## Known Limitations

# 1 Introduction and functional overview

This document specifies the functionality, APIs and the configuration of the AUTOSAR Basic Software module Chinese Vehicle-2-X Network (CnV2xNet).

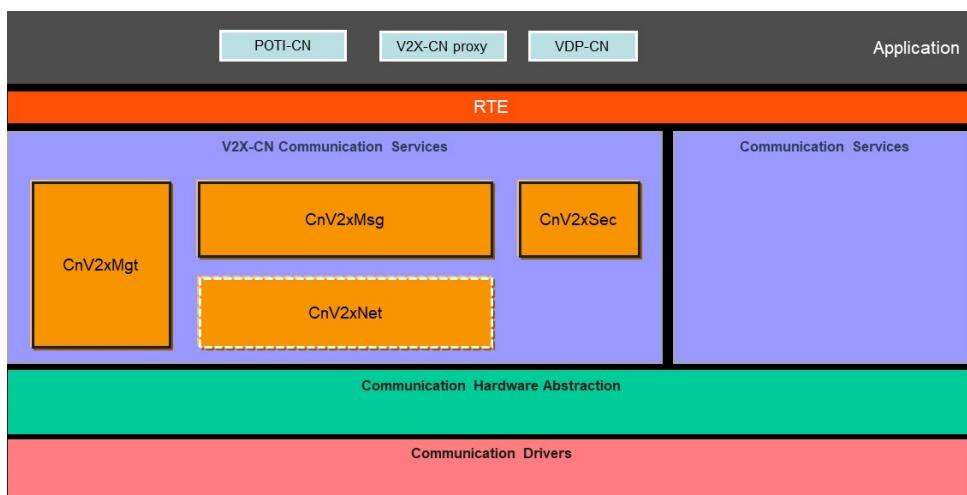

The Chinese Vehicle-2-X Network (CnV2xNet) together with the Chinese Vehicle-2-X Message (CnV2xMsg), Chinese Vehicle-2-X Management (CnV2xMgt), Chinese Vehicle-2-X Security (CnV2xSec), Linklayer Sdu Routing Module (LSduR) , and AUTOSAR BSW module Ethernet Interface (EthIf) forms the Chinese V2X stack within the AUTOSAR architecture.

The bases for this document are the Chinese LTE-V2X based standards [1] [2]. It is assumed that the reader is familiar with these standards.

## 1.1 Architecture Overview

CnV2xNet module provides services to upper module CnV2xMsg to transmit or receive V2X messages (i.e. DSMP SDUs), and gets services from the EthIf module to realize the data exchanging with LTE-V2X hardware. It also responsible for source Layer-2 address and destination layer-2 address selection and maintain QoS related mapping relationships between upper layer and lower layer from protocol perspective, the details are explained in chapter 1.2 and chapter 7 of this document.

Positioning of the CnV2xNet module within the AUTOSAR BSW and the Layered Software architecture is shown in below.

**Figure 1.1: AUTOSAR BSW software architecture - CnV2xNet scope**

## 1.2 Functional Overview

The functionality of CnV2xNet module should comply with the standard of Chinese LTE-V2X based Network protocol [2] and Technical Requirements of Vehicular Communication System based on LTE-V2X Direct Communication [1]. The module provides services to the upper CnV2xMsg module specified in [3] for data transmission and reception. In order to communicate with LTE-V2X hardware to realize packet transport services, it relies on the lower Ethlif module [4].

From protocol perspective, CnV2xNet module includes DSMP sub-layer and Adaptation sub-layer. Adaptation sub-layer provides parameter adaptation function between LTE-V2X access layer and DSMP sub-layer. DSMP sub-layer is responsible for exchanging data with message layer and Adaptation layer.

CnV2xNet module function also includes: mapping between application layer identifier and destination layer-2 ID, generation/change/maintenance of the source layer-2 ID, mapping between the unicast/multicast address and the layer-2 ID, mapping between the message priority and PPPP, indicating the service period to the lower layer, indicating the channel busy rate or maximum data rate to the upper layer, and so on.

## 4 Constraints and assumptions

### 4.1 Limitations

Wireless communication supports LTE-V2X only. Other cellular based wireless communication can be extended in future release of AUTOSAR standard. CnV2xNet module support non-IP (i.e. DSMP) transmission only and mainly focus on broadcast based packet transport services in R20-11. The V2X modules follow the guidance regarding the Day-1 V2X allocations defined in [1] [2], which are by NTCAS and CCSA respectively.

### 4.2 Applicability to car domains

This specification is applicable to all car domains.

## 5 Dependencies to other modules

This section describes the relations of CnV2xNet module to other modules within the AUTOSAR basic software architecture. It outlines the modules that are required or optional for the realization of CnV2xNet module and services.

### 5.1 AUTOSAR Default Error Tracer (DET)

In development mode, CnV2xNet module reports errors through the Det\_ReportError function of DET Module [5].

### 5.2 AUTOSAR Ecu State Manager (EcuM)

The EcuM [6] initializes the CnV2xNet module by calling CnV2xNet\_Init specified in 8.3.1 in this document.

### 5.3 AUTOSAR Ethernet Interface (EthIf)

The Ethernet Interface [4] is the lower layer module of the CnV2xNet module for the control flow.

### 5.4 AUTOSAR Linklayer Sdu Routing Module (LSduR)

The Linklayer Sdu Routing Module [7] is the lower layer module of the CnV2xNet module for the data flow.

### 5.5 AUTOSAR Chinese Vehicle-2-X Message (CnV2xMsg)

CnV2xMsg is the upper layer module of CnV2xNet module. The callback services called by CnV2xNet module are declared and placed inside the CnV2xMsg module. These callbacks provide receive indication and transmit confirmation services for the CnV2xMsg Module.

## 7.5 Error Classification

This chapter lists and classifies all errors that can be detected within this software module. Each error is classified according to relevance (development / production) and related error code. For development errors, a value is defined.

### 7.5.1 Development Errors

**[CP\_SWS\_CnV2xNet\_00126] Development Error Types**

*Status:* DRAFT

「The following table lists development errors that shall be distinguished by the CnV2xNet module. CnV2xNet shall report them to the DET, if development error detection (CnV2xNetDevErrorDetect) is enabled」

Type of error	Related error code	Value [hex]
API service called with invalid parameter	CNV2XNET_E_PARAM	0x01
API service called with invalid pointer	CNV2XNET_E_PARAM_POINTER	0x02
API function called before the CnV2xNet module has been fully initialized	CNV2XNET_E_UNINIT	0x03
CnV2xNet initialization failed	CNV2XNET_E_INIT_FAILED	0x04

**Table 7.1: Development Error Types for CnV2xNet**

### 7.5.2 Runtime Errors

There are no runtime errors.

### 7.5.3 Transient Faults

There are no transient faults.

### 7.5.4 Production Errors

There are no production errors.

### 7.5.5 Extended Production Errors

There are no extended production errors.
