of the ECU is defined by a reference to an ECU specified with the ECU resource description. Tags: atp.recommendedPackage=EcuInstances			
Base	ARObject, CollectableElement, FibexElement, Identifiable, MultilanguageReferrable, PackageableElement, Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
associatedComIPduGroup	ISignalIPduGroup	*	ref	With this reference it is possible to identify which ISignalIPduGroups are applicable for which Communication Connector/ ECU. Only top level ISignalIPduGroups shall be referenced by an EcuInstance. If an ISignalIPduGroup contains other ISignalIPduGroups than these contained ISignalIPduGroups shall not be referenced by the EcuInstance. Contained ISignalIPduGroups are associated to an Ecu Instance via the top level ISignalIPduGroup.
associatedConsumedProvidedServiceInstanceGroup	ConsumedProvidedServiceInstanceGroup	*	ref	With this reference it is possible to identify which ConsumedProvidedServiceInstanceGroups are applicable for which ECUInstance. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=associatedConsumedProvidedServiceInstanceGroup.consumedProvidedServiceInstanceGroup, associatedConsumedProvidedServiceInstanceGroup.variationPoint.shortLabel vh.latestBindingTime=postBuild
associatedPdurIPduGroup	PdurIPduGroup	*	ref	With this reference it is possible to identify which PdurIPdu Groups are applicable for which Communication Connector/ ECU.
channelSynchronousWakeup	Boolean	0..1	attr	If this parameter is available and set to true, then all available channels will be woken up as soon as at least one channel wakeup occurs. If PNCs are configured, then all PNCs will be requested upon a channel wakeup.
clientIdRange	ClientIdRange	0..1	aggr	Restriction of the Client Identifier for this Ecu to an allowed range of numerical values. The Client Identifier of the transaction handle is generated by the client RTE for inter-Ecu Client/Server communication.
comConfigurationGwTimeBase	TimeValue	0..1	attr	The period between successive calls to Com_MainFunctionRouteSignals of the AUTOSAR COM module in seconds.
comConfigurationRxTimeBase	TimeValue	0..1	attr	The period between successive calls to Com_MainFunctionRx of the AUTOSAR COM module in seconds.

Class	EcuInstance			
com ConfigurationTx TimeBase	TimeValue	0..1	attr	The period between successive calls to Com_Main FunctionTx of the AUTOSAR COM module in seconds.
comEnable MDTForCyclic Transmission	Boolean	0..1	attr	Enables for the Com module of this EcuInstance the minimum delay time monitoring for cyclic and repeated transmissions (TransmissionModeTiming has cyclic Timing assigned or eventControlledTiming with numberOfRepetitions > 0).
commController	Communication Controller	*	aggr	CommunicationControllers of the ECU. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=commController.shortName, commController.variationPoint.shortLabel vh.latestBindingTime=postBuild
connector	Communication Connector	*	aggr	All channels controlled by a single controller. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=connector.shortName, connector.variationPoint.shortLabel vh.latestBindingTime=postBuild
dltConfig	DltConfig	0..1	aggr	Describes the Dlt configuration on this EcuInstance.
dolpConfig	DolpConfig	0..1	aggr	Dolp configuration on this EcuInstance. Tags: atp.Status=draft
ecuTaskProxy	OsTaskProxy	*	ref	Reference to OsTaskProxies assigned to the Ecu Instance. Stereotypes: atpSplitable Tags: atp.Splitkey=ecuTaskProxy
ethSwitchPort Group Derivation	Boolean	0..1	attr	Defines whether the derivation of SwitchPortGroups based on VLAN and/or CouplingPort.pncMapping shall be performed for this EcuInstance. If not defined the derivation shall not be done.
firewallRule	StateDependentFirewall	*	ref	Firewall rules defined in the context of an EcuInstance. Tags: atp.Status=candidate
partition	EcuPartition	*	aggr	Optional definition of Partitions within an Ecu.
pncNmRequest	Boolean	0..1	attr	Defines if this EcuInstance shall request Nm on all its PhysicalChannels which have Nm variant set to FULL each time a PNC is requested.
pncPrepare SleepTimer	TimeValue	0..1	attr	Time in seconds the PNC state machine shall wait in PNC_PREPARE_SLEEP.
pnc Synchronous Wakeup	Boolean	0..1	attr	If this parameter is available and set to true then all available PNCs will be woken up as soon as a channel wakeup occurs. This is ensured by adding all PNCs to all channel wakeup sources during upstream mapping.
pnResetTime	TimeValue	0..1	attr	Specifies the runtime of the reset timer in seconds. This reset time is valid for the reset of PN requests in the EIRA and in the ERA.
sleepMode Supported	Boolean	0..1	attr	Specifies whether the ECU instance may be put to a "low power mode" <ul style="list-style-type: none"> • true: sleep mode is supported • false: sleep mode is not supported Note: This flag may only be set to "true" if the feature is supported by both hardware and basic software.

Class	EcuInstance			
tcplplcmpProps	EthTcplplcmpProps	0..1	ref	EcuInstance specific ICMP (Internet Control Message Protocol) attributes
tcplpProps	EthTcplpProps	0..1	ref	EcuInstance specific Tcplp Stack attributes.
v2xSupported	V2xSupportEnum	0..1	attr	This attribute is used to control the existence of the V2X stack on the given EcuInstance.
wakeUpOverBusSupported	Boolean	0..1	attr	Driver support for wakeup over Bus.

Table E.22: EcuInstance

Class	EndToEndProtectionISignalIPdu			
Package	M2::AUTOSARTemplates::SystemTemplate::EndToEndProtection			
Note	<p>It is possible to protect the inter-ECU data exchange of safety-related ISignalGroups at the level of COM IPdus using protection mechanisms provided by E2E Library. For each ISignalGroup to be protected, a separate EndToEndProtectionISignalIPdu element shall be created within the EndToEndProtectionSet.</p> <p>The EndToEndProtectionISignalIPdu element refers to the ISignalGroup that is to be protected and to the ISignalIPdu that transmits the protected ISignalGroup. The information how the referenced ISignalGroup shall be protected (through which E2E Profile and with which E2E settings) is defined in the EndToEndDescription element.</p>			
Base	ARObject			
Aggregated by	EndToEndProtection.endToEndProtectionISignalIPdu			
Attribute	Type	Mult.	Kind	Note
dataOffset	Integer	0..1	attr	This attribute defines the beginning offset (in bits) of the Array representation of the Signal Group (including CRC, counter and application signal group) in the IPdu. This attribute is mandatory and the dataOffset shall always be defined.
iSignalGroup	ISignalGroup	0..1	ref	Reference to the ISignalGroup that is to be protected.
iSignalIPdu	ISignalIPdu	0..1	ref	Reference to the ISignalIPdu that transmits the protected ISignalGroup.

Table E.23: EndToEndProtectionISignalIPdu

Class	EndToEndTransformationDescription			
Package	M2::AUTOSARTemplates::SystemTemplate::Transformer			
Note	EndToEndTransformationDescription holds these attributes which are profile specific and have the same value for all E2E transformers.			
Base	ARObject, Describable , TransformationDescription			
Aggregated by	TransformationTechnology.transformationDescription			
Attribute	Type	Mult.	Kind	Note
clearFromValidToInvalid	Boolean	0..1	attr	Clear monitoring window on transition from state Valid to state Invalid.
counterOffset	PositiveInteger	0..1	attr	Offset of the counter in the Data[] array in bits.
crcOffset	PositiveInteger	0..1	attr	Offset of the CRC in the Data[] array in bits.
dataIdMode	DataIdModeEnum	0..1	attr	This attribute describes the inclusion mode that is used to include the implicit two-byte Data ID in the one-byte CRC.
dataIdNibbleOffset	PositiveInteger	0..1	attr	Offset of the Data ID nibble in the Data[] array in bits.

Class	EndToEndTransformationDescription			
e2eProfileCompatibilityProps	E2EProfileCompatibilityProps	0..1	ref	Reference to additional settings for the E2E state machine.
maxDeltaCounter	PositiveInteger	0..1	attr	Maximum allowed difference between two counter values of two consecutively received valid messages. For example, if the receiver gets data with counter 1 and MaxDeltaCounter is 3, then at the next reception the receiver can accept Counters with values 2, 3 or 4.
maxErrorStateInit	PositiveInteger	0..1	attr	Maximal number of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last WindowSize checks, for the state E2E_SM_INIT.
maxErrorStateInvalid	PositiveInteger	0..1	attr	Maximal number of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last WindowSize checks, for the state E2E_SM_INVALID.
maxErrorStateValid	PositiveInteger	0..1	attr	Maximal number of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last WindowSize checks, for the state E2E_SM_VALID.
maxNoNewOrRepeatedData	PositiveInteger	0..1	attr	The maximum allowed amount of consecutive failed counter checks.
minOkStateInit	PositiveInteger	0..1	attr	Minimal number of checks in which ProfileStatus equal to E2E_P_OK was determined, within the last WindowSize checks, for the state E2E_SM_INIT.
minOkStateInvalid	PositiveInteger	0..1	attr	Minimal number of checks in which ProfileStatus equal to E2E_P_OK was determined, within the last WindowSize checks, for the state E2E_SM_INVALID.
minOkStateValid	PositiveInteger	0..1	attr	Minimal number of checks in which ProfileStatus equal to E2E_P_OK was determined, within the last WindowSize checks, for the state E2E_SM_VALID.
offset	PositiveInteger	0..1	attr	Offset of the E2E header in the Data[] array in bits.
profileBehavior	EndToEndProfileBehaviorEnum	0..1	attr	Behavior of the check functionality
profileName	NameToken	0..1	attr	Definition of the E2E profile.
syncCounterInit	PositiveInteger	0..1	attr	Number of checks required for validating the consistency of the counter that shall be received with a valid counter (i.e. counter within the allowed lock-in range) after the detection of an unexpected behavior of a received counter.
upperHeaderBitsToShift	PositiveInteger	0..1	attr	<p>This attribute describes the number of upper-header bits to be shifted.</p> <p>value = 0 or not present: shift of upper header is NOT performed.</p> <p>value > 0: the E2E Transformer on the protect-side, takes the first upperHeaderBitsToShift bits from the upper buffer (e.g. SOME/IP header part generated by SOME/IP transformer) and shifts them towards the lower bytes and bits within the Data[] for the length of the E2E header (e.g. 12 bytes in case of E2E Profile 4). This means the shift distance is fixed - it depends on the E2E header size - what is configured here is the number of bits that are to be shifted. This option is defined because the Some/IP header generated by SOME/IP transformer shall be, due to compatibility between non-protected and E2E-protected communication, at the same position, which is before E2E header.</p>
windowSizeInit	PositiveInteger	0..1	attr	Size of the monitoring window of state Init for the E2E state machine.

Class	EndToEndTransformationDescription			
windowSize Invalid	PositiveInteger	0..1	attr	Size of the monitoring window of state Invalid for the E2E state machine.
windowSize Valid	PositiveInteger	0..1	attr	Size of the monitoring window of state Valid for the E2E state machine.

Table E.24: EndToEndTransformationDescription

Class	FlatInstanceDescriptor			
Package	M2::AUTOSARTemplates::CommonStructure::FlatMap			
Note	<p>Represents exactly one node (e.g. a component instance or data element) of the instance tree of a software system. The purpose of this element is to map the various nested representations of this instance to a flat representation and assign a unique name (shortName) to it.</p> <p>Use cases:</p> <ul style="list-style-type: none"> Specify unique names of measurable data to be used by MCD tools Specify unique names of calibration data to be used by MCD tool Specify a unique name for an instance of a component prototype in the ECU extract of the system description <p>Note that in addition it is possible to assign alias names via AliasNameAssignment.</p>			
Base	ARObject, Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	FlatMap.instance			
Attribute	Type	Mult.	Kind	Note
ecuExtract Reference	AtpFeature	0..1	iref	<p>Refers to the instance in the ECU extract. This is valid only, if the FlatMap is used in the context of an ECU extract.</p> <p>The reference shall be such that it uniquely defines the object instance. For example, if a data prototype is declared as a role within an SwcInternalBehavior, it is not enough to state the SwcInternalBehavior as context and the aggregated data prototype as target. In addition, the reference shall also include the complete path identifying instance of the component prototype and the Atomic SoftwareComponentType, which is referred by the particular SwcInternalBehavior.</p> <p>Tags: xml.sequenceOffset=40 InstanceRef implemented by: AnyInstanceRef</p>
role	Identifier	0..1	attr	<p>The role denotes the particular role of the downstream memory location described by this FlatInstanceDescriptor.</p> <p>It applies to use case where one upstream object results in multiple downstream objects, e.g. ModeDeclaration GroupPrototypes which are measurable. In this case the RTE will provide locations for current mode, previous mode and next mode.</p>
rtePluginProps	RtePluginProps	0..1	aggr	<p>The properties of a communication graph with respect to the utilization of RTE Implementation Plug-in.</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=rtePluginProps</p>
swDataDef Props	SwDataDefProps	0..1	aggr	<p>The properties of this FlatInstanceDescriptor.</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=swDataDefProps</p>

Class	FlatInstanceDescriptor			
upstream Reference	AtpFeature	0..1	iref	<p>Refers to the instance in the context of an "upstream" description, which could be: the SYSTEM_DESCRIPTION, or SYSTEM_EXTRACT, or ECU_SYSTEM_DESCRIPTION, or SW_CLUSTER_SYSTEM_DESCRIPTION, or the basic software module description (in this case only the target reference of the AnyInstanceRef is needed), or (if a flat map is used in preliminary context) a description of an atomic component or composition.</p> <p>This reference is optional in case the flat map is used in ECU context. The reference shall be such that it uniquely defines the object instance in the given context. For example, if a data prototype is declared as a role within an SwcInternal Behavior, it is not enough to state the Swc Internal Behavior as context and the aggregated data prototype as target. In addition, the reference shall also include the complete path identifying the instance of the component prototype that contains the particular instance of Swc InternalBehavior.</p> <p>Tags: xml.sequenceOffset=20 InstanceRef implemented by: AnyInstanceRef</p>

Table E.25: FlatInstanceDescriptor

Class	HwDescriptionEntity (abstract)			
Package	M2::AUTOSARTemplates::EcuResourceTemplate			
Note	This meta-class represents the ability to describe a hardware entity.			
Base	ARObject , Referrable			
Subclasses	HwElement , HwPin , HwPinGroup , HwType			
Attribute	Type	Mult.	Kind	Note
hwAttribute Value	HwAttributeValue	*	aggr	<p>This aggregation represents a particular hardware attribute value.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=hwAttributeValue, hwAttributeValue.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=50</p>
hwCategory	HwCategory	*	ref	<p>One of the associations representing one particular category of the hardware entity.</p> <p>Tags: xml.sequenceOffset=30</p>
hwType	HwType	0..1	ref	<p>This association is used to assign an optional HwType which contains the common attribute values for all occurrences of this HwDescriptionEntity. Note that HwTypes can not be redefined and therefore shall not have a hwType reference.</p>

Table E.26: HwDescriptionEntity

Class	HwElement			
Package	M2::AUTOSARTemplates::EcuResourceTemplate			
Note	This represents the ability to describe Hardware Elements on an instance level. The particular types of hardware are distinguished by the category. This category determines the applicable attributes. The possible categories and attributes are defined in HwCategory. Tags: atp.recommendedPackage=HwElements			
Base	ARElement , ARObject , CollectableElement , HwDescriptionEntity , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
hwElement Connection	HwElementConnector	*	aggr	This represents one particular connection between two hardware elements. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=hwElementConnection, hwElement Connection.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=110
hwPinGroup	HwPinGroup	*	aggr	This aggregation is used to describe the connection facilities of a hardware element. Note that hardware element has no pins but only pingroups. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=hwPinGroup.shortName, hwPin Group.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=90
nestedElement	HwElement	*	ref	This association is used to establish hierarchies of hw elements. Note that one particular HwElement can be target of this association only once. I.e. multiple instantiation of the same HwElement is not supported (at any hierarchy level). Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=nestedElement.hwElement, nested Element.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=70

Table E.27: HwElement

Table E.28: HwType

Class	ISignal			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore::CoreCommunication			
Note	<p>Signal of the Interaction Layer. The RTE supports a "signal fan-out" where the same System Signal is sent in different SignalIPdus to multiple receivers.</p> <p>To support the RTE "signal fan-out" each SignalIPdu contains ISignals. If the same System Signal is to be mapped into several SignalIPdus there is one ISignal needed for each ISignalToIPduMapping.</p> <p>ISignals describe the Interface between the Precompile configured RTE and the potentially Postbuild configured Com Stack (see ECUC Parameter Mapping).</p> <p>In case of the SystemSignalGroup an ISignal shall be created for each SystemSignal contained in the SystemSignalGroup.</p> <p>Tags: atp.recommendedPackage=ISignals</p>			
Base	ARElement , ARObject , CollectableElement , FibexElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable , UploadableDesignElement , UploadablePackageElement			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
data Transformation	DataTransformation	0..1	ref	<p>Optional reference to a DataTransformation which represents the transformer chain that is used to transform the data that shall be placed inside this ISignal.</p> <p>Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=dataTransformation.dataTransformation, dataTransformation.variationPoint.shortLabel vh.latestBindingTime=codeGenerationTime</p>
dataTypePolicy	DataTypePolicyEnum	0..1	attr	<p>With the aggregation of SwDataDefProps an ISignal specifies how it is represented on the network. This representation follows a particular policy. Note that this causes some redundancy which is intended and can be used to support flexible development methodology as well as subsequent integrity checks.</p> <p>If the policy "networkRepresentationFromComSpec" is chosen the network representation from the ComSpec that is aggregated by the PortPrototype shall be used. If the "override" policy is chosen the requirements specified in the PortInterface and in the ComSpec are not fulfilled by the networkRepresentationProps. In case the System Description doesn't use a complete Software Component Description (VFB View) the "legacy" policy can be chosen.</p>
initValue	ValueSpecification	0..1	aggr	<p>Optional definition of a ISignal's initValue in case the System Description doesn't use a complete Software Component Description (VFB View). This supports the inclusion of legacy system signals.</p> <p>This value can be used to configure the Signal's "Init Value".</p> <p>If a full DataMapping exist for the SystemSignal this information may be available from a configured Sender ComSpec and ReceiverComSpec. In this case the initvalues in SenderComSpec and/or ReceiverComSpec override this optional value specification. Further restrictions apply from the RTE specification.</p>
iSignalProps	ISignalProps	0..1	aggr	<p>Additional optional ISignal properties that may be stored in different files.</p> <p>Stereotypes: atpSplittable Tags: atp.Splitkey=iSignalProps</p>
iSignalType	ISignalTypeEnum	0..1	attr	<p>This attribute defines whether this iSignal is an array that results in a UINT8_N / UINT8_DYN ComSignalType in the COM configuration or a primitive type.</p>

Class	ISignal			
length	UnlimitedInteger	0..1	attr	<p>Size of the signal in bits. The size needs to be derived from the mapped VariableDataPrototype according to the mapping of primitive DataTypes to BaseTypes as used in the RTE. Indicates maximum size for dynamic length signals.</p> <p>The ISignal length of zero bits is allowed.</p>
network Representation Props	SwDataDefProps	0..1	aggr	<p>Specification of the actual network representation. The usage of SwDataDefProps for this purpose is restricted to the attributes compuMethod and baseType. The optional baseType attributes "memAllignment" and "byteOrder" shall not be used.</p> <p>The attribute "dataTypePolicy" in the SystemTemplate element defines whether this network representation shall be ignored and the information shall be taken over from the network representation of the ComSpec.</p> <p>If "override" is chosen by the system integrator the network representation can violate against the requirements defined in the PortInterface and in the network representation of the ComSpec.</p> <p>In case that the System Description doesn't use a complete Software Component Description (VFB View) this element is used to configure "ComSignalDataInvalid Value" and the Data Semantics.</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=networkRepresentationProps</p>
systemSignal	SystemSignal	0..1	ref	Reference to the System Signal that is supposed to be transmitted in the ISignal.
timeout Substitution Value	ValueSpecification	0..1	aggr	Defines and enables the ComTimeoutSubstitution for this ISignal.
transformation ISignalProps	TransformationISignal Props	*	aggr	<p>A transformer chain consists of an ordered list of transformers. The ISignal specific configuration properties for each transformer are defined in the TransformationISignalProps class. The transformer configuration properties that are common for all ISignals are described in the TransformationTechnology class.</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=transformationISignalProps</p>

Table E.29: ISignal

Class	ISignalGroup
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore::CoreCommunication
Note	<p>SignalGroup of the Interaction Layer. The RTE supports a "signal fan-out" where the same System Signal Group is sent in different SignalIPdus to multiple receivers.</p> <p>An ISignalGroup refers to a set of ISignals that shall always be kept together. A ISignalGroup represents a COM Signal Group.</p> <p>Therefore it is recommended to put the ISignalGroup in the same Package as ISignals (see atp.recommendedPackage)</p> <p>Tags: atp.recommendedPackage=ISignalGroup</p>
Base	ARElement, ARObject, CollectableElement, FibexElement, Identifiable, MultilanguageReferrable, PackageableElement, Referrable, UploadableDesignElement, UploadablePackageElement
Aggregated by	ARPackage.element

Class	ISignalGroup			
Attribute	Type	Mult.	Kind	Note
comBasedSignalGroupTransformation	DataTransformation	0..1	ref	Optional reference to a DataTransformation which represents the transformer chain that is used to transform the data that shall be placed inside this ISignalGroup based on the COMBasedTransformer approach. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=comBasedSignalGroupTransformation.dataTransformation, comBasedSignalGroupTransformation.variationPoint.shortLabel vh.latestBindingTime=codeGenerationTime
iSignal	ISignal	*	ref	Reference to a set of ISignals that shall always be kept together.
systemSignalGroup	SystemSignalGroup	0..1	ref	Reference to the SystemSignalGroup that is defined on VFB level and that is supposed to be transmitted in the ISignalGroup.
transformationISignalProps	TransformationISignalProps	*	aggr	A transformer chain consists of an ordered list of transformers. The ISignalGroup specific configuration properties for each transformer are defined in the TransformationISignalProps class. The transformer configuration properties that are common for all ISignalGroups are described in the TransformationTechnology class. Stereotypes: atpSplittable Tags: atp.Splitkey=transformationISignalProps

Table E.30: ISignalGroup

Class	ISignalIPdu			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore::CoreCommunication			
Note	Represents the IPdus handled by Com. The ISignalIPdu assembled and disassembled in AUTOSAR COM consists of one or more signals. In case no multiplexing is performed this IPdu is routed to/from the Interface Layer. A maximum of one dynamic length signal per IPdu is allowed. Tags: atp.recommendedPackage=Pdus			
Base	ARElement , ARObject , CollectableElement , FibexElement , IPdu , Identifiable , MultilanguageReferrable , PackageableElement , Pdu , Referrable , UploadableDesignElement , UploadablePackageElement			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
iPduTimingSpecification	IPduTiming	0..1	aggr	Timing specification for Com IPdus (Transmission Modes). This information is mandatory for the sender in a System Extract. This information may be omitted on receivers in a System Extract. atpVariation: The timing of a Pdu can vary. Stereotypes: atpSplittable; atpVariation Tags: atp.Splitkey=iPduTimingSpecification, iPduTimingSpecification.variationPoint.shortLabel vh.latestBindingTime=postBuild

Class	ISignalIPdu			
iSignalToPdu Mapping	ISignalToPduMapping	*	aggr	Definition of SignalToPduMappings included in the Signal IPdu. atpVariation: The content of a PDU can be variable. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=iSignalToPduMapping.shortName, iSignalToPduMapping.variationPoint.shortLabel vh.latestBindingTime=postBuild
unusedBit Pattern	Integer	0..1	attr	AUTOSAR COM and AUTOSAR IPDUM are filling not used areas of an IPDU with this bit-pattern. This attribute is mandatory to avoid undefined behavior. This byte-pattern will be repeated throughout the IPdu.

Table E.31: ISignalIPdu

Class	<i>Identifiable</i> (abstract)
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable
Note	Instances of this class can be referred to by their identifier (within the namespace borders). In addition to this, Identifiables are objects which contribute significantly to the overall structure of an AUTOSAR description. In particular, Identifiables might contain Identifiables.
Base	<i>ARObject</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>
Subclasses	<p> ARPackage, AbstractDolpLogicAddressProps, AbstractEvent, AbstractImplementationDataTypeElement, AbstractSecurityEventFilter, AbstractSecurityIdsmInstanceFilter, AbstractServiceInstance, AppOsTaskProxyToEcuTaskProxyMapping, ApplicationEndpoint, ApplicationError, ApplicationPartitionToEcuPartitionMapping, AppliedStandard, AsynchronousServerCallResultPoint, AtpBlueprint, AtpBlueprintable, AtpClassifier, AtpFeature, AutosarOperationArgumentInstance, AutosarVariableInstance, BinaryManifestAddressableObject, BinaryManifestItemDefinition, BinaryManifestResource, BinaryManifestResourceDefinition, BlockState, BswInternalTriggeringPoint, BswModuleDependency, BuildActionEntity, BuildActionEnvironment, CanTpAddress, CanTpChannel, CanTpNode, Chapter, ClassContentConditional, ClientIdDefinition, ClientServerOperation, Code, CollectableElement, ComManagementMapping, CommConnectorPort, CommunicationConnector, CommunicationController, Compiler, ConsistencyNeeds, ConsumedEventGroup, CouplingElementAbstractDetails, CouplingPort, CouplingPortAbstractShaper, CouplingPortStructuralElement, CpSoftwareClusterResource, CpSoftwareClusterResourceToApplicationPartitionMapping, CpSoftwareClusterToApplicationPartitionMapping, CpSoftwareClusterToEcuInstanceMapping, CpSoftwareClusterToResourceMapping, CryptoServiceMapping, DataPrototypeGroup, DataTransformation, DdsCpDomain, DdsCpPartition, DdsCpQosProfile, DdsCpTopic, DependencyOnArtifact, DiagEventDebounceAlgorithm, DiagnosticAuthTransmitCertificateEvaluation, DiagnosticConnectedIndicator, DiagnosticDataElement, DiagnosticDebounceAlgorithmProps, DiagnosticFunctionInhibitSource, DiagnosticParameterElement, DiagnosticRoutineSubfunction, DitApplication, DitArgument, DitLogChannel, DitMessage, DolpInterface, DolpLogicAddress, DolpRoutingActivation, ECUMapping, EOCExecutableEntityRefAbstract, EcuPartition, EcuContainerValue, EcuDefinitionElement, EcuDestinationUriDef, EcuEnumerationLiteralDef, EcuQuery, EcuValidationCondition, EndToEndProtection, EthernetWakeupSleepOnDatalineConfig, EventHandler, ExclusiveArea, ExecutableEntity, ExecutionTime, FMAttributeDef, FMFeatureMapAssertion, FMFeatureMapCondition, FMFeatureMapElement, FMFeatureRelation, FMFeatureRestriction, FMFeatureSelection, FlatInstanceDescriptor, FlexrayArTpNode, FlexrayTpConnectionControl, FlexrayTpNode, FlexrayTpPduPool, FrameTriggering, GeneralParameter, GlobalTimeGateway, GlobalTimeMaster, GlobalTimeSlave, HeapUsage, HwAttributeDef, HwAttributeLiteralDef, HwPin, HwPinGroup, IEEE1722TpActBus, IEEE1722TpActBusPart, IPSecRule, IPv6ExtHeaderFilterList, ISignalToPduMapping, ISignalTriggering, IdentCaption, ImpositionTime, InternalTriggeringPoint, J1939SharedAddressCluster, J1939TpNode, Keyword, LifeCycleState, LinScheduleTable, LinTpNode, Linker, MacMulticastGroup, MacSecKayParticipant, McDataInstance, MemorySection, ModeDeclaration, ModeDeclarationMapping, ModeSwitchPoint, NetworkEndpoint, NmCluster, NmEcu, NmNode, NvBlockDescriptor, PackageableElement, ParameterAccess, PduActivationRoutingGroup, PduToFrameMapping, PduTriggering, PerInstanceMemory, PhysicalChannel, PortElementToCommunicationResourceMapping, PortGroup, PortInterfaceMapping, PossibleErrorReaction, ResourceConsumption, RootSwCompositionPrototype, RptComponent, RptContainer, RptExecutableEntity, RptExecutableEntityEvent, RptExecutionContext, RptProfile, RptServicePoint, RteEventInCompositionSeparation, RteEventInCompositionToOsTaskProxyMapping, RteEventInSystemSeparation, </p>

Class	Identifiable (abstract)			
	RteEventInSystemToOsTaskProxyMapping, RunnableEntityGroup , SdgAttribute , SdgClass, SecureCommunicationAuthenticationProps, SecureCommunicationFreshnessProps, SecurityEventContextProps, ServerCallPoint , ServiceNeeds , SignalServiceTranslationElementProps, SignalServiceTranslationEventProps, SignalServiceTranslationProps , SocketAddress, SomeIpTpChannel, SpecElementReference , StackUsage , StaticSocketConnection, StructuredReq, SwGenericAxisParamType , SwServiceArg , SwcServiceDependency , SwcToApplicationPartitionMapping, SwcToEcuMapping, SwcToImplMapping, SwitchAsynchronousTrafficShaperGroupEntry, SwitchFlowMeteringEntry, SwitchStreamFilterActionDestPortModification, SwitchStreamFilterEntry, SwitchStreamFilterRule, SwitchStreamGateEntry, SwitchStreamIdentification, SystemMapping, SystemSignalGroupToCommunicationResourceMapping, SystemSignalToCommunicationResourceMapping, TDCpSoftwareClusterMapping, TDCpSoftwareClusterResourceMapping, TcpOptionFilterList, TimingClock , TimingClockSyncAccuracy, TimingCondition, TimingConstraint , TimingDescription , TimingExtensionResource, TimingModelInstance, TlsCryptoCipherSuite, TlsCryptoCipherSuiteProps, Topic1, TpAddress, TraceableTable, TraceableText, TracedFailure , TransformationProps , TransformationTechnology , Trigger , VariableAccess , VariationPointProxy , ViewMap, VlanConfig, WaitPoint			
Attribute	Type	Mult.	Kind	Note
adminData	AdminData	0..1	aggr	This represents the administrative data for the identifiable object. Stereotypes: atpSplittable Tags: atp.Splitkey=adminData xml.sequenceOffset=-40
annotation	Annotation	*	aggr	Possibility to provide additional notes while defining a model element (e.g. the ECU Configuration Parameter Values). These are not intended as documentation but are mere design notes. Tags: xml.sequenceOffset=-25
category	CategoryString	0..1	attr	The category is a keyword that specializes the semantics of the Identifiable. It affects the expected existence of attributes and the applicability of constraints. Tags: xml.sequenceOffset=-50
desc	MultiLanguageOverviewParagraph	0..1	aggr	This represents a general but brief (one paragraph) description what the object in question is about. It is only one paragraph! Desc is intended to be collected into overview tables. This property helps a human reader to identify the object in question. More elaborate documentation, (in particular how the object is built or used) should go to "introduction". Tags: xml.sequenceOffset=-60
introduction	DocumentationBlock	0..1	aggr	This represents more information about how the object in question is built or is used. Therefore it is a DocumentationBlock. Tags: xml.sequenceOffset=-30

Class	Identifiable (abstract)			
uuid	String	0..1	attr	<p>The purpose of this attribute is to provide a globally unique identifier for an instance of a meta-class. The values of this attribute should be globally unique strings prefixed by the type of identifier. For example, to include a DCE UUID as defined by The Open Group, the UUID would be preceded by "DCE:". The values of this attribute may be used to support merging of different AUTOSAR models. The form of the UUID (Universally Unique Identifier) is taken from a standard defined by the Open Group (was Open Software Foundation). This standard is widely used, including by Microsoft for COM (GUIDs) and by many companies for DCE, which is based on CORBA. The method for generating these 128-bit IDs is published in the standard and the effectiveness and uniqueness of the IDs is not in practice disputed. If the id namespace is omitted, DCE is assumed. An example is "DCE:2fac1234-31f8-11b4-a222-08002b34c003". The uuid attribute has no semantic meaning for an AUTOSAR model and there is no requirement for AUTOSAR tools to manage the timestamp.</p> <p>Tags: xml.attribute=true</p>

Table E.32: Identifiable

Class	McDataInstance			
Package	M2::AUTOSARTemplates::CommonStructure::MeasurementCalibrationSupport			
Note	<p>Describes the specific properties of one data instance in order to support measurement and/or calibration of this data instance.</p> <p>The most important attributes are:</p> <ul style="list-style-type: none"> • Its shortName is copied from the ECU Flat map (if applicable) and will be used as identifier and for display by the MC system. • The category is copied from the corresponding data type (ApplicationDataType if defined, otherwise ImplementationDataType) as far as applicable. • The symbol is the one used in the programming language. It will be used to find out the actual memory address by the final generation tool with the help of linker generated information. <p>It is assumed that in the M1 model this part and all the aggregated and referred elements (with the exception of the Flat Map and the references from ImplementationElementInParameterInstanceRef and McAccessDetails) are completely generated from "upstream" information. This means, that even if an element like e.g. a CompuMethod is only used via reference here, it will be copied into the M1 artifact which holds the complete McSupportData for a given Implementation.</p>			
Base	ARObject, Identifiable, MultilanguageReferrable, Referrable			
Aggregated by	McDataInstance.subElement, McSupportData.mcParameterInstance, McSupportData.mcVariableInstance			
Attribute	Type	Mult.	Kind	Note
arraySize	PositiveInteger	0..1	attr	The existence of this attribute turns the data instance into an array of data. The attribute determines the size of the array in terms of number of elements.
displayIdentifier	McIdentifier	0..1	attr	An optional attribute to be used to set the ASAM ASAP2 DISPLAY_IDENTIFIER attribute.

Class	McDataInstance			
flatMapEntry	FlatInstanceDescriptor	0..1	ref	<p>Reference to the corresponding entry in the ECU Flat Map. This allows to trace back to the original specification of the generated data instance. This link shall be added by the RTE generator mainly for documentation purposes.</p> <p>The reference is optional because</p> <ul style="list-style-type: none"> • The McDataInstance may represent an array or struct in which only the subElements correspond to FlatMap entries. • The McDataInstance may represent a task local buffer for rapid prototyping access which is different from the "main instance" used for measurement access.
instanceInMemory	ImplementationElementInParameterInstanceRef	0..1	aggr	Reference to the corresponding data instance in the description of calibration data structures published by the RTE generator. This is used to support emulation methods inside the ECU, it is not required for A2L generation.
mcDataAccessDetails	McDataAccessDetails	0..1	aggr	Refers to "upstream" information on how the RTE uses this data instance. Use Case: Rapid Prototyping
mcDataAssignment	RoleBasedMcDataAssignment	*	aggr	An assignment between McDataInstances. This supports the indication of related McDataElement implementing the of "RP global buffer", "RP global measurement buffer", "RP enabler flag".
resultingProperties	SwDataDefProps	0..1	aggr	<p>These are the generated properties resulting from decisions taken by the RTE generator for the actually implemented data instance. Only those properties are relevant here, which are needed for the measurement and calibration system.</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=resultingProperties</p>
resultingRptSwPrototypingAccess	RptSwPrototypingAccess	0..1	aggr	Describes the implemented accessibility of data and modes by the rapid prototyping tooling.
role	Identifier	0..1	attr	An optional attribute to be used for additional information on the role of this data instance, for example in the context of rapid prototyping.
rptImplPolicy	RptImplPolicy	0..1	aggr	Describes the implemented code preparation for rapid prototyping at data accesses for a hook based bypassing.
subElement (ordered)	McDataInstance	*	aggr	<p>This relation indicates, that the target element is part of a "struct" which is given by the source element. This information will be used by the final generator to set up the correct addressing scheme.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=subElement.shortName, subElement.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>

Class	McDataInstance			
symbol	SymbolString	0..1	attr	<p>This String is used to determine the memory address during final generation of the MC configuration data (e.g. "A2L" file) . It shall be the name of the element in the programming language such that it can be identified in linker generated information.</p> <p>In case the McDataInstance is part of composite data in the programming language, the symbol String may include parts denoting the element context, unless the context is given by the symbol attribute of an enclosing McDataInstance. This means in particular for the C language that the "." character shall be used as a separator between the name of a "struct" variable the name of one of its elements.</p> <p>The symbol can differ from the shortName in case of generated C data declarations.</p> <p>It is an optional attribute since it may be missing in case the instance represents an element (e.g. a single array element) which has no name in the linker map.</p> <p>Stereotypes: atpSplitable Tags: atp.Splitkey=symbol</p>

Table E.33: McDataInstance

Class	McSupportData			
Package	M2::AUTOSARTemplates::CommonStructure::MeasurementCalibrationSupport			
Note	Root element for all measurement and calibration support data related to one Implementation artifact on an ECU. There shall be one such element related to the RTE implementation (if it owns MC data) and a separate one for each module or component, which owns private MC data.			
Base	ARObject			
Aggregated by	Implementation.mcSupport			
Attribute	Type	Mult.	Kind	Note
emulation Support	McSwEmulationMethod Support	*	aggr	<p>Describes the calibration method used by the RTE. This information is not needed for A2L generation, but to setup software emulation in the ECU.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=emulationSupport, emulationSupport.variationPoint.shortLabel vh.latestBindingTime=preCompileTime</p>
mcParameter Instance	McDataInstance	*	aggr	<p>A data instance to be used for calibration.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=mcParameterInstance.shortName, mcParameterInstance.variationPoint.shortLabel vh.latestBindingTime=postBuild</p>
mcVariable Instance	McDataInstance	*	aggr	<p>A data instance to be used for measurement.</p> <p>Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=mcVariableInstance.shortName, mcVariableInstance.variationPoint.shortLabel vh.latestBindingTime=postBuild</p>
measurable System ConstantValues	SwSystemconstant ValueSet	*	ref	<p>Sets of system constant values to be transferred to the MCD system, because the system constants have been specified with "swCalibrationAccess" = readonly.</p>

Class	McSupportData			
rptSupportData	RptSupportData	0..1	aggr	The rapid prototyping support data belonging to this implementation. The aggregation is <<atpSplittable>> because in case of an already existing BSW Implementation model, this description will be added later in the process, namely at code generation time. Stereotypes: atpSplittable Tags: atp.Splitkey=rptSupportData

Table E.34: McSupportData

Class	<i>MultilanguageReferrable</i> (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable			
Note	Instances of this class can be referred to by their identifier (while adhering to namespace borders). They also may have a longName. But they are not considered to contribute substantially to the overall structure of an AUTOSAR description. In particular it does not contain other Referrables.			
Base	<i>ARObject</i> , <i>Referrable</i>			
Subclasses	Caption, DefItem, DocumentationContext, <i>Identifiable</i> , SdgCaption, <i>TraceReferrable</i> , <i>Traceable</i>			
Attribute	Type	Mult.	Kind	Note
longName	MultilanguageLong Name	0..1	aggr	This specifies the long name of the object. Long name is targeted to human readers and acts like a headline.

Table E.35: MultilanguageReferrable

Class	PostBuildVariantCriterionValueSet			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling			
Note	This meta-class represents the ability to denote one set of postBuildVariantCriterionValues. Tags: atp.recommendedPackage=PostBuildVariantCriterionValueSets			
Base	<i>ARElement</i> , <i>ARObject</i> , <i>CollectableElement</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>PackageableElement</i> , <i>Referrable</i>			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
postBuildVariant CriterionValue	PostBuildVariant CriterionValue	*	aggr	This is one particular postbuild variant criterion/value pair being part of the PostBuildVariantSet.

Table E.36: PostBuildVariantCriterionValueSet

Class	ProvidedServiceInstance			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances			
Note	Service instances that are provided by the ECU that is connected via the ApplicationEndpoint to a CommunicationConnector.			
Base	<i>ARObject</i> , <i>AbstractServiceInstance</i> , <i>Identifiable</i> , <i>MultilanguageReferrable</i> , <i>Referrable</i>			
Aggregated by	ApplicationEndpoint.providedServiceInstance, ServiceInstanceCollectionSet.serviceInstance			
Attribute	Type	Mult.	Kind	Note

Class	ProvidedServiceInstance			
allowedServiceConsumer	NetworkEndpoint	*	ref	NetworkEndpoints on which the ConsumedService Instances that are communicating with this ProvidedServiceInstance are allowed to be located so that the ACL check in the ServiceDiscovery is successful and the connection is allowed to be established. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=allowedServiceConsumer.networkEndpoint, allowedServiceConsumer.variationPoint.shortLabel atp.Status=draft vh.latestBindingTime=postBuild
autoAvailable	Boolean	0..1	attr	Defines that this ProvidedServiceInstance shall be offered by the service discovery at ECU start.
eventHandler	EventHandler	*	aggr	Collection of event groups provided by the ProvidedServiceInstance Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=eventHandler.shortName, eventHandler.variationPoint.shortLabel vh.latestBindingTime=postBuild
instanceIdentifier	PositiveInteger	0..1	attr	Instance identifier. Can be used for e.g. service discovery to identify the instance of the service.
loadBalancingPriority	PositiveInteger	0..1	attr	Defines the value to be used for load balancing priority in the service offer. Lower value means higher priority.
loadBalancingWeight	PositiveInteger	0..1	attr	Defines the value to be used for load balancing weight in the service offer. Higher value means higher probability to be chosen.
localUnicastAddress	ApplicationEndpoint	0..2	ref	The local address over which the PSI is provided (udp, tcp or both). Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=localUnicastAddress.applicationEndpoint, localUnicastAddress.variationPoint.shortLabel vh.latestBindingTime=postBuild
minorVersion	PositiveInteger	0..1	attr	Minor Version of the Service that is provided by this ProvidedServiceInstance.
priority	PositiveInteger	0..1	attr	Defines the frame priority where values from 0 (best effort) to 7 (highest) are allowed.
remoteMulticastSubscriptionAddress	ApplicationEndpoint	*	ref	This reference defines the remote multicast subscribed addresses of service consumers. This reference shall ONLY be used if the remote address of the clients is determined from the configuration and not at runtime. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=remoteMulticastSubscriptionAddress.applicationEndpoint, remoteMulticastSubscriptionAddress.variationPoint.shortLabel vh.latestBindingTime=postBuild
remoteUnicastAddress	ApplicationEndpoint	*	ref	This reference defines the remote addresses of service consumers. This reference shall ONLY be used if the remote address of the clients is determined from the configuration and not at runtime. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=remoteUnicastAddress.applicationEndpoint, remoteUnicastAddress.variationPoint.shortLabel vh.latestBindingTime=postBuild

Class	ProvidedServiceInstance			
sdServerConfig	SdServerConfig	0..1	aggr	Service Discovery Server configuration. Tags: atp.Status=obsolete
sdServerTimerConfig	SomeipSdServerServiceInstanceConfig	0..1	ref	Server specific configuration settings relevant for the SOME/IP service discovery. Stereotypes: atp.Splittable; atp.Variation Tags: atp.Splitkey=sdServerTimerConfig.someipSdServerServiceInstanceConfig, sdServerTimerConfig.variationPoint.shortLabel vh.latestBindingTime=postBuild
serviceIdentifier	PositiveInteger	0..1	attr	This attribute represents the ability to describe the SOME/IP service ID that is offered.

Table E.37: ProvidedServiceInstance

Class	Referrable (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable			
Note	Instances of this class can be referred to by their identifier (while adhering to namespace borders).			
Base	ARObject			
Subclasses	AtpDefinition, BswDistinguishedPartition, BswModuleCallPoint, BswModuleClientServerEntry, BswVariableAccess, CouplingPortTrafficClassAssignment, DiagnosticEnvModeElement, EthernetPriorityRegeneration, ExclusiveAreaNestingOrder, HwDescriptionEntity, ImplementationProps, LinSlaveConfigIdent, ModeTransition, MultilanguageReferrable, PncMappingIdent, SingleLanguageReferrable, SoConIPduIdentifier, SocketConnectionBundle, TimeSyncServerConfiguration, TpConnectionIdent			
Attribute	Type	Mult.	Kind	Note
shortName	Identifier	1	attr	This specifies an identifying shortName for the object. It needs to be unique within its context and is intended for humans but even more for technical reference. Stereotypes: atp.IdentityContributor Tags: xml.enforceMinMultiplicity=true xml.sequenceOffset=-100
shortNameFragment	ShortNameFragment	*	aggr	This specifies how the Referrable.shortName is composed of several shortNameFragments. Tags: xml.sequenceOffset=-90

Table E.38: Referrable

Class	RootSwCompositionPrototype			
Package	M2::AUTOSARTemplates::SystemTemplate			
Note	<p>The RootSwCompositionPrototype represents the top-level-composition of software components within a given System.</p> <p>According to the use case of the System, this may for example be a more or less complete VFB description, the software of a System Extract or the software of a flat ECU Extract with only atomic SWCs.</p> <p>Therefore the RootSwComposition will only occasionally contain all atomic software components that are used in a complete VFB System. The OEM is primarily interested in the required functionality and the interfaces defining the integration of the Software Component into the System. The internal structure of such a component contains often substantial intellectual property of a supplier. Therefore a top-level software composition will often contain empty compositions which represent subsystems.</p> <p>The contained SwComponentPrototypes are fully specified by their SwComponentTypes (including Port Prototypes, PortInterfaces, VariableDataPrototypes, SwcInternalBehavior etc.), and their ports are interconnected using SwConnectorPrototypes.</p>			
Base	ARObject, AtpFeature, AtpPrototype, Identifiable, MultilanguageReferrable, Referrable			
Aggregated by	AtpClassifier.atpFeature, System.rootSoftwareComposition			
Attribute	Type	Mult.	Kind	Note
calibration ParameterValue Set	CalibrationParameter ValueSet	*	ref	Used CalibrationParameterValueSet for instance specific initialization of calibration parameters. Stereotypes: atpSplittable Tags: atp.Splitkey=calibrationParameterValueSet
flatMap	FlatMap	0..1	ref	The FlatMap used in the scope of this RootSw CompositionPrototype. Stereotypes: atpSplittable Tags: atp.Splitkey=flatMap
software Composition	CompositionSw ComponentType	0..1	tref	We assume that there is exactly one top-level composition that includes all Component instances of the system. Stereotypes: isOfType

Table E.39: RootSwCompositionPrototype

Class	ScaleConstr			
Package	M2::MSR::AsamHdo::Constraints::GlobalConstraints			
Note	<p>This meta-class represents the ability to specify constraints as a list of intervals (called scales).</p> <p>Tags: atp.Status=obsolete</p>			
Base	ARObject			
Aggregated by	InternalConstrs.scaleConstr, PhysConstrs.scaleConstr			
Attribute	Type	Mult.	Kind	Note
desc	MultiLanguageOverview Paragraph	0..1	aggr	<desc> represents a general but brief description of the object in question. Tags: xml.sequenceOffset=30
lowerLimit	Limit	0..1	attr	This specifies the lower limit of the scale. Stereotypes: atpVariation Tags: atp.Status=obsolete vh.latestBindingTime=preCompileTime xml.sequenceOffset=40

Class	ScaleConstr			
shortLabel	Identifier	0..1	attr	This element specifies a short name for the scaleConstr. This can for example be used to create more specific messages of a constraint checker. The constraints cannot be associated in the meta-model, therefore shortLabel is somehow a substitute for shortName. Tags: atp.Status=obsolete xml.sequenceOffset=20
upperLimit	Limit	0..1	attr	This specifies the upper limit of a the scale. Stereotypes: atpVariation Tags: atp.Status=obsolete vh.latestBindingTime=preCompileTime xml.sequenceOffset=50
validity	ScaleConstrValidity Enum	0..1	attr	Specifies if the values defined by the scales are considered to be valid. If the attribute is missing then the default value is "VALID". Tags: atp.Status=obsolete xml.attribute=true

Table E.40: ScaleConstr

Class	Sdg			
Package	M2::MSR::AsamHdo::SpecialData			
Note	Sdg (SpecialDataGroup) is a generic model which can be used to keep arbitrary information which is not explicitly modeled in the meta-model. Sdg can have various contents as defined by sdgContentsType. Special Data should only be used moderately since all elements should be defined in the meta-model. Thereby SDG should be considered as a temporary solution when no explicit model is available. If an sdg Caption is available, it is possible to establish a reference to the sdg structure.			
Base	ARObject			
Aggregated by	AdminData.sdg , BuildActionEnvironment.sdg , BuildActionInvoker.sdg , BuildActionIoElement.sdg , FileInfoComment.sdg , RptHook.sdg , SdgContents.sdg , VariationPoint.sdg			
Attribute	Type	Mult.	Kind	Note
gid	NameToken	1	attr	This attributes specifies an identifier. Gid comes from the SGML/XML-Term "Generic Identifier" which is the element name in XML. The role of this attribute is the same as the name of an XML - element. Tags: xml.attribute=true
sdgCaption	SdgCaption	0..1	aggr	This aggregation allows to assign the properties of Identifiable to the sdg. By this, a shortName etc. can be assigned to the Sdg. Stereotypes: atpIdentityContributor Tags: xml.sequenceOffset=20
sdgContents Type	SdgContents	0..1	aggr	This is the content of the Sdg. Tags: xml.roleElement=false xml.roleWrapperElement=false xml.sequenceOffset=30 xml.typeElement=false xml.typeWrapperElement=false

Table E.41: Sdg

Class	SenderReceiverToSignalMapping			
Package	M2::AUTOSARTemplates::SystemTemplate::DataMapping			
Note	Mapping of a sender receiver communication data element to a signal.			
Base	<i>ARObject</i> , DataMapping			
Aggregated by	SystemMapping.dataMapping			
Attribute	Type	Mult.	Kind	Note
dataElement	VariableDataPrototype	0..1	iref	Reference to the data element. InstanceRef implemented by: VariableDataPrototypeInSystemInstanceRef
senderToSignal TextTable Mapping	TextTableMapping	0..1	aggr	This mapping allows for the text-table translation between the sending DataPrototype that is defined in the Port Prototype and the physicalProps defined for the System Signal.
signalTo ReceiverText TableMapping	TextTableMapping	0..1	aggr	This mapping allows for the text-table translation between the physicalProps defined for the SystemSignal and a receiving DataPrototype that is defined in the Port Prototype.
systemSignal	SystemSignal	0..1	ref	Reference to the system signal used to carry the data element.

Table E.42: SenderReceiverToSignalMapping

Class	SignalServiceTranslationProps			
Package	M2::AUTOSARTemplates::CommonStructure::SignalServiceTranslation			
Note	This element allows to define the properties which are applicable for the signal/service translation service.			
Base	<i>ARObject</i> , Identifiable , MultilanguageReferrable , Referrable			
Aggregated by	SignalServiceTranslationPropsSet.signalServiceTranslationProps			
Attribute	Type	Mult.	Kind	Note
control Consumed EventGroup	ConsumedEventGroup	*	ref	Reference to the EventGroup which encapsulates the signal-based payload.
controlPnc	PncMappingIdent	*	ref	Reference to the PNCs which control the offer/subscribe behavior of the translated service instance. Stereotypes: atpSplitable Tags: atp.Splitkey=controlPnc
controlProvided EventGroup	EventHandler	*	ref	Reference to the provided event group (aka Event Handler) which is automatically available when service Control equals translationStart.
serviceControl	SignalService TranslationControlEnum	0..1	attr	Defines how the service instance control shall behave.
signalService Translation EventProps	SignalService TranslationEventProps	*	aggr	Defines properties for a single translated event.

Table E.43: SignalServiceTranslationProps

Primitive	String
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes
Note	<p>This represents a String in which white-space shall be normalized before processing. For example: in order to compare two Strings:</p> <ul style="list-style-type: none"> • leading and trailing white-space needs to be removed • consecutive white-space (blank, cr, lf, tab) needs to be replaced by one blank. <p>Tags: xml.xsd.customType=STRING xml.xsd.type=string</p>

Table E.44: String

Class	SwServiceArg			
Package	M2::MSR::DataDictionary::ServiceProcessTask			
Note	<p>Specifies the properties of a data object exchanged during the call of an SwService, e.g. an argument or a return value.</p> <p>The SwServiceArg can also be used in the argument list of a C-macro. For this purpose the category shall be set to "MACRO". A reference to implementationDataType can optional be added if the actual argument has an implementationDataType.</p>			
Base	ARObject, Identifiable, MultilanguageReferrable, Referrable			
Aggregated by	BswModuleEntry.argument, BswModuleEntry.returnType			
Attribute	Type	Mult.	Kind	Note
direction	ArgumentDirection Enum	0..1	attr	<p>Specifies the direction of the data transfer. The direction shall indicate the direction of the actual information that is being consumed by the caller and/or the callee, not the direction of formal arguments in C.</p> <p>The attribute is optional for backwards compatibility reasons. For example, if a pointer is used to pass a memory address for the expected result, the direction shall be "out". If a pointer is used to pass a memory address with content to be read by the callee, its direction shall be "in".</p> <p>Tags: xml.sequenceOffset=10</p>
swArraysSize	ValueList	0..1	aggr	<p>This turns the argument of the service to an array.</p> <p>Tags: xml.sequenceOffset=20</p>
swDataDef Props	SwDataDefProps	0..1	aggr	<p>Data properties of this SwServiceArg.</p> <p>Stereotypes: atpSplittable Tags: atp.Splitkey=swDataDefProps xml.sequenceOffset=30</p>

Table E.45: SwServiceArg

Class	<<atpMixedString>> SwSystemconstDependentFormula (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling			
Note	This class represents an expression depending on system constants.			
Base	ARObject, FormulaExpression			
Subclasses	AttributeValueVariationPoint, BlueprintFormula, ConditionByFormula, FMFormulaByFeaturesAndSwSystemconsts			
Attribute	Type	Mult.	Kind	Note

Class	<<atpMixedString>> SwSystemconstDependentFormula (abstract)			
sysc	SwSystemconst	0..1	ref	This refers to a system constant. The internal (coded) value of the system constant shall be used. Tags: xml.sequenceOffset=50
syscString	SwSystemconst	0..1	ref	syscString indicates that the referenced system constant shall be evaluated as a string according to [TPS_SWCT_01431].

Table E.46: SwSystemconstDependentFormula

Class	SwSystemconstantValueSet			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling			
Note	This meta-class represents the ability to specify a set of system constant values. Tags: atp.recommendedPackage=SwSystemconstantValueSets			
Base	ARElement , ARObject , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
sw Systemconstant Value	SwSystemconstValue	*	aggr	This is one particular value of a system constant.

Table E.47: SwSystemconstantValueSet

Class	System			
Package	M2::AUTOSARTemplates::SystemTemplate			
Note	The top level element of the System Description. The System description defines five major elements: Topology, Software, Communication, Mapping and Mapping Constraints. The System element directly aggregates the elements describing the Software, Mapping and Mapping Constraints; it contains a reference to an ASAM FIBEX description specifying Communication and Topology. Tags: atp.recommendedPackage=Systems			
Base	ARElement , ARObject , AtpClassifier , AtpFeature , AtpStructureElement , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable , UploadableDesignElement , UploadablePackageElement			
Aggregated by	ARPackage.element , AtpClassifier.atpFeature			
Attribute	Type	Mult.	Kind	Note
clientId DefinitionSet	ClientIdDefinitionSet	*	ref	Set of Client Identifiers that are used for inter-ECU client-server communication in the System.
containerIPdu HeaderByte Order	ByteOrderEnum	0..1	attr	Defines the byteOrder of the header in ContainerIPdus.
ecuExtract Version	RevisionLabelString	0..1	attr	Version number of the Ecu Extract.

Class	System			
fibexElement	FibexElement	*	ref	Reference to ASAM FIBEX elements specifying Communication and Topology. All Fibex Elements used within a System Description shall be referenced from the System Element. atpVariation: In order to describe a product-line, all Fibex Elements can be optional. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=fibexElement.fibexElement, fibexElement.variationPoint.shortLabel vh.latestBindingTime=postBuild
interpolationRoutineMappingSet	InterpolationRoutineMappingSet	*	ref	This reference identifies the InterpolationRoutineMapping Sets that are relevant in the context of the enclosing System.
j1939SharedAddressCluster	J1939SharedAddressCluster	*	aggr	Collection of J1939Clusters that share a common address space for the routing of messages. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=j1939SharedAddressCluster.shortName, j1939SharedAddressCluster.variationPoint.shortLabel vh.latestBindingTime=postBuild
mapping	SystemMapping	*	aggr	Aggregation of all mapping aspects (mapping of SW components to ECUs, mapping of data elements to signals, and mapping constraints). In order to support OEM / Tier 1 interaction and shared development for one common System this aggregation is atpSplitable and atpVariation. The content of System Mapping can be provided by several parties using different names for the SystemMapping. This element is not required when the System description is used for a network-only use-case. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=mapping.shortName, mapping.variationPoint.shortLabel vh.latestBindingTime=postBuild
pncVectorLength	PositiveInteger	0..1	attr	Length of the partial networking request release information vector (in bytes).
pncVectorOffset	PositiveInteger	0..1	attr	Absolute offset (with respect to the NM-PDU) of the partial networking request release information vector that is defined in bytes as an index starting with 0.
rootSoftwareComposition	RootSwCompositionPrototype	0..1	aggr	Aggregation of the root software composition, containing all software components in the System in a hierarchical structure. This element is not required when the System description is used for a network-only use-case. atpVariation: The RootSwCompositionPrototype can vary. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=rootSoftwareComposition.shortName, rootSoftwareComposition.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime

Class	System			
swCluster	CpSoftwareCluster	*	ref	CP Software Clusters of this System Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=swCluster.cpSoftwareCluster, swCluster.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime
system Documentation	Chapter	*	aggr	Possibility to provide additional documentation while defining the System. The System documentation can be composed of several chapters. Stereotypes: atpSplitable; atpVariation Tags: atp.Splitkey=systemDocumentation.shortName, systemDocumentation.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=-10
systemVersion	RevisionLabelString	0..1	attr	Version number of the System Description.

Table E.48: System

Class	SystemSignal			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore::CoreCommunication			
Note	The system signal represents the communication system's view of data exchanged between SW components which reside on different ECUs. The system signals allow to represent this communication in a flattened structure, with exactly one system signal defined for each data element prototype sent and received by connected SW component instances. Tags: atp.recommendedPackage=SystemSignals			
Base	ARElement , ARObject , CollectableElement , Identifiable , MultilanguageReferrable , PackageableElement , Referrable			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
dynamicLength	Boolean	0..1	attr	The length of dynamic length signals is variable in run-time. Only a maximum length of such a signal is specified in the configuration (attribute length in ISignal element).
physicalProps	SwDataDefProps	0..1	aggr	Specification of the physical representation. Stereotypes: atpSplitable Tags: atp.Splitkey=physicalProps

Table E.49: SystemSignal

Class	TransientFault			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	The reported failure is classified as runtime error.			
Base	ARObject , Identifiable , MultilanguageReferrable , Referrable , TracedFailure			
Aggregated by	ErrorTracerNeeds.tracedFailure			
Attribute	Type	Mult.	Kind	Note
possibleError Reaction	PossibleErrorReaction	*	aggr	Describes a possible error reactions for the transient fault handler.

Table E.50: TransientFault

Class		VariationPoint		
Package		M2::AUTOSARTemplates::GenericStructure::VariantHandling		
Note		This meta-class represents the ability to express a "structural variation point". The container of the variation point is part of the selected variant if swSyscond evaluates to true and each postBuildVariant Criterion is fulfilled.		
Base		ARObject		
Attribute	Type	Mult.	Kind	Note
blueprintCondition	DocumentationBlock	0..1	aggr	This represents a description that documents how the variation point shall be resolved when deriving objects from the blueprint. Note that variationPoints are not allowed within a blueprintCondition. Tags: xml.sequenceOffset=28
desc	MultiLanguageOverviewParagraph	0..1	aggr	This allows to describe shortly the purpose of the variation point. Tags: xml.sequenceOffset=20
formalBlueprintGenerator	BlueprintGenerator	0..1	aggr	This represents a description that documents how the variation point shall be resolved when deriving objects from the blueprint by using ARML. Note that variationPoints are not allowed within a formalBlueprintGenerator. Tags: atp.Status=draft xml.sequenceOffset=30
postBuildVariantCondition	PostBuildVariantCondition	*	aggr	This is the set of post build variant conditions which all shall be fulfilled in order to (postbuild) bind the variation point. Tags: xml.sequenceOffset=40
sdg	Sdg	0..1	aggr	An optional special data group is attached to every variation point. These data can be used by external software systems to attach application specific data. For example, a variant management system might add an identifier, an URL or a specific classifier. Tags: xml.sequenceOffset=50
shortLabel	Identifier	0..1	attr	This provides a name to the particular variation point to support the RTE generator. It is necessary for supporting splittable aggregations and if binding time is later than codeGenerationTime, as well as some RTE conditions. It needs to be unique with in the enclosing Identifiables with the same ShortName. Stereotypes: atpIdentityContributor Tags: xml.sequenceOffset=10
swSyscond	ConditionByFormula	0..1	aggr	This condition acts as Binding Function for the Variation Point. Note that the multiplicity is 0..1 in order to support pure postBuild variants. Tags: xml.sequenceOffset=30

Table E.51: VariationPoint

F Glossary

Artifact This is a Work Product Definition that provides a description and definition for tangible work product types. Artifacts may be composed of other artifacts ([53]).

At a high level, an artifact is represented as a single conceptual file.

AUTOSAR Tool This is a software tool which supports one or more tasks defined as AUTOSAR tasks in the methodology. Depending on the supported tasks, an AUTOSAR tool can act as an authoring tool, a converter tool, a processor tool or as a combination of those (see separate definitions).

AUTOSAR Authoring Tool An AUTOSAR Tool used to create and modify AUTOSAR XML Descriptions. Example: System Description Editor.

AUTOSAR Converter Tool An AUTOSAR Tool used to create AUTOSAR XML files by converting information from other AUTOSAR XML files. Example: ECU Flattener

AUTOSAR Definition This is the definition of parameters which can have values. One could say that the parameter values are Instances of the definitions. But in the meta model hierarchy of AUTOSAR, definitions are also instances of the meta model and therefore considered as a description. Examples for AUTOSAR definitions are: `EcucParameterDef`, `PostBuildVariantCriterion`, `SwSystemconst`.

AUTOSAR XML Description In AUTOSAR this means "filled Template". In fact an AUTOSAR XML description is the XML representation of an AUTOSAR model.

The AUTOSAR XML description can consist of several files. Each individual file represents an AUTOSAR partial model and shall validate successfully against the AUTOSAR XML schema.

AUTOSAR Meta-Model This is an UML2.0 model that defines the language for describing AUTOSAR systems. The AUTOSAR meta-model is an UML representation of the AUTOSAR templates. UML2.0 class diagrams are used to describe the attributes and their interrelationships. Stereotypes, UML tags and OCL expressions (object constraint language) are used for defining specific semantics and constraints.

AUTOSAR Meta-Model Tool The AUTOSAR Meta-Model Tool is the tool that generates different views (class tables, list of constraints, diagrams, XML Schema etc.) on the AUTOSAR meta-model.

AUTOSAR Model This is a representation of an AUTOSAR product. The AUTOSAR model represents aspects suitable to the intended use according to the AUTOSAR methodology.

Strictly speaking, this is an instance of the AUTOSAR meta-model. The information contained in the AUTOSAR model can be anything that is representable according to the AUTOSAR meta-model.

AUTOSAR Partial Model In AUTOSAR, the possible partitioning of models is marked in the meta-model by `<<atpSplittable>>`. One partial model is represented in an AUTOSAR XML description by one file. The partial model does not need to fulfill all semantic constraints applicable to an AUTOSAR model.

AUTOSAR Processor Tool An AUTOSAR Tool used to create non-AUTOSAR files by processing information from AUTOSAR XML files. Example: RTE Generator

AUTOSAR Specification Element An AUTOSAR Specification Element is a named element that is part of an AUTOSAR specification. Examples: requirement, constraint, specification item, class or attribute in the meta model, methodology, deliverable, methodology activity, model element, bsw module etc.

AUTOSAR Template The term "Template" is used in AUTOSAR to describe the format different kinds of descriptions. The term template comes from the idea, that AUTOSAR defines a kind of form which shall be filled out in order to describe a model. The filled form is then called the description.

In fact the AUTOSAR templates are now defined as a meta-model.

AUTOSAR Validation Tool A specialized `AUTOSAR Tool` which is able to check an AUTOSAR model against the rules defined by a profile.

AUTOSAR XML Schema This is a W3C XML schema that defines the language for exchanging AUTOSAR models. This Schema is derived from the AUTOSAR meta-model. The AUTOSAR XML Schema defines the AUTOSAR data exchange format.

Blueprint This is a model from which other models can be derived by copy and refinement. Note that in contrast to meta model resp. types, this process is *not* an instantiation.

Instance Generally this is a particular exemplar of a model or of a type.

Life Cycle Life Cycle is the course of development/evolutionary stages of a model element during its life time.

Meta-Model This defines the building blocks of a model. In that sense, a Meta-Model represents the language for building models.

Meta-Data This includes pertinent information about data, including information about the authorship, versioning, access-rights, timestamps etc.

Model A Model is an simplified representation of reality. The model represents the aspects suitable for an intended purpose.

Partial Model This is a part of a model which is intended to be persisted in one particular artifact.

Pattern in GST This is an approach to simplify the definition of the meta model by applying a model transformation. This transformation creates an enhanced model out of an annotated model.

Profile Authoring Support Data Data that is used for efficient authoring of a profile. E.g. list of referable constraints, meta-classes, meta-attributes or other reusable model assets (blueprints)

Profile Authoring Tool A specialized `AUTOSAR Tool` which focuses on the authoring of profiles for data exchange points. It e.g. provides support for the creation of profiles from scratch, modification of existing profiles or composition of existing profiles.

Profile Compatibility Checker Tool A specialized `AUTOSAR Tool` which focuses on checking the compatibility of profiles for data exchange. Note that this compatibility check includes manual compatibility checks by engineers and automated assistance using more formal algorithms.

Profile Consistency Checker Tool A specialized `AUTOSAR Tool` which focuses on checking the consistency of profiles.

Property A property is a structural feature of an object. As an example a “connector” has the properties “receive port” and “send port”

Properties are made variant by the `<<atpVariation>>`.

Prototype This is the implementation of a role of a type within the definition of another type. In other words a type may contain Prototypes that in turn are typed by “Types”. Each one of these prototypes becomes an instance when this type is instantiated.

Type A type provides features that can appear in various roles of this type.

Value This is a particular value assigned to a “Definition”.

Variability Variability of a system is its quality to describe a set of variants. These variants are characterized by variant specific property settings and / or selections. As an example, such a system property selection manifests itself in a particular “receive port” for a connection.

This is implemented using the `<<atpVariation>>`.

Variant A system variant is a concrete realization of a system, so that all its properties have been set respectively selected. The software system has no variability anymore with respect to the binding time.

This is implemented using `EvaluatedVariantSet`.

Variation Binding A variant is the result of a variation binding process that resolves the variability of the system by assigning particular values/selections to all the system’s properties.

This is implemented by `VariationPoint`.

Variation Binding Time The variation binding time determines the step in the methodology at which the variability given by a set of variable properties is resolved.

This is implemented by `vh.LatestBindingtime` at the related properties.

Variation Definition Time The variation definition time determines the step in the methodology at which the variation points are defined.

Variation Point A variation point indicates that a property is subject to variation. Furthermore, it is associated with a condition and a binding time which define the system context for the selection / setting of a concrete variant.

This is implemented by `VariationPoint`.

G History of Constraints and Specification Items

Please note that the lists in this chapter also include constraints and specification items that have been removed from the specification in a later version. These constraints and specification items do not appear as hyperlinks in the document.

G.1 Constraint History of this Document according to AUTOSAR R4.0.1

G.1.1 Changed Constraints in R4.0.1

N/A

G.1.2 Added Constraints in R4.0.1

Number	Heading
[constr_1000]	End-to-end protection is limited to sender/receive communication
[constr_1001]	Value of dataId shall be unique
[constr_1002]	End-to-end protection does not support n:1 communication
[constr_1004]	Mapping of ApplicationDataTypes
[constr_1005]	Compatibility of ImplementationDataTypes mapped to the same Application-DataType
[constr_1006]	applicable data categorys
[constr_1007]	Allowed attributes of SwDataDefProps for ApplicationDataTypes
[constr_1008]	Applicability of categorys STRUCTURE and ARRAY
[constr_1009]	SwDataDefProps applicable to ImplementationDataTypes
[constr_1010]	If nativeDeclaration does not exist
[constr_1011]	category of SwBaseType
[constr_1012]	Value of category is FIXED_LENGTH
[constr_1013]	Value of category is VARIABLE_LENGTH
[constr_1014]	Supported value encodings for SwBaseType
[constr_1015]	Prioritization of SwDataDefProps
[constr_1016]	invalidValue is restricted
[constr_1017]	Supported combinations of swImplPolicy and swCalibrationAccess
[constr_1018]	measurementPoint shall not be referenced by a VariableAccess aggregated by RunnableEntity in the role dataReadAccess
[constr_1019]	Compatibility of input value and axis
[constr_1020]	ParameterDataPrototype needs to be of compatible data type as referenced in sharedAxisType

Number	Heading
[constr_1021]	A CompuMethod shall specify instructions for both directions
[constr_1022]	Limits shall be defined for each direction of CompuMethod
[constr_1023]	Specification of Units in CompuMethods
[constr_1024]	Stepwise definition of CompuMethods
[constr_1025]	Avoid division by zero in rational formula
[constr_1026]	Compatibility of Units
[constr_1027]	Types for record layouts
[constr_1029]	ConstantSpecificationMapping and ConstantSpecification
[constr_1030]	ParameterSwComponentType references ConstantSpecificationMappingSet

G.3 Constraint History of this Document according to AUTOSAR R4.0.3

G.3.1 Changed Constraints in R4.0.3

Number	Heading
[constr_1006]	applicable data categorys
[constr_1009]	SwDataDefProps applicable to ImplementationDataTypes
[constr_1014]	Supported value encodings for SwBaseType
[constr_1015]	Prioritization of SwDataDefProps
[constr_1043]	PortInterface vs. ComSpec
[constr_1051]	Compatibility of SwDataDefProps
[constr_1053]	Compatibility of PhysicalDimensions
[constr_1063]	Compatibility of data types with category BOOLEAN
[constr_1110]	Value of category in EndToEndDescription
[constr_1113]	Existence of attributes in PROFILE_01
[constr_1118]	Existence of attributes in PROFILE_02
[constr_1134]	Allowed structure of TEXTTABLE
[constr_2000]	Compatibility of ClientServerOperations triggering the same RunnableEntity
[constr_2027]	SwcServiceDependency shall be defined for service ports only

Table G.5: Changed Constraints in R4.0.3

G.3.2 Added Constraints in R4.0.3

Number	Heading
[constr_1140]	Combination of invalidValue with the attribute handleInvalid
[constr_1141]	Applicability of the scope attribute
[constr_1142]	category of CompuMethod shall not be extended
[constr_1143]	category of AutosarDataType shall not be extended

Number	Heading
[constr_1144]	SensorActuatorSwComponentType , EcuAbstractionSwComponentType , and ComplexDeviceDriverSwComponentType may only reference a HwType
[constr_1145]	Finding the symbol for the representation of a CompuScale in C code
[constr_1146]	Applicability of a symbol for a CompuScale in C code
[constr_1147]	Standardized values for the attribute category of meta-class PortGroup
[constr_1148]	PortInterfaces of PortPrototypes used to connect to NvBlockSwComponentTypes
[constr_1149]	PortPrototypes used for NV data management
[constr_1150]	Usage of valueType for PortDefinedArgumentValue
[constr_1151]	Applicability of PortInterfaceMapping
[constr_1151]	category of ApplicationArrayElement and AutosarDataType referenced in the role <code>type</code> shall be kept in sync
[constr_1153]	Applicability of compatibility requirements for CompuScales
[constr_1154]	Compatibility of CompuScales for sender-receiver communication and similar use cases
[constr_1155]	Compatibility of CompuScales for client-server communication
[constr_1156]	Relevance of “names” of CompuScales
[constr_1157]	Applicability of constraints of CompuScales
[constr_1158]	Applicable categorys for attribute compuMethod
[constr_1159]	Consistency of VariableAndParameterInterfaceMapping with respect to the referenced DataInterfaces
[constr_1160]	Size of Compound Primitive Data Type is variant
[constr_1161]	Applicability of the index attribute of Ref
[constr_1162]	Compatibility of SwRecordLayouts
[constr_1163]	Compatibility of CompuMethods
[constr_1164]	Number of arguments owned by a RunnableEntity
[constr_1165]	Applicability of RunnableEntityArgument
[constr_1166]	Restrictions of ModeRequestTypeMap
[constr_1167]	ImplementationDataTypes used as ModeRequestTypeMap.implementationDataType
[constr_1168]	Compatibility of ImplementationDataTypes used used in the ModeRequestTypeMap
[constr_1169]	Allowed values for Trigger.swImplPolicy
[constr_1170]	Interpretation of attribute maxDeltaCounterInit owned by EndToEndDescription
[constr_1171]	Interpretation of attribute maxDeltaCounterInit of EndToEndDescription
[constr_1172]	Allowed values of SwCalibrationAccessEnum for ModeDeclarationGroupPrototype
[constr_1173]	Applicability of AutosarParameterRef referencing a VariableDataPrototype
[constr_1174]	PortInterfaces used in the context of CompositionSwComponentTypes cannot refer to AUTOSAR services
[constr_1175]	Depending on its category , CompuMethod shall refer to a unit

△

Number	Heading
[constr_1176]	Compatibility of <code>CompuScales</code> of category <code>LINEAR</code> and <code>RAT_FUNC</code>
[constr_1177]	Allowed category for <code>SwPointerTargetProps</code>
[constr_1178]	Existence of attributes of <code>SwDataDefProps</code> in the context of <code>Implementation-DataType</code>
[constr_1179]	Existence of <code>ModeDeclaration.value</code> within a <code>ModeDeclarationGroup</code>
[constr_1180]	Existence of <code>ModeDeclarationGroup.onTransitionValue</code>
[constr_1181]	Numerical values used in <code>ModeDeclaration.value</code> and <code>ModeDeclarationGroup.onTransitionValue</code>
[constr_1182]	Allowed values for <code>InternalTriggeringPoint.swImplPolicy</code>
[constr_1183]	<code>EndToEndProtectionVariablePrototypes</code> aggregated by <code>EndToEndProtection</code>
[constr_1184]	Consistency of <code>rootDataPrototype</code> and <code>base</code> in the context of <code>Application-CompositeElementInPortInterfaceInstanceRef</code>
[constr_1185]	Consistency of data types in the context of <code>ApplicationCompositeElementInPortInterfaceInstanceRef</code>
[constr_1186]	Consistency of data types in the context of <code>ArVariableInImplementation-DataInstanceRef</code>
[constr_1187]	Compatibility of <code>VariableDataPrototypes</code> or <code>ParameterDataPrototypes</code> typed by composite data types
[constr_1188]	Existence of <code>ReceiverComSpec.replaceWith</code>
[constr_1189]	Allowed targets of <code>externalReplacement</code>
[constr_1190]	Only one mapping for composite to primitive use case
[constr_2049]	Different <code>ModeDeclarationGroups</code> shall have different <code>shortNames</code> .
[constr_2050]	Mandatory information of a <code>SwAxisCont</code>
[constr_2051]	Mandatory information of a <code>SwValueCont</code>
[constr_2052]	Values of <code>swArraysizes</code> and the number of values provided by <code>swValuesPhys</code> shall be consistent.
[constr_2053]	Consistency between <code>role</code> <code>IUMPRNumerator</code> and <code>ObdRatioServiceNeeds.connectionType</code>
[constr_2544]	Limits need to be consistent
[constr_2545]	<code>invalidValue</code> shall fit in the specified ranges
[constr_2548]	Data constraint of value axis shall match
[constr_2549]	Units of input axis shall be consistent
[constr_2550]	Units of value axis shall be consistent
[constr_2551]	<code>SwCalprmAxis.baseType</code> shall be ignored
[constr_2561]	Application of <code>DataConstrRule.constrLevel</code>

Table G.6: Added Constraints in R4.0.3

G.3.3 Added Specification Items in R4.0.3

Number	Heading
[TPS_SWCT_01000]	Usage of attribute <code>symbol</code> of the <code>symbolProps</code>
[TPS_SWCT_01001]	Prefix symbols generated for the <code>RunnableEntity</code>
[TPS_SWCT_01002]	<code>SwComponentTypes</code> may only interact by means of their <code>PortPrototypes</code>
[TPS_SWCT_01003]	Inconsistencies regarding the value of <code>serviceKind</code> and the actual implementation of the <code>PortInterface</code>
[TPS_SWCT_01004]	Default value if <code>serviceKind</code> is not defined
[TPS_SWCT_01005]	Usage of <code>SwServiceDependencies</code> for vendor-specific services
[TPS_SWCT_01006]	<code>arraySize</code> of <code>ImplementationDataType</code> shall be used to define the size of the array
[TPS_SWCT_01007]	Semantics of array index
[TPS_SWCT_01008]	Definition of positive integer values that are directly taken over by the RTE generator for creating the programmatic representations of the <code>ModeDeclaration</code>
[TPS_SWCT_01009]	The numerical values used to define the values of <code>ModeDeclaration.value</code> and <code>ModeDeclarationGroup.onTransitionValue</code> can be arbitrarily defined
[TPS_SWCT_01010]	<code>categorys</code> for the definition of a <code>ModeDeclarationGroup</code>
[TPS_SWCT_01011]	Default <code>category</code> of a <code>ModeDeclarationGroup</code>
[TPS_SWCT_01012]	<code>AtomicSwComponentType</code> reads the current ECU mode (fixed variant)
[TPS_SWCT_01013]	<code>AtomicSwComponentType</code> shall keep the ECU alive (fixed variant)
[TPS_SWCT_01014]	<code>AtomicSwComponentType</code> wants to select a shutdown target (fixed variant)
[TPS_SWCT_01015]	<code>AtomicSwComponentType</code> wants to select a boot target (fixed variant)
[TPS_SWCT_01016]	<code>AtomicSwComponentType</code> wants to select a shutdown target (flexible variant)
[TPS_SWCT_01017]	<code>AtomicSwComponentType</code> wants to select a boot target (flexible variant)
[TPS_SWCT_01018]	<code>AtomicSwComponentType</code> wants to use an alarm clock (flexible variant)
[TPS_SWCT_01019]	<code>AtomicSwComponentType</code> reads the current ComM mode
[TPS_SWCT_01020]	<code>AtomicSwComponentType</code> requests a ComM mode. It may also check later whether the requested ComM mode has become effective
[TPS_SWCT_01021]	<code>AtomicSwComponentType</code> acts as a mode manager that influences the ECU state
[TPS_SWCT_01022]	Queued processing of internal trigger
[TPS_SWCT_01023]	Mapping of elements of composite data types
[TPS_SWCT_01024]	Combination of <code>ApplicationCompositeDataType</code> and nested <code>ImplementationDataType</code>
[TPS_SWCT_01025]	The role of <code>PortPrototypes</code> in the AUTOSAR architecture
[TPS_SWCT_01026]	The role of <code>PortInterfaces</code> in the AUTOSAR architecture
[TPS_SWCT_01027]	Different flavors of <code>PortInterfaces</code>
[TPS_SWCT_01028]	<code>AtomicSwComponentType</code> implements a Diagnostic Monitor

Number	Heading
[TPS_SWCT_01029]	AtomicSwComponentType implements a Diagnostic Monitor
[TPS_SWCT_01030]	RunnableEntity
[TPS_SWCT_01031]	ExclusiveArea
[TPS_SWCT_01032]	CompositionSwComponentType
[TPS_SWCT_01033]	Nested definition of CompositionSwComponentTypes
[TPS_SWCT_01034]	CompositionSwComponentTypes do not have any binary footprint
[TPS_SWCT_01035]	CompositionSwComponentType aggregates SwComponentPrototypes
[TPS_SWCT_01036]	SwComponentPrototype implements a specific role
[TPS_SWCT_01037]	arbitrary numbers of SwComponentPrototypes can be created
[TPS_SWCT_01038]	Support for Variant Handling in the in Software Component Template
[TPS_SWCT_01039]	Purpose of variant handling
[TPS_SWCT_01040]	SwConnector exists depending on a <i>PostBuild</i> condition
[TPS_SWCT_01041]	API functions of not existing SwConnector are still part of the software-component's implementation
[TPS_SWCT_01042]	Four types of locations in the meta-model which may exhibit variability
[TPS_SWCT_01043]	ApplicationSwComponentTypes are independent from actual ECU Hardware
[TPS_SWCT_01044]	ServiceNeeds
[TPS_SWCT_01045]	Actual values of ECU configuration parameters fulfill the requirements given by the ServiceNeeds
[TPS_SWCT_01046]	ServiceNeeds are defined in the scope of the SwcInternalBehavior
[TPS_SWCT_01047]	Reference from the software representation of a sensor/actuator to the actual hardware element
[TPS_SWCT_01048]	SensorActuatorSwComponentType may use the I/O hardware abstraction directly
[TPS_SWCT_01049]	Two ways to use the ExclusiveAreas
[TPS_SWCT_01050]	RunnableEntity always runs inside an ExclusiveArea
[TPS_SWCT_01051]	RunnableEntity explicitly enters and leaves a specific ExclusiveArea
[TPS_SWCT_01052]	Inter-runnable variable
[TPS_SWCT_01053]	Relationship of interchanged data with RunnableEntities
[TPS_SWCT_01054]	Semantics of the explicitInterRunnableVariable
[TPS_SWCT_01055]	Semantics of implicitInterRunnableVariable
[TPS_SWCT_01056]	Physical dimension
[TPS_SWCT_01057]	Unit references one physical dimension
[TPS_SWCT_01058]	UnitGroup
[TPS_SWCT_01059]	Exponent for each of the seven fundamental dimensions
[TPS_SWCT_01060]	Negative exponents
[TPS_SWCT_01061]	Conversion of units
[TPS_SWCT_01062]	Documentation of software-components

Number	Heading
[TPS_SWCT_01063]	PortGroup
[TPS_SWCT_01064]	PortGroups have to be defined on the VFB level
[TPS_SWCT_01065]	PortPrototype may belong to more than one PortGroups
[TPS_SWCT_01066]	PortGroups can be associated with certain ServiceNeeds
[TPS_SWCT_01067]	Initial mode
[TPS_SWCT_01068]	Units can be grouped with the help of UnitGroup
[TPS_SWCT_01069]	DataInterface is defined as abstract base class
[TPS_SWCT_01070]	PortInterface acts as a <i>type</i> for a PortPrototype
[TPS_SWCT_01071]	ModeDeclaration
[TPS_SWCT_01072]	ApplicationDataType and ImplementationDataType
[TPS_SWCT_01073]	Composite ApplicationDataType
[TPS_SWCT_01074]	Composite ImplementationDataType
[TPS_SWCT_01075]	SwcInternalBehavior
[TPS_SWCT_01076]	Number of elements of a specific ApplicationArrayDataType might vary at run-time
[TPS_SWCT_01077]	Configure the response to mode changes
[TPS_SWCT_01078]	Configurable array size
[TPS_SWCT_01079]	SwConnector
[TPS_SWCT_01080]	Delegation ports
[TPS_SWCT_01081]	Implications of being a delegation port
[TPS_SWCT_01082]	AssemblySwConnector
[TPS_SWCT_01083]	DelegationSwConnector
[TPS_SWCT_01084]	Outer PortPrototype is referenced by multiple DelegationSwConnectors
[TPS_SWCT_01085]	Variation on the behavior level
[TPS_SWCT_01086]	Request mode change
[TPS_SWCT_01087]	Propagation of mode information
[TPS_SWCT_01088]	ComSpecs defined by CompositionSwComponentTypes
[TPS_SWCT_01089]	end-to-end communication protection
[TPS_SWCT_01090]	EndToEndProtection
[TPS_SWCT_01091]	Two cases for end-to-end protection
[TPS_SWCT_01092]	EndToEndProtectionSet
[TPS_SWCT_01093]	Definition of end-to-end protection is splittable
[TPS_SWCT_01094]	<i>category</i> of EndToEndDescription
[TPS_SWCT_01095]	<i>category</i> set to NONE
[TPS_SWCT_01096]	PortGroup
[TPS_SWCT_01097]	CompositionSwComponentType cannot have RunnableEntities
[TPS_SWCT_01098]	Only AtomicSwComponentType can have RunnableEntities
[TPS_SWCT_01099]	PortInterfaceMapping

Number	Heading
[TPS_SWCT_01100]	Precedence of PortInterfaceMapping
[TPS_SWCT_01101]	Unmapped elements of PortInterfaces
[TPS_SWCT_01102]	VariableAndParameterInterfaceMapping
[TPS_SWCT_01103]	Mapping between different kinds of PortInterfaces
[TPS_SWCT_01104]	Possible mappings are restricted by the swImplPolicy
[TPS_SWCT_01105]	ClientServerInterfaceMapping
[TPS_SWCT_01106]	ClientServerOperation
[TPS_SWCT_01107]	swMinAxisPoints and swMaxAxisPoints represent variation points
[TPS_SWCT_01108]	Added value of an AtomicSwComponentType
[TPS_SWCT_01109]	Adding the SwcInternalBehavior in a later process step
[TPS_SWCT_01110]	Symbolic name of a software-component
[TPS_SWCT_01111]	PortPrototypes need an additional model artifact, the PortInterface
[TPS_SWCT_01112]	PortPrototypes are either <i>require-</i> or <i>provide-</i> ports.
[TPS_SWCT_01113]	Connecting two PortPrototypes
[TPS_SWCT_01114]	SenderReceiverInterface
[TPS_SWCT_01115]	invalidationPolicy
[TPS_SWCT_01116]	swImplPolicy
[TPS_SWCT_01117]	Communication patterns for sender-receiver communication
[TPS_SWCT_01118]	ClientServerInterface
[TPS_SWCT_01119]	Direction of ArgumentDataPrototypes
[TPS_SWCT_01120]	Client needs to provide ArgumentDataPrototypes
[TPS_SWCT_01121]	Pass correct data type
[TPS_SWCT_01122]	Synchronous call of ClientServerOperation
[TPS_SWCT_01123]	No default values for ArgumentDataPrototypes
[TPS_SWCT_01124]	Definition of ArgumentDataPrototypes within the context of a ClientServerOperation is ordered
[TPS_SWCT_01125]	serverArgumentImplPolicy
[TPS_SWCT_01126]	Access to partial networking via BswM
[TPS_SWCT_01127]	Byte array with variable size
[TPS_SWCT_01128]	SwRecordLayout needed
[TPS_SWCT_01129]	Express diagnostic capabilities
[TPS_SWCT_01130]	Measurement and calibration access to model elements is defined by swCalibrationAccess
[TPS_SWCT_01131]	AtomicSwComponentType accepts a request to restart an entire function
[TPS_SWCT_01132]	AtomicSwComponentType provides information about operating cycles
[TPS_SWCT_01133]	AtomicSwComponentType provides information about aging cycles
[TPS_SWCT_01134]	AtomicSwComponentType enables storage of DTCs in general
[TPS_SWCT_01135]	AtomicSwComponentType enables storage of subsequent DTCs
[TPS_SWCT_01136]	AtomicSwComponentType retrieves information from the fault storage

Number	Heading
[TPS_SWCT_01137]	Dem provides information that the fault storage overflows
[TPS_SWCT_01138]	AtomicSwComponentType suppresses the storage of DTCs within the Dem
[TPS_SWCT_01139]	AtomicSwComponentType informs the Dem that the PTO is active
[TPS_SWCT_01140]	AtomicSwComponentType needs information about specific DTC without being a diagnostic monitor
[TPS_SWCT_01141]	AtomicSwComponentType may have RPortPrototypes typed by an Nv-DataInterface
[TPS_SWCT_01142]	non-volatile data are provided by a specialized AtomicSwComponentType
[TPS_SWCT_01143]	Non-volatile data represented by an NvBlockComponent can be read and written
[TPS_SWCT_01144]	NvBlockDescriptor specifies the properties of exactly one NvBlock
[TPS_SWCT_01145]	ramBlock and the romBlock are described by a VariableDataPrototype and a ParameterDataPrototype
[TPS_SWCT_01146]	romBlock is optional
[TPS_SWCT_01147]	No romBlock is configured
[TPS_SWCT_01148]	NvBlockDataMapping
[TPS_SWCT_01149]	RoleBasedPortAssignment of NvBlockDescriptor
[TPS_SWCT_01150]	InternalBehavior of a NvBlockSwComponentType
[TPS_SWCT_01151]	RunnableEntity s do not have further attributes
[TPS_SWCT_01152]	InternalBehavior does not have further attributes
[TPS_SWCT_01153]	IncludedModeDeclarationGroupSet
[TPS_SWCT_01154]	Attribute prefix of IncludedModeDeclarationGroupSet
[TPS_SWCT_01155]	IncludedDataTypeSet
[TPS_SWCT_01156]	Required if the AutosarDataType is not used for any DataPrototype
[TPS_SWCT_01157]	Attribute literalPrefix of IncludedDataTypeSet
[TPS_SWCT_01158]	Three cases for PortInterfaceMapping
[TPS_SWCT_01159]	Mapping is described separately from the SwConnector as reusable ARElement
[TPS_SWCT_01160]	ModeInterfaceMapping
[TPS_SWCT_01161]	TriggerInterfaceMapping
[TPS_SWCT_01162]	Conditional existence of TextTableMapping
[TPS_SWCT_01163]	Conversion from firstValue to secondValue
[TPS_SWCT_01164]	Conversion from secondValue to firstValue
[TPS_SWCT_01165]	Invertible mapping
[TPS_SWCT_01166]	Non-invertible mapping
[TPS_SWCT_01167]	Validity of ModeInterfaceMapping
[TPS_SWCT_01168]	Linear conversion factor can be calculated
[TPS_SWCT_01169]	Support for partial networking
[TPS_SWCT_01170]	Purpose of Virtual Function Cluster
[TPS_SWCT_01171]	Purpose of a control port

Number	Heading
[TPS_SWCT_01172]	Requesting and releasing partial networks
[TPS_SWCT_01173]	Control port shall not become a part of the PortGroup
[TPS_SWCT_01174]	Status port shall not become a member of the PortGroup
[TPS_SWCT_01175]	Actively query the status of a partial network
[TPS_SWCT_01176]	last-is-best semantics for sender-receiver communication
[TPS_SWCT_01177]	Assignment of constant values
[TPS_SWCT_01178]	Specialized subclasses of ValueSpecification
[TPS_SWCT_01179]	Compound Primitive Data Type
[TPS_SWCT_01180]	Maximum possible size of Compound Primitive Data Type
[TPS_SWCT_01181]	Bound model specifies a primitive which is smaller than the maximum defined by the range of the involved SwSystemconst
[TPS_SWCT_01182]	Conceptual levels for the definition of initial values
[TPS_SWCT_01183]	Actual value of an <code>initValue</code> shall be interpreted according to the Autosar-DataType
[TPS_SWCT_01184]	ApplicationPrimitiveDataTypes with <code>category</code> VALUE
[TPS_SWCT_01185]	<code>initValues</code> for Compound Primitive Data Types
[TPS_SWCT_01186]	ConstantSpecificationMapping
[TPS_SWCT_01187]	ConstantSpecificationMappingSet referenced by the InternalBehavior
[TPS_SWCT_01188]	Definition of calibration data sets through RTE-generator and compiler
[TPS_SWCT_01189]	DataTypeMap
[TPS_SWCT_01190]	ModeRequestTypeMap
[TPS_SWCT_01191]	mapped ApplicationDataType and ImplementationDataType shall be compatible
[TPS_SWCT_01192]	Meta-classes that have an association to a DataTypeMappingSet
[TPS_SWCT_01193]	Mappings between application and implementation types do not necessarily have to form a 1:1 relation
[TPS_SWCT_01194]	Symbolic name of an ImplementationDataType
[TPS_SWCT_01195]	Mapping of composite element to primitive DataPrototype
[TPS_SWCT_01196]	Semantics of an external trigger event communication
[TPS_SWCT_01197]	TriggerInterface
[TPS_SWCT_01198]	Period for periodic triggering
[TPS_SWCT_01199]	Queued processing of Triggers
[TPS_SWCT_01200]	ModeDeclarationGroupPrototype per ModeSwitchInterface
[TPS_SWCT_01201]	CompositionSwComponentType requires and provides the modes that are required or provided by its contained SwComponentPrototypes
[TPS_SWCT_01202]	ApplicationDataType defines a subset of the values used in the ModeDeclarationGroup
[TPS_SWCT_01203]	PortPrototype may own port annotations
[TPS_SWCT_01204]	GeneralAnnotation
[TPS_SWCT_01205]	Typical annotations for sender/receiver communication

Number	Heading
[TPS_SWCT_01206]	Min and Max annotations are valid for a certain amount of time
[TPS_SWCT_01207]	<code>VariableDataPrototypes</code> use the same application-level <code>SenderReceiverAnnotation</code>
[TPS_SWCT_01208]	Grouping for <code>SenderReceiverAnnotation</code>
[TPS_SWCT_01209]	<code>ClientServerAnnotation</code>
[TPS_SWCT_01210]	<code>IoHwAbstractionServerAnnotation</code>
[TPS_SWCT_01211]	Assign several annotations to <code>ArgumentDataPrototype</code>
[TPS_SWCT_01212]	<code>ParameterPortAnnotation</code>
[TPS_SWCT_01213]	<code>ModePortAnnotation</code>
[TPS_SWCT_01214]	<code>TriggerPortAnnotation</code>
[TPS_SWCT_01215]	<code>NvDataPortAnnotation</code>
[TPS_SWCT_01216]	<code>DelegatedPortAnnotation</code>
[TPS_SWCT_01217]	Semantics of <code>DelegatedPortAnnotation.signalFan</code>
[TPS_SWCT_01218]	Big picture of <code>ComSpec</code>
[TPS_SWCT_01219]	<code>ComSpec</code> for queued and non-queued sender-receiver communication
[TPS_SWCT_01220]	<code>initValue</code> defines an initial value that shall be taken if the corresponding <code>dataElement</code> has not yet been received
[TPS_SWCT_01221]	<code>DataFilter</code>
[TPS_SWCT_01222]	Applicability of <code>DataFilter</code>
[TPS_SWCT_01223]	<code>networkRepresentation</code> defines how a specific <code>dataElement</code> is represented on a communication bus
[TPS_SWCT_01224]	<code>CompuMethods</code> of <code>dataElement</code> and the <code>networkRepresentation</code> are used for conversion purposes
[TPS_SWCT_01225]	<code>RunnableEntity</code> implements the functionality of two or more <code>ClientServerOperations</code>
[TPS_SWCT_01226]	<code>initValue</code> on the level of a <code>ComSpec</code> is relevant for connections to the corresponding <code>PortPrototype</code>
[TPS_SWCT_01227]	Unconnected <code>RPortPrototype</code> typed by <code>NvDataInterface</code>
[TPS_SWCT_01228]	<code>NvProvideComSpec</code>
[TPS_SWCT_01229]	Three different levels of abstraction regarding the definition of data types
[TPS_SWCT_01230]	Application Data Level
[TPS_SWCT_01231]	Application level may impose strong requirements on the design of the corresponding implementation level
[TPS_SWCT_01232]	Implementation Data Level
[TPS_SWCT_01233]	Use case for the Implementation Data Level
[TPS_SWCT_01234]	Base Level
[TPS_SWCT_01235]	Mapping of data defined on the <i>Application</i> level to the <i>Implementation</i> and <i>Base Type</i> level
[TPS_SWCT_01236]	Big picture of data types
[TPS_SWCT_01237]	<code>SwDataDefProps</code>
[TPS_SWCT_01238]	Attribute <code>category</code> used in the context of <code>AutosarDataType</code>

Number	Heading
[TPS_SWCT_01239]	default value for attribute <code>category</code> used in the context of <code>AutosarDataType</code>
[TPS_SWCT_01240]	Subclasses of <code>ApplicationDataType</code>
[TPS_SWCT_01241]	Applicable <code>categorys</code> for subclasses <code>ApplicationDataType</code>
[TPS_SWCT_01242]	<code>category</code> characterizes the nature of a data type on application level
[TPS_SWCT_01243]	Definition of enumeration types
[TPS_SWCT_01244]	Data types for calibration parameters are also described as primitive types
[TPS_SWCT_01245]	<code>SwDataDefProps</code> control the structure of calibration parameters
[TPS_SWCT_01246]	<code>SwRecordLayout</code> may be required for A2L generation
[TPS_SWCT_01247]	<code>ApplicationArrayDataType</code> and <code>ApplicationRecordDataType</code>
[TPS_SWCT_01248]	Nested definition of <code>ImplementationDataType</code>
[TPS_SWCT_01249]	<code>ApplicationRecordDataType</code>
[TPS_SWCT_01250]	<code>ImplementationDataType</code> has been introduced to optimize the formal support for data type handling on the implementation level
[TPS_SWCT_01251]	Limited set of values for <code>category</code> are applicable for <code>Implementation-DataType</code>
[TPS_SWCT_01252]	<code>ImplementationDataType</code> can express concepts not available on application level
[TPS_SWCT_01253]	Rules apply for the usage of the attribute <code>ImplementationDataType.type-Emitter</code>
[TPS_SWCT_01254]	<code>ImplementationDataType</code> with array semantics
[TPS_SWCT_01255]	Indicate whether the array is supposed to have a fixed size or whether the actual size might change during run-time
[TPS_SWCT_01256]	Definition of multi-dimensional array data types
[TPS_SWCT_01257]	<code>ImplementationDataType</code> or the aggregated <code>Implementation-DataTypeElements</code> do not form closed sets
[TPS_SWCT_01258]	Definition of a pointer to data
[TPS_SWCT_01259]	Definition of a pointer to a function
[TPS_SWCT_01260]	<code>SwBaseType</code>
[TPS_SWCT_01261]	Use case for <code>SwBaseType</code>
[TPS_SWCT_01262]	<code>memAlignment</code> and <code>byteOrder</code> are platform specific
[TPS_SWCT_01263]	Further use cases for <code>SwBaseType</code>
[TPS_SWCT_01264]	Data prototypes implement a role of a data type
[TPS_SWCT_01265]	<code>DataPrototype</code> aggregates an own set of <code>SwDataDefProps</code>
[TPS_SWCT_01266]	Three non-abstract classes derived from <code>AutosarDataPrototype</code>
[TPS_SWCT_01267]	<code>DataPrototype</code> can be aggregated in different roles
[TPS_SWCT_01268]	Definition of <code>initValue</code> for a <code>VariableDataPrototype</code> or a <code>Parameter-DataPrototype</code>
[TPS_SWCT_01269]	In <code>PortInterfaces</code> , initial values defined for <code>DataPrototypes</code> are ignored
[TPS_SWCT_01270]	<code>AutosarVariableRef</code>
[TPS_SWCT_01271]	<code>AutosarParameterRef</code>
[TPS_SWCT_01272]	Semantics of <code>swComparisonVariable</code>

Number	Heading
[TPS_SWCT_01273]	Precedence rules for the application of <code>SwDataDefProps</code>
[TPS_SWCT_01274]	<code>SwDataDefProps</code> used to support calibration and measurement
[TPS_SWCT_01275]	values of the attribute <code>swImplPolicy</code> are restricted depending on the context
[TPS_SWCT_01276]	Computation methods
[TPS_SWCT_01277]	Computation methods are used for the conversion of <i>internal</i> values into their <i>physical</i> representation and vice versa
[TPS_SWCT_01278]	<code>CompuMethods</code> can also be used to assign symbolic names to internal values
[TPS_SWCT_01279]	Preferred conversion direction depends on the use case
[TPS_SWCT_01280]	<code>CompuMethod</code> applied to values outside of its limits
[TPS_SWCT_01281]	<code>Unit</code> associated with a <code>PhysicalDimension</code>
[TPS_SWCT_01283]	Rational function
[TPS_SWCT_01284]	<code>CompuScale</code> might require a representation in the generated RTE C code
[TPS_SWCT_01285]	Physical dimension
[TPS_SWCT_01286]	<code>DataConstr</code>
[TPS_SWCT_01287]	Standard limits and extended limits in the ASAM-MCD2 (ASAP2) specification
[TPS_SWCT_01288]	Interpretation of <code>PhysConstrs</code> and <code>InternalConstrs</code> by tools
[TPS_SWCT_01289]	Semantics of <code>Limit</code>
[TPS_SWCT_01290]	<code>SwAddrMethod</code>
[TPS_SWCT_01291]	Association of <code>MemorySection</code> with <code>SwAddrMethod</code>
[TPS_SWCT_01292]	Usage of <code>SwAddrMethod</code> in the context of a <code>DataPrototype</code>
[TPS_SWCT_01293]	RTE Generator has to derive the Memory Allocation Keyword
[TPS_SWCT_01294]	Missing <code>SwDataDefProps.swAddrMethod</code>
[TPS_SWCT_01295]	<code>SwRecordLayout</code>
[TPS_SWCT_01296]	Different approaches of ASAM MCD-2MC and AUTOSAR with respect to <code>SwRecordLayout</code>
[TPS_SWCT_01297]	Compliance of <code>ApplicationDataTypes</code> or <code>ImplementationDataTypes</code> to <code>swDataDefProps</code>
[TPS_SWCT_01298]	Computing <code>SwRecordLayout</code> from <code>ImplementationDataTypes</code> is not possible
[TPS_SWCT_01299]	Relation of <code>swRecordLayoutGroup</code> to <code>subElement</code>
[TPS_SWCT_01300]	Relationship between record layouts and interpolation routines
[TPS_SWCT_01301]	Importance of initial values
[TPS_SWCT_01302]	Semantics of <code>minimumStartInterval</code>
[TPS_SWCT_01303]	<code>symbol</code> attribute describes the <code>RunnableEntity</code> 's entry point
[TPS_SWCT_01304]	Cat. 1A and 1B <code>RunnableEntity</code> s will eventually terminate
[TPS_SWCT_01305]	<code>RunnableEntity</code> as one that cannot be invoked concurrently
[TPS_SWCT_01306]	Software-component description itself does not put any bounds on the number of concurrent invocations of a <code>RunnableEntity</code>
[TPS_SWCT_01307]	<code>supportsMultipleInstantiation</code> vs. <code>canBeInvokedConcurrently</code>

Number	Heading
[TPS_SWCT_01308]	Combination of <code>supportsMultipleInstantiation=false</code> and <code>canBeInvokedConcurrently=false</code>
[TPS_SWCT_01309]	signature of a <code>RunnableEntity</code> depends on the connected <code>RTEEvent</code>
[TPS_SWCT_01310]	Categories of <code>RunnableEntitys</code>
[TPS_SWCT_01311]	Name of an operation argument
[TPS_SWCT_01312]	<code>RunnableEntity</code> has a mapping to <code>BswModuleEntry</code>
[TPS_SWCT_01313]	Conditions for a transition from <code>suspended to</code> to be started
[TPS_SWCT_01314]	<code>RTEEvent</code>
[TPS_SWCT_01315]	Interaction of <code>RunnableEntity</code> with <code>RTEEvent</code>
[TPS_SWCT_01316]	Abstract base class <code>RTEEvent</code>
[TPS_SWCT_01317]	RTE triggers <code>RunnableEntity</code> in response to occurring <code>RTEEvent</code>
[TPS_SWCT_01318]	<code>RunnableEntity</code> and <code>WaitPoint</code>
[TPS_SWCT_01319]	<code>RTEEvent</code> can be used to trigger <code>WaitPoints</code> in different <code>RunnableEntitys</code>
[TPS_SWCT_01320]	<code>RunnableEntitys</code> of category 2
[TPS_SWCT_01321]	Communication among <code>RunnableEntitys</code>
[TPS_SWCT_01322]	Interaction patterns for the application of the sender-receiver paradigm
[TPS_SWCT_01323]	Read and write access to a <code>dataElement</code>
[TPS_SWCT_01324]	Mode switches need to be completed in finite time
[TPS_SWCT_01325]	Read and write access is only applicable for <code>RunnableEntitys</code> of category 1
[TPS_SWCT_01326]	Constrain the scope of a specific communication
[TPS_SWCT_01327]	RTE generator can omit the creation of checks at run-time
[TPS_SWCT_01328]	Default value of attribute <code>scope</code>
[TPS_SWCT_01329]	Access to specific data is implemented by means of aggregating the meta-class <code>VariableAccess</code> in specific roles
[TPS_SWCT_01330]	<code>RunnableEntity</code> can also have <code>dataSendPoints</code>
[TPS_SWCT_01331]	<code>dataWriteAccess</code> vs. <code>dataSendPoint</code>
[TPS_SWCT_01332]	<code>dataReceivePointByValue</code> vs. <code>dataReceivePointByArgument</code>
[TPS_SWCT_01333]	<code>dataReceivePointByValue/dataReceivePointByArgument</code> vs. <code>dataReadAccess</code>
[TPS_SWCT_01334]	<code>RunnableEntitys</code> of category 1 may have <code>dataReceivePointByValues/</code> <code>dataReceivePointByArguments</code>
[TPS_SWCT_01335]	Combine <code>dataReceivePointByValue</code> or <code>dataReceivePointByArgument</code> with a <code>WaitPoint</code>
[TPS_SWCT_01336]	<code>dataSendPoint</code> also allows for the definition of a <code>DataSendCompletedEvent</code>
[TPS_SWCT_01337]	<code>DataReceivedEvent</code>
[TPS_SWCT_01338]	<code>DataReceiveErrorEvent</code>
[TPS_SWCT_01339]	RTE activates <code>RunnableEntity</code> in response to <code>DataReceiveErrorEvent</code>
[TPS_SWCT_01340]	<code>DataReceiveErrorEvent</code> cannot be combined with a <code>WaitPoint</code>

Number	Heading
[TPS_SWCT_01341]	<code>DataReceiveErrorEvent</code> is directly associated with the corresponding <code>VariableDataPrototype</code>
[TPS_SWCT_01342]	Invocation of a server operation
[TPS_SWCT_01343]	Synchronous vs. asynchronous invocation
[TPS_SWCT_01344]	Consistency of values of <code>timeout</code>
[TPS_SWCT_01345]	Synchronous operation invocation
[TPS_SWCT_01346]	Asynchronous operation invocation
[TPS_SWCT_01347]	Blocking access to operation result in an asynchronous operation invocation
[TPS_SWCT_01348]	Trigger source
[TPS_SWCT_01349]	Trigger sink
[TPS_SWCT_01350]	Calibration Parameters shared among several <code>SwComponentTypes</code>
[TPS_SWCT_01351]	Access to a <code>ParameterDataPrototype</code>
[TPS_SWCT_01352]	Requested mode is just sent and received as an ordinary data value
[TPS_SWCT_01353]	<code>RunnableEntity</code> s react on a mode request via a corresponding <code>RTEEvent</code>
[TPS_SWCT_01354]	<code>PortAPIOption</code>
[TPS_SWCT_01355]	<code>enableTakeAddress = true</code>
[TPS_SWCT_01356]	<code>indirectAPI</code> option switches the generation of the RTE's indirect API functionality
[TPS_SWCT_01357]	Definition of implicit values that are passed by the RTE to the server's entry point
[TPS_SWCT_01358]	Values are hidden from the client components
[TPS_SWCT_01359]	Private memory per instance
[TPS_SWCT_01360]	Arbitrary number of per-instance memory blocks
[TPS_SWCT_01361]	attribute <code>supportsMultipleInstantiation == false</code>
[TPS_SWCT_01362]	Initialization of <code>PerInstanceMemory</code>
[TPS_SWCT_01363]	<code>PerInstanceMemory</code> typed by 'C' Data Types
[TPS_SWCT_01364]	Initial value of a <code>PerInstanceMemory</code> typed by 'C' Data Types
[TPS_SWCT_01365]	<code>PerInstanceMemory</code> typed by AUTOSAR Data Types
[TPS_SWCT_01366]	Initial value of a <code>PerInstanceMemory</code> typed by AUTOSAR Data Types
[TPS_SWCT_01367]	Typed by AUTOSAR data type vs. typed by C data type
[TPS_SWCT_01368]	Describe static and constant memory
[TPS_SWCT_01369]	Static and constant memory is not instantiated by the RTE
[TPS_SWCT_01370]	<code>VariationPointProxy</code>
[TPS_SWCT_01371]	<code>VariationPointProxy</code> vs. <code>VariationPoint</code>
[TPS_SWCT_01372]	<code>bindingTime = preCompileTime</code>
[TPS_SWCT_01373]	RTE generator shall evaluate the <code>SwSystemconstDependentFormula</code>
[TPS_SWCT_01374]	Implementation of <code>AutosarParameterRef</code>
[TPS_SWCT_01375]	Implementation of <code>AutosarVariableRef</code>
[TPS_SWCT_01376]	Software-components need to be capable of reacting to state changes

Number	Heading
[TPS_SWCT_01377]	Two mechanisms to define how <code>SwcInternalBehavior</code> should interact with the mode management
[TPS_SWCT_01378]	<code>AtomicSwComponentType</code> can define an <code>SwcModeSwitchEvent</code> to execute <code>RunnableEntity</code>
[TPS_SWCT_01379]	<code>AtomicSwComponentType</code> can indicate whether an <code>RTEEvent</code> that starts an associated <code>RunnableEntity</code> is disabled in a certain mode
[TPS_SWCT_01380]	Mode management behavior on the sender side
[TPS_SWCT_01381]	Read the currently active mode
[TPS_SWCT_01382]	Mode switch requests are handled asynchronously by the RTE
[TPS_SWCT_01383]	<code>ModeSwitchPoint</code>
[TPS_SWCT_01384]	Execution of initialization code for software-components
[TPS_SWCT_01385]	Execution of initialization code for software-components
[TPS_SWCT_01386]	Initialization by mode management
[TPS_SWCT_01387]	Finalization by mode management
[TPS_SWCT_01388]	Initial modes of <code>AtomicSwComponentTypes</code> are defined by the <code>initialMode</code>
[TPS_SWCT_01389]	I/O Hardware Abstraction interfaces MCAL drivers
[TPS_SWCT_01390]	I/O Hardware Abstraction might have sub-structures
[TPS_SWCT_01391]	I/O Hardware Abstraction abstracts from the location of peripheral I/O devices
[TPS_SWCT_01392]	Mapping between the <code>EcuAbstractionSwComponentType</code> and the corresponding <code>BswModuleDescription</code>
[TPS_SWCT_01393]	Complex Driver
[TPS_SWCT_01394]	Complex Driver is represented by the <code>ComplexDeviceDriverSwComponentType</code>
[TPS_SWCT_01395]	<code>ComplexDeviceDriverSwComponentType</code> has dependencies to ECU Hardware
[TPS_SWCT_01396]	Mapping between the <code>ComplexDeviceDriverSwComponentType</code> and the corresponding <code>BswModuleDescription</code>
[TPS_SWCT_01397]	Hybrid concept between Basic Software Modules and a <code>SwComponentType</code>
[TPS_SWCT_01398]	Communication patterns for AUTOSAR services
[TPS_SWCT_01399]	Dependency is modeled by aggregating required and provided <code>PortPrototypes</code>
[TPS_SWCT_01400]	<code>PortInterface</code> selected from the set of standardized Service Interfaces
[TPS_SWCT_01401]	Form a top-level <code>RootSwCompositionPrototype</code>
[TPS_SWCT_01402]	Mapping of all <code>AtomicSwComponentType</code> instances to <code>EcuInstances</code>
[TPS_SWCT_01403]	Impact of AUTOSAR services on the methodology
[TPS_SWCT_01404]	Creation of the <code>EcuExtract</code>
[TPS_SWCT_01405]	Creation of the <code>ServiceSwComponentTypes</code>
[TPS_SWCT_01406]	Creation of <code>SwComponentPrototype</code> typed by a <code>ServiceSwComponentType</code>

Number	Heading
[TPS_SWCT_01407]	Creation of <code>InternalBehavior</code> typed by a <code>ServiceSwComponentType</code>
[TPS_SWCT_01408]	Creation of <code>SwCbswMapping</code>
[TPS_SWCT_01409]	Update of <code>PortDefinedArgumentValues</code>
[TPS_SWCT_01410]	<code>Dcm</code> and <code>Dem</code> can directly access <code>dataElements</code> in <code>PPortPrototypes</code> typed by a <code>SenderReceiverInterface</code>
[TPS_SWCT_01411]	Use cases for a <code>ServiceSwComponentType</code> to express <code>ServiceNeeds</code>
[TPS_SWCT_01412]	<code>ServiceSwComponentType</code> shall be added in ECU Configuration phase
[TPS_SWCT_01413]	Local communication with services
[TPS_SWCT_01414]	Mode manager needs to communicate with application software components located on other ECUs
[TPS_SWCT_01415]	Interfaces of <code>ServiceProxySwComponentType</code>
[TPS_SWCT_01416]	Difference between a <code>ServiceProxySwComponentType</code> and an <code>ApplicationSwComponentType</code>
[TPS_SWCT_01417]	Define calibration parameters common to all <code>SwComponentPrototypes</code> of the same <code>SwComponentType</code>
[TPS_SWCT_01418]	Ways to define a calibration parameter
[TPS_SWCT_01419]	<code>ParameterSwComponentType</code> shall never aggregate a <code>SwCInternalBehavior</code>
[TPS_SWCT_01420]	<code>SwComponentType</code> requiring access to shared calibration parameters needs <code>RPortPrototype</code> typed by a <code>ParameterInterface</code>
[TPS_SWCT_01421]	<code>ParameterInterface</code> is not restricted to parameters which can actually be calibrated
[TPS_SWCT_01422]	Delegation of <code>PortPrototypes</code> typed by a <code>ParameterInterface</code>
[TPS_SWCT_01423]	<code>ParameterDataPrototype</code> aggregated in the role <code>constantMemory</code>
[TPS_SWCT_01424]	<code>ParameterDataPrototype</code> aggregated in the role <code>perInstanceParameter</code>
[TPS_SWCT_01425]	<code>AtomicSwComponentType</code> provides one callback per event if diagnostic event data change
[TPS_SWCT_01426]	<code>AtomicSwComponentType</code> provides callback if any diagnostic event data and/or status changed
[TPS_SWCT_01427]	<code>AtomicSwComponentType</code> provides data for diagnostic purposes via <code>ClientServerInterface</code>
[TPS_SWCT_01428]	<code>ServiceSwComponentType</code> representing the <code>Dem</code> provides a <code>PPortPrototype</code> for the <code>Dcm</code>
[TPS_SWCT_01429]	[constr_1135] only applies for <code>BITFIELD_TEXTTABLE</code>
[TPS_SWCT_01430]	Conversion specification from internal to physical values as well as the reverse conversion
[TPS_SWCT_01431]	Finding the symbol for the representation of a <code>CompuScale</code> in C code
[TPS_SWCT_01432]	Keep the <code>invalidValue</code> transparent to the sending and receiving software components
[TPS_SWCT_01433]	Invalid values outside the range limits
[TPS_SWCT_01434]	Sender and receiver have knowledge of invalid value
[TPS_SWCT_01435]	Invalid values outside the range limits

Number	Heading
[TPS_SWCT_01436]	Different receivers require different handling of data invalidation
[TPS_SWCT_01437]	<code>invalidValue</code> can also be specified without setting a <code>compuMethod</code>
[TPS_SWCT_01438]	Handling of invalidation in the sending RTE
[TPS_SWCT_01439]	Handling of invalidation in the receiving RTE
[TPS_SWCT_01440]	Measurement is not limited to primitive objects
[TPS_SWCT_01441]	Nature of a <code>TYPE_REFERENCE</code>
[TPS_SWCT_01442]	<code>ImplementationDataType</code> of <code>category</code> <code>TYPE_REFERENCE</code> does not define own properties
[TPS_SWCT_01443]	<code>ImplementationDataType</code> of <code>category</code> <code>TYPE_REFERENCE</code> overwrites properties of refined <code>ImplementationDataType</code>
[TPS_SWCT_01444]	Size of <code>SwBaseType</code> is specified in bits
[TPS_SWCT_01445]	Applicability of <code>SwDataDefProps</code> for <code>DataPrototypes</code>
[TPS_SWCT_01446]	References to a <code>DataPrototype</code> may or may not imply the necessity for using an <code>instanceRef</code>
[TPS_SWCT_01447]	Applicable binding times for model elements in the scope of the Software Component Template
[TPS_SWCT_01448]	Pre-defined values for the <code>category</code> of <code>VariationPointProxy</code>
[TPS_SWCT_02000]	Default value for attribute <code>swImplPolicy</code>
[TPS_SWCT_02001]	Values of <code>SwAxisCont</code> with the <code>category</code> <code>COM_AXIS</code> , <code>RES_AXIS</code> are for display only
[TPS_SWCT_02002]	<code>AtomicSwComponentType</code> offers a <code>PPortPrototypes</code> typed by <code>ClientServerInterface</code> to read/write current value via diagnostic services
[TPS_SWCT_02003]	<code>AtomicSwComponentType</code> offers <code>PortPrototypes</code> typed by <code>SenderReceiverInterfaces</code> to read/write current values via diagnostic services
[TPS_SWCT_02004]	<code>AtomicSwComponentType</code> offers a <code>PortPrototype</code> typed by a <code>ClientServerInterface</code> to start/stop or request routine results of diagnostic routines
[TPS_SWCT_02005]	<code>AtomicSwComponentType</code> offers <code>PortPrototypes</code> typed by <code>ClientServerInterfaces</code> to adjust the IO signal via diagnostic services
[TPS_SWCT_02006]	<code>AtomicSwComponentType</code> offers sender receiver ports to adjust the IO signal via diagnostic services
[TPS_SWCT_02007]	<code>AtomicSwComponentType</code> implements a OBD system monitor with In-Use-Monitor Performance Ratio
[TPS_SWCT_02008]	<code>AtomicSwComponentType</code> offers a server port to read/write current value via OBD services
[TPS_SWCT_02009]	<code>AtomicSwComponentType</code> offers sender receiver ports to read/write current values via OBD services
[TPS_SWCT_02010]	<code>AtomicSwComponentType</code> offers a server port to read vehicle information values via OBD services
[TPS_SWCT_02011]	<code>AtomicSwComponentType</code> offers a server port to read DTR value via OBD services
[TPS_SWCT_02012]	<code>AtomicSwComponentType</code> offers a server port for request control of on-board system, test or component via OBD services

Number	Heading
[TPS_SWCT_02013]	<i>AtomicSwComponentType</i> offers a server port to get protocol, session and security information or to request a Reset to Default Session
[TPS_SWCT_02014]	<i>AtomicSwComponentType</i> supports Response On Event (ROE) via diagnostic services
[TPS_SWCT_02015]	<i>AtomicSwComponentType</i> verifies the access to security level via diagnostic services
[TPS_SWCT_02016]	<i>AtomicSwComponentType</i> requires information on the status of the protocol communication and may disallow a protocol
[TPS_SWCT_02017]	<i>AtomicSwComponentType</i> requires the notification about a Service Request via diagnostic services
[TPS_SWCT_02018]	Setup for <i>AtomicSwComponentType</i> which contains a Supervised Entity
[TPS_SWCT_02019]	Setup for <i>AtomicSwComponentType</i> which requires <i>Global Supervision Status</i> notification
[TPS_SWCT_02020]	<i>AtomicSwComponentType</i> uses the hash calculation of the Crypto Service
[TPS_SWCT_02021]	<i>AtomicSwComponentType</i> uses the message authentication code (MAC) calculation of the Crypto Service
[TPS_SWCT_02022]	<i>AtomicSwComponentType</i> uses the message authentication code (MAC) verification of the Crypto Service
[TPS_SWCT_02023]	<i>AtomicSwComponentType</i> uses the generation of random seed of the Crypto Service
[TPS_SWCT_02024]	<i>AtomicSwComponentType</i> uses the generation of random numbers of the Crypto Service
[TPS_SWCT_02025]	<i>AtomicSwComponentType</i> uses the symmetrical block encryption of the Crypto Service
[TPS_SWCT_02026]	<i>AtomicSwComponentType</i> uses the symmetrical block decryption of the Crypto Service
[TPS_SWCT_02027]	<i>AtomicSwComponentType</i> uses the symmetrical encryption of the Crypto Service
[TPS_SWCT_02028]	<i>AtomicSwComponentType</i> uses the symmetrical decryption of the Crypto Service
[TPS_SWCT_02029]	<i>AtomicSwComponentType</i> uses the asymmetrical encryption of the Crypto Service
[TPS_SWCT_02030]	<i>AtomicSwComponentType</i> uses the asymmetrical decryption of the Crypto Service
[TPS_SWCT_02031]	<i>AtomicSwComponentType</i> uses the signature generation of the Crypto Service
[TPS_SWCT_02032]	<i>AtomicSwComponentType</i> uses the signature verification of the Crypto Service
[TPS_SWCT_02033]	<i>AtomicSwComponentType</i> uses the checksum calculation of the Crypto Service
[TPS_SWCT_02034]	<i>AtomicSwComponentType</i> uses the key derivation of the Crypto Service
[TPS_SWCT_02035]	<i>AtomicSwComponentType</i> uses the symmetric key derivation of the Crypto Service
[TPS_SWCT_02036]	<i>AtomicSwComponentType</i> uses the key exchange interface for public value calculation of the Crypto Service

Number	Heading
[TPS_SWCT_02037]	AtomicSwComponentType uses the key exchange interface for secret value calculation of the Crypto Service
[TPS_SWCT_02038]	AtomicSwComponentType uses the key exchange interface to calculate symmetric key with the Crypto Service
[TPS_SWCT_02039]	AtomicSwComponentType uses the symmetrical key extraction of the Crypto Service
[TPS_SWCT_02040]	AtomicSwComponentType uses the symmetrical key wrapping of the Crypto Service to export a symmetrical key structure with a symmetric key
[TPS_SWCT_02041]	AtomicSwComponentType uses the asymmetrical key wrapping of the Crypto Service to export a symmetrical key structure with a asymmetric key
[TPS_SWCT_02042]	AtomicSwComponentType uses the asymmetrical public key extraction of the Crypto Service
[TPS_SWCT_02043]	AtomicSwComponentType uses the asymmetrical private key extraction of the Crypto Service
[TPS_SWCT_02044]	AtomicSwComponentType uses the asymmetrical key wrapping of the Crypto Service to export a (asymmetric) private key structure with a symmetrical wrapping key
[TPS_SWCT_02045]	AtomicSwComponentType uses the asymmetrical key wrapping of the Crypto Service to export a (asymmetric) private key structure with a asymmetrical wrapping key

Table G.7: Added Specification Items in 4.0.3

G.3.4 Deleted Constraints in R4.0.3

Number	Heading
[constr_1023]	Specification of Units in CompuMethods (the text is still there but it does no longer represent a constraint)
[constr_1062]	Compatibility of data types with category BIT

Number	Heading
[constr_1068]	Compatibility of <code>VariableDataPrototypes</code> or <code>ParameterDataPrototypes</code> typed by primitive data types
[constr_1069]	Compatibility of <code>PortPrototypes</code> of different <code>DataInterfaces</code> in the context of <code>AssemblySwConnectors</code>
[constr_1070]	Compatibility of <code>PortPrototypes</code> of different <code>DataInterfaces</code> in the context of <code>DelegationSwConnectors</code>
[constr_1072]	Compatibility of <code>ModeSwitchInterfaces</code> in the context of an <code>AssemblySwConnector</code>
[constr_1073]	Compatibility of <code>ModeSwitchInterfaces</code> in the context of an <code>DelegationSwConnector</code>
[constr_1074]	Compatibility of <code>ModeDeclarationGroupPrototypes</code>
[constr_1079]	Compatibility of <code>ClientServerInterfaces</code> in the context of an <code>AssemblySwConnector</code>
[constr_1080]	Compatibility of <code>ClientServerInterfaces</code> in the context of an <code>DelegationSwConnector</code>
[constr_1081]	Compatibility of <code>TriggerInterfaces</code> in the context of an <code>AssemblySwConnector</code>
[constr_1082]	Compatibility of <code>TriggerInterfaces</code> in the context of an <code>DelegationSwConnector</code>
[constr_1108]	Value of <code>ApplicationError.errorCode</code>
[constr_1177]	Allowed <code>targetCategory</code> for <code>SwPointerTargetProps</code>
[constr_1187]	Compatibility of <code>VariableDataPrototypes</code> or <code>ParameterDataPrototypes</code> typed by composite data types

Table G.9: Changed Constraints in R4.1.1

G.4.2 Added Constraints in R4.1.1

Number	Heading
[constr_1191]	Value of <code>Limit</code> shall yield a numerical value
[constr_1192]	Compatibility of “IDENTICAL” to “RAT_FUNC” or “LINEAR”
[constr_1193]	<code>ModeDeclaration</code> shall be referenced by at least one <code>ModeTransition</code> in the role <code>enteredMode</code>
[constr_1194]	Identical <code>ModeTransitions</code>
[constr_1195]	<code>SwcModeSwitchEvent</code> and the definition of <code>ModeTransition</code>
[constr_1196]	Existence of <code>networkRepresentation</code> vs. <code>compositeNetworkRepresentation</code>
[constr_1197]	Existence of <code>compositeNetworkRepresentation</code> shall be comprehensive
[constr_1200]	Queued communication is not applicable for <code>dataElements</code> owned by <code>PRPortPrototype</code>
[constr_1201]	<code>initValue</code> shall exist in an <code>RPortPrototype</code>

Number	Heading
[constr_1202]	Supported connections by AssemblySwConnector for PortPrototypes typed by a SenderReceiverInterface or NvDataInterface
[constr_1203]	Supported connections by DelegationSwConnector for PortPrototypes typed by a SenderReceiverInterface or NvDataInterface
[constr_1204]	Supported connections by AssemblySwConnector for PortPrototypes typed by a ClientServerInterface , ModeSwitchInterface , or TriggerInterface
[constr_1205]	Supported connections by DelegationSwConnector for PortPrototypes typed by a ClientServerInterface , ModeSwitchInterface , or TriggerInterface
[constr_1209]	Mapping of ModeDeclarations of mode user to ModeDeclaration of mode manager
[constr_1210]	Mapping of ModeDeclarations of mode user to all ModeDeclarations of mode manager
[constr_1211]	Constraints of maxNoNewOrRepeatedData in PROFILE_01
[constr_1212]	Constraints of syncCounterInit in PROFILE_01
[constr_1213]	Constraints of maxNoNewOrRepeatedData in PROFILE_02
[constr_1214]	Constraints of syncCounterInit in PROFILE_02
[constr_1215]	Interpretation of attribute maxNoNewOrRepeatedData owned by EndToEndDescription in PROFILE_01
[constr_1216]	Interpretation of attribute syncCounterInit owned by EndToEndDescription in PROFILE_01
[constr_1217]	Interpretation of attribute maxNoNewOrRepeatedData owned by EndToEndDescription in PROFILE_02
[constr_1218]	Interpretation of attribute syncCounterInit owned by EndToEndDescription in PROFILE_02
[constr_1219]	Invalidation depends on the value of swImplPolicy
[constr_1220]	Compatibility of SwBaseType
[constr_1221]	DataPrototype is typed by an ApplicationPrimitiveDataType
[constr_1222]	category of an AutosarDataType used to type a DataPrototype is set to STRING
[constr_1223]	DataPrototype is typed by an ApplicationRecordDataType
[constr_1224]	DataPrototype is typed by an ApplicationArrayDataType
[constr_1225]	DataPrototype is typed by an ImplementationDataType that references a CompuMethod of category TEXTTABLE or BITFIELD_TEXTTABLE
[constr_1226]	Applicable range for ExecutableEntityActivationReason.bitPosition
[constr_1227]	Value of attribute ExecutableEntityActivationReason.bitPosition shall be unique
[constr_1228]	RTEEvent that is referenced by a WaitPoint in the role trigger shall not reference ExecutableEntityActivationReason
[constr_1229]	category of ImplementationDataType boils down to VALUE
[constr_1230]	ApplicationDataType that qualifies for Integral Primitive Type
[constr_1231]	ConsistencyNeeds aggregated by CompositionSwComponentType
[constr_1232]	ConsistencyNeeds aggregated by AtomicSwComponentType

Number	Heading
[constr_1233]	InstantiationTimingEventProps shall only reference TimingEvent
[constr_1234]	Value of RunnableEntity.symbol
[constr_1237]	Scope of mapped ClientServerOperations in the context of a ClientServerOperationMapping
[constr_1238]	Scope of mapped ApplicationErrors in the context of a ClientServerOperationMapping
[constr_1239]	RuleBasedValueSpecification shall not exceed the number of values required
[constr_1240]	Consistency of ArgumentDataPrototypes within the context of a ClientServerOperationMapping
[constr_1241]	Compound Primitive Data Types and invalidValue
[constr_1242]	Restriction of invalidValue for ApplicationPrimitiveDataType
[constr_1243]	NumericalOrText shall either define vf or vt
[constr_1244]	DataPrototypes used in application software shall not be typed by C enums
[constr_1245]	Consideration of ModeTransitions for the compatibility of ModeDeclarationGroups
[constr_1246]	Consistency of firstMode and secondMode in the scope of one ModeDeclarationMappingSet
[constr_1247]	Consistency of ModeDeclarationMappingSet with respect to the referenced firstModeGroup and secondModeGroup
[constr_1248]	Compatibility of PortPrototypes of different DataInterfaces in the context of a PassThroughSwConnector
[constr_1249]	Compatibility of ModeSwitchInterfaces in the context of a PassThroughSwConnector
[constr_1250]	Compatibility of ClientServerInterfaces in the context of a PassThroughSwConnector
[constr_1251]	Compatibility of PortPrototypes of TriggerInterfaces in the context of a PassThroughSwConnector
[constr_1252]	Creation of a loop involving a PassThroughSwConnector is not allowed
[constr_1253]	Supported usage of VariationPointProxy
[constr_1254]	Definition of a pointer to a pointer
[constr_1255]	ApplicationPrimitiveDataTypes of category BOOLEAN and STRING
[constr_1256]	Acknowledgement feedback in n:1 writer case
[constr_1257]	No WaitPoints allowed
[constr_1258]	Value of minimumStartInterval for RunnableEntities triggered by an InitEvent
[constr_1259]	Aggregation of AsynchronousServerCallPoint and AsynchronousServerCallResultPoint
[constr_1260]	No mode disabling for InitEvents
[constr_1261]	Applicability for EndToEndDescription.dataIdNibbleOffset
[constr_1263]	Existence of ModeErrorBehavior.defaultMode
[constr_1264]	Iteration along output axis is only supported for VALUE and VAL_BLK
[constr_1268]	ArgumentDataPrototype.direction shall be preserved in a ClientServerOperationMapping

△

Number	Heading
[constr_1269]	Number of <code>arguments</code> shall be preserved in a <code>ClientServerOperationMapping</code>
[constr_1270]	<code>ArgumentDataPrototype</code> shall be mapped only once in a <code>ClientServerOperationMapping</code>
[constr_1271]	<code>ArrayValueSpecification.elements</code> shall be identical to the number of <code>ApplicationRecordDataType.element</code>
[constr_1272]	<code>ArrayValueSpecification.elements</code> shall be identical to the number of <code>subElements</code> of <code>ImplementationDataType</code> of category STRUCTURE
[constr_1273]	<code>ArrayValueSpecification.elements</code> shall be identical to the value of <code>ApplicationArrayDataType.element.maxNumberOfElements</code>
[constr_1274]	<code>ArrayValueSpecification.elements</code> shall be identical to the value of <code>ImplementationDataType.subElement.arraySize</code> of category ARRAY
[constr_2054]	Valid targets of <code>rptSystem</code>
[constr_2055]	Valid targets of <code>byPassPoint</code> and <code>rptHook</code> reference
[constr_2056]	Consistency of <code>RapidPrototypingScenario</code> with respect to <code>rptSystem</code> and <code>rptArHook</code> references
[constr_2057]	Mandatory information of a <code>RuleBasedAxisCont</code>
[constr_2058]	Mandatory information of a <code>RuleBasedValueCont</code>
[constr_4082]	<code>RunnableEntity.reentrancyLevel</code> shall not be set.

Table G.10: Added Constraints in R4.1.1

G.4.3 Changed Specification Items in R4.1.1

Number	Heading
[TPS_SWCT_01000]	Usage of attribute <code>symbol</code> of the <code>symbolProps</code>
[TPS_SWCT_01001]	Prefix symbols generated for the <code>RunnableEntity</code>
[TPS_SWCT_01085]	Variation on the behavior level
[TPS_SWCT_01112]	Semantics of <code>PortPrototypes</code>
[TPS_SWCT_01113]	Connecting two <code>PortPrototypes</code>
[TPS_SWCT_01128]	<code>SwRecordLayout</code> needed for <code>ApplicationPrimitiveDataType</code> of category STRING
[TPS_SWCT_01179]	Compound Primitive Data Type
[TPS_SWCT_01368]	Describe static and constant memory

Table G.11: Changed Specification Items in R4.1.1

G.4.4 Added Specification Items in R4.1.1

Number	Heading
[TPS_SWCT_01448]	Pre-defined values for the <code>category</code> of <code>VariationPointProxy</code>
[TPS_SWCT_01449]	Semantics of a <code>ModeDeclarationGroupPrototypeMapping</code>
[TPS_SWCT_01450]	Semantics of a <code>ModeTransition</code>
[TPS_SWCT_01451]	Relations between <code>ModeTransition</code> and <code>ModeDeclaration</code>
[TPS_SWCT_01452]	Applicability of <code>networkRepresentation</code> for <code>ApplicationComposite-DataType</code>
[TPS_SWCT_01454]	<code>PRPortPrototype</code> can own both <code>RPortComSpecs</code> and <code>PPortComSpecs</code>
[TPS_SWCT_01455]	Duplicate existence of <code>initValue</code> in the context of a <code>PRPortPrototype</code>
[TPS_SWCT_01456]	Predefined values for <code>MemorySection.option</code> and <code>SwAddrMethod.option</code>
[TPS_SWCT_01457]	<code>ExclusiveAreaNestingOrder</code>
[TPS_SWCT_01458]	Indicate that the locking behavior is fully described for <code>RunnableEntity</code>
[TPS_SWCT_01459]	Locking behavior is not described for this <code>RunnableEntity</code>
[TPS_SWCT_01460]	Relation of <code>SynchronousServerCallPoint</code> to <code>ExclusiveAreaNestingOrder</code>
[TPS_SWCT_01461]	Existence of <code>ImplementationDataType</code>
[TPS_SWCT_01462]	<code>ModeDeclarationMapping</code> defines the explicit correlation of <code>ModeDeclarations</code>
[TPS_SWCT_01463]	<code>ModeDeclarationGroupPrototypeMapping.modeDeclarationMappingSet</code> defines the applicable set of <code>ModeDeclarationMappings</code>
[TPS_SWCT_01464]	<code>ModeDeclaration</code> of a mode user is mapped to exactly one <code>ModeDeclaration</code> of a mode manager
[TPS_SWCT_01465]	<code>ModeDeclaration</code> of a mode user is mapped to several <code>ModeDeclarations</code> of a mode manager
[TPS_SWCT_01466]	<code>ConsistencyNeeds</code> applied on <code>RunnableEntities</code> that do not use implicit communication
[TPS_SWCT_01467]	<code>ImplementationDataType</code> references an <code>SwBaseType</code> with a string encoding
[TPS_SWCT_01469]	RTE API for retrieving the current activation reason
[TPS_SWCT_01470]	<code>RunnableEntityGroup</code>
[TPS_SWCT_01471]	<code>DataPrototypeGroup</code>
[TPS_SWCT_01472]	Receiving <code>SwComponentType</code> owns a <code>DataPrototypeGroup</code> in the role <code>regRequiresStability</code>
[TPS_SWCT_01473]	Receiving <code>SwComponentType</code> owns a <code>RunnableEntityGroup</code> in the role <code>regRequiresStability</code>
[TPS_SWCT_01474]	Receiving <code>SwComponentType</code> owns a <code>RunnableEntityGroup</code> in the role <code>regRequiresStability</code> and also owns one or several <code>DataPrototypeGroups</code> in the role <code>regRequiresStability</code>
[TPS_SWCT_01475]	Sending <code>SwComponentType</code> owns a <code>DataPrototypeGroup</code> in the role <code>regRequiresStability</code>

Number	Heading
[TPS_SWCT_01476]	Sender and receiver of the same implicitly communicated <code>VariableDataPrototypes</code> are associated with the same <code>RunnableEntityGroup</code>
[TPS_SWCT_01477]	Integral Primitive Types
[TPS_SWCT_01478]	Array size is defined as an attribute of the <code>ImplementationDataTypeElement</code>
[TPS_SWCT_01479]	Applicability of <code>ConsistencyNeeds</code>
[TPS_SWCT_01480]	<i>Stability</i> and/or <i>coherence</i> is not required
[TPS_SWCT_01481]	The meaning of the term <i>stability</i> with respect to <code>ConsistencyNeeds</code>
[TPS_SWCT_01482]	The meaning of the term <i>coherence</i> with respect to <code>ConsistencyNeeds</code>
[TPS_SWCT_01483]	Use static and constant memory to support Measurement and Calibration
[TPS_SWCT_01484]	Meaning of <code>ApplicationRuleBasedValueSpecification</code>
[TPS_SWCT_01485]	<code>RuleBasedValueSpecification</code> shall initialize first elements in an array
[TPS_SWCT_01486]	<code>ApplicationPrimitiveDataType</code> of category <code>STRING</code> may have <code>invalidValue</code>
[TPS_SWCT_01487]	Correspondence of <code>invalidValue</code> for <code>ApplicationPrimitiveDataType</code> and <code>ImplementationDataType</code>
[TPS_SWCT_01488]	<code>ApplicationPrimitiveDataType</code> shall be interpreted as a string of a particular encoding
[TPS_SWCT_01489]	Standardized values of <code>SwRecordLayoutV.swRecordLayoutVProp</code>
[TPS_SWCT_01490]	AUTOSAR supports <code>ApplicationErrors</code> only for <code>ClientServerInterfaces</code>
[TPS_SWCT_01491]	AUTOSAR system does not need to explicitly describe infrastructure errors
[TPS_SWCT_01492]	Default values for <code>factorSiToUnit</code> and <code>offsetSiToUnit</code>
[TPS_SWCT_01493]	The number of <code>RuleArguments.arguments</code> shall not exceed the array size
[TPS_SWCT_01494]	A <code>RuleBasedValueSpecification</code> of <code>rule FILL_UNITIL_END</code> shall fill the value of the last <code>RuleArguments.argument</code> until the last element of the array
[TPS_SWCT_01495]	Standardized value of <code>RuleBasedValueSpecification.category</code>
[TPS_SWCT_01496]	General precedence rule for attributes of <code>SwDataDefProps</code>
[TPS_SWCT_01497]	Precedence of the <code>unit</code> of value axis
[TPS_SWCT_01498]	Precedence of the <code>DataConstr</code> of value axis
[TPS_SWCT_01499]	Precedence of the <code>CompuMethod</code> of value axis
[TPS_SWCT_01500]	Precedence of the display format of value axis
[TPS_SWCT_01501]	Precedence of the calibration access of value axis
[TPS_SWCT_01502]	Precedence of the <code>Unit</code> of the input axis
[TPS_SWCT_01503]	Precedence of the <code>DataConstr</code> of the input axis
[TPS_SWCT_01504]	Precedence of the display format of the input axis
[TPS_SWCT_01505]	Precedence of calibration access along structure hierarchies in complex types
[TPS_SWCT_01506]	Precedence of the calibration access of input axis
[TPS_SWCT_01507]	The role of <code>PassThroughSwConnector</code>
[TPS_SWCT_01508]	Scope of end-to-end protection

Number	Heading
[TPS_SWCT_01509]	Implicit communication behavior
[TPS_SWCT_01510]	The role of pretended networking
[TPS_SWCT_01511]	Configuration option is encoded into <code>ModeDeclaration</code>
[TPS_SWCT_01512]	Request change of <code>Pretended Networking mode</code>
[TPS_SWCT_01513]	React on the change of <code>Pretended Networking mode</code>
[TPS_SWCT_01514]	Duplicate existence of <code>initValue</code> in the context of a <code>PRPortPrototype</code>
[TPS_SWCT_01515]	<code>PPortInCompositionInstanceRef</code> shall be used for attaching <code>DelegationSwConnector</code> to an inner <code>PRPortPrototype</code>
[TPS_SWCT_01516]	<code>PortInterface</code> describes the static structure of information interchange
[TPS_SWCT_01517]	<code>ClientServerOperation</code> cannot be passed as a reference
[TPS_SWCT_01518]	Priority of initial value definition with respect to conceptual levels
[TPS_SWCT_01519]	RTE executes certain <code>RunnableEntity</code> periodically
[TPS_SWCT_01520]	Implication of the existence of <code>possibleError</code> on compatibility of <code>ClientServerOperations</code>
[TPS_SWCT_01521]	Use <code>AutosarVariableRef.localVariable</code> for referencing inter-runnable variables
[TPS_SWCT_01522]	No initial value is specified for <code>implicitInterRunnableVariable</code> or <code>explicitInterRunnableVariable</code>
[TPS_SWCT_01523]	Internal trigger event
[TPS_SWCT_01524]	Usage of <code>IoHwAbstractionServerAnnotation</code>
[TPS_SWCT_01525]	<code>InitEvent</code> references a <code>RunnableEntity</code> in the role <code>startOnEvent</code>
[TPS_SWCT_01528]	Meaning of <code>NumericalRuleBasedValueSpecification</code>
[TPS_SWCT_01529]	Default value for <code>EndToEndDescription.dataIdNibbleOffset</code>
[TPS_SWCT_01530]	Error behavior of mode manager and mode user
[TPS_SWCT_01531]	The semantics of <code>ModeErrorReactionPolicyEnum</code>
[TPS_SWCT_01532]	The role of <code>ModeErrorBehavior.defaultMode</code>
[TPS_SWCT_01533]	<code>ModeDeclarationGroup.initialMode</code> shall be assumed in the absence of <code>ModeDeclarationGroup.modeManagerErrorBehavior</code>
[TPS_SWCT_01534]	<code>ModeDeclarationGroup.initialMode</code> shall be assumed in the absence of <code>ModeDeclarationGroup.modeUserErrorBehavior</code>
[TPS_SWCT_01535]	Mode manager reacts on mode error
[TPS_SWCT_01536]	Coherent behavior of all mode users in case of errors in the mode switch communication
[TPS_SWCT_01541]	Preferential selection of <code>modeUserErrorBehavior</code>
[TPS_SWCT_01542]	Preferential selection of <code>modeManagerErrorBehavior</code>
[TPS_SWCT_01543]	<code>PortInterfaceMapping</code> overrides all other compatibility rules
[TPS_SWCT_01544]	<i>prefix</i> used for the actual name of the used <code>PortInterface</code> for the routing activation
[TPS_SWCT_01545]	<code>ModeDeclaration</code> of a <i>mode user</i> that is not mapped to a <code>ModeDeclaration</code> of a <i>mode manager</i>
[TPS_SWCT_01546]	Notification when an external tester is attached or activated

Number	Heading
[TPS_SWCT_01547]	Ability to set and reset the Warning Indicator Status bit
[TPS_SWCT_02046]	<code>byPassPoint</code> specifies the rapid prototyping capability
[TPS_SWCT_02047]	<code>RptHook</code> specifies the link to rapid prototyping algorithm
[TPS_SWCT_02048]	Implicit <code>SwComponentPrototype</code> selection for Rapid Prototyping Scenario
[TPS_SWCT_02049]	Implicit <code>RunnableEntity</code> selection for Rapid Prototyping Scenario
[TPS_SWCT_02050]	Explicit access point selection for Rapid Prototyping Scenario
[TPS_SWCT_02051]	Explicit <code>DataPrototype</code> selection for Rapid Prototyping Scenario
[TPS_SWCT_02052]	Definition of Rapid Prototyping Scenario is splittable
[TPS_SWCT_02053]	Values of <code>RuleBasedAxisCont</code> with the <code>category</code> <code>COM_AXIS</code> , <code>RES_AXIS</code> are for display only
[TPS_SWCT_02507]	Instantiation-specific <code>RTEEvents</code>

Table G.12: Added Specification Items in 4.1.1

G.4.5 Deleted Constraints in R4.1.1

Number	Heading
[constr_1239]	<code>RuleBasedValueSpecification</code> shall not exceed the number of values required
[constr_1145]	Finding the symbol for the representation of a <code>CompuScale</code> in C code
[constr_2533]	Iteration along output axis is only supported for VALUE and VAL_BLK

Table G.13: Deleted Constraints in R4.1.1

Please note that [constr_2533] has been retagged to [constr_1264] to fix a duplicate constraint ID.

G.6.2 Changed Traceables in R4.1.3

Number	Heading
[TPS_SWCT_01009]	The numerical values used to define the values of <code>ModeDeclaration.value</code> and <code>ModeDeclarationGroup.onTransitionValue</code> can be arbitrarily defined
[TPS_SWCT_01049]	Two ways to use the <code>ExclusiveAreas</code>

Table G.22: Changed Traceables in R4.1.3

G.6.3 Deleted Traceables in R4.1.3

Number	Heading
[TPS_SWCT_01417]	Define calibration parameters common to all <code>SwComponentPrototypes</code> of the same <code>SwComponentType</code>
[TPS_SWCT_01419]	<code>ParameterSwComponentType</code> shall never aggregate a <code>SwcInternalBehavior</code>
[TPS_SWCT_02006]	<code>AtomicSwComponentType</code> offers sender receiver ports to adjust the IO signal via diagnostic services

Table G.23: Deleted Traceables in R4.1.3

G.6.4 Added Constraints in R4.1.3

Number	Heading
[constr_1297]	Applicability of serverArgumentImplPolicy set to <code>useArrayBaseType</code>
[constr_1298]	Existence of attributes if <code>category</code> of a ModeDeclarationGroup is set to <code>EXPLICIT_ORDER</code>
[constr_1299]	Existence of attributes if <code>category</code> of a ModeDeclarationGroup is set to other than <code>EXPLICIT_ORDER</code>

Table G.24: Added Constraints in R4.1.3

G.6.5 Changed Constraints in R4.1.3

Number	Heading
[constr_1006]	applicable data categories
[constr_1007]	Allowed attributes of SwDataDefProps for ApplicationDataTypes
[constr_1230]	ApplicationDataType that qualifies for <code>Integral Primitive Type</code>

Table G.25: Changed Constraints in R4.1.3

G.6.6 Deleted Constraints in R4.1.3

Number	Heading
[constr_1179]	Existence of ModeDeclaration.value within a ModeDeclarationGroup
[constr_1180]	Existence of ModeDeclarationGroup.onTransitionValue

Table G.26: Deleted Constraints in R4.1.3

G.7 Constraint History of this Document according to AUTOSAR R4.2.1

G.7.1 Added Traceables in R4.2.1

Number	Heading
[TPS_SWCT_01572]	Application Mode Manager interacts with both BswM and other Application-SwComponentTypes
[TPS_SWCT_01577]	AtomicSwComponentType requires the notification about a Service Request via diagnostic services with <i>manufacturer</i> characteristics
[TPS_SWCT_01578]	AtomicSwComponentType requires the notification about a Service Request via diagnostic services with <i>supplier</i> characteristics
[TPS_SWCT_01579]	Dcm can directly access dataElements in PPortPrototypes typed by a SenderReceiverInterface
[TPS_SWCT_01580]	Dem can directly access dataElements in PPortPrototypes typed by a SenderReceiverInterface
[TPS_SWCT_01581]	Communication patterns for mode-related communication
[TPS_SWCT_01582]	Semantics of DiagnosticEventNeeds.deferringFid
[TPS_SWCT_01583]	Completeness of TextTableMapping is not a requirement
[TPS_SWCT_01584]	InternalBehavior of a NvBlockSwComponentType for implementing a writing strategy
[TPS_SWCT_01585]	Relevance of NvBlockDescriptor.timingEvent.period
[TPS_SWCT_01586]	Writing strategies for <i>nv data</i>
[TPS_SWCT_01587]	The cyclic writing of <i>nv data</i> requires the existence of a TimingEvent
[TPS_SWCT_01588]	DataReceivedEvent for storing <i>nv data</i> immediately
[TPS_SWCT_01589]	Implementation of emergency storing of <i>nv data</i>
[TPS_SWCT_01590]	Combination of writing strategies for <i>nv data</i> is possible
[TPS_SWCT_01591]	Existence of attribute DiagnosticEventNeeds.reportBehavior
[TPS_SWCT_01592]	Communication among RunnableEntitys of different instances of the same AtomicSwComponentType
[TPS_SWCT_01593]	Semantics of attribute ReceiverComSpec.transformationComSpecProps
[TPS_SWCT_01594]	Semantics of TransformationComSpecProps
[TPS_SWCT_01595]	Semantics of attribute ClientComSpec.transformationComSpecProps
[TPS_SWCT_01596]	Semantics of attribute ServerComSpec.transformationComSpecProps
[TPS_SWCT_01597]	PortPrototype -specific data transformation configuration
[TPS_SWCT_01598]	More than one user-defined transformer is used within one transformer chain
[TPS_SWCT_01599]	PortPrototype -specific configuration for custom transformers
[TPS_SWCT_01600]	PortPrototype -specific configuration for data transformers related to end-to-end protection
[TPS_SWCT_01601]	Size Indicator shall be updated by software-component

Number	Heading
[TPS_SWCT_01602]	<code>Size Indicator</code> shall be read by the software-component
[TPS_SWCT_01603]	Variable size array with <code>Size Indicator</code>
[TPS_SWCT_01604]	Enable <code>Size Indicator</code>
[TPS_SWCT_01605]	Semantics of <code>ApplicationArrayElement.arraySizeHandling</code>
[TPS_SWCT_01606]	Internal structure of mapped <code>ImplementationDataType</code>
[TPS_SWCT_01607]	Profiles for internal structure of mapped <code>ImplementationDataType</code>
[TPS_SWCT_01608]	Custom profiles for internal structure of mapped <code>ImplementationDataType</code>
[TPS_SWCT_01609]	A <code>RuleBasedValueSpecification</code> of rule <code>FILL_UNTIL_MAX_SIZE</code> shall fill the value of the last <code>RuleArguments.argument</code> until the number of elements specified in <code>maxSizeToFill</code>
[TPS_SWCT_01610]	Modeling of a <code>Variable-Size Array Data Type</code> with <code>Size Indicator</code> enabled
[TPS_SWCT_01611]	Enable <code>Size Indicator</code>
[TPS_SWCT_01612]	<code>arraySizeHandling</code> specifies how the size is determined
[TPS_SWCT_01613]	Internal structure of mapped <code>ImplementationDataType</code>
[TPS_SWCT_01614]	Profiles for internal structure of mapped <code>ImplementationDataType</code>
[TPS_SWCT_01615]	Custom profiles for internal structure of mapped <code>ImplementationDataType</code>
[TPS_SWCT_01616]	Semantics of <code>TransformerHardErrorEvent</code>
[TPS_SWCT_01617]	Structure of an <code>ImplementationDataType</code> that represents a variable-sized array data type
[TPS_SWCT_01618]	<code>Size Indicator</code> for <code>dynamicArraySizeProfile</code> set to <code>VSA_LINEAR</code> , <code>VSA_SQUARE</code> , or <code>VSA_FULLY_FLEXIBLE</code>
[TPS_SWCT_01619]	<code>Size Indicator</code> for <code>dynamicArraySizeProfile</code> set to <code>VSA_RECTANGULAR</code>
[TPS_SWCT_01620]	<code>Size Indicator</code> for <code>dynamicArraySizeProfile</code> set to <code>VSA_RECTANGULAR</code>
[TPS_SWCT_01621]	Payload for <code>dynamicArraySizeProfile</code>
[TPS_SWCT_01622]	Modeling of a <code>Variable-Size Array Data Type</code> only with <code>ImplementationDataType</code>
[TPS_SWCT_01623]	Justification for the existence of attributes <code>ApplicationArrayDataType.dynamicArraySizeProfile</code> and <code>ApplicationArrayElement.arraySizeHandling</code>
[TPS_SWCT_01624]	Hard error occurs during the execution of a transformer chain
[TPS_SWCT_01625]	Sending <code>SwComponentType</code> owns a <code>DataPrototypeGroup</code> in the role <code>dp-gRequiresCoherency</code> and also <code>RunnableEntityGroups</code>
[TPS_SWCT_01626]	Error notification of data transformer errors
[TPS_SWCT_01627]	Suffix used for the resulting name of the <code>PortInterface</code> for the Security Access
[TPS_SWCT_01628]	Suffix used for the resulting name of the <code>PortInterface</code> for the Data Services
[TPS_SWCT_01629]	Suffix used for the resulting name of the <code>PortInterface</code> for the Data Services

Number	Heading
[TPS_SWCT_01630]	Suffix used for the resulting name of the <code>PortInterface</code> for the Data Services
[TPS_SWCT_01631]	Suffix used for the resulting name of the <code>PortInterface</code> for the Infotype Services
[TPS_SWCT_01632]	Suffix used for the resulting name of the <code>PortInterface</code> for the Routine Services
[TPS_SWCT_01633]	Suffix used for the resulting name of the <code>PortInterface</code> for the Request Control Services
[TPS_SWCT_01634]	Suffix used for the resulting name of the <code>PortInterface</code> for the Data Services
[TPS_SWCT_01635]	Naming conventions may support the effectiveness of <code>SymbolProps</code>
[TPS_SWCT_01636]	Definition of profiles for the definition of <code>Variable-Size Array Data Types</code>

Table G.27: Added Traceables in 4.2.1

G.7.2 Changed Traceables in R4.2.1

Number	Heading
[TPS_SWCT_01044]	<code>ServiceNeeds</code>
[TPS_SWCT_01053]	Relationship of interchanged data with <code>RunnableEntitys</code>
[TPS_SWCT_01141]	<code>AtomicSwComponentType</code> may have <code>AbstractRequiredPortPrototypes</code> typed by an <code>NvDataInterface</code>
[TPS_SWCT_01150]	<code>InternalBehavior</code> of a <code>NvBlockSwComponentType</code> to enable access to the NVRAM Block management API
[TPS_SWCT_01162]	Existence of <code>TextTableMapping</code>
[TPS_SWCT_01180]	Maximum possible size of Compound Primitive Data Type
[TPS_SWCT_01227]	Unconnected <code>AbstractRequiredPortPrototype</code> typed by <code>NvDataInterface</code>
[TPS_SWCT_01228]	<code>NvProvideComSpec</code>
[TPS_SWCT_01239]	default value for attribute <code>category</code> used in the context of <code>SwSystemconst</code>
[TPS_SWCT_01274]	<code>SwDataDefProps</code> used to support calibration and measurement
[TPS_SWCT_01321]	Communication among <code>RunnableEntitys</code>
[TPS_SWCT_01330]	<code>RunnableEntity</code> can also have <code>dataSendPoints</code>
[TPS_SWCT_01335]	Combine <code>dataReceivePointByValue</code> or <code>dataReceivePointByArgument</code> with a <code>WaitPoint</code>
[TPS_SWCT_01348]	Trigger source
[TPS_SWCT_01385]	Execution of finalization code for software-components
[TPS_SWCT_01456]	Predefined values for <code>MemorySection.option</code> and <code>SwAddrMethod.option</code>
[TPS_SWCT_01475]	Sending <code>SwComponentType</code> owns a <code>DataPrototypeGroup</code> in the role <code>dp-gRequiresCoherency</code>

Number	Heading
[TPS_SWCT_01494]	A RuleBasedValueSpecification of rule <code>FILL_UNTIL_END</code> shall fill the value of the last RuleArguments.argument until the last element of the array
[TPS_SWCT_01495]	Standardized value of RuleBasedValueSpecification.rule
[TPS_SWCT_01549]	Definition of linear data scaling
[TPS_SWCT_01560]	Supported categorys of CompuMethods for data conversion
[TPS_SWCT_02501]	Setup for Nvm Use Case: Permanent RAM Block
[TPS_SWCT_02502]	Setup for Nvm Use Case: Temporary RAM Block
[TPS_SWCT_02503]	Setup for NVM Use Case: Software-Components using Nv Data provided by NvBlockSwComponentType
[TPS_SWCT_02504]	Setup for Nvm Use Case: RAM Block with explicit synchronization using Mirror Interfaces

Table G.28: Changed Traceables in R4.2.1

G.7.3 Deleted Traceables in R4.2.1

Number	Heading
Id	Heading
[TPS_SWCT_01131]	AtomicSwComponentType accepts a request to restart an entire function
[TPS_SWCT_01386]	Initialization by mode management
[TPS_SWCT_01387]	Finalization by mode management
[TPS_SWCT_01410]	<code>Dcm</code> and <code>Dem</code> can directly access dataElements in PPortPrototypes typed by a SenderReceiverInterface
[TPS_SWCT_01438]	Handling of invalidation in the sending RTE
[TPS_SWCT_01439]	Handling of invalidation in the receiving RTE
[TPS_SWCT_02017]	AtomicSwComponentType requires the notification about a Service Request via diagnostic services

Table G.29: Deleted Traceables in R4.2.1

G.7.4 Added Constraints in R4.2.1

Number	Heading
[constr_1300]	Primitive DataPrototype on the provider side shall not be mapped to element of a composite data type on the requester side
[constr_1301]	Existence of RoleBasedDataTypeAssignment.role vs. RoleBasedDataAssignment.role

Number	Heading
[constr_1302]	Restriction of data invalidation
[constr_1303]	Applicability of <code>TextTableMapping</code> depending on the value of <code>CompuMethod.category</code>
[constr_1304]	Existence of attribute <code>bitfieldTextTableMaskFirst</code>
[constr_1305]	Existence of attribute <code>bitfieldTextTableMaskSecond</code>
[constr_1306]	Limitation of <code>TextTableMapping</code> for <code>CompuMethods</code> that have the value of <code>category</code> set to <code>BITFIELD_TEXTTABLE</code>
[constr_1307]	Consistency of values and masks in <code>TextTableMapping</code>
[constr_1308]	Existence of <code>NvBlockNeeds.cyclicWritingPeriod</code>
[constr_1309]	Existence of <code>NvBlockDescriptor.timingEvent</code>
[constr_1310]	Existence of attributes of meta-class <code>NvBlockNeeds</code>
[constr_1311]	Appearance of safety-related possible values of <code>MemorySection.option</code> or <code>SwAddrMethod.option</code> according to [TPS_SWCT_01456]
[constr_1312]	<code>PortPrototypes</code> typed by a <code>ParameterInterface</code>
[constr_1313]	Completeness of <code>TextTableMapping</code> for the values of a given bit mask on the sender side
[constr_1314]	Profile <code>VSA_LINEAR</code> for <code>ApplicationArrayDataType</code>
[constr_1315]	Profile <code>VSA_SQUARE</code> for <code>ApplicationArrayDataType</code>
[constr_1316]	Profile <code>VSA_RECTANGULAR</code> for <code>ApplicationArrayDataType</code>
[constr_1317]	Profile <code>VSA_FULLY_FLEXIBLE</code> for <code>ApplicationArrayDataType</code>
[constr_1318]	Profile <code>VSA_LINEAR</code> for <code>ImplementationDataType</code>
[constr_1319]	Profile <code>VSA_SQUARE</code> for <code>ImplementationDataType</code>
[constr_1320]	Profile <code>VSA_RECTANGULAR</code> for <code>ImplementationDataType</code>
[constr_1321]	Profile <code>VSA_FULLY_FLEXIBLE</code> for <code>ImplementationDataType</code>
[constr_1322]	<code>Size Indicator</code> for undefined <code>dynamicArraySizeProfile</code>
[constr_1323]	Applicability of attribute <code>ReceiverComSpec.usesEndToEndProtection</code>
[constr_1363]	Existence of attributes of <code>DiagnosticValueNeeds</code>
[constr_1364]	Existence of attributes of <code>DiagnosticIoControlNeeds</code>
[constr_1375]	Existence of attributes of <code>CompuMethod</code> and related meta-classes

Table G.30: Added Constraints in R4.2.1

G.7.5 Changed Constraints in R4.2.1

Number	Heading
[constr_1006]	applicable data categories
[constr_1007]	Allowed attributes of <code>SwDataDefProps</code> for <code>ApplicationDataTypes</code>
[constr_1009]	<code>SwDataDefProps</code> applicable to <code>ImplementationDataTypes</code>

Number	Heading
[constr_1014]	Supported value encodings for SwBaseType
[constr_1015]	Prioritization of SwDataDefProps
[constr_1037]	Client shall not be connected to multiple servers
[constr_1072]	Compatibility of ModeSwitchInterfaces in the context of an AssemblySwConnector
[constr_1073]	Compatibility of ModeSwitchInterfaces in the context of an DelegationSwConnector
[constr_1074]	Compatibility of ModeDeclarationGroupPrototypes
[constr_1101]	Mode-related communication
[constr_1112]	Constraints of dataIdMode in PROFILE_01
[constr_1149]	PortPrototypes used for NV data management
[constr_1188]	Existence of ReceiverComSpec.replaceWith
[constr_1288]	Allowed Attributes vs. category for DataPrototypes typed by ImplementationDataTypes
[constr_1289]	Allowed Attributes vs. category for DataPrototypes typed by ApplicationDataTypes
[constr_2009]	Supported kinds of PortPrototypes of a NvBlockSwComponentType
[constr_2015]	Limitation of SwcInternalBehavior of a NvBlockSwComponentType
[constr_2019]	ServiceSwComponentType shall have service ports only
[constr_2022]	Mutually exclusive use of SynchronousServerCallPoints and AsynchronousServerCallPoints
[constr_2051]	Mandatory information of a SwValueCont

Table G.31: Changed Constraints in R4.2.1

G.7.6 Deleted Constraints in R4.2.1

Number	Heading
[constr_1189]	Allowed targets of externalReplacement
[constr_1293]	Existence of DiagnosticEventNeeds.dtcNumber
[constr_1294]	Existence of DiagnosticEventInfoNeeds.dtcNumber
[constr_2551]	SwCalprmAxis.baseType shall be ignored

Table G.32: Deleted Constraints in R4.2.1

G.8 Constraint History of this Document according to AUTOSAR R4.2.2

G.8.1 Added Traceables in R4.2.2

Number	Heading
[TPS_SWCT_01637]	Initial value for a specific <code>implicitInterRunnableVariable</code> or <code>explicitInterRunnableVariable</code>
[TPS_SWCT_01638]	Existence of <code>SwConnector</code> between two <code>PRPortPrototypes</code>
[TPS_SWCT_01639]	<code>AtomicSwComponentType</code> offers a <code>PPortPrototype</code> typed by <code>ClientServerInterface</code> to read/write current value via diagnostic services where the applicable DID is passed as an argument to the access functions
[TPS_SWCT_01640]	Suffix used for the resulting name of the <code>PortInterface</code> for the Data Services
[TPS_SWCT_01641]	Definition of an “old-world” dynamic-size array data type by means of an <code>ApplicationArrayDataType</code>
[TPS_SWCT_01642]	Definition of an “old-world” dynamic-size array data type by means of an <code>ImplementationDataType</code>
[TPS_SWCT_01644]	Definition of a “new-world” variable-size array data type by means of an <code>ApplicationArrayDataType</code>
[TPS_SWCT_01645]	Definition of a “new-world” variable-size array data type by means of an <code>ImplementationDataType</code>
[TPS_SWCT_01646]	Sending <code>invalidValue</code> without invalidation applied by RTE/Com
[TPS_SWCT_01647]	Size Indicator for <code>dynamicArraySizeProfile</code> set to <code>VSA_LINEAR</code> , <code>VSA_SQUARE</code> , or <code>VSA_FULLY_FLEXIBLE</code> if only <code>ImplementationDataType</code> is present
[TPS_SWCT_01648]	Size Indicator for <code>dynamicArraySizeProfile</code> set to <code>VSA_RECTANGULAR</code> if only <code>ImplementationDataType</code> is present
[TPS_SWCT_01649]	Payload for <code>dynamicArraySizeProfile</code> if only <code>ImplementationDataType</code> is present
[TPS_SWCT_01650]	Structure of the <code>VSA ImplementationDataType</code>
[TPS_SWCT_01651]	UTF-16BE
[TPS_SWCT_01652]	UTF-16LE
[TPS_SWCT_01653]	UTF-16-encoded strings are not allowed to start with a BOM
[TPS_SWCT_01654]	<code>AtomicSwComponentType</code> offers <code>PortPrototypes</code> typed by <code>SenderReceiverInterfaces</code> to adjust the IO signal via diagnostic services
[TPS_SWCT_01655]	Reference from <code>DiagnosticIoControlNeeds</code> to <code>DiagnosticValueNeeds</code>
[TPS_SWCT_01656]	Suffix used for the resulting name of the <code>PortInterface</code> for <code>IOControlRequest</code> and <code>IOControlResponse</code>
[TPS_SWCT_01657]	NamingRule for <code>RPortPrototype</code> referenced by a <code>RoleBasedPortAssignment</code> with attribute <code>role</code> set to “IOControlRequest”

Number	Heading
[TPS_SWCT_01658]	NamingRule for PPortPrototype referenced by a RoleBasedPortAssignment with attribute <code>role</code> set to "IOControlResponse"
[TPS_SWCT_01659]	Mapping of VariableDataPrototype to a NvBlockDescriptor

Table G.33: Added Traceables in 4.2.2

G.8.2 Changed Traceables in R4.2.2

Number	Heading
[TPS_SWCT_01133]	AtomicSwComponentType provides information about aging cycles
[TPS_SWCT_01158]	Three cases for PortInterfaceMapping
[TPS_SWCT_01179]	Compound Primitive Data Type
[TPS_SWCT_01244]	Data types for calibration parameters are also described as primitive types
[TPS_SWCT_01370]	VariationPointProxy
[TPS_SWCT_01431]	Finding the symbol for the representation of a CompuScale with a point-range in C code
[TPS_SWCT_01432]	Keep the <code>invalidValue</code> transparent to the sending and receiving software components
[TPS_SWCT_01434]	Sender and receiver have knowledge of invalid value
[TPS_SWCT_01610]	Modeling of a Variable-Size Array Data Type with Size Indicator enabled
[TPS_SWCT_01616]	Semantics of TransformerHardErrorEvent
[TPS_SWCT_01617]	Structure of an ImplementationDataType that represents a variable-sized array data type
[TPS_SWCT_01624]	Hard error occurs during the execution of a transformer chain
[TPS_SWCT_02001]	Values of SwAxisCont with the <code>category</code> , <code>COM_AXIS</code> , <code>RES_AXIS</code> are for display only
[TPS_SWCT_02053]	Values of RuleBasedAxisCont with the <code>category</code> <code>COM_AXIS</code> , <code>RES_AXIS</code> are for display only

Table G.34: Changed Traceables in R4.2.2

G.8.3 Deleted Traceables in R4.2.2

Number	Heading
[TPS_SWCT_01308]	Combination of <code>supportsMultipleInstantiation=false</code> and <code>canBeInvokedConcurrently=false</code>
[TPS_SWCT_01433]	Invalid values outside the range limits

Number	Heading
[TPS_SWCT_01435]	Invalid values outside the range limits
[TPS_SWCT_01603]	Variable size array with Size Indicator
[TPS_SWCT_01611]	Enable Size Indicator

Table G.35: Deleted Traceables in R4.2.2

G.8.4 Added Constraints in R4.2.2

Number	Heading
[constr_1381]	Appearance of core-related possible values of MemorySection.option or SwAddrMethod.option according to [TPS_SWCT_01456]
[constr_1382]	Mutually exclusive existence of attributes SwVariableRefProxy.autosarVariable vs. SwVariableRefProxy.mcDataInstanceVar
[constr_1383]	Existence of CompuMethod and DataConstr for ImplementationDataTypes of category TYPE_REFERENCE
[constr_1384]	Definition of invalidValue for DataPrototype typed by ApplicationPrimitiveDataType of category CURVE , MAP , CUBOID , CUBE_4 , CUBE_5 , COM_AXIS , RES_AXIS , and VAL_BLK
[constr_1385]	DataPrototype is typed by an ImplementationDataType
[constr_1386]	PortDefinedArgumentValue shall only be defined for AbstractProvidedPortPrototype
[constr_1388]	VariationPointProxy of category VALUE shall not mix “pre-build” and “post-build” use-cases
[constr_1389]	Restriction regarding the value of category of VariationPointProxy.implementationDataType
[constr_1390]	Restriction to the value of SenderReceiverInterface.invalidationPolicy.handleInvalid
[constr_1391]	Compatibility of Units in the context of assignment using an ApplicationValueSpecification
[constr_1392]	Compatibility of Units in the context of assignment using an ApplicationRuleBasedValueSpecification
[constr_1393]	Existence of RuleBasedValueCont.unit
[constr_1395]	NvBlockDataMapping shall be complete
[constr_1396]	Restriction for the value of attribute category for non-terminating ImplementationDataTypeElements taken to model a Variable-Size Array Data Type
[constr_1397]	Existence of attributes of TransformerHardErrorEvent
[constr_1398]	Existence of attributes of BaseTypeDirectDefinition
[constr_1399]	Standardized values of ModeDeclarationGroup.category
[constr_1400]	Reference to a specific DataTransformation
[constr_1401]	Restrictions on the relation between DataPrototypeMapping and DataTransformation

Number	Heading
[constr_1402]	Applicability of core-related possible values of <code>MemorySection.option</code> or <code>SwAddrMethod.option</code> related to <code>SwAddrMethod.sectionInitializationPolicy</code>
[constr_1403]	<code>NvBlockDataMappings</code> to a given <code>nvData</code> shall be unambiguous
[constr_1404]	All <code>NvDataInterface.nvData</code> of <code>PortPrototypes</code> in the context of a specific <code>SwcServiceDependency</code> shall be mapped to the same <code>NvBlockDescriptor</code>

Table G.36: Added Constraints in R4.2.2

G.8.5 Changed Constraints in R4.2.2

Number	Heading
[constr_1006]	applicable data categories
[constr_1007]	Allowed attributes of <code>SwDataDefProps</code> for <code>ApplicationDataTypes</code>
[constr_1040]	Conversion of <code>SenderReceiverInterfaces</code>
[constr_1045]	Supported value encodings for <code>SwBaseType</code> in the context of <code>PortInterfaces</code>
[constr_1060]	Compatibility of data types with <code>category ARRAY, VAL_BLK</code>
[constr_1064]	Compatibility of data types with <code>category COM_AXIS, RES_AXIS, CURVE, MAP, CUBOID, CUBE_4, or CUBE_5</code>
[constr_1066]	Forbidden mappings to <code>ImplementationDataType</code>
[constr_1075]	Compatibility of <code>ModeDeclarationGroups</code>
[constr_1164]	Number of <code>arguments</code> owned by a <code>RunnableEntity</code>
[constr_1234]	Value of <code>RunnableEntity.symbol</code>
[constr_1318]	Profile <code>VSA_LINEAR</code> for <code>ImplementationDataType</code>
[constr_1319]	Profile <code>VSA_SQUARE</code> for <code>ImplementationDataType</code>
[constr_1320]	Profile <code>VSA_RECTANGULAR</code> for <code>ImplementationDataType</code>
[constr_1321]	Profile <code>VSA_FULLY_FLEXIBLE</code> for <code>ImplementationDataType</code>
[constr_1322]	<code>Size Indicator</code> for undefined <code>dynamicArraySizeProfile</code>
[constr_2051]	Mandatory information of a <code>SwValueCont</code>
[constr_2058]	Mandatory information of a <code>RuleBasedValueCont</code>

Table G.37: Changed Constraints in R4.2.2

G.8.6 Deleted Constraints in R4.2.2

Number	Heading
[constr_1002]	End-to-end protection does not support n:1 communication
[constr_1067]	<code>ApplicationDataType</code> is or is not compatible to specific <code>ImplementationDataType</code>
[constr_2001]	Initial value for a specific <code>implicitInterRunnableVariable</code> or <code>explicitInterRunnableVariable</code>

Table G.38: Deleted Constraints in R4.2.2

G.9 Constraint History of this Document according to AUTOSAR R4.3.0

G.9.1 Added Traceables in R4.3.0

Number	Heading
[TPS_SWCT_01660]	Values of <code>SwcServiceDependency.category</code> reserved by the standard
[TPS_SWCT_01661]	Default value of <code>SwcServiceDependency.category</code>
[TPS_SWCT_01662]	Applicability of <code>DataTypeMappingSets</code> inside an <code>NvBlockSwComponentType</code>
[TPS_SWCT_01663]	<code>dataReadAccess</code> vs. <code>dataReceivePointByValue</code> or <code>dataReceivePointByArgument</code>
[TPS_SWCT_01664]	BswM acts as a mode requester towards an application mode manager
[TPS_SWCT_01665]	Usage of <code>SwcModeSwitchEvent</code> for triggering a write procedure of <code>nv data</code>
[TPS_SWCT_01666]	Semantics of <code>ModeSwitchEventTriggeredActivity.role</code>
[TPS_SWCT_01667]	Avoidance of overlapping of directly adjacent intervals within <code>CompuMethods</code>
[TPS_SWCT_01668]	<code>SecOc</code> Use Case: obtain the verification status of secure communication
[TPS_SWCT_01672]	<code>SecOc</code> Use Case: software component retires from secure communication for a given period
[TPS_SWCT_01673]	Application Software Component sends requests using the J1939Rm
[TPS_SWCT_01674]	Application Software Component accepts requests using the J1939Rm

[constr_1219]	Invalidation depends on the value of <code>swImplPolicy</code>
[constr_1220]	Compatibility of <code>SwBaseType</code>
[constr_1221]	<code>DataPrototype</code> is typed by an <code>ApplicationPrimitiveDataType</code>
[constr_1222]	<code>category</code> of an <code>AutosarDataType</code> used to type a <code>DataPrototype</code> is set to <code>STRING</code>
[constr_1223]	<code>DataPrototype</code> is typed by an <code>ApplicationRecordDataType</code>
[constr_1224]	<code>DataPrototype</code> is typed by an <code>ApplicationArrayDataType</code>
[constr_1225]	<code>DataPrototype</code> is typed by an <code>ImplementationDataType</code> that references a <code>CompuMethod</code> of category <code>TEXTTABLE</code> or <code>BITFIELD_TEXTTABLE</code>
[constr_1226]	Applicable range for <code>ExecutableEntityActivationReason.bitPosition</code>

Number	Heading
[constr_1227]	Value of attribute <code>ExecutableEntityActivationReason.bitPosition</code> shall be unique
[constr_1228]	<code>RTEEvent</code> that is referenced by a <code>WaitPoint</code> in the role <code>trigger</code> shall not reference <code>ExecutableEntityActivationReason</code>
[constr_1229]	<code>category</code> of <code>ImplementationDataType</code> boils down to <code>VALUE</code>
[constr_1230]	<code>ApplicationDataType</code> that qualifies for <code>Integral Primitive Type</code>
[constr_1231]	<code>ConsistencyNeeds</code> aggregated by <code>CompositionSwComponentType</code>
[constr_1232]	<code>ConsistencyNeeds</code> aggregated by <code>AtomicSwComponentType</code>
[constr_1233]	<code>InstantiationTimingEventProps</code> shall only reference <code>TimingEvent</code>
[constr_1234]	Value of <code>RunnableEntity.symbol</code>
[constr_1237]	Scope of mapped <code>ClientServerOperations</code> in the context of a <code>ClientServerOperationMapping</code>
[constr_1238]	Scope of mapped <code>ApplicationErrors</code> in the context of a <code>ClientServerOperationMapping</code>
[constr_1240]	Consistency of <code>ArgumentDataPrototypes</code> within the context of a <code>ClientServerOperationMapping</code>
[constr_1241]	<code>Compound Primitive Data Types</code> and <code>invalidValue</code>
[constr_1242]	Restriction of <code>invalidValue</code> for <code>ApplicationPrimitiveDataType</code> of <code>category STRING</code>
[constr_1243]	<code>NumericalOrText</code> shall either define <code>vf</code> or <code>vt</code>
[constr_1244]	<code>DataPrototypes</code> used in application software shall not be typed by C enums
[constr_1245]	Consideration of <code>ModeTransitions</code> for the compatibility of <code>ModeDeclarationGroups</code>
[constr_1246]	Consistency of <code>firstMode</code> and <code>secondMode</code> in the scope of one <code>ModeDeclarationMappingSet</code>
[constr_1247]	Consistency of <code>ModeDeclarationMappingSet</code> with respect to the referenced <code>firstModeGroup</code> and <code>secondModeGroup</code>
[constr_1248]	Compatibility of <code>PortPrototypes</code> of different <code>DataInterfaces</code> in the context of a <code>PassThroughSwConnector</code>
[constr_1249]	Compatibility of <code>ModeSwitchInterfaces</code> in the context of a <code>PassThroughSwConnector</code>
[constr_1250]	Compatibility of <code>ClientServerInterfaces</code> in the context of a <code>PassThroughSwConnector</code>
[constr_1251]	Compatibility of <code>PortPrototypes</code> of <code>TriggerInterfaces</code> in the context of a <code>PassThroughSwConnector</code>
[constr_1252]	Creation of a loop involving a <code>PassThroughSwConnector</code> is not allowed
[constr_1253]	Supported usage of <code>VariationPointProxy</code>
[constr_1254]	Definition of a pointer to a pointer
[constr_1255]	<code>ApplicationPrimitiveDataTypes</code> of <code>category BOOLEAN</code> and <code>STRING</code>
[constr_1256]	Acknowledgement feedback in n:1 writer case
[constr_1257]	No <code>WaitPoints</code> allowed
[constr_1258]	Value of <code>minimumStartInterval</code> for <code>RunnableEntities</code> triggered by an <code>InitEvent</code>

Number	Heading
[constr_1259]	Aggregation of AsynchronousServerCallPoint and AsynchronousServerCallResultPoint
[constr_1260]	No mode disabling for InitEvents
[constr_1261]	Applicability for EndToEndDescription.dataIdNibbleOffset
[constr_1263]	Existence of ModeErrorBehavior.defaultMode
[constr_1264]	Iteration along output axis is only supported for VALUE and VAL_BLK
[constr_1268]	ArgumentDataPrototype.direction shall be preserved in a ClientServerOperationMapping
[constr_1269]	Number of arguments shall be preserved in a ClientServerOperationMapping
[constr_1270]	ArgumentDataPrototype shall be mapped only once in a ClientServerOperationMapping
[constr_1271]	RecordValueSpecification.fields shall be identical to the number of ApplicationRecordDataType.elements
[constr_1272]	RecordValueSpecification.fields shall be identical to the number of subElements of ImplementationDataType of category STRUCTURE
[constr_1273]	Rules for the initialization of ApplicationArrayDataType by means of ArrayValueSpecification
[constr_1274]	Rules for the initialization of array-shaped ImplementationDataType with a fixed size by means of ArrayValueSpecification
[constr_1277]	SwDataDefProps.swImplPolicy of a VariableDataPrototype referenced by a VariableAccess aggregated in the role dataReceivePointByValue
[constr_1278]	PhysConstrs references a Unit
[constr_1279]	Unmapped elements of ApplicationCompositeDataTypes or ImplementationDataTypes and the attribute swImplPolicy
[constr_1280]	Unmapped dataElement on the “target” end shall have an initValue
[constr_1282]	Restriction concerning the usage of RuleBasedValueSpecification or a ReferenceValueSpecification for the specification of an invalidValue
[constr_1284]	Limitation of the use of TextValueSpecification
[constr_1285]	Applicability of roles vs. PortPrototypes
[constr_1286]	serverArgumentImplPolicy and ArgumentDataPrototype typed by primitive data types
[constr_1287]	Compatibility of SenderReceiverInterfaces with respect to invalidationPolicy
[constr_1288]	Allowed Attributes vs. category for DataPrototypes typed by ImplementationDataTypes
[constr_1289]	Allowed Attributes vs. category for DataPrototypes typed by ApplicationDataTypes
[constr_1290]	Limitation on the number of PPortComSpecs in the context of one PPortPrototype
[constr_1291]	Limitation on the number of RPortComSpecs in the context of one PPortPrototype

Number	Heading
[constr_1292]	Limitation on the number of <code>RPortComSpecs</code> / <code>PPortComSpecs</code> in the context of one <code>PRPortPrototype</code>
[constr_1295]	<code>PortInterfaces</code> and category <code>DATA_REFERENCE</code>
[constr_1296]	<code>DataPrototypes</code> used as <code>explicitInterRunnableVariable</code> or <code>implicitInterRunnableVariable</code> and category <code>DATA_REFERENCE</code>
[constr_1298]	Existence of attributes if category of a <code>ModeDeclarationGroup</code> is set to <code>EXPLICIT_ORDER</code>
[constr_1299]	Existence of attributes if category of a <code>ModeDeclarationGroup</code> is set to other than <code>EXPLICIT_ORDER</code>
[constr_1300]	Primitive <code>DataPrototype</code> on the “source” end shall not be mapped to element of a composite data type on the “target” end of the <code>SwConnector</code>
[constr_1301]	Existence of <code>RoleBasedDataTypeAssignment.role</code> vs. <code>RoleBasedDataAssignment.role</code>
[constr_1302]	Restriction of data invalidation
[constr_1303]	Applicability of <code>TextTableMapping</code> depending on the value of <code>CompuMethod.category</code>
[constr_1304]	Existence of attribute <code>bitfieldTextTableMaskFirst</code>
[constr_1305]	Existence of attribute <code>bitfieldTextTableMaskSecond</code>
[constr_1306]	Limitation of <code>TextTableMapping</code> for <code>CompuMethods</code> that have the value of category set to <code>BITFIELD_TEXTTABLE</code>
[constr_1307]	Consistency of values and masks in <code>TextTableMapping</code>
[constr_1308]	Existence of <code>NvBlockNeeds.cyclicWritingPeriod</code>
[constr_1309]	Existence of <code>NvBlockDescriptor.timingEvent</code>
[constr_1310]	Existence of attributes of meta-class <code>NvBlockNeeds</code>
[constr_1311]	Appearance of safety-related possible values of <code>MemorySection.option</code> or <code>SwAddrMethod.option</code>
[constr_1312]	<code>PortPrototypes</code> typed by a <code>ParameterInterface</code>
[constr_1313]	Completeness of <code>TextTableMapping</code> for the values of a given bit mask on the sender side
[constr_1314]	Profile <code>VSA_LINEAR</code> for <code>ApplicationArrayDataType</code>
[constr_1315]	Profile <code>VSA_SQUARE</code> for <code>ApplicationArrayDataType</code>
[constr_1316]	Profile <code>VSA_RECTANGULAR</code> for <code>ApplicationArrayDataType</code>
[constr_1317]	Profile <code>VSA_FULLY_FLEXIBLE</code> for <code>ApplicationArrayDataType</code>
[constr_1318]	Profile <code>VSA_LINEAR</code> for <code>ImplementationDataType</code>
[constr_1319]	Profile <code>VSA_SQUARE</code> for <code>ImplementationDataType</code>
[constr_1320]	Profile <code>VSA_RECTANGULAR</code> for <code>ImplementationDataType</code>
[constr_1321]	Profile <code>VSA_FULLY_FLEXIBLE</code> for <code>ImplementationDataType</code>
[constr_1322]	<code>Size Indicator</code> for undefined <code>dynamicArraySizeProfile</code>
[constr_1363]	Existence of attributes of <code>DiagnosticValueNeeds</code>
[constr_1364]	Existence of attributes of <code>DiagnosticIoControlNeeds</code>
[constr_1375]	Existence of attributes of <code>CompuMethod</code> and related meta-classes

Number	Heading
[constr_1381]	Appearance of core-related possible values of <code>MemorySection.option</code> or <code>SwAddrMethod.option</code>
[constr_1382]	Mutually exclusive existence of attributes <code>SwVariableRefProxy.autosarVariable</code> vs. <code>SwVariableRefProxy.mcDataInstanceVar</code>
[constr_1383]	Existence of <code>CompuMethod</code> and <code>DataConstr</code> for <code>ImplementationDataTypes</code> of category <code>TYPE_REFERENCE</code>
[constr_1384]	Definition of <code>invalidValue</code> for <code>DataPrototype</code> typed by <code>ApplicationPrimitiveDataType</code> of category <code>CURVE</code> , <code>MAP</code> , <code>CUBOID</code> , <code>CUBE_4</code> , <code>CUBE_5</code> , <code>COM_AXIS</code> , <code>RES_AXIS</code> , and <code>VAL_BLK</code>
[constr_1385]	<code>DataPrototype</code> is typed by an <code>ImplementationDataType</code>
[constr_1386]	<code>PortDefinedArgumentValue</code> shall only be defined for <code>AbstractProvidedPortPrototype</code>
[constr_1388]	<code>VariationPointProxy</code> of category <code>VALUE</code> shall not mix “pre-build” and “post-build” use-cases
[constr_1389]	Restriction regarding the value of <code>category</code> of <code>VariationPointProxy.implementationDataType</code>
[constr_1390]	Restriction to the value of <code>SenderReceiverInterface.invalidationPolicy.handleInvalid</code>
[constr_1391]	Compatibility of <code>Units</code> in the context of assignment using an <code>ApplicationValueSpecification</code>
[constr_1392]	Compatibility of <code>Units</code> in the context of assignment using an <code>ApplicationRuleBasedValueSpecification</code>
[constr_1393]	Existence of <code>RuleBasedValueCont.unit</code>
[constr_1395]	<code>NvBlockDataMapping</code> shall be complete
[constr_1396]	Restriction for the value of attribute <code>category</code> for non-terminating <code>ImplementationDataTypeElements</code> taken to model a <code>Variable-Size Array Data Type</code>
[constr_1397]	Existence of attributes of <code>TransformerHardErrorEvent</code>
[constr_1398]	Existence of attributes of <code>BaseTypeDirectDefinition</code>
[constr_1399]	Standardized values of <code>ModeDeclarationGroup.category</code>
[constr_1400]	Reference to a specific <code>DataTransformation</code>
[constr_1401]	Restrictions on the relation between <code>DataPrototypeMapping</code> and <code>DataTransformation</code>
[constr_1402]	Applicability of core-related possible values of <code>MemorySection.option</code> or <code>SwAddrMethod.option</code> related to <code>SwAddrMethod.sectionInitializationPolicy</code>
[constr_1403]	<code>NvBlockDataMapping</code> s to a given <code>nvData</code> shall be unambiguous
[constr_1404]	All <code>NvDataInterface.nvData</code> of <code>PortPrototypes</code> in the context of a specific <code>SwcServiceDependency</code> shall be mapped to the same <code>NvBlockDescriptor</code>
[constr_1407]	Definition of <code>SwDataDefProps.dataConstr</code> depending on the capabilities of the data type
[constr_1408]	Definition of <code>SwDataDefProps.displayFormat</code> depending on the capabilities of the data type

Number	Heading
[constr_1409]	Definition of <code>SwDataDefProps.dataConstr</code> depending on the capabilities of the element data type
[constr_1410]	Definition of <code>SwDataDefProps.displayFormat</code> depending on the capabilities of the element data type
[constr_1413]	Definition of <code>SwDataDefProps.stepSize</code> depending on the capabilities of the data type
[constr_1414]	Definition of <code>SwDataDefProps.stepSize</code> depending on the capabilities of the element data type
[constr_1415]	Supported values of <code>ModeSwitchEventTriggeredActivity.role</code>
[constr_1416]	Existence of <code>ApplicationArrayElement.maxNumberOfElements</code>
[constr_1417]	Invalid connection between <code>NvBlockSwComponentType</code> and other <code>AtomicSwComponentType</code> (I)
[constr_1418]	Invalid connection between <code>NvBlockSwComponentType</code> and other <code>AtomicSwComponentType</code> (II)
[constr_1420]	Existence of <code>SwAxisIndividual.inputVariableType</code>
[constr_1422]	Value of <code>category</code> is VOID
[constr_1423]	Completeness of references <code>ArVariableInImplementationDataInstanceRef.contextDataPrototype</code>
[constr_1424]	Existence of <code>ArVariableInImplementationDataInstanceRef.contextDataPrototype</code>
[constr_1425]	Definition of <code>swCalprmAxisSet.swCalprmAxis / SwAxisIndividual.swVariableRef</code> depending on the capabilities of the data type
[constr_1426]	Consistency of array sizes for axes and input variable array
[constr_1427]	Definition of <code>swCalprmAxisSet.swCalprmAxis / SwAxisGrouped.swCalprmRef</code> depending on the capabilities of the data type
[constr_1428]	Consistency of array sizes for arrays of elements of <code>category</code> CURVE, MAP, CUBOID, CUBE_4, or CUBE_5 arrays and used group axes arrays
[constr_1429]	Access to data within <code>PortPrototypes</code> from within <code>RunnableEntitys</code>
[constr_1430]	Access to local data from within <code>RunnableEntitys</code>
[constr_1431]	Access to parameters from within <code>RunnableEntitys</code>
[constr_1432]	Multiplicity of <code>CommunicationBufferLocking</code>
[constr_1433]	Transient faults are not applicable to software-components
[constr_1434]	<code>CompuScale</code> s shall not have identical <code>CompuScale Value Symbolic Name</code> s
[constr_1438]	<code>ApplicationArrayElement.indexDataType</code> needs to refer to a <code>CompuMethod</code> of <code>category</code> TEXTTABLE
[constr_1439]	Requirements on <code>ApplicationArrayElement</code> if attribute <code>indexDataType</code> exists
[constr_1440]	Size of the <code>CompuMethod</code> of <code>category</code> TEXTTABLE referenced by <code>ApplicationArrayElement.indexDataType</code>
[constr_1442]	<code>category</code> TYPE_REFERENCE shall not be used for modeling the “payload” of a <code>Wrapped Union Data Type</code>
[constr_1444]	Limited applicability of <code>Wrapped Union Data Type</code>

Number	Heading
[constr_1445]	Initialization of the <code>Member Selector of a Wrapped Union Data Type</code>
[constr_1446]	No definition of <code>invalidValue</code> for a <code>Wrapped Union Data Type</code>
[constr_1468]	Limitation on the number of <code>SwcExclusiveAreaPolicys</code>
[constr_1469]	Applicability of constraints depending on the existence of a data transformation
[constr_1516]	Completeness of references <code>ArParameterInImplementationDataInstanceRef</code> . <code>contextDataPrototype</code>
[constr_1517]	Existence of <code>ArParameterInImplementationDataInstanceRef</code> . <code>contextDataPrototype</code>
[constr_1518]	Consistency of data types in the context of <code>ArParameterInImplementationDataInstanceRef</code>
[constr_1519]	Existence of attributes vs. <code>category</code> of <code>ApplicationValueSpecification</code>
[constr_1520]	Semantics of <code>ObdRatioServiceNeeds.rateBasedMonitoredEvent</code>
[constr_1521]	Reference from <code>AsynchronousServerCallReturnsEvent</code> to <code>AsynchronousServerCallResultPoint</code>
[constr_1523]	No mode disabling for <code>OperationInvokedEvents</code>
[constr_1538]	Restriction for <code>ReceiverComSpec.dataElement</code>
[constr_1539]	Restriction for <code>SenderComSpec.dataElement</code>
[constr_1540]	Existence of <code>ClientComSpec.operation</code>
[constr_1541]	Existence of <code>ServerComSpec.operation</code>
[constr_1544]	Modeling of <code>SwAxisGeneric</code> for the definition of a fix axis
[constr_1545]	No initialization for fix axis
[constr_1583]	<code>PortInterfaceMapping</code> for <code>DataPrototype</code> typed by <code>Compound Primitive Data Type</code>
[constr_1592]	Definition of <code>SwDataDefProps.displayPresentation</code> depending on the capabilities of the data type
[constr_1602]	Definition of <code>SwDataDefProps.displayPresentation</code> depending on the capabilities of the element
[constr_1607]	Only <code>Wrapped Union Data Types</code> in <code>PortInterface</code>
[constr_1608]	Existence of <code>rootParameterDataPrototype</code>
[constr_1609]	Existence of <code>rootVariableDataPrototype</code>
[constr_1610]	Existence of <code>SwDataDefProps.swValueBlockSize</code> and <code>SwDataDefProps.swValueBlockSizeMult</code>
[constr_1622]	Value of <code>TimingEvent.offset</code> vs. <code>TimingEvent.period</code>
[constr_1631]	Applicability of <code>DataPrototypeMapping</code> . <code>secondToFirstDataTransformation</code>
[constr_1632]	Restriction for <code>firstToSecondDataTransformation</code> and <code>secondToFirstDataTransformation</code>
[constr_1634]	Allowed combinations of <code>ApplicationDataType.category</code> vs. <code>CompuMethod.category</code>
[constr_1635]	Relevance of attribute <code>isOptional</code>
[constr_1636]	Mapping of data types that represent an <code>Optional Element Structure</code>

Number	Heading
[constr_1637]	Existence of <code>ImplementationDataTypeElement.isOptional</code> vs. <code>ImplementationDataType.isStructWithOptionalElement</code>
[constr_1638]	First <code>ImplementationDataTypeElement</code> of <code>ImplementationDataType</code> that represents an <code>Optional Element Structure</code>
[constr_1639]	<code>ImplementationDataTypeElement</code> with attribute <code>isOptional</code> set to <code>True</code>
[constr_1640]	No use of <code>Optional Element Structure</code> for interaction with the diagnostic stack
[constr_1662]	Compatibility of <code>ApplicationRecordDataType</code> and <code>ImplementationDataType</code> that both represent an <code>Optional Element Structure</code>
[constr_1679]	Existence of attribute <code>RoleBasedDataAssignment.usedDataElement.localVariable</code> for <code>RoleBasedDataAssignment.role = signalBasedDiagnostics</code>
[constr_1680]	Existence of attribute <code>RoleBasedDataAssignment.usedDataElement.localVariable</code> for <code>RoleBasedDataAssignment.role = AppModeRequestInterface</code>
[constr_1681]	Existence of attribute <code>RoleBasedDataAssignment.usedDataElement.localVariable</code> for <code>RoleBasedDataAssignment.role = VerificationStatus</code>

H Upstream Mapping

H.1 Introduction

This chapter describes the mapping of the ECU Configuration parameters (M1 model) onto the meta-classes and attributes of the AUTOSAR upstream templates (in this case: Software Component Template).

The relationships between upstream templates and ECU Configuration are described in order to answer typical questions like:

- How shall a supplier use the information in a System Description in order to fulfill the needs defined by the systems engineer?
- How is a tool vendor supposed to generate an ECU Configuration Description out of ECU Extract of System Description?

Please note that the upstream mapping tables contain the following columns:

Column Name	Column Meaning
BSW Module	Name of BSW module
BSW Context	Reference to parameter container
BSW Parameter	Name of the BSW parameter
BSW Type	Type of parameter
BSW Description	Description from the configuration document
Template Description	Class note or attribute note of the M2 model element
M2 Parameter	Name of the upstream template model element
Mapping Rule	Textual description on how to transform between M2 and BSW domains
Mapping Type	One of: local no mapping needed since parameter local to BSW partial some data can be automatically mapped but not all full all data can be automatically mapped
Mapping Status	Indication of life-cycle status of the mapping
ECUC Parameter ID	ID of the parameter in the respective SWS document (may be empty if the mapping is owned by an enumeration literal)

Table H.1: Upstream mapping table columns

H.2 BswM

BSW Module	BSW Context
BswM	BswM/BswMConfig/BswMArbitration/BswMModeCondition/BswMConditionValue/BswMCompuScaleModeValue
BSW Parameter	BSW Type

BswMCompuMethodRef	ECUC-FOREIGN-REFERENCE-DEF
BSW Description	
This is a foreign reference to the CompuMethod used for mode requests.	
Template Description	
This meta-class represents the ability to express the relationship between a physical value and the mathematical representation. Note that this is still independent of the technical implementation in data types. It only specifies the formula how the internal value corresponds to its physical pendant.	
M2 Parameter

Com	Com/ComConfig/ComSignal	
BSW Parameter	BSW Type	
ComTimeout	ECUC-FLOAT-PARAM-DEF	
BSW Description		
<p>Defines the length of the deadline monitoring timeout period in seconds. The period for the first timeout period can be configured separately by ECUC_Com_00183.</p>		
Template Description		
<p>ISignalPort.timeout:</p> <ul style="list-style-type: none"> ISignalPort with communicationDirection = in: Optional timeout value in seconds for the reception of the ISignal. The attribute value is used to configure the ComTimeout in the COM module. The RTE ignores this attribute. The timeout can also be specified with the NonqueuedReceiverComSpec.aliveTimeout attribute. If a full DataMapping exists for the SystemSignal and the value is available in the configured ReceiverComSpec, then the timeout value in the ReceiverComSpec overrides this optional timeout specification during the creation of the Base Ecu Configuration of the COM module. ISignalPort with communicationDirection = out: Optional timeout value in seconds for the transmission of the ISignal. The attribute value is used to configure the ComTimeout in the COM module. The RTE ignores this attribute. The timeout can also be specified with the enderComSpec.transmissionAcknowledge.timeout attribute. If a full DataMapping exists for the SystemSignal and the value is available in the configured SenderComSpec, then the timeout value in the SenderComSpec overrides this optional timeout specification during the creation of the Base Ecu Configuration of the COM module. <p>This attribute can be used in the following cases:</p> <ul style="list-style-type: none"> legacy signal where the System Description doesn't use a complete Software Component Description (VFB View) and where the DataMapping is missing. bus monitoring use cases in which the DataMapping is ignored. <p>TransmissionAcknowledgementRequest.timeout: Number of seconds before an error is reported or in case of allowed redundancy, the value is sent again.</p> <p>NonqueuedReceiverComSpec.aliveTimeout: Specify the amount of time (in seconds) after which the software component (via the RTE) needs to be notified if the corresponding data item have not been received according to the specified timing description. If the aliveTimeout attribute is 0 no timeout monitoring shall be performed.</p>		
M2 Parameter		
<p>SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalPort.timeout, SWComponentTemplate::Communication::TransmissionAcknowledgementRequest.timeout, SWComponentTemplate::Communication::NonqueuedReceiverComSpec.aliveTimeout</p>		
Mapping Rule	Mapping Type	
<p>TX Signals: If a full DataMapping exist for the SystemSignal this information may be available from a configured SenderComSpec.transmissionAcknowledge.timeout that specifies the amount of time (in seconds) after which the software component (via the RTE) needs to be notified if the corresponding data item have not been transmitted according to the specified timing description. In this case the timeout value in SenderComSpec overrides the optional timeout specification in the System Template defined on the ISignalPort.</p> <p>RX Signals: If a full DataMapping exist for the SystemSignal this information may be available from a configured NonqueuedReceiverComSpec.aliveTimeout. In this case the timeout value in ReceiverComSpec overrides the optional timeout specification in the System Template defined on the ISignalPort. Please note that the SWS_RTE defines an algorithm to finally set the applicable timeout value.</p>	full

BSW Module	BSW Context
EcuC	EcuC/EcuConfigSet/EcuPduCollection/Pdu
BSW Parameter	BSW Type
MetaDataTypeRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to meta data that is transported in the Pdu through the AUTOSAR layers.	
Template Description	
<p>VariableDataPrototype: A VariableDataPrototype represents a formalized generic piece of information that is typically mutable by the application software layer. VariableDataPrototype is used in various contexts and the specific context gives the otherwise generic VariableDataPrototype a dedicated semantics.</p> <p>SenderReceiverToSignalMapping: Mapping of a sender receiver communication data element to a signal.</p> <p>SystemSignal: The system signal represents the communication system's view of data exchanged between SW components which reside on different ECUs. The system signals allow to represent this communication in a flattened structure, with exactly one system signal defined for each data element prototype sent and received by connected SW component instances.</p> <p>ISignal: Signal of the Interaction Layer. The RTE supports a "signal fan-out" where the same System Signal is sent in different Signal IPdus to multiple receivers.</p> <p>To support the RTE "signal fan-out" each SignalIPdu contains ISignals. If the same System Signal is to be mapped into several SignalIPdus there is one ISignal needed for each ISignalToIPduMapping.</p>	

<p>ISignals describe the Interface between the Precompile configured RTE and the potentially Postbuild configured Com Stack (see ECUC Parameter Mapping).</p> <p>In case of the SystemSignalGroup an ISignal shall be created for each SystemSignal contained in the SystemSignalGroup.</p> <p>ISignalIPdu: Represents the IPdus handled by Com. The ISignalIPdu assembled and disassembled in AUTOSAR COM consists of one or more signals. In case no multiplexing is performed this IPdu is routed to/from the Interface Layer.</p> <p>A maximum of one dynamic length signal per IPdu is allowed.</p>	
M2 Parameter	
<p>SWComponentTemplate::Datatype::DataPrototypes::VariableDataPrototype, SystemTemplate::DataMapping::SenderReceiverToSignalMapping, SystemTemplate::Fibex::FibexCore::CoreCommunication::SystemSignal, SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal, SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalIPdu</p>	
Mapping Rule	Mapping Type
A MetaDataTypeRef shall be derived for a given Pdu if a MetaDataItemSet exists that refers to a VariablePrototype that is also referenced from a SenderReceiverToSignalMapping that in turn references a SystemSignal that is referenced by a ISignal that is mapped to an ISignalIPdu that is derived to the mentioned Pdu in EcuC.	full

BSW Module	BSW Context	
EcuC	EcuC/EcucUnitGroupAssignment	
BSW Parameter		BSW Type
EcucUnitGroupRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Optional reference to the UnitGroup to support the generation of ASAM MCD file. These UnitGroups are selecting a set of units for a specific country.		
Template Description		

<p>This meta-class represents the ability to specify a logical grouping of units. The category denotes the unit system that the referenced units are associated to.</p> <p>In this way, e.g. country-specific unit systems (CATEGORY="COUNTRY") can be defined as well as specific unit systems for certain application domains.</p> <p>In the same way a group of equivalent units, can be defined which are used in different countries, by setting CATEGORY="EQUIV_UNITS". KmPerHour and MilesPerHour could such be combined to one group named "vehicle_speed". The unit MeterPerSec would not belong to this group because it is normally not used for vehicle speed. But all of the mentioned units could be combined to one group named "speed".</p> <p>Note that the UnitGroup does not ensure the physical compliance of the units. This is maintained by the physical dimension.</p>

H.7 MemMap

BSW Module	BSW Context	
MemMap	MemMap/MemMapAllocation/MemMapGenericMapping	
BSW Parameter		BSW Type
MemMapSwAddressMethodRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to the SwAddrMethod which applies to the MemMapGenericMapping.		
Template Description		
Used to assign a common addressing method, e.g. common memory section, to data or code objects. These objects could actually live in different modules or components.		
M2 Parameter		
DataDictionary::AuxillaryObjects::SwAddrMethod		
Mapping Rule	Mapping Type	
1:1 mapping	full	
Mapping Status	ECUC Parameter ID	
valid	[ECUC_MemMap_00013]	

BSW Module	BSW Context	
MemMap	MemMap/MemMapAllocation/MemMapSectionSpecificMapping	
BSW Parameter		BSW Type
MemMapMemorySectionRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to the MemorySection which applies to the MemMapSectionSpecificMapping.		
Template Description		

Provides a description of an abstract memory section used in the Implementation for code or data. It shall be declared by the Implementation Description of the module or component, which actually allocates the memory in its code. This means in case of data prototypes which are allocated by the RTE, that the generated Implementation Description of the RTE shall contain the corresponding MemorySections.

The attribute "symbol" (if symbol is missing: "shortName") defines the module or component specific section name used in the code. For details see the document "Specification of Memory Mapping". Typically the section name is build according the pattern:

<SwAddrMethod shortName>[_<further specialization nominator>][_<alignment>]

where

- [**<SwAddrMethod shortName>**] is the shortName of the referenced SwAddrMethod
- [**<further specialization nominator>**] is an optional infix to indicate the specialization in the case that several Memory Sections for different purpose of the same Implementation Description referring to the same or equally named SwAddr Methods.
- [**<alignment>**] is the alignment attributes value and is only applicable in the case that the memoryAllocationKeyword Policy value of the referenced SwAddrMethod is set to addrMethodShortNameAndAlignment

MemorySection used to Implement the code of RunnableEntitys and BswSchedulableEntitys shall have a symbol (if missing: shortName) identical to the referred SwAddrMethod to conform to the generated RTE header files.

In addition to the section name described above, a prefix is used in the corresponding macro code in order to define a name space. This prefix is by default given by the shortName of the BswModuleDescription resp. the SwComponentType. It can be superseded by the prefix attribute.

M2 Parameter

CommonStructure::ResourceConsumption::MemorySectionUsage::MemorySection

H.8 NvM

BSW Module	BSW Context	
NvM	NvM/NvMBlockDescriptor	
BSW Parameter		BSW Type
NvMBlockJobPriority		ECUC-INTEGER-PARAM-DEF
BSW Description		
Defines the job priority for a NVRAM block (0 = Immediate priority).		
Template Description		
NvBlockNeeds.writingPriority: Requires the priority of writing this block in case of concurrent requests to write other blocks.		
NvBlockNeeds.storeEmergency: Defines whether or not the associated RAM Block shall be implicitly stored in case of ECU failure (e.g. loss of power) by the basic software. If the attribute storeEmergency is set to true the associated RAM Block shall be configured to have immediate priority.		
M2 Parameter		
CommonStructure::ServiceNeeds::NvBlockNeeds.writingPriority, CommonStructure::ServiceNeeds::NvBlockNeeds.storeEmergency		
Mapping Rule		Mapping Type

It is the integrators job to secure the value-monotonic assignment of writingPriority to NvMBlockJobPriority. This means that the lowest assigned value of writingPriority=MEDIUM shall be greater than highest assigned value of writingPriority=HIGH etc.If NvBlockNeeds.storeEmergency is set to true, then NvMBlockJobPriority shall be 0 (Immediate priority). If NvBlockNeeds.storeEmergency is set to false, then the value of NvMBlockJobPriority depends on the value of NvBlockNeeds.writingPriority.	full
Mapping Status	ECUC Parameter ID
valid	[ECUC_NvM_00477]

BSW Module	BSW Context	
NvM	NvM/NvMBlockDescriptor	
BSW Parameter		BSW Type
NvMBlockManagementType		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
Defines the block management type for the NVRAM block.[SWS_NvM_00137]		
Template Description		
Reliability against data loss on the non-volatile medium.		
M2 Parameter		
CommonStructure::ServiceNeeds::NvBlockNeeds.reliability		
Mapping Rule		Mapping Type
if (reliability == errorDetection noProtection) && nDataSets==0 then NvmBlockManagementType = NVM_BLOCK_NATIVE. if reliability == errorCorrection then NvmBlockManagementType = NVM_BLOCK_REDUNDANT. [constr_1095] applies.		full

H.9 Os

BSW Module	BSW Context	
Os	Os/Osloc/OslocCommunication/OslocDataProperties	
BSW Parameter	BSW Type	
OslocDataTypeRef	ECUC-FOREIGN-REFERENCE-DEF	

BSW Description	
<p>This is the type of the data to be transferred on the IOC communication channel. This attribute is necessary to generate the parameter type of the loc functions. Additionally this information should be used to compute the data size for necessary data copy operations within the loc module.</p> <p>If more than one attribute is defined, the IOC generator should generate an locXxxGroup function (Xxx= CHOICE [Send, Receive, Write, Read]).</p> <p>N:1 or N:M communication (Multiplicity of OslocSenderProperties > 1) is only allowed for multiplicity of OslocDataTypeRef = 1</p>	
Template Description	
<p>Describes a reusable data type on the implementation level. This will typically correspond to a typedef in C-code.</p>	
M2 Parameter	
<p>CommonStructure::ImplementationDataTypes::ImplementationDataType</p>	
Mapping Rule	Mapping Type
1:1 mapping	full

H.10 Rte

BSW Module	BSW Context	
Rte	Rte/RteImplicitCommunication	
BSW Parameter		BSW Type
RteVariableReadAccessRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
<p>Reference to the VariableAccess in the dataReadAccess role.</p>		
Template Description		
<p>The presence of a VariableAccess implies that a RunnableEntity needs access to a VariableDataPrototype. The kind of access is specified by the role in which the class is used.</p>		

M2 Parameter	
SWComponentTemplate::SwcInternalBehavior::DataElements::VariableAccess	
Mapping Rule	Mapping Type
1:1 mapping	full
Mapping Status	ECUC Parameter ID
valid	[ECUC_Rte_09035]

BSW Module	BSW Context	
Rte	Rte/RteImplicitCommunication	
BSW Parameter		BSW Type
RteVariableWriteAccessRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to the VariableAccess in the dataWriteAccess role.		
Template Description		
The presence of a VariableAccess implies that a RunnableEntity needs access to a VariableDataPrototype. The kind of access is specified by the role in which the class is used.		
M2 Parameter		
SWComponentTemplate::SwcInternalBehavior::DataElements::VariableAccess		
Mapping Rule	Mapping Type	
1:1 mapping	full	
Mapping Status	ECUC Parameter ID	
valid	[ECUC_Rte_09036]	

BSW Module	BSW Context	
Rte	Rte/RteOsInteraction/RteModeToScheduleTableMapping/RteModeSchtblMapBsw	
BSW Parameter		BSW Type
RteModeSchtblMapBswProvidedModeGroupRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to an instance of a ModeDeclarationGroupPrototype of a Bsw-Module.		
Template Description		
The ModeDeclarationGroupPrototype specifies a set of Modes (ModeDeclarationGroup) which is provided or required in the given context.		
M2 Parameter		
CommonStructure::ModeDeclaration::ModeDeclarationGroupPrototype		
Mapping Rule	Mapping Type	
1:1 mapping	full	
Mapping Status	ECUC Parameter ID	
valid	[ECUC_Rte_09053]	

BSW Module	BSW Context	
Rte	Rte/RteOsInteraction/RteModeToScheduleTableMapping	
BSW Parameter		BSW Type
RteModeSchtblMapModeDeclarationRef		ECUC-FOREIGN-REFERENCE-DEF

BSW Description	
Reference to the ModeDeclarations.	
Template Description	
Declaration of one Mode. The name and semantics of a specific mode is not defined in the meta-model.	
M2 Parameter	
CommonStructure::ModeDeclaration::ModeDeclaration	
Mapping Rule	Mapping Type
1:1 mapping	full
Mapping Status	ECUC Parameter ID
valid	[ECUC_Rte_09054]

BSW Module	BSW Context	
Rte	Rte/RteOsInteraction/RteModeToScheduleTableMapping/RteModeSchtblMapSwc	
BSW Parameter		BSW Type
RteModeSchtblMapSwcPortRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to the PPortPrototype of a SwComponentPrototype.		
Template Description		
Component port providing a certain port interface.		
M2 Parameter		
SWComponentTemplate::Components::PPortPrototype		
Mapping Rule	Mapping Type	
1:1 mapping	full	
Mapping Status	ECUC Parameter ID	
valid	[ECUC_Rte_09057]	

BSW Module	BSW Context	
Rte	Rte/RteSwComponentInstance/RteEventTolsrMapping	
BSW Parameter		BSW Type
RteIlsrEventRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to the description of the ExternalTriggerOccurredEvent or TimingEvent which is pointing to the RunnableEntity being mapped. This allows a fine grained mapping of RunnableEntites based on the activating RTEEvent.		
Template Description		
Abstract base class for all RTE-related events		
M2 Parameter		
SWComponentTemplate::SwcInternalBehavior::RTEEvents::RTEEvent		
Mapping Rule	Mapping Type	
1:1 mapping	full	
Mapping Status	ECUC Parameter ID	
valid	[ECUC_Rte_09153]	

BSW Module	BSW Context	
Rte	Rte/RteSwComponentInstance/RteEventToTaskMapping	
BSW Parameter	BSW Type	
RteActivationOffset	ECUC-FLOAT-PARAM-DEF	
BSW Description		
Activation offset in seconds.		
Template Description		
The value makes an assumption about the time offset of the first activation of the RunnableEntity triggered by the mapped TimingEvent relative to the periodic activation of the time base of this TimingEvent. Unit: second.		
M2 Parameter		
SWComponentTemplate::SwcInternalBehavior::RTEEvents::TimingEvent.offset		
Mapping Rule		Mapping Type
1:1 mapping		full
Mapping Status		ECUC Parameter ID
valid		[ECUC_Rte_09018]

BSW Module	BSW Context	
Rte	Rte/RteSwComponentInstance/RteEventToTaskMapping	
BSW Parameter	BSW Type	
RteEventRef	ECUC-FOREIGN-REFERENCE-DEF	
BSW Description		
Reference to the description of the RTEEvent which is pointing to the RunnableEntity being mapped. This allows a fine grained mapping of RunnableEntites based on the activating RTEEvent.		
Template Description		
Abstract base class for all RTE-related events		
M2 Parameter		
SWComponentTemplate::SwcInternalBehavior::RTEEvents::RTEEvent		
Mapping Rule		Mapping Type
1:1 mapping		full
Mapping Status		ECUC Parameter ID
valid		[ECUC_Rte_09019]

BSW Module	BSW Context	
Rte	Rte/RteSwComponentInstance/RteEventToTaskMapping	
BSW Parameter	BSW Type	
RteServerQueueLength	ECUC-INTEGER-PARAM-DEF	
BSW Description		
Specifies the length of the queue for the server call serialization. This value overwrites the queueLength specified at the ServerComSpec.		
Template Description		
Length of call queue on the server side. The queue is implemented by the RTE. The value shall be greater or equal to 1. Setting the value of queueLength to 1 implies that incoming requests are rejected while another request that arrived earlier is being processed.		
M2 Parameter		
SWComponentTemplate::Communication::ServerComSpec.queueLength		
Mapping Rule		Mapping Type

1:1 mapping	full
Mapping Status	ECUC Parameter ID
valid	[ECUC_Rte_09133]

BSW Module	BSW Context	
Rte	Rte/RteSwComponentInstance/RteExclusiveAreaImplementation	
BSW Parameter		BSW Type
RteExclusiveAreaRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to the ExclusiveArea.		
Template Description		
Prevents an executable entity running in the area from being preempted.		
M2 Parameter		
CommonStructure::InternalBehavior::ExclusiveArea		
Mapping Rule		Mapping Type
1:1 mapping		full
Mapping Status		ECUC Parameter ID
valid		[ECUC_Rte_09032]

BSW Module	BSW Context	
Rte	Rte/RteSwComponentInstance/RteInternalTriggerConfig	
BSW Parameter		BSW Type
RteSwcTriggerSourceRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to an InternalTriggeringPoint of the related component instance.		
The referenced InternalTriggeringPoint has to belong to the same software component instance as the RteSwComponent Instance owning this parameter configures.		
Template Description		
If a RunnableEntity owns an InternalTriggeringPoint it is entitled to trigger the execution of RunnableEntities of the corresponding software-component.		
M2 Parameter		
SWComponentTemplate::SwcInternalBehavior::Trigger::InternalTriggeringPoint		
Mapping Rule		Mapping Type
1:1 mapping		full
Mapping Status		ECUC Parameter ID
valid		[ECUC_Rte_09097]

BSW Module	BSW Context	
Rte	Rte/RteSwComponentInstance/RteNvRamAllocation	
BSW Parameter		BSW Type
RteSwNvBlockDescriptorRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to the NvBlockDescriptor in case the RTE needs to call the NvM directly (e.g. for the supportDirtyFlag feature, storeCyclic feature, server invocation for NV data management or mode switch based invocation NvM services).		

Template Description	
Specifies the properties of exactly on NVRAM Block.	
M2 Parameter	
SWComponentTemplate::NvBlockComponent::NvBlockDescriptor	
Mapping Rule	Mapping Type
1:1 mapping	full
Mapping Status	ECUC Parameter ID
valid	[ECUC_Rte_09132]

BSW Module	BSW Context	
Rte	Rte/RteSwComponentInstance/RteNvRamAllocation	
BSW Parameter		BSW Type
RteSwNvRamMappingRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to the SwServeDependency which is used to specify the NvBlockNeeds.		
Template Description		
Specialization of ServiceDependency in the context of an SwcInternalBehavior. It allows to associate ports, port groups and (in special cases) data defined for an atomic software component to a given ServiceNeeds element.		
M2 Parameter		
SWComponentTemplate::SwcInternalBehavior::ServiceMapping::SwcServiceDependency		
Mapping Rule		Mapping Type
1:1 mapping		full
Mapping Status		ECUC Parameter ID
valid		[ECUC_Rte_09044]

BSW Module	BSW Context	
Rte	Rte/RteSwComponentInstance	
BSW Parameter		BSW Type
RteSoftwareComponentInstanceRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to a SwComponentPrototype.		
Template Description		
Role of a software component within a composition.		
M2 Parameter		
SWComponentTemplate::Composition::SwComponentPrototype		
Mapping Rule		Mapping Type
1:1 mapping		full
Mapping Status		ECUC Parameter ID
valid		[ECUC_Rte_09004]

BSW Module	BSW Context	
Rte	Rte/RteSwComponentType/RteComponentTypeCalibration	
BSW Parameter		BSW Type

RteCalibrationSwAddrMethodRef	ECUC-FOREIGN-REFERENCE-DEF
BSW Description	
Reference to the SwAddrMethod for which software calibration support shall be enabled.	
Template Description	
Used to assign a common addressing method, e.g. common memory section, to data or code objects. These objects could actually live in different modules or components.	
M2 Parameter	
DataDictionary::AuxillaryObjects::SwAddrMethod	
Mapping Rule	Mapping Type
1:1 mapping	full
Mapping Status	ECUC Parameter ID
valid	[ECUC_Rte_09038]

BSW Module	BSW Context	
Rte	Rte/RteSwComponentType	
BSW Parameter		BSW Type
RteComponentTypeRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
Reference to either AtomicSwComponentType or ParameterSwComponentType.		
Template Description		
Base class for AUTOSAR software components.		
M2 Parameter		
SWComponentTemplate::Components::SwComponentType		
Mapping Rule	Mapping Type	
1:1 mapping	full	
Mapping Status	ECUC Parameter ID	
valid	[ECUC_Rte_09003]	

BSW Module	BSW Context	
Rte	Rte/RteSwComponentType	
BSW Parameter		BSW Type
RteImplementationRef		ECUC-FOREIGN-REFERENCE-DEF
BSW Description		
The Implementation which shall be assigned to the SwComponentType.		
Template Description		
This meta-class represents a specialization of the general Implementation meta-class with respect to the usage in application software.		
M2 Parameter		
SWComponentTemplate::SwcImplementation::SwcImplementation		
Mapping Rule	Mapping Type	
1:1 mapping	full	
Mapping Status	ECUC Parameter ID	
valid	[ECUC_Rte_09028]	

H.11 SecOC

BSW Module	BSW Context	
SecOC	SecOC/SecOCRxPduProcessing/SecOCClientServerVerificationStatusPropagationMode	
BSW Parameter	BSW Type	
BOTH	ECUC-ENUMERATION-LITERAL-DEF	
BSW Description		
Both "TRUE" and "FALSE" AuthenticationStatus is propagated to SW-C		
Template Description		
Verification attempts that came out "false" or "true" shall be forwarded to the application software.		
M2 Parameter		
CommonStructure::ServiceNeeds::VerificationStatusIndicationModeEnum.failureAndSuccess		
Mapping Rule		Mapping Type
1:1 mapping		full
Mapping Status		ECUC Parameter ID
valid		

BSW Module	BSW Context	
SecOC	SecOC/SecOCRxPduProcessing/SecOCClientServerVerificationStatusPropagationMode	
BSW Parameter	BSW Type	
FAILURE_ONLY	ECUC-ENUMERATION-LITERAL-DEF	
BSW Description		
Only "FALSE" Authentication Status is propagated to SW-C		
Template Description		
Only verification attempts that came out "false" shall be forwarded to the application software.		
M2 Parameter		
CommonStructure::ServiceNeeds::VerificationStatusIndicationModeEnum.failureOnly		
Mapping Rule		Mapping Type
1:1 mapping		full
Mapping Status		ECUC Parameter ID

H.13 WdgM

BSW Module	BSW Context
WdgM	WdgM/WdgMConfigSet/WdgMMode/WdgMLocalStatusParams
BSW Parameter	BSW Type
WdgMFailedAliveSupervisionRefCycleTol	ECUC-INTEGER-PARAM-DEF
BSW Description	
This parameter shall contain the acceptable amount of reference cycles with incorrect/failed alive supervisions for this Supervised Entity.	
Template Description	
Number of consecutive failed alive cycles for this SupervisedEntity which shall be tolerated until the supervision status of the SupervisedEntity is set to WDG_M_ALIVE_EXPIRED (see SWS WdgM for more details). Note that this value has to be recalculated with respect to the WdgM's own cycle time for ECU configuration.	
M2 Parameter	
CommonStructure::ServiceNeeds::SupervisedEntityNeeds.toleratedFailedCycles	
Mapping Rule	Mapping Type
1:1	full
Mapping Status	ECUC Parameter ID
valid	[ECUC_WdgM_-00327]

I Splitable Elements in the Scope of this Document

This chapter contains a table of all model elements stereotyped `<<atpSplitable>>` in the scope of this document.

Each entry in the table consists of the identification of the specific model element itself and the applicable value of the tagged value `atp.Splitkey`.

For more information about the concept of splitable model elements and how these shall be treated please refer to [11].

Table I.1: Usage of splitable elements

J Variation Points in the Scope of this Document

This chapter contains a table of all model elements stereotyped `<<atpVariation>>` in the scope of this document.

Each entry in the table consists of the identification of the model element itself and the applicable value of the tagged value `vh.latestBindingTime`.

For more information about the concept of variation points and how model elements that contain variation points shall be treated please refer to [11].
