BSW Parameter		**BSW Type**	
CanNmPduCbvPosition		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
Defines the position of the control bit vector within the NM PDU. The value of the parameter represents the location of the Control Bit Vector in the NM PDU (CanNmPduByte0 means byte 0, CanNmPduByte1 means byte 1, CanNmPduOff means source node identifier is not part of the NM PDU) ImplementationType: CanNm_PduPositionType			
Template Description			
Defines the position of the control bit vector within the NmPdu (Byte position). If this attribute is not configured, the Control Bit Vector is not used.			
M2 Parameter			
SystemTemplate::NetworkManagement::CanNmCluster.nmCbvPosition			
Mapping Rule			**Mapping Type**
Derive byte position from nmCbvPosition attribute. If this optional attribute is missing set CANNM_PDU_OFF as value.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanNm_00026]

BSW Module	BSW Context		
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig		
BSW Parameter		**BSW Type**	
CanNmPduNidPosition		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
Defines the position of the source node identifier within the NM PDU. The value of the parameter represents the location of the source node identifier in the NM PDU (CANNM_PDU_BYTE_0 means byte 0, CANNM_PDU_BYTE_1 means byte 1, CANNM_PDU_OFF means source node identifier is not part of the NM PDU) ImplementationType: CanNm_PduPositionType			
Template Description			
Defines the byte position of the source node identifier within the NmPdu. If this attribute is not configured, the Node Identification is not used.			
M2 Parameter			
SystemTemplate::NetworkManagement::CanNmCluster.nmNidPosition			
Mapping Rule			**Mapping Type**
Derive byte position from nmNidPosition attribute. If this optional attribute is missing set CANNM_PDU_OFF as value.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanNm_00025]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig	
BSW Parameter		**BSW Type**
CanNmPnEnabled		ECUC-BOOLEAN-PARAM-DEF

▽

△

BSW Description	
Enables or disables support of partial networking. false: Partial networking Range not supported true: Partial networking supported	
Template Description	
Defines whether this NmCluster contributes to the partial network mechanism.	
M2 Parameter	
SystemTemplate::NetworkManagement::NmCluster.nmPncParticipation	
Mapping Rule	**Mapping Type**
If NmCluster.nmPncParticipation has the value "true" or is not defined then CanNmPnEnabled shall be set to true.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanNm_-00066]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig	
BSW Parameter	**BSW Type**	
CanNmRemoteSleepIndTime	ECUC-FLOAT-PARAM-DEF	
BSW Description		
Timeout for Remote Sleep Indication. It defines the time in seconds how long it shall take to recognize that all other nodes are ready to sleep.		
Template Description		
Timeout for Remote Sleep Indication in seconds. It defines the time how long it shall take to recognize that all other nodes are ready to sleep.		
M2 Parameter		
SystemTemplate::NetworkManagement::CanNmCluster.nmRemoteSleepIndicationTime		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanNm_-00023]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig	
BSW Parameter	**BSW Type**	
CanNmRepeatMessageTime	ECUC-FLOAT-PARAM-DEF	
BSW Description		
Timeout for Repeat Message State. It defines the time in seconds how long the NM shall stay in the Repeat Message State.		
Template Description		
Timeout for Repeat Message State in seconds. Defines the time how long the NM shall stay in the Repeat Message State.		
M2 Parameter		
SystemTemplate::NetworkManagement::CanNmCluster.nmRepeatMessageTime		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanNm_-00022]

BSW Module	BSW Context		
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig		
BSW Parameter		**BSW Type**	
CanNmRepeatMsgIndEnabled		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Enable/disable the notification that a RepeatMessageRequest bit has been received.			
Template Description			
Switch for enabling the Repeat Message Bit Indication.			
M2 Parameter			
SystemTemplate::NetworkManagement::NmCluster.nmRepeatMsgIndEnabled			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanNm_00089]

BSW Module	BSW Context		
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig		
BSW Parameter		**BSW Type**	
CanNmRxPdu		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container is used to configure the Rx PDU properties that are used for the CanNm Channel.			
Template Description			
M2 Parameter			
SystemTemplate::NetworkManagement::NmNode.rxNmPdu			
Mapping Rule			**Mapping Type**
Create container for each NmPdu that is received on the regarded Nm cluster			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanNm_00038]

BSW Module	BSW Context		
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig		
BSW Parameter		**BSW Type**	
CanNmTimeoutTime		ECUC-FLOAT-PARAM-DEF	
BSW Description			
If NM is in Ready Sleep State it denotes the time in seconds how long after the last NM PDU transmission or reception state transition into the Prepare Bus-Sleep Mode is initiated. If NM is in Repeat Message or Normal Operation state and no NM PDU can be transmitted or received within this time, a run-time error is raised.			
Template Description			
Network Timeout for NmPdus in seconds It denotes the time how long the CanNm shall stay in the Network Mode before transition into Prepare Bus-Sleep Mode shall take place.			
M2 Parameter			
SystemTemplate::NetworkManagement::CanNmCluster.nmNetworkTimeout			
Mapping Rule			**Mapping Type**
1:1 mapping			full

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig	
BSW Parameter		**BSW Type**
CanNmTxPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the CanNmTxConfirmationPduId and the CanNmTxPduRef.		
Template Description		
M2 Parameter		
SystemTemplate::NetworkManagement::NmNode.txNmPdu		
Mapping Rule		**Mapping Type**
Create container for each NmPdu that is transmitted on the regarded Nmcluster		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanNm_-00036]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig	
BSW Parameter		**BSW Type**
CanNmUserDataTxPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This optional container is used to configure the UserNm PDU. This container is only available if CanNmComUserDataSupport is enabled.		
Template Description		
An ISignalToIPduMapping describes the mapping of ISignals to ISignalIPdus and defines the position of the ISignal within an ISignalIPdu.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalToIPduMapping		
Mapping Rule		**Mapping Type**
Create container for each NmPdu that aggregates the ISignalToIPduMapping element. The configuration for these Pdus (e.g. Transfer Properties) shall be derived from this information.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanNm_-00045]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig/CanNmChannelConfig	
BSW Parameter		**BSW Type**
CanNmWaitBusSleepTime		ECUC-FLOAT-PARAM-DEF
BSW Description		
Timeout for bus calm down phase. It denotes the time in seconds how long the NM shall stay in the Prepare Bus-Sleep Mode before transition into Bus-Sleep Mode shall take place.		

▽

△

Template Description	
Timeout for bus calm down phase in seconds. It denotes the time how long the CanNm shall stay in the Prepare Bus-Sleep Mode before transition into Bus-Sleep Mode shall take place.	
M2 Parameter	
SystemTemplate::NetworkManagement::CanNmCluster.nmWaitBusSleepTime

1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanNm_-00021]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig	
BSW Parameter		**BSW Type**
CanNmComControlEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Pre-processor switch for enabling the Communication Control support.		
Template Description		
Enables the Communication Control support.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmEcu.nmComControlEnabled		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanNm_-00013]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig	
BSW Parameter		**BSW Type**
CanNmComUserDataSupport		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Preprocessor switch for enabling the Tx path of Com User Data. Use case: Setting of NMUserData via SWC.		
Template Description		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.iSignalToIPduMapping		
Mapping Rule		**Mapping Type**
If an NmPdu contains user data defined via the existence of NmPdu.iSignalToIPduMapping and is consequently handled via the PduR and Com this attribute shall be set to true.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanNm_-00044]

BSW Module	BSW Context		
CanNm	CanNm/CanNmGlobalConfig		
BSW Parameter		**BSW Type**	
CanNmDynamicPncToChannelMappingSupport		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Precompile time switch to enable the dynamic PNC-to-channel-mapping handling. False: Dynamic PNC-to-channel-mapping is disabled True: Dynamic PNC-to-channel-mapping is enabled			
Template Description			
Defines if this EcuInstance shall implement the dynamic PNC-to-channel-mapping functionality on this Communication Connector and its respective PhysicalChannel.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationConnector.dynamicPncToChannelMappingEnabled			
Mapping Rule			**Mapping Type**
If at least one dynamicPncToChannelMappingEnabled attribute is defined and if at least one CommunicationConnector of the EcuInstance has dynamicPncToChannelMappingEnabled set to true, then CanNmDynamicPncToChannelMappingSupport shall be set to true. Otherwise CanNm DynamicPncToChannelMappingSupport shall be set to false.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanNm_-00094]

BSW Module	BSW Context		
CanNm	CanNm/CanNmGlobalConfig		
BSW Parameter		**BSW Type**	
CanNmImmediateRestartEnabled		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Pre-processor switch for enabling the immediate transmission of a NM PDU upon bus-communication request in Prepare-Bus-Sleep mode.			
Template Description			
Enables the asynchronous transmission of a CanNm PDU upon bus-communication request in Prepare-Bus-Sleep mode.			
M2 Parameter			
SystemTemplate::NetworkManagement::CanNmClusterCoupling.nmImmediateRestartEnabled			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanNm_-00009]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig	
BSW Parameter		**BSW Type**
CanNmPassiveModeEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Pre-processor switch for enabling support of the Passive Mode.		
Template Description		
Enables support of the Passive Mode. The passive mode is configurable per channel.		

▽

△

M2 Parameter	
SystemTemplate::NetworkManagement::NmNode.nmPassiveModeEnabled	
Mapping Rule	**Mapping Type**
1:1 mapping. nmNode.nmPassiveModeEnabled shall always have the same value in all Nm Clusters with the same bus protocol in the scope of one EcuInstance.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanNm_-00010]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig	
BSW Parameter		**BSW Type**
CanNmPduRxIndicationEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Pre-processor switch for enabling the PDU Rx Indication.		
Template Description		
Switch for enabling the PDU Rx Indication.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmEcu.nmPduRxIndicationEnabled		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanNm_-00011]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig	
BSW Parameter		**BSW Type**
CanNmRemoteSleepIndEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Pre-processor switch for enabling remote sleep indication support. This feature is required for gateway nodes only.		
Template Description		
Switch for enabling remote sleep indication support.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmEcu.nmRemoteSleepIndEnabled		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanNm_-00055]

BSW Module	BSW Context	
CanNm	CanNm/CanNmGlobalConfig	
BSW Parameter		**BSW Type**

CanNmStateChangeIndEnabled		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Pre-processor switch for enabling the CAN NM state change notification.			
Template Description			
Enables the CAN Network Management state change notification.			
M2 Parameter			
SystemTemplate::NetworkManagement::NmEcu.nmStateChangeIndEnabled			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanNm_-00012]

BSW Module	**BSW Context**		
CanNm	CanNm/CanNmGlobalConfig		
BSW Parameter		**BSW Type**	
CanNmUserDataEnabled		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Pre-processor switch for enabling user data support.			
Template Description			
Switch for enabling user data support.			
M2 Parameter			
SystemTemplate::NetworkManagement::NmEcu.nmUserDataEnabled			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanNm_-00004]

C.4 CanSM

BSW Module	**BSW Context**	
CanSM	CanSM/CanSMConfiguration/CanSMManagerNetwork	
BSW Parameter		**BSW Type**
CanSMBorCounterL1ToL2		ECUC-INTEGER-PARAM-DEF
BSW Description		
This threshold defines the count of bus-offs until the bus-off recovery switches from level 1 (short recovery time) to level 2 (long recovery time).		
Template Description		
This threshold defines the count of bus-offs until the bus-off recovery switches from level 1 (short recovery time) to level 2 (long recovery time).		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Can::CanTopology::CanClusterBusOffRecovery.borCounterL1ToL2		

▽

△

Mapping Rule	Mapping Type
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanSM_-00131]

BSW Module	BSW Context	
CanSM	CanSM/CanSMConfiguration/CanSMManagerNetwork	
BSW Parameter		**BSW Type**
CanSMBorTimeL1		ECUC-FLOAT-PARAM-DEF
BSW Description		
This time parameter defines in seconds the duration of the bus-off recovery time in level 1 (short recovery time).		
Template Description		
This attribute defines the duration of the bus-off recovery time in level 1 (short recovery time) in seconds.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Can::CanTopology::CanClusterBusOffRecovery.borTimeL1		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanSM_-00128]

BSW Module	BSW Context	
CanSM	CanSM/CanSMConfiguration/CanSMManagerNetwork	
BSW Parameter		**BSW Type**
CanSMBorTimeL2		ECUC-FLOAT-PARAM-DEF
BSW Description		
This time parameter defines in seconds the duration of the bus-off recovery time in level 2 (long recovery time).		
Template Description		
This attribute defines the duration of the bus-off recovery time in level 2 (long recovery time) in seconds.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Can::CanTopology::CanClusterBusOffRecovery.borTimeL2		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanSM_-00129]

BSW Module	BSW Context	
CanSM	CanSM/CanSMConfiguration/CanSMManagerNetwork	
BSW Parameter		**BSW Type**
CanSMBorTimeTxEnsured		ECUC-FLOAT-PARAM-DEF
BSW Description		

▽

△

This parameter defines in seconds the duration of the bus-off event check. This check assesses, if the recovery has been successful after the recovery reenables the transmit path. If a new bus-off occurs during this time period, the CanSM assesses this bus-off as sequential bus-off without successful recovery. Because a bus-off only can be detected, when PDUs are transmitted, the time has to be great enough to ensure that PDUs are transmitted again (e. g. time period of the fastest cyclic transmitted PDU of the COM module, ComTxModeTimePeriod).
Template Description
This attribute defines the duration of the bus-off event check in seconds.
M2 Parameter
SystemTemplate::Fibex::Fibex4Can::CanTopology::CanClusterBusOffRecovery.borTimeTxEnsured

Mapping Rule	**Mapping Type**
If borTimeTxEnsured is defined set this parameter to true otherwise to false.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanSM_-00130]

BSW Module	**BSW Context**
CanSM	CanSM/CanSMGeneral

BSW Parameter	**BSW Type**
CanSMMainFunctionTimePeriod	ECUC-FLOAT-PARAM-DEF

BSW Description
This parameter defines the cycle time of the function CanSM_MainFunction in seconds
Template Description
This attribute defines the cycle time of the function CanSM_MainFunction in seconds.
M2 Parameter
SystemTemplate::Fibex::Fibex4Can::CanTopology::CanClusterBusOffRecovery.mainFunctionPeriod

Mapping Rule	**Mapping Type**
The value that is defined in the System Extract defines the upperbound of the cycle time. The integrator may choose a smaller value.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanSM_-00312]

C.5 CanTSyn

BSW Module	**BSW Context**
CanTSyn	CanTSyn

BSW Parameter	**BSW Type**
CanTSynGlobalTimeDomain	ECUC-PARAM-CONF-CONTAINER-DEF

BSW Description
This represents the existence of a global time domain on CAN. The CanTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains. If the CanTSyn exists it is assumed that at least one global time domain exists.
Template Description
This represents the ability to define a global time domain.

▽

△

M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeDomain	
Mapping Rule	**Mapping Type**
The container shall exist if a GlobalTimeDomain exists that has a slave or master that refers to a CommunicationConnector that in turn is aggregated by the EcuInstance for which the ECU configuration is created.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTSyn_-00004]

BSW Module	BSW Context	
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain	
BSW Parameter		**BSW Type**
CanTSynGlobalTimeDomainId		ECUC-INTEGER-PARAM-DEF
BSW Description		
The global time domain ID.		
Template Description		
This represents the ID of the GlobalTimeDomain used in the network messages sent on behalf of global time management.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeDomain.domainId		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTSyn_-00005]

BSW Module	BSW Context	
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain	
BSW Parameter		**BSW Type**
CanTSynGlobalTimeFupDataIDList		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
The DataIDList for FUP messages ensures the identification of data elements due to CRC calculation and message authentication process.		
Template Description		
The DataIDList for FUP messages to calculate CRC.		
M2 Parameter		
SystemTemplate::GlobalTime::CAN::CanGlobalTimeDomainProps.fupDataIDList		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTSyn_-00025]

BSW Module	BSW Context
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeFupDataIDList
BSW Parameter	**BSW Type**
CanTSynGlobalTimeFupDataIDListElement	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Element of the DataIDList for FUP messages ensures the identification of data elements due to CRC calculation and message authentication process.	
Template Description	
The DataIDList for FUP messages to calculate CRC.	
M2 Parameter	
SystemTemplate::GlobalTime::CAN::CanGlobalTimeDomainProps.fupDataIDList	
Mapping Rule	**Mapping Type**
Value shall be derived from element of the ordered fupDataIDList.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTSyn_-00031]

BSW Module	BSW Context
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain
BSW Parameter	**BSW Type**
CanTSynGlobalTimeMaster	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Configuration of a Time Master for a Time Domain (refer to parent container). If CanTSynGlobalTimeMaster container exists, the local ECU acts as a Time Master for the Time Domain.	
Template Description	
This represents the generic concept of a global time master.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeMaster	
Mapping Rule	**Mapping Type**
The existence of the CanTSynGlobalTimeMaster is bound to the existence of a GlobalTimeMaster that refers to a CommunicationConnector that in turn in aggregated at the EcuInstance for which the ECU configuration exists,	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTSyn_-00007]

BSW Module	BSW Context
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeMaster
BSW Parameter	**BSW Type**
CanTSynCyclicMsgResumeTime	ECUC-FLOAT-PARAM-DEF
BSW Description	
Defines the time where the 1st regular cycle time based message transmission takes place, after an immediate transmission before. Unit: seconds	
Template Description	
Defines the minimum time between an "immediate" message and the next periodic message.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeMaster.immediateResumeTime	

▽

△

CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeMaster	
BSW Parameter		**BSW Type**
CanTSynGlobalTimeDebounceTime		ECUC-FLOAT-PARAM-DEF
BSW Description		
This represents the configuration of a TX debounce time for SYNC and FUP messages compared to a message before with the same PDU. Unit: seconds		
Template Description		
Defines the minimum amount of time between two time sync messages are transmitted.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeDomain.debounceTime		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTSyn_-00045]

BSW Module	BSW Context	
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeMaster/CanTSynGlobalTimeMaster Pdu	
BSW Parameter		**BSW Type**
CanTSynGlobalTimePduRef		ECUC-REFERENCE-DEF
BSW Description		
This represents the reference to the Pdu taken to transmit the global time information. The global time master of a global time domain acts as the sender of the Pdu while all the time slaves are supposed to receive the Pdu.		
Template Description		
This PduTriggering will be taken to transmit the global time information from a GlobalTimeMaster to a the associated Global TimeSlaves.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeDomain.pduTriggering		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**

CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeMaster		
BSW Parameter		**BSW Type**	
CanTSynGlobalTimeTxIcvGeneration		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container collects configuration that shall be used for ICV generation.			
Template Description			
Defines whether an Integrity Check Value (ICV) shall be added to the sent time sync messages.			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeMaster.icvSecured			
Mapping Rule			**Mapping Type**
Create this container if GlobalTimeMaster.icvSecured is defined as the value GlobalTimeIcv SupportEnum.icvSupported.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTSyn_-00060]

BSW Module	BSW Context		
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeMaster/CanTSynGlobalTimeTxIcv Generation		
BSW Parameter		**BSW Type**	
CanTSynIcvGenerationFvIdRef		ECUC-REFERENCE-DEF	
BSW Description			
This represents the reference to the FV taken to generate the ICV generation.			
Template Description			
This attribute defines the Id of the Freshness Value for the Integrity Check Value (ICV) calculation and verification.			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeDomain.icvFreshnessValueId			
Mapping Rule			**Mapping Type**
Reference to the StbMFreshnessValue created for this GlobalTimeMaster.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTSyn_-00061]

BSW Module	BSW Context		
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeMaster/CanTSynGlobalTimeTxIcv Generation		
BSW Parameter		**BSW Type**	
CanTSynIcvGenerationJobRef		ECUC-REFERENCE-DEF	
BSW Description			
This represents the reference to the CSM job to fetch the CSM job ID.			
Template Description			
Defines whether an Integrity Check Value (ICV) shall be added to the sent time sync messages.			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeMaster.icvSecured			
Mapping Rule			**Mapping Type**

▽

△

If GlobalTimeMaster.icvSecured is set to the value icvSupported, then the referenced CsmJob needs to be configured.	full

BSW Module	**BSW Context**		
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain		
BSW Parameter		**BSW Type**	
CanTSynGlobalTimeNetworkSegmentId		ECUC-INTEGER-PARAM-DEF	
BSW Description			
This represents the numerical identifier of the network on system level scope where this Global Time has been communicated on.			
Template Description			
This attribute represents the numerical identifier of a PhysicalChannel on system level scope.			
M2 Parameter			
SystemTemplate::GlobalTime::NetworkSegmentIdentification.networkSegmentId			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTSyn_-00052]

BSW Module	**BSW Context**		
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain		
BSW Parameter		**BSW Type**	
CanTSynGlobalTimeSlave		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			

▽

△

Configuration of a Time Slave for a Time Domain (refer to parent container). If CanTSynGlobalTimeSlave container exists, the local ECU acts as a Time Slave for the Time Domain.
Template Description
This represents the generic concept of a global time slave.
M2 Parameter
SystemTemplate::GlobalTime::GlobalTimeSlave

Mapping Rule	**Mapping Type**
The existence of the CanTSynGlobalTimeSlave is bound to the existence of a GlobalTimeSlave that refers to a CommunicationConnector that in turn in aggregated at the EcuInstance for which the ECU configuration exists,	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTSyn_-00012]

BSW Module	**BSW Context**
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave
BSW Parameter	**BSW Type**
CanTSynGlobalTimeFollowUpTimeout	ECUC-FLOAT-PARAM-DEF
BSW Description	
Rx timeout for the follow-up message. This is only relevant for selected bus systems Unit:seconds	
Template Description	
Rx timeout for the follow-up message.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeSlave.followUpTimeoutValue	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTSyn_-00006]

BSW Module	**BSW Context**
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave
BSW Parameter	**BSW Type**
CanTSynGlobalTimeRxIcvVerification	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container collects configuration required for ICV verification.	
Template Description	
Defines how an Integrity Check Value (ICV) shall be handled at the receiver.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeSlave.icvVerification	
Mapping Rule	**Mapping Type**
Create this container if GlobalTimeSlave.icvVerification is defined as the value GlobalTimeIcv VerificationEnum. icvVerified or GlobalTimeIcvVerificationEnum.icvOptional.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTSyn_-00076]

BSW Module	BSW Context		
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave/CanTSynGlobalTimeRxIcv Verification		
BSW Parameter		**BSW Type**	
CanTSynIcvVerificationAttempts		ECUC-INTEGER-PARAM-DEF	
BSW Description			
This parameter specifies the number of ICV verification attempts that are to be carried out when the verification of the ICV failed for a given FUP message. If zero is set, then only one ICV verification attempt is done.			
Template Description			
This attribute defines the additional number of authentication attempts that are to be carried out when the generation of the authentication information failed for a given message. If zero is set than only one authentication attempt is done.			
M2 Parameter			
AdaptivePlatform::ServiceInstanceManifest::SecureCommunication::SecOcSecureComProps.`authenticationVerifyAttempts`			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTSyn_-00082]

BSW Module	BSW Context		
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave/CanTSynGlobalTimeRxIcv Verification		
BSW Parameter		**BSW Type**	
CanTSynIcvVerificationFvIdRef		ECUC-REFERENCE-DEF	
BSW Description			
This represents the reference to the FV taken to generate the ICV generation.			
Template Description			
This attribute defines the Id of the Freshness Value for the Integrity Check Value (ICV) calculation and verification.			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeDomain.`icvFreshnessValueId`			
Mapping Rule			**Mapping Type**
Reference to the StbMFreshnessValue created for this GlobalTimeSlave.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTSyn_-00077]

BSW Module	BSW Context	
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave/CanTSynGlobalTimeRxIcv Verification	
BSW Parameter		**BSW Type**
CanTSynIcvVerificationJobRef		ECUC-REFERENCE-DEF
BSW Description		
This represents the reference to the CSM job to fetch the CSM job ID.		
Template Description		
Defines how an Integrity Check Value (ICV) shall be handled at the receiver.		
M2 Parameter		

▽

△

SystemTemplate::GlobalTime::GlobalTimeSlave.icvVerification	
Mapping Rule	**Mapping Type**
If GlobalTimeSlave.icvVerification is set to the value icvVerified or icvOptional, then the referenced CsmJob needs to be configured.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTSyn_-00080]

BSW Module	**BSW Context**
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave
BSW Parameter	**BSW Type**
CanTSynGlobalTimeSequenceCounterJumpWidth	ECUC-INTEGER-PARAM-DEF
BSW Description	
The SequenceCounterJumpWidth specifies the maximum allowed gap of the Sequence Counter between two SYNC messages.	
Template Description	
Specifies the maximum allowed gap of the sequence counter between two SYNC resp. two OFS messages.	
M2 Parameter	
SystemTemplate::GlobalTime::CAN::GlobalTimeCanSlave.sequenceCounterJumpWidth	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTSyn_-00011]

BSW Module	**BSW Context**
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave/CanTSynGlobalTimeSlavePdu
BSW Parameter	**BSW Type**
CanTSynGlobalTimePduRef	ECUC-REFERENCE-DEF
BSW Description	
This represents the reference to the Pdu taken to transmit the global time information. The global time master of a global time domain acts as the sender of the Pdu while all the time slaves are supposed to receive the Pdu.	
Template Description	
This PduTriggering will be taken to transmit the global time information from a GlobalTimeMaster to a the associated Global TimeSlaves.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeDomain.pduTriggering	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTSyn_-00027]

BSW Module	BSW Context		
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave		
BSW Parameter		**BSW Type**	
CanTSynRxCrcValidated		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
Definition of whether or not validation of the CRC is supported.			
Template Description			
Definition of whether or not validation of the CRC is supported.			
M2 Parameter			
SystemTemplate::GlobalTime::CAN::GlobalTimeCanSlave.crcValidated			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTSyn_-00021]

BSW Module	BSW Context		
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave/CanTSynRxCrcValidated		
BSW Parameter		**BSW Type**	
CRC_IGNORED		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
The Timesync module accepts Time Synchronization messages, which are CRC secured (without actually validating the CRC) and those, which are not CRC secured. That means, the Timesync module ignores the CRC.			
Template Description			
The CRC is supposed to be ignored			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeCrcValidationEnum.crcIgnored			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			

BSW Module	BSW Context		
CanTSyn	CanTSyn/CanTSynGlobalTimeDomain/CanTSynGlobalTimeSlave/CanTSynRxCrcValidated		
BSW Parameter		**BSW Type**	
CRC_NOT_VALIDATED		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
The Timesync module accepts only Time Synchronization messages, which are not CRC secured. All other Time Synchronization messages are ignored.			
Template Description			
The CRC is not supposed to be present. If CRC is present the message is ignored.			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeCrcValidationEnum.crcNotValidated			
Mapping Rule			**Mapping Type**
1:1 mapping			full

Element of the DataIDList for SYNC messages ensures the identification of data elements due to CRC calculation and message authentication process.		
Template Description		
The DataIDList for SYNC messages to calculate CRC.		
M2 Parameter		
SystemTemplate::GlobalTime::CAN::CanGlobalTimeDomainProps.syncDataIDList		
Mapping Rule		**Mapping Type**
Value shall be derived from element of the ordered syncDataIDList.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTSyn_-00028]

C.6 CanTp

BSW Module	BSW Context	
CanTp	CanTp/CanTpConfig	
BSW Parameter		**BSW Type**
CanTpChannel		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the configuration parameters of the CanTp channel.		
Template Description		
Configuration parameters of the CanTp channel.		
M2 Parameter		
SystemTemplate::TransportProtocols::CanTpChannel		
Mapping Rule		**Mapping Type**
Create Container ifor each CanTpChannel that exist in ECU Extract.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTp_-00288]

BSW Module	BSW Context		
CanTp	CanTp/CanTpConfig/CanTpChannel		
BSW Parameter		**BSW Type**	
CanTpRxNSdu		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
The following parameters needs to be configured for each CAN N-SDU that the CanTp module receives via the CanTp Channel. This N-SDU produces meta data items of type SOURCE_ADDRESS_16, TARGET_ADDRESS_16 and ADDRESS_EXTENSION_8.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::CanTpConnection.tpSdu			
Mapping Rule			**Mapping Type**
Create container for each existing CanTpConnection that contains a reference to an N-SDU that is received.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTp_-00137]

BSW Module	BSW Context		
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpRxNSdu		
BSW Parameter		**BSW Type**	
CanTpBs		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Sets the number of N-PDUs the CanTp receiver allows the sender to send, before waiting for an authorization to continue transmission of the following N-PDUs.For further details on this parameter value see ISO 15765-2 specification.			
Template Description			
The maximum number of N-PDUs the CanTp receiver allows the sender to send, before waiting for an authorization to continue transmission of the following N-PDUs. For further details on this parameter value see ISO 15765-2 specification. Note: For reasons of buffer length, the CAN Transport Layer can adapt the BS value within the limit of this maximum BS

BSW Module	BSW Context	
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpRxNSdu	
BSW Parameter		**BSW Type**
CanTpNAe		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container is required for each RxNSdu and TxNSdu with AddressingFormat CANTP_MIXED or CANTP_MIXED29BIT.		
Template Description		
Declares which communication addressing mode is supported.		
M2 Parameter		

▽

△

SystemTemplate::TransportProtocols::CanTpConnection.addressingFormat	
Mapping Rule	**Mapping Type**
Create container if addressingFormat is set to "mixed".	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_-00284]

BSW Module	**BSW Context**
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpRxNSdu/CanTpNAe
BSW Parameter	**BSW Type**
CanTpNAe	ECUC-INTEGER-PARAM-DEF
BSW Description	
This parameter contains the transport protocol address extension value.	
Template Description	
If the mixed addressing format is used, this parameter contains the transport protocol address extension value.	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpAddress.tpAddressExtensionValue	
Mapping Rule	**Mapping Type**
The CanTPConnection contains a reference to the SDU and a relation to the TpNode that contains the TpAddressExtension.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_-00285]

BSW Module	**BSW Context**
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpRxNSdu
BSW Parameter	**BSW Type**
CanTpNSa	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container is required for each RxNSdu and TxNSdu with RxTaType CANTP_PHYSICAL and CanTpAddressingFormat CANTP_EXTENDED. When DynIdSupport is enabled, this container is also required for each TxNSdu with Addressing Format CANTP_NORMALFIXED or CANTP_MIXED29BIT. When DynIdSupport is enabled and GenericConnectionSupport is not enabled, this container is also required for each RxNSdu with AddressingFormat CANTP_NORMALFIXED or CANTP_MIXED29BIT.	
Template Description	
Declares which communication addressing mode is supported.	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpConnection.addressingFormat	
Mapping Rule	**Mapping Type**
Create container if addressingFormat is set to "extended".	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_-00253]

BSW Module	**BSW Context**
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpRxNSdu/CanTpNSa
BSW Parameter	**BSW Type**
CanTpNSa	ECUC-INTEGER-PARAM-DEF
BSW Description	
This parameter contains the transport protocol source address value.	
Template Description	
An ECUs TP address on the referenced channel. This represents the diagnostic Address.	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpAddress.tpAddress	
Mapping Rule	**Mapping Type**
The CanTPConnection contains a reference to the SDU and a relation to the TpNode that contains the TpAddress.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_-00254]

BSW Module	**BSW Context**
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpRxNSdu
BSW Parameter	**BSW Type**
CanTpNTa	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container is required for each RxNSdu and TxNSdu with AddressingFormat CANTP_EXTENDED. When DynIdSupport is enabled, this container is also required for each RxNSdu with AddressingFormat CANTP_NORMALFIXED or CANTP_MIXED29BIT. When DynIdSupport is enabled and GenericConnectionSupport is not enabled, this container is also required for each TxNSdu with AddressingFormat CANTP_NORMALFIXED or CANTP_MIXED29BIT.	
Template Description	
Declares which communication addressing mode is supported.	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpConnection.addressingFormat	
Mapping Rule	**Mapping Type**
Create container if addressingFormat is set to "extended".	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_-00139]

BSW Module	**BSW Context**
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpRxNSdu/CanTpNTa
BSW Parameter	**BSW Type**
CanTpNTa	ECUC-INTEGER-PARAM-DEF
BSW Description	
This parameter contains the transport protocol target address value.	
Template Description	
An ECUs TP address on the referenced channel. This represents the diagnostic Address.	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpAddress.tpAddress	

△

CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpRxNSdu
BSW Parameter	**BSW Type**
CanTpRxNPdu	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Used for grouping of the ID of a PDU and the Reference to a PDU. This N-PDU consumes a meta data item of type CAN_ID_32.	
Template Description	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpConnection.dataPdu	
Mapping Rule	**Mapping Type**

▽

△

Create container if the CanTpConnection contains a reference to a DataNpdu that is received by the regarded ECU.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_-00256]

BSW Module	**BSW Context**
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpRxNSdu
BSW Parameter	**BSW Type**
CanTpRxPaddingActivation	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
Defines if the received frame uses padding or not. This parameter is restricted to 8 bytes N-PDUs. Definition of enumeration values: CanTpOn: The N-PDU received uses padding for SF, FC and the last CF. (N-PDU length is always >= 8 bytes in case of CAN 2.0) CanTpOff: The N-PDU received does not use padding for SF, FC and the last CF. (N-PDU length is dynamic - any valid DLC value). Note: The mandatory mapping to the next higher valid DLC value for N-PDUs with a length > 8 bytes is not affected by this parameter.	
Template Description	
This specifies whether or not Sfs, FCs and the last CF shall be padded to 8 bytes length in case it contains less payload. true: The N-PDU received uses padding for SF, FC and the last CF. (N-PDU length is always 8 bytes) false: The N-PDU received does not use padding for SF, CF and the last CF. (N-PDU length is dynamic)

Template Description		
Declares which communication addressing mode is supported.		
M2 Parameter		
SystemTemplate::TransportProtocols::CanTpConnection.addressingFormat		
Mapping Rule		**Mapping Type**
Create container if addressingFormat is set to "mixed".		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTp_-00284]

BSW Module	**BSW Context**	
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu/CanTpNAe	
BSW Parameter		**BSW Type**
CanTpNAe		ECUC-INTEGER-PARAM-DEF
BSW Description		
This parameter contains the transport protocol address extension value.		
Template Description		
If the mixed addressing format is used, this parameter contains the transport protocol address extension value.		
M2 Parameter		
SystemTemplate::TransportProtocols::CanTpAddress.tpAddressExtensionValue		
Mapping Rule		**Mapping Type**
The CanTPConnection contains a reference to the SDU and a relation to the TpNode that contains the TpAddressExtension.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTp_-00285]

BSW Module	BSW Context
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu
BSW Parameter	**BSW Type**
CanTpNSa	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container is required for each RxNSdu and TxNSdu with RxTaType CANTP_PHYSICAL and CanTpAddressingFormat CANTP_EXTENDED. When DynIdSupport is enabled, this container is also required for each TxNSdu with Addressing Format CANTP_NORMALFIXED or CANTP_MIXED29BIT. When DynIdSupport is enabled and GenericConnectionSupport is not enabled, this container is also required for each RxNSdu with AddressingFormat CANTP_NORMALFIXED or CANTP_MIXED29BIT.	
Template Description	
Declares which communication addressing mode is supported.	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpConnection.addressingFormat	
Mapping Rule	**Mapping Type**
Create container if addressingFormat is set to "extended".	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_00253]

BSW Module	BSW Context
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu/CanTpNSa
BSW Parameter	**BSW Type**
CanTpNSa	ECUC-INTEGER-PARAM-DEF
BSW Description	
This parameter contains the transport protocol source address value.	
Template Description	
An ECUs TP address on the referenced channel. This represents the diagnostic Address.	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpAddress.tpAddress	
Mapping Rule	**Mapping Type**
The CanTPConnection contains a reference to the SDU and a relation to the TpNode that contains the TpAddress.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_00254]

BSW Module	BSW Context
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu
BSW Parameter	**BSW Type**
CanTpNTa	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container is required for each RxNSdu and TxNSdu with AddressingFormat CANTP_EXTENDED. When DynIdSupport is enabled, this container is also required for each RxNSdu with AddressingFormat CANTP_NORMALFIXED or CANTP_MIXED29BIT. When DynIdSupport is enabled and GenericConnectionSupport is not enabled, this container is also required for each TxNSdu with AddressingFormat CANTP_NORMALFIXED or CANTP_MIXED29BIT.	
Template Description	

▽

△

Declares which communication addressing mode is supported.	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpConnection.addressingFormat	
Mapping Rule	**Mapping Type**
Create container if addressingFormat is set to "extended".	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_-00139]

BSW Module	**BSW Context**	
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu/CanTpNTa	
BSW Parameter		**BSW Type**
CanTpNTa		ECUC-INTEGER-PARAM-DEF
BSW Description		
This parameter contains the transport protocol target address value.		
Template Description		
An ECUs TP address on the referenced channel. This represents the diagnostic Address.		
M2 Parameter		
SystemTemplate::TransportProtocols::CanTpAddress.tpAddress		
Mapping Rule		**Mapping Type**
The CanTPConnection contains a reference to the SDU and a relation to the TpNode that contains the TpAddress.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTp_-00255]

BSW Module	**BSW Context**	
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu	
BSW Parameter		**BSW Type**
CanTpNas		ECUC-FLOAT-PARAM-DEF
BSW Description		
Value in second of the N_As timeout. N_As is the time for transmission of a CAN frame (any N_PDU) on the part of the sender.		
Template Description		
This attribute states the timeout between the PDU transmit request for the first PDU of the group used in the current connection of the Transport Layer to the Can Interface and the corresponding confirmation of the Can Interface (when having sent the last PDU of the group used in this connection) on the sender side (SF-x, FF-x, CF or FC (in case of Transmit Cancellation)). Specified in seconds.		
M2 Parameter		
SystemTemplate::TransportProtocols::CanTpNode.timeoutAs		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTp_-00263]

BSW Module	BSW Context		
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu		
BSW Parameter		**BSW Type**	
CanTpNbs		ECUC-FLOAT-PARAM-DEF	
BSW Description			
Value in seconds of the N_Bs timeout. N_Bs is the time of transmission until reception of the next Flow Control N_PDU.			
Template Description			
This parameter defines the timeout for waiting for an FC or AF on the sender side in an 1:1 connection. Specified in seconds.			
M2 Parameter			
SystemTemplate::TransportProtocols::CanTpConnection.timeoutBs			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTp_-00264]

BSW Module	BSW Context		
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu		
BSW Parameter		**BSW Type**	
CanTpNcs		ECUC-FLOAT-PARAM-DEF	
BSW Description			
Value in seconds of the performance requirements relating to N_Cs. CanTpNcs is the time in which CanTp is allowed to request from PduR the Tx data of a Consecutive Frame N_PDU.			
Template Description			
The attribute timeoutCs represents the time (in seconds) which elapses between the transmit request of a CF N-PDU until the transmit request of the next CF N-PDU.			
M2 Parameter			
SystemTemplate::TransportProtocols::CanTpConnection.timeoutCs			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTp_-00265]

BSW Module	BSW Context		
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu		
BSW Parameter		**BSW Type**	
CanTpRxFcNPdu		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Used for grouping of the ID of a PDU and the Reference to a PDU. This N-PDU consumes a meta data item of type CAN_ID_32.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::CanTpConnection.flowControlPdu			
Mapping Rule			**Mapping Type**

▽

△

Create container if the CanTpConnection contains a reference to a FlowControlNPdu that is received by the regarded ECU.	full
Mapping Status	**ECUC Parameter ID**

BSW Module	**BSW Context**		
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu		
BSW Parameter		**BSW Type**	
CanTpTc		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Switch for enabling Transmit Cancellation.			
Template Description			
With this switch Tx Cancellation can be turned on or off. Please note that the Rx Cancellation is always enabled.			
M2 Parameter			
SystemTemplate::TransportProtocols::CanTpConnection.cancellation			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTp_-00282]

BSW Module	**BSW Context**		
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu		
BSW Parameter		**BSW Type**	
CanTpTxAddressingFormat		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
Declares which communication addressing format is supported for this TxNSdu. Definition of Enumeration values: CanTp Standard to use normal addressing format. CanTpExtended to use extended addressing format. CanTpMixed to use mixed 11 bit addressing format. CanTpNormalFixed to use normal fixed addressing format. CanTpMixed29Bit to use mixed 29 bit addressing format.			
Template Description			
Declares which communication addressing mode is supported.			
M2 Parameter			
SystemTemplate::TransportProtocols::CanTpConnection.addressingFormat			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_CanTp_-00262]

CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu	
BSW Parameter		**BSW Type**
CanTpTxNPdu		ECUC-PARAM-CONF-CONTAINER-DEF

▽

△

BSW Description	
Used for grouping of the ID of a PDU and the Reference to a PDU. This N-PDU produces a meta data item of type CAN_ID_32.	
Template Description	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpConnection.dataPdu	
Mapping Rule	**Mapping Type**
Create container if the CanTpConnection contains a reference to a DataNpdu that is received by the regarded ECU.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_-00274]

BSW Module	BSW Context
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu
BSW Parameter	**BSW Type**
CanTpTxPaddingActivation	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
Defines if the transmit frame use padding or not. This parameter is restricted to 8 byte N-PDUs. Definition of Enumeration values: CanTpOn The transmit N-PDU uses padding for SF, FC and the last CF. (N-PDU length is always 8 bytes in case of CAN 2.0) CanTpOff The transmit N-PDU does not use padding for SF, CF and the last CF. (N-PDU length is dynamic - any valid DLC value). Note: The mandatory mapping to the next higher valid DLC value for N-PDUs with a length > 8 bytes is not affected by this parameter.	
Template Description	
This specifies whether or not Sfs, FCs and the last CF shall be padded to 8 bytes length in case it contains less payload. true: The N-PDU received uses padding for SF, FC and the last CF. (N-PDU length is always 8 bytes) false: The N-PDU received does not use padding for SF, CF and the last CF. (N-PDU length is dynamic)	
M2 Parameter	
SystemTemplate::TransportProtocols::CanTpConnection.paddingActivation	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_CanTp_-00269]

BSW Module	BSW Context
CanTp	CanTp/CanTpConfig/CanTpChannel/CanTpTxNSdu
BSW Parameter	**BSW Type**
CanTpTxTaType	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
Declares the communication type of this TxNsdu. Enumeration values: CanTpPhysical. Used for 1:1 communication. CanTpFunctional. Used for 1:n communication.	
Template Description	
Network Target Address type.	

▽

△

BSW Module	BSW Context	
CanTp	CanTp/CanTpConfig	
BSW Parameter		**BSW Type**
CanTpMainFunctionPeriod		ECUC-FLOAT-PARAM-DEF
BSW Description		
Allow to configure the time for the MainFunction (as float in seconds). The CanTpMainFunctionPeriod should be assigned a value which is optimal regarding all of the timers configured for CanTp in TX and RX data transfer i.e. the differences from the configured timing should be as small as possible. Please note: This period shall be the same as call cycle time of the periodic task were CanTp Main function is called.		
Template Description		
The period between successive calls to the Main Function of the AUTOSAR TP. Specified in seconds.		
M2 Parameter		
SystemTemplate::TransportProtocols::CanTpEcu.cycleTimeMainFunction		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_CanTp_-00240]

C.7 CanTrcv

BSW Module	BSW Context	
CanTrcv	CanTrcv/CanTrcvConfigSet/CanTrcvChannel/CanTrcvPartialNetwork	
BSW Parameter		**BSW Type**
CanTrcvBaudRate		ECUC-INTEGER-PARAM-DEF
BSW Description		
Indicates the data transfer rate in kbps.		
Template Description		
Channels speed in bits/s.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationCluster.baudrate		
Mapping Rule		**Mapping Type**
CanTrcvBaudRate = SystemTemplate baudrate is in bps, so divide it by 1000 to get kbps		full
Mapping Status		**ECUC Parameter ID**

▽

△

valid	[ECUC_CanTrcv_-00169]

BSW Parameter	BSW Type
CanTrcvPnFrameDlc	ECUC-INTEGER-PARAM-DEF

BSW Description
Data Length of the Wake-up Frame (WUF).

Template Description
Data Length of the remote data frame used to configure the CAN Transceiver for partial network wakeup in Bytes.

M2 Parameter
SystemTemplate::Fibex::Fibex4Can::CanTopology::CanCommunicationConnector.pncWakeupDlc

Mapping Rule	Mapping Type
1:1 mapping	full

Mapping Status	ECUC Parameter ID
valid	[ECUC_CanTrcv_-00168]

BSW Module	BSW Context
CanTrcv	CanTrcv/CanTrcvConfigSet/CanTrcvChannel

BSW Parameter	BSW Type
CanTrcvWakeupByBusUsed	ECUC-BOOLEAN-PARAM-DEF

BSW Description
Is wake up by bus supported? If CAN transceiver hardware does not support wake up by bus value is always FALSE. If CAN transceiver hardware supports wake up by bus value is TRUE or FALSE depending whether it is used or not. TRUE = Is used. FALSE = Is not used.

Template Description
Defines whether the ECU shall be woken up by this CommunicationController. TRUE: wake up is possible FALSE: wake up is not supported Note: If wakeUpByControllerSupported is set to TRUE the feature shall be supported by both hardware and basic software.

M2 Parameter
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationController.wakeUpByControllerSupported

C.8 Cdd

BSW Module	BSW Context	
Cdd	Cdd/CddGlobalTimeContribution/CddGlobalTimeDomain/CddGlobalTimeMaster	
BSW Parameter		**BSW Type**
CddGlobalTimeTxPeriod		ECUC-FLOAT-PARAM-DEF
BSW Description		
This represents configuration of the TX period. Unit: seconds		
Template Description		
This represents the period. Unit: seconds		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeMaster.syncPeriod		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Cdd_00074]

C.9 Com

BSW Module	BSW Context	
Com	Com/ComConfig	
BSW Parameter		**BSW Type**
ComGwMapping		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Each instance of this container defines one mapping of the integrated Signal Gateway.		
Template Description		
Arranges those signals (or SignalGroups) that are transferred by the gateway from one channel to the other in pairs and defines the mapping between them. Each pair consists in a source and a target referencing to a ISignalTriggering.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Multiplatform::ISignalMapping		
Mapping Rule		**Mapping Type**

▽

△

In the System Extract an explicit ISignalMapping or an implicit ISignalMapping may be defined. Explicit Mapping: Create Container for each ISignalMapping.sourceSignal where the referenced ISignalTriggering refers to an ISignal. Implicit Mapping: Ifthe ISignalMapping.sourceSignal refers to an ISignalTriggering where the ISignalTriggering refers to an ISignalGroup (and no explicit mapping is defined for the ISignal Group), then create Container for each ISignal referenced by the ISignalGroup where the short Name of the source ISignal matches the shortName of a destination ISignal of the ISignal Mapping.targetSignal ISignalGroup.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Com_00544]

BSW Module	**BSW Context**	
Com	Com/ComConfig/ComGwMapping	
BSW Parameter		**BSW Type**
ComGwDestination		ECUC-CHOICE-CONTAINER-DEF
BSW Description		
Each instance of this choice container allows to define one routing destination either by reference to an already configured COM signal / group signal or by a destination description container.		
Template Description		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Multiplatform::ISignalMapping.targetSignal		
Mapping Rule		**Mapping Type**
Explicit Mapping: Create Container for each targetSignal reference that is defined in the ISignal Mapping. Implicit Mapping: If the ISignalMapping.targetSignal refers to an ISignalTriggering where the ISignalTriggering refers to an ISignalGroup (and no explicit mapping is defined for the ISignal Group), then create Container for each ISignal referenced by the ISignalGroup where the short Name of the target ISignal matches the shortName of a source ISignal of the ISignal Mapping.sourceSignal ISignalGroup.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Com_00546]

BSW Module	**BSW Context**	
Com	Com/ComConfig/ComGwMapping/ComGwDestination	
BSW Parameter		**BSW Type**
ComGwDestinationDescription		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Description of a gateway destination. This container allows defining a gateway destination without the configuration of a complete COM signal. This allows adding / changing gateway relations post build without the configuration of new signals.		
Template Description		
An ISignalToIPduMapping describes the mapping of ISignals to ISignalIPdus and defines the position of the ISignal within an ISignalIPdu.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalToIPduMapping		
Mapping Rule		**Mapping Type**
Informations can be derived from ISignalToIPduMapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Com_00549]

BSW Module	**BSW Context**	
Com	Com/ComConfig/ComGwMapping/ComGwDestination/ComGwDestinationDescription	
BSW Parameter		**BSW Type**
ComBitPosition		ECUC-INTEGER-PARAM-DEF
BSW Description		
Starting position within the I-PDU. This parameter refers to the position in the I-PDU and not in the shadow buffer. If the endianness conversion is configured to Opaque the parameter ComBitPosition shall define the bit0 of the first byte like in little endian byte order		
Template Description		
This parameter is necessary to describe the bitposition of a signal within an SignalIPdu. It denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packing ByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7. Please note that the way the bytes will be actually sent on the bus does not impact this representation: they will always be seen by the software as a byte array. If a mapping for the ISignalGroup is defined, this attribute is irrelevant and shall be ignored.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalToIPduMapping.startPosition		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**

Com	Com/ComConfig/ComGwMapping/ComGwDestination/ComGwDestinationDescription	
BSW Parameter		**BSW Type**
ComSignalEndianness		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
Defines the endianness of the signal's network representation.		
Template Description		
This parameter defines the order of the bytes of the signal and the packing into the SignalIPdu. The byte ordering "Little Endian" (MostSignificantByteLast), "Big Endian" (MostSignificantByteFirst) and "Opaque" can be selected. For opaque data endianness conversion shall be configured to Opaque. The value of this attribute impacts the absolute position of the signal into the SignalIPdu (see the startPosition attribute description). For an ISignalGroup the packingByteOrder is irrelevant and shall be ignored.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalToIPduMapping.packingByteOrder

BSW Parameter		**BSW Type**
ComSignalInitValue		ECUC-STRING-PARAM-DEF
BSW Description		
Initial value for this signal. In case of UINT8_N the default value is a string of length ComSignalLength with all bytes set to 0x00. In case of UINT8_DYN the initial size shall be 0. In case the ComSignalType is UINT8, UINT16, UINT32, UINT64, SINT8, SINT16, SINT32, SINT64 the string shall be interpreted as defined in the chapter Integer Type in the AUTOSAR EcuC specification. In case the ComSignalType is FLOAT32, FLOAT64 the string shall be interpreted as defined in the chapter Float Type in the AUTOSAR EcuC specification. In case the ComSignalType is BOOLEAN the string shall be interpreted as defined in the chapter Boolean Type in the AUTOSAR EcuC specification. In case the ComSignal is a UINT8_N, UINT8_DYN the string shall be interpreted as a decimal representation of the characters separated by blanks, e.g. "97 98 100" means a string "abd", where the char "a" is in byte 0(lowest address), "b" is in byte 1, and "d" is in byte 2 and (highest address). For the ComSignalType UINT8_DYN the dynamic length shall be set to the number of configured characters. An empty string "" shall be interpreted as 0-sized dynamic signal.		
Template Description		
Initial value to be sent if sender component is not yet fully initialized, but receiver needs data already.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal.initValue, SWComponent Template::Communication::NonqueuedSenderComSpec.initValue		
Mapping Rule		**Mapping Type**
It is possible to aggregate an initValue at the level of a ComSpec in the SWC Template. in case the System Description doesn't use a complete Software Component Description (VFB View) the init Value is defined in the System Template.		full

BSW Module	BSW Context		
Com	Com/ComConfig/ComGwMapping/ComGwDestination/ComGwDestinationDescription		
BSW Parameter		**BSW Type**	
ComUpdateBitPosition		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Bit position of update-bit inside I-PDU. If this attribute is omitted then there is no update-bit. This setting must be consistently on sender and on receiver side. Range: 0..63 for CAN and LIN, 0..511 for CAN FD, 0..2031 for FlexRay, 0..4294967295 for TP.			
Template Description			
The UpdateIndicationBit indicates to the receivers that the signal (or the signal group) was updated by the sender. Length is always one bit. The UpdateIndicationBitPosition attribute describes the position of the update bit within the SignalIPdu. For Signals of a ISignalGroup this attribute is irrelevant and shall be ignored. Note that the exact bit position of the updateIndicationBitPosition is linked to the value of the attribute packingByteOrder because the method of finding the bit position is different for the values mostSignificantByteFirst and mostSignificantByte Last. This means that if the value of packingByteOrder is changed while the value of updateIndicationBitPosition remains unchanged the exact bit position of updateIndicationBitPosition within the enclosing ISignalIPdu still undergoes a change. This attribute denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packingByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7.

Com	Com/ComConfig/ComGwMapping/ComGwSource/ComGwSourceDescription	
BSW Parameter		**BSW Type**
ComBitPosition		ECUC-INTEGER-PARAM-DEF
BSW Description		
Starting position within the I-PDU. This parameter refers to the position in the I-PDU and not in the shadow buffer. If the endianness conversion is configured to Opaque the parameter ComBitPosition shall define the bit0 of the first byte like in little endian byte order		
Template Description		
This parameter is necessary to describe the bitposition of a signal within an SignalIPdu. It denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packing ByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7. Please note that the way the bytes will be actually sent on the bus does not impact this representation: they will always be seen by the software as a byte array. If a mapping for the ISignalGroup is defined, this attribute is irrelevant and shall be ignored.		
M2 Parameter

BSW Module	**BSW Context**	
Com	Com/ComConfig/ComGwMapping/ComGwSource/ComGwSourceDescription	
BSW Parameter		**BSW Type**
ComSignalType		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
The AUTOSAR type of the signal. Whether or not the signal is signed or unsigned can be found by examining the value of this attribute. This type could also be used to reserved appropriate storage in AUTOSAR COM.		
Template Description		
With the aggregation of SwDataDefProps an ISignal specifies how it is represented on the network. This representation follows a particular policy. Note that this causes some redundancy which is intended and can be used to support flexible development methodology as well as subsequent integrity checks. If the policy "networkRepresentationFromComSpec" is chosen the network representation from the ComSpec that is aggregated by the PortPrototype shall be used. If the "override" policy is chosen the requirements specified in the Port Interface and in the ComSpec are not fulfilled by the networkRepresentationProps. In case the System Description doesn't use a complete Software Component Description (VFB View) the "legacy" policy can be chosen.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal.dataTypePolicy		
Mapping Rule		**Mapping Type**
The mapping depends from the setting in the ISignal.dataTypePolicy: - ISignal.dataTypePolicy = override or legacy: SystemTemplate::Fibex::FibexCore::Core Communication::ISignal.networkRepresentationProps.swBaseType - ISignal.dataTypePolicy = networkRepresentationFromComSpec: if defined on ComSpec: SWComponentTemplate::Communication::SenderComSpec.networkRepresentation.swBaseType SWComponentTemplate::Communication::SenderComSpec.compositeNetwork Representation.networkRepresentation.swBaseType SWComponentTemplate::Communication::ReceiverComSpec.networkRepresentation.swBase Type SWComponentTemplate::Communication::ReceiverComSpec.compositeNetwork Representation.networkRepresentation.swBaseType if not defined on ComSpec: CommonStructure::ImplementationDataTypes::ImplementationData Type.swDataDefProps.swBaseType Find the ImplementationDataType according to TPS_ SYST_02079 and access SwDataDefProps.swBaseType. Consequence: If two SenderReceiverToSignalMappings that point to the same SystemSignal result in incompatible BaseTypes (see constr_1220 in SoftwareComponentTemplate) => Com SignalType should not be configured. - ISignal.dataTypePolicy = portInterfaceDefinition --> option has atpStatus "removed", in consequence no mapping is available." - ISignal.dataTypePolicy = transformingISignal Hardcoded to UINT8_N or UINT8_DYN. Datatype can be derived from SystemSignal.dynamicLength: UINT8_N should be used if System Signal.dynamicLength = false UINT8_DYN should be used if SystemSignal.dynamicLength = true		full

Com	Com/ComConfig
BSW Parameter	**BSW Type**
ComSignal	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Contains the configuration parameters of the AUTOSAR COM module's signals.	
Template Description	
An ISignalToIPduMapping describes the mapping of ISignals to ISignalIPdus and defines the position of the ISignal within an ISignalIPdu.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalToIPduMapping	
Mapping Rule	**Mapping Type**

▽

△

A ComSignal container shall be created for an ISignal that is contained in an ISignalIPdu which the Com module is sending. The creation of a ComSignal container may be omitted for an ISignal that is contained in an ISignal IPdu which the Com module is receiving if no Rx ISignalPort exists for the ISignal.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Com_00344]

BSW Module	**BSW Context**		
Com	Com/ComConfig/ComSignal		
BSW Parameter		**BSW Type**	
ComBitPosition		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Starting position within the I-PDU. This parameter refers to the position in the I-PDU and not in the shadow buffer. If the endianness conversion is configured to Opaque the parameter ComBitPosition shall define the bit0 of the first byte like in little endian byte order			
Template Description			
This parameter is necessary to describe the bitposition of a signal within an SignalIPdu. It denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packing ByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7. Please note that the way the bytes will be actually sent on the bus does not impact this representation: they will always be seen by the software as a byte array. If a mapping for the ISignalGroup is defined, this attribute is irrelevant and shall be ignored.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalToIPduMapping.startPosition			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**

BSW Module	**BSW Context**		
Com	Com/ComConfig/ComSignal		
BSW Parameter		**BSW Type**	
ComBitSize		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Size in bits, for integer signal types. For ComSignalType UINT8_N and UINT8_DYN the size shall be configured by Com SignalLength. For ComSignalTypes FLOAT32 and FLOAT64 the size is already defined by the signal type and therefore may be omitted.			
Template Description			
Size of the signal in bits. The size needs to be derived from the mapped VariableDataPrototype according to the mapping of primitive DataTypes to BaseTypes as used in the RTE. Indicates maximum size for dynamic length signals. The ISignal length of zero bits is allowed.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal.length

BSW Module	**BSW Context**		
Com	Com/ComConfig/ComSignal		
BSW Parameter		**BSW Type**	
ComRxDataTimeoutAction		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
This parameter defines the action performed upon expiration of the reception deadline monitoring timer.			
Template Description			
This attribute controls the behavior with respect to the handling of timeouts.			
M2 Parameter			
SWComponentTemplate::Communication::NonqueuedReceiverComSpec.handleTimeoutType			
Mapping Rule			**Mapping Type**

▽

△

If a full DataMapping exists for the SystemSignal and there is a single receiver on this ECU then this information shall be configured in accordance with the configured NonqueuedReceiverCom Spec. If a full DataMapping exists for the SystemSignal and there are multiple receivers on this ECU then this information is available in the NonqueuedReceiverComSpecs. In this case the attribute Com RxDataTimeoutAction of the related ComSignal/ComSignalGroup shall be configured to NONE to ensure that the RTE always has access to the last received value. Please note that the SWS_RTE defines an algorithm to implement the applicable timeout action.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Com_00412]

BSW Module	**BSW Context**
Com	Com/ComConfig/ComSignal
BSW Parameter	**BSW Type**
ComSignalDataInvalidValue	ECUC-STRING-PARAM-DEF
BSW Description	
Defines the data invalid value of the signal. In case the ComSignalType is UINT8, UINT16, UINT32, UINT64, SINT8, SINT16, SINT32, SINT64 the string shall be interpreted as defined in the chapter Integer Type in the AUTOSAR EcuC specification. In case the ComSignalType is FLOAT32, FLOAT64 the string shall be interpreted as defined in the chapter Float Type in the AUTOSAR EcuC specification. In case the ComSignalType is BOOLEAN the string shall be interpreted as defined in the chapter Boolean Type in the AUTOSAR EcuC specification. In case the ComSignal is a UINT8_N, UINT8_DYN the string shall be interpreted as a decimal representation of the characters separated by blanks, e.g. "97 98 100" means a string "abd", where the char "a" is in byte 0(lowest address), "b" is in byte 1, and "d" is in byte 2 and (highest address). For the ComSignalType UINT8_DYN the dynamic length shall be set to the number of configured characters. An empty string "" shall be interpreted as 0-sized dynamic signal.	
Template Description	
InvalidationPolicy: Specifies whether the component can actively invalidate a particular dataElement. If no invalidationPolicy points to a dataElement this is considered to yield the identical result as if the handleInvalid attribute was set to dontInvalidate. **SwDataDefProps.invalidValue:** Optional value to express invalidity of the actual data element.	
M2 Parameter	
SWComponentTemplate::PortInterface::`InvalidationPolicy`, DataDictionary::DataDefProperties::SwDataDefProps.`invalidValue`	
Mapping Rule	**Mapping Type**
ComSignalDataInvalidValue is only derived 1:1 from the SwDataDefProps.invalidValue if the InvalidationPolicy equals keep or replace. In all other cases of InvalidationPolicy the ComSignal DataInvalidValue shall not be configured.	full
Mapping Status	**ECUC Parameter ID**

ComSignalEndianness	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
Defines the endianness of the signal's network representation.	
Template Description	

▽

△

This parameter defines the order of the bytes of the signal and the packing into the SignalIPdu. The byte ordering "Little Endian" (MostSignificantByteLast), "Big Endian" (MostSignificantByteFirst) and "Opaque" can be selected. For opaque data endianness conversion shall be configured to Opaque. The value of this attribute impacts the absolute position of the signal into the SignalIPdu (see the startPosition attribute description). For an ISignalGroup the packingByteOrder is irrelevant and shall be ignored.
M2 Parameter
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalToIPduMapping.packingByteOrder

Mapping Rule	**Mapping Type**

valid	[ECUC_Com_00157]

BSW Module	**BSW Context**
Com	Com/ComConfig/ComSignal

BSW Parameter	**BSW Type**
ComSignalInitValue	ECUC-STRING-PARAM-DEF

BSW Description
Initial value for this signal. In case of UINT8_N the default value is a string of length ComSignalLength with all bytes set to 0x00. In case of UINT8_DYN the initial size shall be 0. In case the ComSignalType is UINT8, UINT16, UINT32, UINT64, SINT8, SINT16, SINT32, SINT64 the string shall be interpreted as defined in the chapter Integer Type in the AUTOSAR EcuC specification. In case the ComSignalType is FLOAT32, FLOAT64 the string shall be interpreted as defined in the chapter Float Type in the AUTOSAR EcuC specification. In case the ComSignalType is BOOLEAN the string shall be interpreted as defined in the chapter Boolean Type in the AUTOSAR EcuC specification. In case the ComSignal is a UINT8_N, UINT8_DYN the string shall be interpreted as a decimal representation of the characters separated by blanks, e.g. "97 98 100" means a string "abd", where the char "a" is in byte 0(lowest address), "b" is in byte 1, and "d" is in byte 2 and (highest address). For the ComSignalType UINT8_DYN the dynamic length shall be set to the number of configured characters. An empty string "" shall be interpreted as 0-sized dynamic signal.
Template Description
Initial value to be sent if sender component is not yet fully initialized, but receiver needs data already.
M2 Parameter
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal.initValue, SWComponentTemplate::Communication::NonqueuedSenderComSpec.initValue

Mapping Rule	**Mapping Type**
It is possible to aggregate an initValue at the level of a ComSpec in the SWC Template. in case the System Description doesn't use a complete Software Component Description (VFB View) the init Value is defined in the System Template.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Com_00170]

BSW Module	**BSW Context**
Com	Com/ComConfig/ComSignal

BSW Parameter	**BSW Type**
ComSignalLength	ECUC-INTEGER-PARAM-DEF

BSW Description

▽

△

Description: For ComSignalType UINT8_N this parameter specifies the length n in bytes. For ComSignalType UINT8_DYN it specifies the maximum length in bytes. For all other types this parameter shall be ignored. The supported maximum length is restricted by the used transportation system. For non TP-PDUs the maximum size of a PDU, and therefore also of any included signal, is limited by the concrete bus characteristic. For example, the limit is 8 bytes for CAN and LIN, 64 bytes for CAN FD and 254 for FlexRay.	
Template Description	
Size of the signal in bits. The size needs to be derived from the mapped VariableDataPrototype according to the mapping of primitive DataTypes to BaseTypes as used in the RTE. Indicates maximum size for dynamic length signals. The ISignal length of zero bits is allowed.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal.length	
Mapping Rule	**Mapping Type**
ComSignalLength = ISignal.length / 8 (i.e. value of baseTypeSize)	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Com_00437]

BSW Module	**BSW Context**	
Com	Com/ComConfig/ComSignal	
BSW Parameter		**BSW Type**
ComSignalType		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
The AUTOSAR type of the signal. Whether or not the signal is signed or unsigned can be found by examining the value of this attribute. This type could also be used to reserved appropriate storage in AUTOSAR COM.		
Template Description		
With the aggregation of SwDataDefProps an ISignal specifies how it is represented on the network. This representation follows a particular policy. Note that this causes some redundancy which is intended and can be used to support flexible development methodology as well as subsequent integrity checks. If the policy "networkRepresentationFromComSpec" is chosen the network representation from the ComSpec that is aggregated by the PortPrototype shall be used. If the "override" policy is chosen the requirements specified in the Port Interface and in the ComSpec are not fulfilled by the networkRepresentationProps. In case the System Description doesn't use a complete Software Component Description (VFB View) the "legacy" policy can be chosen.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal.dataTypePolicy		
Mapping Rule		**Mapping Type**
The mapping depends from the setting in the ISignal.dataTypePolicy: - ISignal.dataTypePolicy = override or legacy: SystemTemplate::Fibex::FibexCore::Core Communication::ISignal.networkRepresentationProps.swBaseType - ISignal.dataTypePolicy = networkRepresentationFromComSpec: if defined on ComSpec: SWComponentTemplate::Communication::SenderComSpec.networkRepresentation.swBaseType SWComponentTemplate::Communication::SenderComSpec.compositeNetwork Representation.networkRepresentation.swBaseType SWComponentTemplate::Communication::ReceiverComSpec.networkRepresentation.swBase Type SWComponentTemplate::Communication::ReceiverComSpec.compositeNetwork Representation.networkRepresentation.swBaseType if not defined on ComSpec: CommonStructure::ImplementationDataTypes::ImplementationData Type.swDataDefProps.swBaseType Find the ImplementationDataType according to TPS_ SYST_02079 and access SwDataDefProps.swBaseType. Consequence: If two SenderReceiverToSignalMappings that point to the same SystemSignal result in incompatible BaseTypes (see constr_1220 in SoftwareComponentTemplate) => Com SignalType should not be configured. ▽		full

▽

△

△ - ISignal.dataTypePolicy = portInterfaceDefinition --> option has atpStatus "removed", in consequence no mapping is available." - ISignal.dataTypePolicy = transformingISignal Hardcoded to UINT8_N or UINT8_DYN. Datatype can be derived from SystemSignal.dynamicLength: UINT8_N should be used if SystemSignal.dynamicLength = false UINT8_DYN should be used if SystemSignal.dynamicLength = true

Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Com_00002]

BSW Module	**BSW Context**	
Com	Com/ComConfig/ComSignal	
BSW Parameter		**BSW Type**
ComTimeout		ECUC-FLOAT-PARAM-DEF
BSW Description		
Defines the length of the deadline monitoring timeout period in seconds. The period for the first timeout period can be configured separately by ECUC_Com_00183.		
Template Description		
ISignalPort.timeout: • ISignalPort with communicationDirection = in: Optional timeout value in seconds for the reception of the ISignal. The attribute value is used to configure the ComTimeout in the COM module. The RTE ignores this attribute. The timeout can also be specified with the NonqueuedReceiverComSpec.aliveTimeout attribute. If a full DataMapping exists for the SystemSignal and the value is available in the configured ReceiverComSpec, then the timeout value in the ReceiverComSpec overrides this optional timeout specification during the creation of the Base Ecu Configuration of the COM module. • ISignalPort with communicationDirection = out: Optional timeout value in seconds for the transmission of the ISignal. The attribute value is used to configure the ComTimeout in the COM module. The RTE ignores this attribute. The timeout can also be specified with the enderComSpec.transmissionAcknowledge.timeout attribute. If a full DataMapping exists for the SystemSignal and the value is available in the configured SenderComSpec, then the timeout value in the SenderComSpec overrides this optional timeout specification during the creation of the Base Ecu Configuration of the COM module. This attribute can be used in the following cases: ▽		

▽

△

△ • legacy signal where the System Description doesn't use a complete Software Component Description (VFB View) and where the DataMapping is missing. • bus monitoring use cases in which the DataMapping is ignored. **TransmissionAcknowledgementRequest.timeout:** Number of seconds before an error is reported or in case of allowed redundancy, the value is sent again. **NonqueuedReceiverComSpec.aliveTimeout:** Specify the amount of time (in seconds) after which the software component (via the RTE) needs to be notified if the corresponding data item have not been received according to the specified timing description. If the aliveTimeout attribute is 0 no timeout monitoring shall be performed.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalPort.timeout, SWComponentTemplate::Communication::TransmissionAcknowledgementRequest.timeout, SWComponentTemplate::Communication::NonqueuedReceiverComSpec.aliveTimeout		
Mapping Rule		**Mapping Type**
TX Signals: If a full DataMapping exist for the SystemSignal this information may be available from a configured SenderComSpec.transmissionAcknowledge.timeout that specifies the amount of time (in seconds) after which the software component (via the RTE) needs to be notified if the corresponding data item have not been transmitted according to the specified timing description. In this case the timeout value in SenderComSpec overrides the optional timeout specification in the System Template defined on the ISignalPort. RX Signals: If a full DataMapping exist for the SystemSignal this information may be available from a configured NonqueuedReceiverComSpec.aliveTimeout. In this case the timeout value in ReceiverComSpec overrides the optional timeout specification in the System Template defined on the ISignalPort. Please note that the SWS_RTE defines an algorithm to finally set the applicable timeout value.		full

Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Com_00232]

BSW Module	**BSW Context**
Com	Com/ComConfig/ComSignal
BSW Parameter	**BSW Type**
ComUpdateBitPosition	ECUC-INTEGER-PARAM-DEF
BSW Description	
Bit position of update-bit inside I-PDU. If this attribute is omitted then there is no update-bit. This setting must be consistently on sender and on receiver side. Range: 0..63 for CAN and LIN, 0..511 for CAN FD, 0..2031 for FlexRay, 0..4294967295 for TP.	
Template Description	
The UpdateIndicationBit indicates to the receivers that the signal (or the signal group) was updated by the sender. Length is always one bit. The UpdateIndicationBitPosition attribute describes the position of the update bit within the SignalIPdu. For Signals of a ISignalGroup this attribute is irrelevant and shall be ignored. Note that the exact bit position of the updateIndicationBitPosition is linked to the value of the attribute packingByteOrder because the method of finding the bit position is different for the values mostSignificantByteFirst and mostSignificantByte Last. This means that if the value of packingByteOrder is changed while the value of updateIndicationBitPosition remains unchanged the exact bit position of updateIndicationBitPosition within the enclosing ISignalIPdu still undergoes a change. This attribute denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packingByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7.

Com	Com/ComConfig/ComSignalGroup	
BSW Parameter		**BSW Type**
ComGroupSignal		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the configuration parameters of group signals. I.e. signals that are included within a signal group.		
Template Description		
Signal of the Interaction Layer. The RTE supports a "signal fan-out" where the same System Signal is sent in different Signal IPdus to multiple receivers. To support the RTE "signal fan-out" each SignalIPdu contains ISignals. If the same System Signal is to be mapped into several SignalIPdus there is one ISignal needed for each ISignalToIPduMapping. ISignals describe the Interface between the Precompile configured RTE and the potentially Postbuild configured Com Stack (see ECUC Parameter Mapping). In case of the SystemSignalGroup an ISignal shall be created for each SystemSignal contained in the SystemSignalGroup.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal		
Mapping Rule		**Mapping Type**
A ComGroupSignal container shall be created for an ISignal contained in an ISignalGroup that is contained in an ISignalIPdu which the Com module is sending. The creation of a ComGroupSignal container may be omitted for an ISignal contained in an ISignal Group that is contained in an ISignalIPdu which the Com module is receiving if no Rx ISignalPort exists for the ISignal of the ISignalGroup.		full

BSW Module	BSW Context	
Com	Com/ComConfig/ComSignalGroup/ComGroupSignal	
BSW Parameter		**BSW Type**
ComBitPosition		ECUC-INTEGER-PARAM-DEF
BSW Description		
Starting position within the I-PDU. This parameter refers to the position in the I-PDU and not in the shadow buffer. If the endianness conversion is configured to Opaque the parameter ComBitPosition shall define the bit0 of the first byte like in little endian byte order		
Template Description		
This parameter is necessary to describe the bitposition of a signal within an SignalIPdu. It denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packing ByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7. Please note that the way the bytes will be actually sent on the bus does not impact this representation: they will always be seen by the software as a byte array. If a mapping for the ISignalGroup is defined, this attribute is irrelevant and shall be ignored.

BSW Module	**BSW Context**	
Com	Com/ComConfig/ComSignalGroup/ComGroupSignal	
BSW Parameter		**BSW Type**
ComSignalLength		ECUC-INTEGER-PARAM-DEF
BSW Description		

▽

△

Description: For ComSignalType UINT8_N this parameter specifies the length n in bytes. For ComSignalType UINT8_DYN it specifies the maximum length in bytes. For all other types this parameter shall be ignored. The supported maximum length is restricted by the used transportation system. For non TP-PDUs the maximum size of a PDU, and therefore also of any included signal, is limited by the concrete bus characteristic. For example, the limit is 8 bytes for CAN and LIN, 64 bytes for CAN FD and 254 for FlexRay.		
Template Description		
Size of the signal in bits. The size needs to be derived from the mapped VariableDataPrototype according to the mapping of primitive DataTypes to BaseTypes as used in the RTE. Indicates maximum size for dynamic length signals. The ISignal length of zero bits is allowed.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal.length		
Mapping Rule		**Mapping Type**
ComSignalLength = ISignal.length / 8 (i.e. value of baseTypeSize)		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Com_00437]

BSW Module	**BSW Context**		
Com	Com/ComConfig/ComSignalGroup/ComGroupSignal		
BSW Parameter		**BSW Type**	
ComSignalType		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
The AUTOSAR type of the signal. Whether or not the signal is signed or unsigned can be found by examining the value of this attribute. This type could also be used to reserved appropriate storage in AUTOSAR COM.			
Template Description			
With the aggregation of SwDataDefProps an ISignal specifies how it is represented on the network. This representation follows a particular policy. Note that this causes some redundancy which is intended and can be used to support flexible development methodology as well as subsequent integrity checks. If the policy "networkRepresentationFromComSpec" is chosen the network representation from the ComSpec that is aggregated by the PortPrototype shall be used. If the "override" policy is chosen the requirements specified in the Port Interface and in the ComSpec are not fulfilled by the networkRepresentationProps. In case the System Description doesn't use a complete Software Component Description (VFB View) the "legacy" policy can be chosen.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal.dataTypePolicy			
Mapping Rule			**Mapping Type**
The mapping depends from the setting in the ISignal.dataTypePolicy: - ISignal.dataTypePolicy = override or legacy: SystemTemplate::Fibex::FibexCore::Core Communication::ISignal.networkRepresentationProps.swBaseType - ISignal.dataTypePolicy = networkRepresentationFromComSpec: if defined on ComSpec: SWComponentTemplate::Communication::SenderComSpec.networkRepresentation.swBaseType SWComponentTemplate::Communication::SenderComSpec.compositeNetwork Representation.networkRepresentation.swBaseType SWComponentTemplate::Communication::ReceiverComSpec.networkRepresentation.swBase Type SWComponentTemplate::Communication::ReceiverComSpec.compositeNetwork Representation.networkRepresentation.swBaseType if not defined on ComSpec: CommonStructure::ImplementationDataTypes::ImplementationData Type.swDataDefProps.swBaseType Find the ImplementationDataType according to TPS_ SYST_02079 and access SwDataDefProps.swBaseType. Consequence: If two SenderReceiverToSignalMappings that point to the same SystemSignal result in incompatible BaseTypes (see constr_1220 in SoftwareComponentTemplate) => Com SignalType should not be configured. ▽			full

▽

△

- ISignal.dataTypePolicy = portInterfaceDefinition --> option has atpStatus "removed", in consequence no mapping is available." - ISignal.dataTypePolicy = transformingISignal Hardcoded to UINT8_N or UINT8_DYN. Datatype can be derived from SystemSignal.dynamicLength: UINT8_N should be used if System Signal.dynamicLength = false UINT8_DYN should be used if SystemSignal.dynamicLength = true

BSW Parameter		**BSW Type**
ComTimeout		ECUC-FLOAT-PARAM-DEF
BSW Description		
Defines the length of the deadline monitoring timeout period in seconds. The period for the first timeout period can be configured separately by ECUC_Com_00183.		
Template Description		
ISignalPort.timeout: • ISignalPort with communicationDirection = in: Optional timeout value in seconds for the reception of the ISignal. The attribute value is used to configure the ComTimeout in the COM module. The RTE ignores this attribute. The timeout can also be specified with the NonqueuedReceiverCom Spec.aliveTimeout attribute. If a full DataMapping exists for the SystemSignal and the value is available in the configured ReceiverComSpec, then the timeout value in the ReceiverComSpec overrides this optional timeout specification during the creation of the Base Ecu Configuration of the COM module. • ISignalPort with communicationDirection = out: Optional timeout value in seconds for the transmission of the ISignal. The attribute value is used to configure the Com Timeout in the COM module. The RTE ignores this attribute. The timeout can also be specified with the enderCom Spec.transmissionAcknowledge.timeout attribute. If a full DataMapping exists for the SystemSignal and the value is available in the configured SenderComSpec, then the timeout value in the SenderComSpec overrides this optional timeout specification during the creation of the Base Ecu Configuration of the COM module. This attribute can be used in the following cases: • legacy signal where the System Description doesn't use a complete Software Component Description (VFB View) and where the DataMapping is missing. • bus monitoring use cases in which the DataMapping is ignored. **TransmissionAcknowledgementRequest.timeout:** Number of seconds before an error is reported or in case of allowed redundancy, the value is sent again. **NonqueuedReceiverComSpec.aliveTimeout:** Specify the amount of time (in seconds) after which the software component (via the RTE) needs to be notified if the corresponding data item have not been received according to the specified timing description. If the aliveTimeout attribute is 0 no timeout monitoring shall be performed.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalPort.timeout, SWComponent Template::Communication::TransmissionAcknowledgementRequest.timeout, SWComponent Template::Communication::NonqueuedReceiverComSpec.aliveTimeout		
Mapping Rule		**Mapping Type**

▽

△

TX Signals: If a full DataMapping exist for the SystemSignal this information may be available from a configured SenderComSpec.transmissionAcknowledge.timeout that specifies the amount of time (in seconds) after which the software component (via the RTE) needs to be notified if the corresponding data item have not been transmitted according to the specified timing description. In this case the timeout value in SenderComSpec overrides the optional timeout specification in the System Template defined on the ISignalPort. RX Signals: If a full DataMapping exist for the SystemSignal this information may be available from a configured NonqueuedReceiverComSpec.aliveTimeout. In this case the timeout value in ReceiverComSpec overrides the optional timeout specification in the System Template defined on the ISignalPort. Please note that the SWS_RTE defines an algorithm to finally set the applicable timeout value.	full

ComUpdateBitPosition		ECUC-INTEGER-PARAM-DEF
BSW Description		
Bit position of update-bit inside I-PDU. If this attribute is omitted then there is no update-bit. This setting must be consistently on sender and on receiver side. Range: 0..63 for CAN and LIN, 0..511 for CAN FD, 0..2031 for FlexRay, 0..4294967295 for TP.		
Template Description		

▽

△

The UpdateIndicationBit indicates to the receivers that the signal (or the signal group) was updated by the sender. Length is always one bit. The UpdateIndicationBitPosition attribute describes the position of the update bit within the SignalIPdu. For Signals of a ISignalGroup this attribute is irrelevant and shall be ignored. Note that the exact bit position of the updateIndicationBitPosition is linked to the value of the attribute packingByteOrder because the method of finding the bit position is different for the values mostSignificantByteFirst and mostSignificantByte Last. This means that if the value of packingByteOrder is changed while the value of updateIndicationBitPosition remains unchanged the exact bit position of updateIndicationBitPosition within the enclosing ISignalIPdu still undergoes a change. This attribute denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packingByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7.

Reference to the ComMChannel that is required for this PNC. ImplementationType: NetworkHandleType		
Template Description		
PncMapping.pncGroup: IPduGroup participating in a Partial Network Cluster. This reference is optional in case an ecu extract has only indirect pnc access, i.e. ecu is not directly connected to a network which supports partial network. **PncMapping.physicalChannel:** This reference maps the partial network to a communication channel. **PncMapping.pncPdurGroup:** This reference maps the Partial Network Cluster to a set of PdurIpduGroups.		
M2 Parameter		
SystemTemplate::PncMapping::PncMapping.pncGroup, SystemTemplate::PncMapping::PncMapping.physicalChannel, SystemTemplate::PncMapping::PncMapping.pncPdurGroup		
Mapping Rule		**Mapping Type**
The ComMChannels that need to be referenced shall be derived from the PhysicalChannels that are either reachable by PncMapping.pncGroup, PncMapping.pncPdurGroup, or by PncMapping.physicalChannel. From the pncGroup reference all ISignalIPduGroups can be retrieved to which the PncMapping refers. From the ISignalIPduGroup all ISignalIPdus shall be collected that are contained in the ISignalIPduGroup or one of the sub ISignalIPduGroups. The search for all PduTriggerings associated with these ISignalIPdus provides a set of PhysicalChannels since the PduTriggerings are directly aggregated by a PhysicalChannel. From the pncPdurGroup reference all PdurIPduGroups can be retrieved to which the PncMapping refers to. From the PdurIPduGroup all PduTriggerings associated with these PdurIPduGroups provides a set of PhysicalChannels since the PduTriggerings are directly aggregated by a PhysicalChannel. In addition to the PhysicalChannels that are retrieved from the PncMapping.pncGroup and PncMapping.pncPdurGroup the directly referenced PncMapping.physicalChannels shall be added. ▽		full

▽

△

△ Please note that the PncMapping.physicalChannel reference was introduced in Release 4.4.0 and for backward compatibility reasons nobody is forced to configure this new reference. Therefore the old approach via the PncMapping.pncGroup and PncMapping.pncPdurGroup shall still be respected.

ComMPncWakeupSleepRequestEnabled		ECUC-BOOLEAN-PARAM-DEF	

▽

△

BSW Description	
Used for PNCs where a requested PNC shall report an active communication request towards the BswM. The BswM forward the active communication request to the lower layer communication channels where the used hardware support wake-up and/or sleep request capability on the network, e.g. OA TC10 compatible PHYs for Ethernet. This is used e.g. for Ethernet Switch port group switching.	
Template Description	
EcuInstance.wakeUpOverBusSupported: Driver support for wakeup over Bus. **EcuInstance.ethSwitchPortGroupDerivation:** Defines whether the derivation of SwitchPortGroups based on VLAN and/or CouplingPort.pncMapping shall be performed for this EcuInstance. If not defined the derivation shall not be done. **EthernetCommunicationController:** Ethernet specific communication port attributes. **PncMapping:** Describes a mapping between one or several Virtual Function Clusters onto Partial Network Clusters. A Virtual Function Cluster is realized by a PortGroup. A Partial Network Cluster is realized by one or more IPduGroups.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreTopology::EcuInstance.wakeUpOverBusSupported, SystemTemplate::Fibex::FibexCore::CoreTopology::EcuInstance.ethSwitchPortGroupDerivation, SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetCommunicationController, SystemTemplate::PncMapping::PncMapping	
Mapping Rule	**Mapping Type**
If EcuInstance.wakeUpOverBusSupported is defined and set to TRUE, the EcuInstance.ethSwitchPortGroupDeriviation is set to TRUE and the aggregated EthernetCommunicatonController aggregate a CouplingElement with couplingType set to "switch" and the aggregated CouplingPorts has set the with physicalLayerType to "100Base-T1" and "1000Base-T1", respectively, then all derived ComMPnc shall set ComMPncWakeupSleepRequestEnabled to TRUE.	full

BSW Module	BSW Context
ComM	ComM/ComMGeneral
BSW Parameter	**BSW Type**
ComMDynamicPncToChannelMappingSupport	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
Precompile time switch to enable the dynamic PNC-to-channel-mapping handling. False: Dynamic PNC-to-channel-mapping is disabled True: Dynamic PNC-to-channel-mapping is enabled	
Template Description	
Defines if this EcuInstance shall implement the dynamic PNC-to-channel-mapping functionality on this Communication Connector and its respective PhysicalChannel.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationConnector.dynamicPncToChannelMappingEnabled	
Mapping Rule	**Mapping Type**
If at least one dynamicPncToChannelMappingEnabled attribute is defined and if at least one CommunicationConnector of the EcuInstance has dynamicPncToChannelMappingEnabled set to true, then ComMDynamicPncToChannelMappingSupport shall be set to true. Otherwise ComMDynamicPncToChannelMappingSupport shall be set to false.	full

CsmJobPrimitiveRef		ECUC-REFERENCE-DEF
BSW Description		
This parameter refers to the used CsmPrimitive. Different jobs may refer to one CsmPrimitive. The referred CsmPrimitive provides detailed information on the actual cryptographic routine.		
Template Description		
This reference identifies the applicable crypto primitive for the authentication.		
M2 Parameter		
SystemTemplate::SecureCommunication::SecOcCryptoServiceMapping.authentication

1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Csm_00122]

BSW Module	**BSW Context**	
Csm	Csm/CsmJobs/CsmJob	
BSW Parameter		**BSW Type**
CsmJobQueueRef		ECUC-REFERENCE-DEF
BSW Description		
This parameter refers to the queue. The queue is used if the underlying crypto driver object is busy. The queue refers also to the channel which is used.		
Template Description		
This meta-class has the ability to represent a crypto queue.		
M2 Parameter		
SystemTemplate::SecureCommunication::CryptoServiceQueue		
Mapping Rule		**Mapping Type**
If the SecOcCryptoServiceMapping this CsmJob is derived from has a reference cryptoServiceQueue defined then the CsmJobQueueRef shall refer to the respective CsmQueue.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Csm_00125]

BSW Module	**BSW Context**	
Csm	Csm/CsmKeys	
BSW Parameter		**BSW Type**
CsmKey		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Container for configuration of a CSM key. The container name serves as a symbolic name for the identifier of a key configuration.		
Template Description		
This meta-class has the ability to represent a crypto key.		
M2 Parameter		
SystemTemplate::SecureCommunication::CryptoServiceKey		
Mapping Rule		**Mapping Type**

BSW Parameter		**BSW Type**	
CsmQueueSize		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Size of the CsmQueue. If jobs cannot be processed by the underlying hardware since the hardware is busy, the jobs stay in the prioritized queue. If the queue is full, the next job will be rejected.			
Template Description			
Defines the queue size of the CryptoServiceQueue.			
M2 Parameter			
SystemTemplate::SecureCommunication::CryptoServiceQueue.queueSize			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Csm_00034]

C.13 Dcm

BSW Module	**BSW Context**
Dcm	Dcm/DcmConfigSet/DcmDsl/DcmDslProtocol/DcmDslProtocolRow/DcmDslConnection
BSW Parameter	**BSW Type**
DcmDslMainConnection	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container contains the configuration for a main connection of a diagnostic protocol. Additionally it may contain references to ROE and Periodic connections if the protocol type or protocol transmission type needs them.	
Template Description	
DiagnosticConncection that is used to describe the relationship between several TP connections.	
M2 Parameter	
SystemTemplate::DiagnosticConnection::`DiagnosticConnection`	
Mapping Rule	**Mapping Type**
A DcmDslMainConnection subcontainer is created for a DiagnosticConnection that refers via functionRequest, physicalRequest or response to one or more TpConnectionIdent elements that are in turn contained in TpConnection elements via which the EcuInstancethat is included in the EcuExtract sends or receives PDUs.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Dcm_00706]

BSW Module	**BSW Context**
Dcm	Dcm/DcmConfigSet/DcmDsl/DcmDslProtocol/DcmDslProtocolRow/DcmDslConnection/DcmDsl MainConnection
BSW Parameter	**BSW Type**
DcmDslProtocolRxTesterSourceAddr	ECUC-INTEGER-PARAM-DEF
BSW Description	
Tester source address uniquely describes a client and will be used e.g within the jump to Bootloader interfaces. This parameter is not required for generic connections (DcmPdus with MetaDataLength >= 1).	
Template Description	
TpConnection Base Class.	
M2 Parameter	
SystemTemplate::DiagnosticConnection::`TpConnection`	
Mapping Rule	**Mapping Type**
DcmDslProtocolRxTesterSourceAddr shall be derived from the TpConnection that is referenced from the DiagnosticConnection from which the DcmDslMainConnection container was derived. The TpConnection points in the role transmitter and receiver to TpNodes that in turn point to a Tp Address. The DcmDslProtocolRxTesterSourceAddr value shall be set to the diagnostic address (Tp Address) of the remote node. This means that if the TpConnection.transmitter does not represent the configured EcuInstance then the DcmDslProtocolRxTesterSourceAddr value can be derived from the TpNode that is referenced in the transmitter role and in turn references the TpAddress. If the TpConnection.transmitter represents the configured EcuInstance then the DcmDslProtocolRx TesterSourceAddr value can only be retrived if the TpConnection sends its Pdus to a physical address. In this case the remote node is the TpNode referenced in the TpConnection.receiver role. The tester address can be derived from the TpAddress that is referenced by the TpNode if only one receiver is configured. In case that several TpNode elements are referenced in the Tp Conncetion.receiver role this parameter can not be derived from the System Description.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Dcm_01115]

BSW Module	BSW Context	
Dcm	Dcm/DcmGeneral/DcmSecureCoding	
BSW Parameter		**BSW Type**
DcmSecureCodingValidationRoutine		ECUC-REFERENCE-DEF
BSW Description		
Refers to a routine control that triggers the secure coding validation and data update process.		
Template Description		
Refer to a routine control that is used to authenticate and persist the secure coding data.		
M2 Parameter		
DiagnosticExtract::DiagnosticMapping::DiagnosticSecureCodingMapping.validation		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**

BSW Module	BSW Context
Dds	Dds/DdsConfig/DdsDomainParticipantCollection
BSW Parameter	**BSW Type**
DdsDomainParticipant	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container represents the configuration of one single Domain Participant hosted within the current node. One node can contain more than one Domain Participant.	
Template Description	
Definition of a DDS Domain.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::Dds::DdsCpDomain	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Dds_00012]

BSW Module	BSW Context
Dds	Dds/DdsConfig/DdsDomainParticipantCollection/DdsDomainParticipant
BSW Parameter	**BSW Type**
DdsDataReceiver	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Container useful to usability: it defines a DDS DataReader linked to a Sender/ReceiverInterface.	
Template Description	
Mapping of an ISignal to a DdsTopic.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::Dds::DdsCpISignalToDdsTopicMapping	
Mapping Rule	**Mapping Type**
Collection of DdsDataReaders used for signal based communication.	full

DdsResouceLimitsMaxSamplesPerInstance		ECUC-INTEGER-PARAM-DEF	
BSW Description			
See "RESOURCE_LIMITS" chapter of DDS [27].			
Template Description			
See "RESOURCE_LIMITS" chapter of DDS.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::Dds::DdsResourceLimits.maxSamplesPerInstance			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Dds_00065]

BSW Module	BSW Context		
Dds	Dds/DdsConfig/DdsDomainParticipantCollection/DdsDomainParticipant		
BSW Parameter		**BSW Type**	
DdsTopic		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container represents the configuration of one Topic.			
Template Description			
Definition of a DDS Partition.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::Dds::DdsCpTopic			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Dds_00018]

BSW Module	BSW Context		
Dds	Dds/DdsConfig/DdsDomainParticipantCollection/DdsDomainParticipant/DdsTopic		
BSW Parameter		**BSW Type**	
DdsTopicName		ECUC-STRING-PARAM-DEF	
BSW Description			
Identifies name of the Topic. Communication between publishers and subscribers is based on the topic name.			
Template Description			
Definition of the DDS Topic Name.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::Dds::DdsCpTopic.topicName			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Dds_00103]

BSW Module	BSW Context		
Dds	Dds/DdsConfig/DdsDomainParticipantCollection/DdsDomainParticipant/DdsTopic		
BSW Parameter		**BSW Type**	
DdsTopicQoS		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container contains the configuration of the QoS supported by the DdsTopic			
Template Description			
Definition of a DDS QOS Profile.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::Dds::DdsCpQosProfile			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Dds_00102]

BSW Module	BSW Context		
Dds	Dds/DdsConfig/DdsDomainParticipantCollection/DdsDomainParticipant/DdsTopic/DdsTopicQoS		
BSW Parameter		**BSW Type**	
DdsDeadline		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Describes the DDS [27] DEADLINE QoS policy.			
Template Description			
Describes the DDS DEADLINE QoS policy.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::Dds::DdsDeadline			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Dds_00039]

BSW Module	BSW Context		
Dds	Dds/DdsConfig/DdsDomainParticipantCollection/DdsDomainParticipant/DdsTopic/DdsTopicQoS/ DdsDeadline		
BSW Parameter		**BSW Type**	
DdsDeadlinePeriod		ECUC-FLOAT-PARAM-DEF	
BSW Description			
See "DEADLINE" chapter of DDS [27]. Time given in seconds.			
Template Description			
See "DEADLINE" chapter of DDS. Time given in seconds.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::Dds::DdsDeadline.deadlinePeriod			
Mapping Rule			**Mapping Type**
1:1 mapping			full

C.15 Dlt

BSW Module	BSW Context		
Dlt	Dlt/DltConfigSet/DltLogOutput		
BSW Parameter		**BSW Type**	
DltLogChannel		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Contains settings for log/trace message output			
Template Description			
This element contains the settings for the log/trace message output for a tuple of ApplicationId and ContextId (verbose mode) or a SessionId (non-verbose mode).			
M2 Parameter			
SystemTemplate::Dlt::DltLogChannel			
Mapping Rule			**Mapping Type**
Create container for each DltLogChannel that is available in the Ecu description.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Dlt_00876]

BSW Module	BSW Context		
Dlt	Dlt/DltConfigSet/DltLogOutput/DltLogChannel		
BSW Parameter		**BSW Type**	
DltLogChannelId		ECUC-STRING-PARAM-DEF	
BSW Description			
This is the 4 ASCII character long name of the log channel as used in the Dlt control messages as parameter name Dlt_interface			
Template Description			
This attribute identifies the Channel for usage within the Log And Trace protocol.			
M2 Parameter			
SystemTemplate::Dlt::DltLogChannel.logChannelId			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Dlt_00877]

BSW Module	BSW Context	
Dlt	Dlt/DltConfigSet/DltLogOutput/DltLogChannel	
BSW Parameter		**BSW Type**
DltLogChannelSegmentationSupported		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Segmentation will be used if a DLT message is larger than Pdu length.		
Template Description		
If enabled, segmentation will be used if a DLT message is larger than Pdu.length referenced via DltLogChannel.txPduTriggering.		
M2 Parameter		
SystemTemplate::Dlt::DltLogChannel.segmentationSupported

BSW Module	BSW Context	
Dlt	Dlt/DltConfigSet/DltLogOutput/DltLogChannel	
BSW Parameter		**BSW Type**
DltLogTraceStatusFlag		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Parameter to turn on/off tracing on this LogChannel completely.		
Template Description		
This attributes defines the default trace status.		
M2 Parameter		
SystemTemplate::Dlt::DltLogChannel.defaultTraceState		
Mapping Rule		**Mapping Type**
Set to true if DefaultTraceStateEnabled. Set to false if DefaultTraceStateDisabled.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Dlt_00879]

BSW Module	BSW Context	
Dlt	Dlt/DltConfigSet/DltLogOutput/DltLogChannel	
BSW Parameter		**BSW Type**
DltTxPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Contains the configuration parameters of the AUTOSAR Dlt module's Tx Pdus.		
Template Description		
Reference to DltPdu that is transmitted by the DltLogChannel.		

▽

△

M2 Parameter	
SystemTemplate::Dlt::DltLogChannel.txPduTriggering	
Mapping Rule	**Mapping Type**
This container shall be created for the PduTriggering that is referenced from the DltLogChannel. The referenced PduTriggering shall point to a GeneralPurposeIPdu with the category DLT.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Dlt_00907]

BSW Module	BSW Context
Dlt	Dlt/DltConfigSet/DltLogOutput
BSW Parameter	**BSW Type**
DltLogChannelAssignment	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container contains a preconfiguration of ApplicationId / ContextId pairs and their assigned log channel.	
Template Description	
Reference to the Swc that produces the log or trace message. Please note that this reference shall not be set in case that the Bsw module produces the associated log or trace messages.	
M2 Parameter	
SystemTemplate::Dlt::DltLogChannel.applicationContext	
Mapping Rule	**Mapping Type**
This container shall be created for each applicationContext that is referenced from the DltLog Channel that is available in the Ecu description.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Dlt_00887]

BSW Module	BSW Context
Dlt	Dlt/DltConfigSet/DltLogOutput/DltLogChannelAssignment
BSW Parameter	**BSW Type**
DltLogChannelAssignmentSwcContextRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to an ApplicationId/ContextId pair that is assigned to a DltLogChannel.	
Template Description	
Reference to the Swc that produces the log or trace message. Please note that this reference shall not be set in case that the Bsw module produces the associated log or trace messages.	
M2 Parameter	
SystemTemplate::Dlt::DltLogChannel.applicationContext	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Dlt_00896]

BSW Module	BSW Context
Dlt	Dlt/DltConfigSet/DltLogOutput/DltLogChannelAssignment
BSW Parameter	**BSW Type**

▽

△

DltLogChannelRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to a DltLogChannel that is assigned to an ApplicationId / ContextId pair.		
Template Description		
This element contains the settings for the log/trace message output for a tuple of ApplicationId and ContextId (verbose mode) or a SessionId (non-verbose mode).		
M2 Parameter		
SystemTemplate::Dlt::DltLogChannel		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Dlt_00888]

BSW Module	**BSW Context**	
Dlt	Dlt/DltConfigSet/DltProtocol	
BSW Parameter		**BSW Type**
DltEcuId		ECUC-CHOICE-CONTAINER-DEF
BSW Description		
This is a choice container to choose between a EcuId value or a callout to get the EcuId.		
Template Description		
This element represents an Ecu or Machine that produces logging and tracing information.		
M2 Parameter		
LogAndTraceExtract::DltEcu		
Mapping Rule		**Mapping Type**
Create container if DltEcu is referenced by DltConfig. Please note that only the DltEcuIdValue Choice can be derived from System Description.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Dlt_00860]

BSW Module	**BSW Context**	
Dlt	Dlt/DltConfigSet/DltProtocol/DltEcuId/DltEcuIdValueChoice	
BSW Parameter		**BSW Type**
DltEcuIdValue		ECUC-STRING-PARAM-DEF
BSW Description		
If this choice is used the EcuId shall be taken from the configured string. This is the name of the ECU for use within the Dlt protocol. If you want to use a number representation type this as character.		
Template Description		
This attribute defines the name of the ECU for use within the Dlt protocol.		
M2 Parameter		
LogAndTraceExtract::DltEcu.ecuId		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Dlt_00861]

BSW Module	BSW Context	
Dlt	Dlt/DltConfigSet/DltProtocol	
BSW Parameter		**BSW Type**
DltHeaderUseEcuId		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Corresponds to field WEID (With ECU ID). If set ECU ID shall be placed in the header, else not. If DltGeneralNvRAMSupport is enabled the value of the parameter defined here is also the initial value for the corresponding NvRam entry. If DltGeneralNv RAMSupport is not set, Link-Time or Post-Build configuration shall be used.		
Template Description		
Reference to the Ecu representation in the Log And Trace Extract.		
M2 Parameter		
SystemTemplate::Dlt::DltConfig.dltEcu		
Mapping Rule		**Mapping Type**
Set this parameter to true if the reference is available. Set to false if reference is missing.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Dlt_00811]

BSW Module	BSW Context	
Dlt	Dlt/DltConfigSet/DltProtocol	
BSW Parameter		**BSW Type**
DltHeaderUseSessionID		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Corresponds to field WSID (with Session ID). If set the Session ID shall be placed in the header, else not. If DltGeneralNv RAMSupport is enabled the value of the parameter defined here is also the initial value for the corresponding NvRam entry. If DltGeneralNvRAMSupport is not set, Link-Time or Post-Build configuration shall be used.		
Template Description		
This attribute defines whether the sessionId is used or not.		
M2 Parameter		
SystemTemplate::Dlt::DltConfig.sessionIdSupport		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Dlt_00813]

BSW Module	BSW Context
Dlt	Dlt/DltConfigSet/DltProtocol
BSW Parameter	**BSW Type**
DltHeaderUseTimestamp	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
Corresponds to field WTMS (With Timestamp). If set the timestamp shall be placed in the header, else not. If DltGeneralNv RAMSupport is enabled the value of the parameter defined here is also the initial value for the corresponding NvRam entry. If DltGeneralNvRAMSupport is not set, Link-Time or Post-Build configuration shall be used.	
Template Description	
This attribute defines whether a timestamp shall be added to the Dlt messages or not.	
M2 Parameter	
SystemTemplate::Dlt::DltConfig.timestampSupport

BSW Module	BSW Context	
Dlt	Dlt/DltConfigSet	
BSW Parameter		**BSW Type**
DltRxPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Contains the Pdu IDs to be used for Dlt control messages reception.		
Template Description		
GeneralPurposeIPdu: This element is used for AUTOSAR Pdus without attributes that are routed by the PduR. Please note that the category name of such Pdus is standardized in the AUTOSAR System Template. **DltLogChannel.rxPduTriggering:** Reference to DltPdu that is received by the DltLogChannel		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::GeneralPurposeIPdu, SystemTemplate::Dlt::DltLogChannel.rxPduTriggering		
Mapping Rule		**Mapping Type**
This container shall be created if a GeneralPurposeIPdu with the category DLT is defined in the ECU_SYSTEM_DESCRIPTION and this GeneralPurposeIPdu is received by the regarded Ecu.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Dlt_00900]

BSW Module	BSW Context	
Dlt	Dlt/DltSwc	
BSW Parameter		**BSW Type**
DltSwcContext		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the configuration of ApplicationId / ContextId pairs which are supported by this SWC.		
Template Description		
This meta-class represents the Context that groups Log and Trace Messages that are generated by an application.		
M2 Parameter		
LogAndTraceExtract::DltContext		
Mapping Rule		**Mapping Type**
Create container for each DltContext that is available in the ECU Description		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Dlt_00854]

BSW Module	BSW Context	
Dlt	Dlt/DltSwc/DltSwcContext	
BSW Parameter		**BSW Type**
DltSwcApplicationId		ECUC-INTEGER-PARAM-DEF
BSW Description		
Abbreviation for the SWC (4 characters)		
Template Description		
This attribute identifies the SW-C/BSW module in the log and trace message.		
M2 Parameter		
LogAndTraceExtract::DltApplication.applicationId		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**

BSW Module	BSW Context	
Dlt	Dlt/DltSwc/DltSwcContext	
BSW Parameter		**BSW Type**
DltSwcContextId		ECUC-INTEGER-PARAM-DEF
BSW Description		
Abbreviation for the ContextId (4 characters)		
Template Description		
This attribute is used to group log and trace messages produced by an application to distinguish functionality.		
M2 Parameter		
LogAndTraceExtract::DltContext.contextId		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Dlt_00859]

C.16 DoIP

BSW Module	BSW Context		
DoIP	DoIP/DoIPConfigSet/DoIPInterface		
BSW Parameter		**BSW Type**	
DoIPChannel		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Configuration of one DoIPChannel.			
Template Description			
A connection identifies the sender and the receiver of this particular communication. The DoIp module routes a tpSdu through this connection.			
M2 Parameter			
SystemTemplate::DiagnosticConnection::DoIpTpConnection			
Mapping Rule			**Mapping Type**
One DoIPChannel container is created for each DoIP channel of the configured EcuInstance. A DoIP channel is constituted by the set of all DoIpTpConnection elements via which the configured EcuInstance sends or receives SDUs (SDUs are referenced by the PduTriggering DoIpTpConnection.tpSdu refers to) and that share the same local diagnosis address and tester address.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_DoIP_00069]

BSW Module	BSW Context		
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPChannel		
BSW Parameter		**BSW Type**	
DoIPChannelSARef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to the DoIPTester.			
Template Description			
Reference to the address of the sender of the tpSdu.			
M2 Parameter			
SystemTemplate::DiagnosticConnection::DoIpTpConnection.doIpSourceAddress			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_DoIP_00070]

BSW Module	BSW Context	
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPChannel	
BSW Parameter		**BSW Type**
DoIPChannelTARef		ECUC-REFERENCE-DEF
BSW Description		
Reference to the target address.		
Template Description		
Reference to the address of the receiver of the tpSdu.		
M2 Parameter		
SystemTemplate::DiagnosticConnection::DoIpTpConnection.doIpTargetAddress		

▽

△

Mapping Rule	Mapping Type

BSW Module	**BSW Context**	
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPChannel	
BSW Parameter		**BSW Type**
DoIPPduRRxPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the Rx Pdus to connect with the Rx Pdus of the PduR.		
Template Description		
M2 Parameter		
SystemTemplate::DiagnosticConnection::DoIpTpConnection.tpSdu		
Mapping Rule		**Mapping Type**
If the DoIP channel receives an SDU, one DoIPPduRRxPdu container is created.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_DoIP_00055]

BSW Module	**BSW Context**	
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPChannel/DoIPPduRRxPdu	
BSW Parameter		**BSW Type**
DoIPPduRRxPduRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to the "global" Pdu structure to allow harmonization of handle IDs in the COM-Stack.		
Template Description		
M2 Parameter		
SystemTemplate::DiagnosticConnection::DoIpTpConnection.tpSdu		
Mapping Rule		**Mapping Type**
Reference to the EcuC container that corresponds to the SDU received by the DoIP channel		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_DoIP_00058]

BSW Module	**BSW Context**	
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPChannel	
BSW Parameter		**BSW Type**
DoIPPduRTxPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the Tx Pdus to connect with the Tx Pdus of the PduR. If the parameter is not configured the channel is for functional addressing.		
Template Description		
M2 Parameter		

▽

△

SystemTemplate::DiagnosticConnection::DoIpTpConnection.tpSdu	
Mapping Rule	**Mapping Type**
If the DoIP channel sends an SDU, one DoIPPduRTxPdu container is created.	full

DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPConnections	
BSW Parameter		**BSW Type**
DoIPTargetAddress		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container describes a possible TargetAddress that is supported by DoIP.		
Template Description		
The logical DoIP address.		
M2 Parameter		
SystemTemplate::TransportProtocols::DoIpLogicAddress		
Mapping Rule		**Mapping Type**
This container shall be created for each DoIpLogicAddress referenced by a DoIpTpConnection in the role doIpTargetAddress		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_DoIP_00053]

BSW Module	**BSW Context**	
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPConnections/DoIPTargetAddress	
BSW Parameter		**BSW Type**
DoIPTargetAddressValue		ECUC-INTEGER-PARAM-DEF
BSW Description		
Valid Target Address of a DoIP target address.		
Template Description		

▽

△

The logical DoIP address.	
M2 Parameter	
SystemTemplate::TransportProtocols::DoIpLogicAddress.address	
Mapping Rule	**Mapping Type**
This value shall be derived from DoIpLogicAddress that is referenced by DoIpConnection in the role doIpTargetAddress	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_DoIP_00054]

BSW Module	**BSW Context**		
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPConnections		
BSW Parameter		**BSW Type**	
DoIPTcpConnection		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container describes a TCP connection to the lower layer SoAd module.			
Template Description			
Definition of static SocketConnection between the Socket that is defined by the aggregating SocketAddress and the remote Address.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::StaticSocketConnection			
Mapping Rule			**Mapping Type**
A DoIPTcpConnection is created for each SocketConnection for which the following conditions hold: - Protocol: Tcp, i.e. the SocketConnection refers to a local SocketAddress containing an ApplicationEndpoint which in turn contains a TcpTp configuration.- DoIP PDU transmission: The EcuInstance sends and/or receives via the SocketConnection PDUs that are of Type General PurposeIPdu and have their category set to "DoIP".			full

BSW Module	BSW Context	
DoIP	DoIP/DoIPConfigSet/DoIPInterface	
BSW Parameter	**BSW Type**	
DoIPRoutingActivation	ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description		
This container describes the routing activation possibilities by representing for each container a possible routing activation request message to the DoIP entity and the according references to the activated diagnostic messages.		
Template Description		
Collection of DoIpRoutingActivation possibilities defined in the DoIpInterface.		
M2 Parameter		
SystemTemplate::DoIP::DoIpInterface.doIpRoutingActivation		
Mapping Rule	**Mapping Type**	
1:1 mapping	full	
Mapping Status	**ECUC Parameter ID**	
valid	[ECUC_DoIP_00030]	

BSW Module	BSW Context	
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPRoutingActivation	
BSW Parameter	**BSW Type**	
DoIPTargetAddressRef	ECUC-REFERENCE-DEF	
BSW Description		
Reference to all DoIPTargetAddress which are activated on this Routing activation.		
Template Description		
Reference to DoIPTargetAddress which is activated on this DoIpRoutingActivation.		
M2 Parameter		
SystemTemplate::DoIP::DoIpRoutingActivation.doIpTargetAddress		
Mapping Rule	**Mapping Type**	
1:1 mapping	full	
Mapping Status	**ECUC Parameter ID**	
valid	[ECUC_DoIP_00034]	

BSW Module	BSW Context		
DoIP	DoIP/DoIPConfigSet/DoIPInterface		
BSW Parameter		**BSW Type**	
DoIPTester		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container describes the properties of the possible connectable Tester for the DoIP entity.			
Template Description			
A connection identifies the sender and the receiver of this particular communication. The DoIp module routes a tpSdu through this connection.			
M2 Parameter			
SystemTemplate::DiagnosticConnection::DoIpTpConnection			
Mapping Rule			**Mapping Type**
One DoIPTester container is created for each valid and unique tester address value of any DoIpTp Connection of the configured EcuInstance. If the configured EcuInstance receives the PDU Triggering referenced via DoIpTpConnection.tpSdu, the tester address of a DoIpTpConnection is referenced via DoIpTpConnection.doIpSourceAddress. If the configured EcuInstance sends the PDU Triggering referenced via DoIpTpConnection.tpSdu, the tester address of a DoIpTpConnection is referenced via DoIpTpConnection.doIpTargetAddress.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_DoIP_00031]

BSW Module	BSW Context		
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPTester		
BSW Parameter		**BSW Type**	
DoIPRoutingActivationRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to a DoIPRoutingActivation describing the possible routing activations of the DoIPTester			
Template Description			
Reference to a DoIPRoutingActivation describing the possible routing activations of the DoIPTester.			
M2 Parameter			
SystemTemplate::DoIP::DoIpLogicTesterAddressProps.doIpTesterRoutingActivation			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_DoIP_00062]

BSW Module	BSW Context	
DoIP	DoIP/DoIPConfigSet/DoIPInterface/DoIPTester	
BSW Parameter		**BSW Type**
DoIPTesterSA		ECUC-INTEGER-PARAM-DEF
BSW Description		
Source Address of the Tester sent via routing activation or diagnostic message.		
Template Description		
The logical DoIP address.		
M2 Parameter		
SystemTemplate::TransportProtocols::DoIpLogicAddress.address		

▽

△

Mapping Rule	Mapping Type
If the configured EcuInstance receives the PDU Triggering referenced via DoIpTpConnection.tpSdu, the tester address of a DoIpTpConnection is referenced via DoIpLogicAddress.doIpSourceAddress. If the configured EcuInstance sends the PDU Triggering referenced via DoIpTpConnection.tpSdu, the tester address of a DoIpTpConnection is referenced via DoIpLogicAddress.doIpTargetAddress.	full

valid	[ECUC_DoIP_00013]

C.17 EcuC

BSW Module	BSW Context
EcuC	EcuC/EcucConfigSet/EcucPduCollection/MetaDataType/MetaDataItem
BSW Parameter	**BSW Type**
MetaDataItemType	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
This parameter defines the type of a meta data item.	
Template Description	
This aggregation contributes the specification of the concrete meta-data item type.	
M2 Parameter	
SWComponentTemplate::PortInterface::MetaDataItem.metaDataItemType	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EcuC_00076]

BSW Module	BSW Context		
EcuC	EcuC/EcucConfigSet/EcucPduCollection/Pdu		
BSW Parameter		**BSW Type**	
DynamicLength		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
This parameter defines whether the Pdu has dynamic length (true) or not (false). Please note that the usage of this attribute is restricted by [constr_3448].			
Template Description			
This attribute defines whether the Pdu has dynamic length (true) or not (false). Please note that the usage of this attribute is restricted by [constr_3448].			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::Pdu.hasDynamicLength			
Mapping Rule			**Mapping Type**
Attribute can be derived from Pdu.hasDynamicLength attribute that is only relevant for UserDefined Pdus, UserDefinedIPdus, J1939DcmIPdus.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_EcuC_00078]

BSW Module	BSW Context		
EcuC	EcuC/EcucConfigSet/EcucPduCollection/Pdu		
BSW Parameter		**BSW Type**	
J1939Requestable		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Pdu can be triggered by the J1939 request message.			
Template Description			
CanFrameTriggering.j1939requestable: Frame can be triggered by the J1939 request message. **J1939TpPg.requestable:** Parameter Group can be triggered by the J1939 request message.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Can::CanCommunication::CanFrameTriggering.j1939requestable, SystemTemplate::TransportProtocols::J1939TpPg.requestable			
Mapping Rule			**Mapping Type**
CanFrameTriggering.j1939requestable: CanFrameTriggering references a Frame where the aggregated PduToFrameMapping references the given Pdu. J1939TpPg.requestable: J1939TpPg references the given Pdu in the role sdu.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_EcuC_00072]

BSW Module	BSW Context	
EcuC	EcuC/EcucConfigSet/EcucPduCollection/Pdu	
BSW Parameter		**BSW Type**
MetaDataTypeRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to meta data that is transported in the Pdu through the AUTOSAR layers.		
Template Description		

▽

△

VariableDataPrototype: A VariableDataPrototype represents a formalized generic piece of information that is typically mutable by the application software layer. VariableDataPrototype is used in various contexts and the specific context gives the otherwise generic VariableDataPrototype a dedicated semantics. **SenderReceiverToSignalMapping:** Mapping of a sender receiver communication data element to a signal. **SystemSignal:** The system signal represents the communication system's view of data exchanged between SW components which reside on different ECUs. The system signals allow to represent this communication in a flattened structure, with exactly one system signal defined for each data element prototype sent and received by connected SW component instances. **ISignal:** Signal of the Interaction Layer. The RTE supports a "signal fan-out" where the same System Signal is sent in different Signal IPdus to multiple receivers. To support the RTE "signal fan-out" each SignalIPdu contains ISignals. If the same System Signal is to be mapped into several SignalIPdus there is one ISignal needed for each ISignalToIPduMapping. ISignals describe the Interface between the Precompile configured RTE and the potentially Postbuild configured Com Stack (see ECUC Parameter Mapping). In case of the SystemSignalGroup an ISignal shall be created for each SystemSignal contained in the SystemSignalGroup. **ISignalIPdu:** Represents the IPdus handled by Com. The ISignalIPdu assembled and disassembled in AUTOSAR COM consists of one or more signals. In case no multiplexing is performed this IPdu is routed to/from the Interface Layer. A maximum of one dynamic length signal per IPdu is allowed.		
M2 Parameter		
SWComponentTemplate::Datatype::DataPrototypes::`VariableDataPrototype`, SystemTemplate::DataMapping::`SenderReceiverToSignalMapping`, SystemTemplate::Fibex::FibexCore::CoreCommunication::`SystemSignal`, SystemTemplate::Fibex::FibexCore::CoreCommunication::`ISignal`, SystemTemplate::Fibex::FibexCore::CoreCommunication::`ISignalIPdu`		
Mapping Rule	**Mapping Type**	
A MetaDataTypeRef shall be derived for a given Pdu if a MetaDataItemSet exists that refers to a VariablePrototype that is also referenced from a SenderReceiverToSignalMapping that in turn references a SystemSignal that is referenced by a ISignal that is mapped to an ISignalIPdu that is derived to the mentioned Pdu in EcuC.	full	
Mapping Status	**ECUC Parameter ID**	
valid	[ECUC_EcuC_00077]	

BSW Module	**BSW Context**
EcuC	EcuC/EcucConfigSet/EcucPduCollection/Pdu
BSW Parameter	**BSW Type**
PduBufferAlignment	ECUC-INTEGER-PARAM-DEF
BSW Description	
This parameter defines the byte alignment of temporary local buffers that is required by the hardware. Using this parameter, a configuration can ensure that an upper layer module is aware of the alignment requirements of a driver. Unit: Byte	
Template Description	
Pdu.length: Pdu length in bytes. In case of dynamic length IPdus (containing a dynamical length signal), this value indicates the maximum data length. It should be noted that in former AUTOSAR releases (Rel 2.1, Rel 3.0, Rel 3.1, Rel 4.0 Rev. 1) this parameter was defined in bits. The Pdu length of zero bytes is allowed. **IPduMapping.pduMaxLength:** Define the maximum length in bytes which limits the length of the Pdu during gateway operation if the runtime length of the received Pdu exceeds this limit.	

▽

△

M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::Pdu.length, SystemTemplate::Fibex::Fibex4Multiplatform::IPdu Mapping.pduMaxLength	
Mapping Rule	**Mapping Type**
1:1 mapping of Pdu.length in case that IPduMapping is not used. In case IPduMapping is used: 1:1 (sourceIPdu:targetIPdu) routing: When the SysTPduToPduTriggeringRef PduTriggering is referenced by an IPduMapping in the role sourceIPdu or targetIPdu,respectively, and that IPdu Mapping has a pduMaxLength defined then IPduMapping.pduMaxLength shall be used as Pdu Length for the derived PduRSrcPdu and PduRDestPdu, respectively. Otherwise use Pdu.length. 1:N (sourceIPdu:targetIPdu) routing: If 1:N (sourceIPdu:targetIPdu) routing is modeled, then the maximum length of the available IPduMapping.pduMaxLength and Pdu.length shall be derived for the PduRSrcPdu. The derivation of the length of each PduRDestPdu shall follow the rule for 1:1 routing. N:1 (sourceIPdu:targetIPdu): If N:1 (sourceIPdu:targetIPdu) routing is modeled, then the maximum length of the available IPduMapping.pduMaxLength and Pdu.length shall be derived for the PduRDestPdu. The derivation of the length of each PduRSrcPdu shall follow the rule for 1:1 routing.	full
Mapping Status	**ECUC Parameter ID**

BSW Module	BSW Context
EcuC	EcuC/EcucConfigSet/EcucPduCollection/Pdu
BSW Parameter	**BSW Type**
PduLength	ECUC-INTEGER-PARAM-DEF
BSW Description	
Length of the Pdu in bytes. It should be noted that in former AUTOSAR releases (Rel 2.1, Rel 3.0, Rel 3.1, Rel 4.0 Rev. 1) this parameter was defined in bits.	
Template Description	
Pdu.length: Pdu length in bytes. In case of dynamic length IPdus (containing a dynamical length signal), this value indicates the maximum data length. It should be noted that in former AUTOSAR releases (Rel 2.1, Rel 3.0, Rel 3.1, Rel 4.0 Rev. 1) this parameter was defined in bits. The Pdu length of zero bytes is allowed. **IPduMapping.pduMaxLength:** Define the maximum length in bytes which limits the length of the Pdu during gateway operation if the runtime length of the received Pdu exceeds this limit.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::Pdu.length, SystemTemplate::Fibex::Fibex4Multiplatform::IPdu Mapping.pduMaxLength	
Mapping Rule	**Mapping Type**
1:1 mapping of Pdu.length in case that IPduMapping is not used. In case IPduMapping is used: 1:1 (sourceIPdu:targetIPdu) routing: When the SysTPduToPduTriggeringRef PduTriggering is referenced by an IPduMapping in the role sourceIPdu or targetIPdu,respectively, and that IPdu Mapping has a pduMaxLength defined then IPduMapping.pduMaxLength shall be used as Pdu Length for the derived PduRSrcPdu and PduRDestPdu, respectively. Otherwise use Pdu.length. 1:N (sourceIPdu:targetIPdu) routing: If 1:N (sourceIPdu:targetIPdu) routing is modeled, then the maximum length of the available IPduMapping.pduMaxLength and Pdu.length shall be derived for the PduRSrcPdu. The derivation of the length of each PduRDestPdu shall follow the rule for 1:1 routing. N:1 (sourceIPdu:targetIPdu): If N:1 (sourceIPdu:targetIPdu) routing is modeled, then the maximum length of the available IPduMapping.pduMaxLength and Pdu.length shall be derived for the PduRDestPdu. The derivation of the length of each PduRSrcPdu shall follow the rule for 1:1 routing.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EcuC_00003]

BSW Module	BSW Context		
EcuC	EcuC/EcucConfigSet/EcucPduCollection/Pdu		
BSW Parameter		**BSW Type**	
SysTPduToFrameTriggeringRef		ECUC-FOREIGN-REFERENCE-DEF	
BSW Description			
Reference to the FrameTriggering from the SystemTemplate which this Pdu belongs to. SysTPduToFrameTriggeringRef shall be used for UserDefinedPdus, NmPdus and NPdus which are not going through the Pdu Router. This reference shall not be used if SysTPduToPduTriggeringRef exists.			
Template Description			
The FrameTriggering describes the instance of a frame sent on a channel and defines the manner of triggering (timing information) and identification of a frame on the channel, on which it is sent. For the same frame, if FrameTriggerings exist on more than one channel of the same cluster the fan-out/in is handled by the Bus interface.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::FrameTriggering			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**

BSW Module	BSW Context		
EcuC	EcuC/EcucConfigSet/EcucPduCollection/Pdu		
BSW Parameter		**BSW Type**	
SysTPduToPduTriggeringRef		ECUC-FOREIGN-REFERENCE-DEF	
BSW Description			
Reference to the PduTriggering from the SystemTemplate which this Pdu represents. SysTPduToPduTriggeringRef shall be used for all Pdus except UserDefinedPdus, NmPdus and NPdus which are not going through the Pdu Router. For these Pdus, SysTPduToFrameTriggeringRef shall be used.			
Template Description			
The PduTriggering describes on which channel the IPdu is transmitted. The Pdu routing by the PduR is only allowed for subclasses of IPdu. Depending on its relation to entities such channels and clusters it can be unambiguously deduced whether a fan-out is handled by the Pdu router or the Bus Interface. If the fan-out is specified between different clusters it shall be handled by the Pdu Router. If the fan-out is specified between different channels of the same cluster it shall be handled by the Bus Interface.

C.20 EthIf

BSW Module	BSW Context		
EthIf	EthIf/EthIfConfigSet/EthIfController		
BSW Parameter		**BSW Type**	
EthIfCtrlMtu		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Specifies the maximum transmission unit (MTU) of the EthIfCtrl in [bytes]. Note: In case a VLAN tag is used for the EthIfCtrl, the frame length of the Ethernet frame will increase by 4 bytes.			
Template Description			
This attribute specifies the maximum transmission unit in bytes.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetCommunicationConnector. maximumTransmissionUnit			
Mapping Rule			**Mapping Type**
Different MTU values may be defined for different VLANs. Therefore the maximumTransmission Unit is specified in the EthernetCommunicationConnector. The value that is defined in the CommunicationConnector shall be used as the value of this parameter.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_EthIf_00032]

BSW Module	BSW Context		
EthIf	EthIf/EthIfConfigSet/EthIfController		
BSW Parameter		**BSW Type**	
EthIfVlanId		ECUC-INTEGER-PARAM-DEF	
BSW Description			
A virtual-LAN is identified by this attribute according to IEEE 802.1Q.			
Template Description			
A VLAN is identified by this attribute according to IEEE 802.1Q. The allowed values range is from 0..4095.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::VlanConfig.vlanIdentifier

EthIf	EthIf/EthIfConfigSet/EthIfFrameConfig	
BSW Parameter		**BSW Type**
EthIfFrameType		ECUC-INTEGER-PARAM-DEF
BSW Description		
Selects the Ethernet frame type.		
Template Description		
Ethernet specific attributes to the Frame.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::EthernetFrame::AbstractEthernetFrame		

▽

△

Mapping Rule	Mapping Type
If an AbstractEthernetFrame is defined in the System Extract then it may be possible to derive this parameter from this information.	partial
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthIf_00122]

BSW Module	BSW Context	
EthIf	EthIf/EthIfConfigSet	
BSW Parameter		**BSW Type**
EthIfSwitchPortGroup		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the configuration of EthIfSwitchPortGroups. If EthIfSwitchPortGroups are controlled by PNC one EthIfSwitchPortGroup per PNC shall exist. The host port shall be part of all EthIfSwitchPortGroups. The up link port of a master switch and the up link port of the slave switch shall be part of all EthIfSwitchPortGroups that contain EthSwtPorts belonging to the slave switch.		
Template Description		
EcuInstance.ethSwitchPortGroupDerivation: Defines whether the derivation of SwitchPortGroups based on VLAN and/or CouplingPort.pncMapping shall be performed for this EcuInstance. If not defined the derivation shall not be done. **CouplingPort.pncMapping:** Reference to the partial networks this CouplingPort participates in.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::EcuInstance.ethSwitchPortGroupDerivation, SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingPort.pncMapping		
Mapping Rule		**Mapping Type**
Derive EthIfSwitchPortGroup from M2 according to the following requirements only if EcuInstance.ethSwitchPortGroupDerivation is defined and set to TRUE: • For each EthernetPhysicalChannel that has CouplingPorts connected (CouplingPort has a VlanMembership refering to the EthernetPhysicalChannel) exactly one EthIfSwitchPortGroup shall be derived containing all connected CouplingPorts via the EthIfPortRef. Thus a EthSwtPort may be part in several EthIfSwitchPortGroups. • For each PNC that is referenced by at least one CouplingPort exactly one EthIfSwitchPortGroup shall be derived. The referenced CouplingPort shall be part of the EthIfSwitchPortGroup via the EthIfPortRef. Thus a EthSwtPort may be part in several EthIfSwitchPortGroups. • If the CouplingPorts have no reference to any PNC or all referenced PNCs have no relation to this EthernetPhysicalChannel then the derived EthIfSwitchPortGroupRefSemantics shall have the value ETHIF_SWITCH_PORT_GROUP_CONTROL, because this EthIfSwitchPortGroup is switched by EthSM. • If the CouplingPorts have at least one reference to any PNC that has a relation to this EthernetPhysicalChannel then the derived EthIfSwitchPortGroupRefSemantics shall have the value ETHIF_SWITCH_PORT_GROUP_LINK_INFO, because this EthIfSwitchPortGroup is only used for link status accumulation towards EthSM.		full
Mapping Status		**ECUC Parameter ID**

EthIf	EthIf/EthIfConfigSet/EthIfTransceiver	
BSW Parameter		**BSW Type**

▽

△

EthIfQualifiedUnexpectedLinkDownTime	ECUC-FLOAT-PARAM-DEF
BSW Description	
Specifies the time in seconds an unexpected link down is qualified. This parameter is only used for those Ethernet channels where the ECU act as a passive communication slave (referenced EthTrcv set EthTrcvActAsSlavePassiveEnabled = TRUE). The value shall be a multiple integral of EthIf_MainFunctionState.	
Template Description	
EcuInstance.wakeUpOverBusSupported: Driver support for wakeup over Bus. **EthernetCommunicationController.slaveQualifiedUnexpectedLinkDownTime:** This attribute specifies time when an unexpected link down is evaluated as link down and indicated to the AUTOSAR communication stack.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreTopology::EcuInstance.wakeUpOverBusSupported, SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetCommunicationController.slaveQualifiedUnexpectedLinkDownTime	
Mapping Rule	**Mapping Type**
If EcuInstance.wakeUpOverBusSupported is defined and set to TRUE and the aggregated EthernetCommunicatonController has set EthernetCommunicationController.slaveActAsPassiveSlave to TRUE and the EthernetController aggregate an CouplingPort with physicalLayerType set to "100Base-T1" and "1000Base-T1", respectively, than the corresponding EthIfTransceiver shall set EthIfQualifiedUnexpectedLinkDownTime to EthernetCommunicatonController.slaveQualifiedUnexpectedLinkDownTime.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthIf_00078]

BSW Module	**BSW Context**
EthIf	EthIf/EthIfGeneral
BSW Parameter	**BSW Type**
EthIfPortStartupActiveTime	ECUC-FLOAT-PARAM-DEF
BSW Description	
Denote the time delay after the mode "ETH_MODE_ACTIVE" of all EthIfSwitchPorts are requested via EthIf_StartAllPorts. This is only used for ports in EthIfSwtPortGroups which are not referenced by any EthIfController.	
Template Description	
EthernetCluster.couplingPortStartupActiveTime: The attribute specifies the time in second a coupling port is switched on to enable the host ECU (ECU that maintains an Ethernet switch) to listen to the network for potential network management requests. **EcuInstance.ethSwitchPortGroupDerivation:** Defines whether the derivation of SwitchPortGroups based on VLAN and/or CouplingPort.pncMapping shall be performed for this EcuInstance. If not defined the derivation shall not be done.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetCluster.couplingPortStartupActiveTime, SystemTemplate::Fibex::FibexCore::CoreTopology::EcuInstance.ethSwitchPortGroupDerivation	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthIf_00055]

BSW Module	BSW Context		
EthIf	EthIf/EthIfGeneral		
BSW Parameter		**BSW Type**	
EthIfSwitchOffPortTimeDelay		ECUC-FLOAT-PARAM-DEF	
BSW Description			
Denote the time delay after the mode "ETH_MODE_DOWN" of a EthIfSwitchPortGroup will be executed. This is only used for EthIfSwtPortGroups which are not referenced by any EthIfController. The time delay shall be greater than the UdpNm timings, because UdpNm shall finish its shutdown handling. (Repeat Message State, Prepare Bus-Sleep state, Bus-Sleep state).			
Template Description			
EthernetCluster.couplingPortSwitchoffDelay: Switch off delay for CouplingPorts in seconds. It denotes the delay of switching off couplingPorts after the request to switch off a couplingPort was issued. (e.g. switch off of Ethernet switch ports). **EcuInstance.ethSwitchPortGroupDerivation:** Defines whether the derivation of SwitchPortGroups based on VLAN and/or CouplingPort.pncMapping shall be performed for this EcuInstance. If not defined the derivation shall not be done.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetCluster.couplingPortSwitchoffDelay, SystemTemplate::Fibex::FibexCore::CoreTopology::EcuInstance.ethSwitchPortGroupDerivation			
Mapping Rule			**Mapping Type**
Derivation shall only be done if EcuInstance.ethSwitchPortGroupDerivation is available and set to TRUE.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_EthIf_00054]

BSW Module	BSW Context		
EthIf	EthIf/EthIfGeneral		
BSW Parameter		**BSW Type**	
EthIfWakeUpSupport		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Configures if wake-up handling is supported or not: TRUE: wake-up handling is supported FALSE: wake-up handling is not supported This configuration parameter also enables particular other the API at Pre-Compile-Time, e.g. EthIf_CheckWakeup.			
Template Description			
EcuInstance.wakeUpOverBusSupported: Driver support for wakeup over Bus. **EthernetCommunicationController:** Ethernet specific communication port attributes.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreTopology::EcuInstance.wakeUpOverBusSupported, SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetCommunicationController			
Mapping Rule			**Mapping Type**
If EcuInstance.wakeUpOverBusSupported is defined and set to TRUE, the aggregated Ethernet CommunicatonController has set to TRUE and the the aggregated EthernetCommunicaton Controller aggregate an CouplingPort with physicalLayerType set to "100Base-T1" and"1000Base-T1",respectively, or the aggregated CouplingPort is part of a CouplingElement with couplingType set to "switch" and the affected CouplingPorts have a physicalLayerType set to "100Base-T1" and "1000Base-T1", respectively, then EthIfWakeUpSupport shall set to TRUE.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_EthIf_00040]

C.21 EthSM

BSW Module	BSW Context	
EthSM	EthSM	
BSW Parameter		**BSW Type**
EthSMNetwork		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the Ethernet network-specific parameters of each Ethernet network. It also contains the reference to combination of controller and transceiver assigned to an Ethernet network.		
Template Description		
The EthernetPhysicalChannel represents a VLAN or an untagged channel. An untagged channel is modeled as an Ethernet PhysicalChannel without an aggregated VLAN.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetPhysicalChannel		
Mapping Rule		**Mapping Type**
1:1 For each EthernetPhysicalChannel the EcuInstance is connected to, one EthSMNetwork container is created.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_EthSM_-00067]

BSW Module	BSW Context	
EthSM	EthSM/EthSMNetwork	
BSW Parameter		**BSW Type**
EthSMWakeupSleepOnDatalineEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Specifies if an active communication request shall be forwarded to the lower layer to trigger a wake-up on the Ethernet network, e.g. trigger a wake-up on dataline if OA TC10 compliant Ethernet hardware is used. If the parameter is set to TRUE and EthSM in called with COMM_FULL_COMMUNICATION_WITH_WAKEUP_REQUEST, then EthSM call the corresponding EthIfController everytime with ETH_MODE_ACTIVE_WITH_WAKEUP_REQUEST to trigger an wake-up request in the lower layer.		
Template Description		
EcuInstance.wakeUpOverBusSupported: Driver support for wakeup over Bus. **EcuInstance.ethSwitchPortGroupDerivation:** Defines whether the derivation of SwitchPortGroups based on VLAN and/or CouplingPort.pncMapping shall be performed for this EcuInstance. If not defined the derivation shall not be done. **EthernetCommunicationController:** Ethernet specific communication port attributes.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::EcuInstance.wakeUpOverBusSupported, SystemTemplate::Fibex::FibexCore::CoreTopology::EcuInstance.ethSwitchPortGroupDerivation, SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetCommunicationController		
Mapping Rule		**Mapping Type**

▽

△

If EcuInstance.wakeUpOverBusSupported is defined and set to TRUE and the aggregated EthernetCommunicatonController aggregate an CouplingPort with physicalLayerType set to "100Base-T1" and "1000Base-T1",respectively, or the aggregated CouplingPort is partof a CouplingElement with couplingType set to "switch" and EcuInstance.ethSwitchPortGroup Deriviation is not defined or set to FALSE and the affected CouplingPorts have a physicalLayer Type set to "100Base-T1" and "1000Base-T1", respectively, than the corresponding ComM channel shall set ComMWakeupSleepRequestEnabled to TRUE.	full

C.22 EthSwt

BSW Module	**BSW Context**
EthSwt	EthSwt
BSW Parameter	**BSW Type**
EthSwtConfig	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Configuration of one Ethernet Switch.	
Template Description	
A CouplingElement is used to connect EcuInstances to the VLAN of an EthernetCluster. CouplingElements can reach from a simple hub to a complex managed switch or even devices with functionalities in higher layers. A CouplingElement that is not related to an EcuInstance occurs as a dedicated single device.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingElement	
Mapping Rule	**Mapping Type**
For each CouplingElement with couplingType=switch one EthSwtConfig shall be created.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthSwt_-00001]

BSW Module	**BSW Context**
EthSwt	EthSwt/EthSwtConfig
BSW Parameter	**BSW Type**
EthSwtMacAddressLearningMode	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
Defines the MAC address learning mode specified by [7, IEEE802.1Q] either shared VLAN learning (SVL) or independent VLAN learning (IVL).	
Template Description	
Defines the MAC address learning mode of the Ethernet switch.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingElement.switchMacAddressLearningMode	
Mapping Rule	**Mapping Type**

▽

△

Set to SVL if CouplingElement.switchMacAddressLearningMode equals sharedVlanLearning or is not defined. Set to IVL if CouplingElement.switchMacAddressLearningMode equals independentVlanLearning.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthSwt_-00236]

BSW Module	**BSW Context**		
EthSwt	EthSwt/EthSwtConfig/EthSwtMacAddressLearningMode		
BSW Parameter		**BSW Type**	
IVL		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
The Ethernet switch updates the ARL table (address resolution table) with an entry consiting of source MAC address and VLAN-ID of the received Ethernet frame and the ingress port from on which the Ethernet frame was received.			
Template Description			
sent without a VLAN tag			
M2 Parameter

Mapping Status			**ECUC Parameter ID**
valid			

BSW Module	**BSW Context**		
EthSwt	EthSwt/EthSwtConfig/EthSwtMacAddressLearningMode		
BSW Parameter		**BSW Type**	
SVL		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
The Ethernet switch updates the ARL table (address resolution table) with an entry consiting of source MAC address of the received Ethernet frame and the ingress port on which the Ethernet frame was received.			
Template Description			
will not be sent			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetSwitchVlanEgressTaggingEnum.notSent			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			

BSW Module	**BSW Context**	
EthSwt	EthSwt/EthSwtConfig	
BSW Parameter		**BSW Type**
EthSwtMacForwardingTable		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Represents a MAC forwarding table.		

▽

△

Template Description	
Defines a set of macMulticastAddresses to be mapped to the CouplingPort.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::MacAddressVlanMembership.macMulticastAddress, SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingPort.macMulticastAddress	
Mapping Rule	**Mapping Type**
If a MacMulticastGroup is referenced at least once from CouplingPort.macAddressVlanAssignment.macMulticastAddress or CouplingPort.macMulticastAddress, then create an instance of EthSwtMacForwardingTable.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthSwt_-00205]

BSW Module	BSW Context
EthSwt	EthSwt/EthSwtConfig/EthSwtMacForwardingTable
BSW Parameter	**BSW Type**
EthSwtMacForwardingTablePortRef	ECUC-REFERENCE-DEF
BSW Description	
References the ports the MAC shall be assigned to.	
Template Description	
Defines a set of macMulticastAddresses to be mapped to the CouplingPort.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingPort.macMulticastAddress, SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::MacAddressVlanMembership.macMulticastAddress	
Mapping Rule	**Mapping Type**
If a CouplingPort has a reference to a MacMulticastGroup (via CouplingPort.macAddressVlanAssignment.macMulticastAddress or CouplingPort.macMulticastAddress), then a reference to the EthSwtPort container which was created for that CouplingPort shall be added to the EthSwtMacForwardingTable container.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthSwt_-00207]

BSW Module	BSW Context
EthSwt	EthSwt/EthSwtConfig/EthSwtMacForwardingTable
BSW Parameter	**BSW Type**
EthSwtPredefinedMacAddress	ECUC-STRING-PARAM-DEF
BSW Description	
Specifies a 48-bit physical addresses (MAC addresses) network byte order, which can be reached via the referenced port and if available via the referenced VLAN . Note that further addresses can be learned during runtime.	
Template Description	
A multicast MAC address (Media Access Control address) is a identifier for a group of hosts in a network.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::MacMulticastGroup.macMulticastAddress	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthSwt_-00206]

BSW Module	BSW Context		
EthSwt	EthSwt/EthSwtConfig/EthSwtMacForwardingTable		
BSW Parameter		**BSW Type**	
EthSwtVlanMembershipRef		ECUC-REFERENCE-DEF	
BSW Description			
References the VLAN-IDs the MAC address shall be assigned to. Please note, this reference is used if EthSwtMacAddress LearningMode is set to IVL (independent VLAN learning).			
Template Description			
Defines a set of VLANs the set of macMulticastAddress apply to.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::MacAddressVlanMembership.vlan			
Mapping Rule			**Mapping Type**
If a CouplingPort has a reference to an EthernetPhysicalChannel (representing a VLAN) via CouplingPort.macAddressVlanAssignment.vlan, then a reference to the EthSwtVlanMembership container which was created for that EthernetPhysicalChannel (VLAN) shall be added to the Eth SwtMacForwardingTable container.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_EthSwt_-00237]

BSW Module	BSW Context		
EthSwt	EthSwt/EthSwtConfig		
BSW Parameter		**BSW Type**	
EthSwtPort		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Configuration of one Ethernet Switch Port.			
Template Description			
A CouplingPort is used to connect a CouplingElement with an EcuInstance or two CouplingElements with each other via a CouplingPortConnection. Optionally, the CouplingPort may also have a reference to a macMulticastGroup and a defaultVLAN.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingPort			
Mapping Rule			**Mapping Type**
For each CouplingElement.couplingPort of a CouplingElement with couplingType=switch one Eth SwtPort shall be created.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_EthSwt_-00005]

BSW Module	BSW Context	
EthSwt	EthSwt/EthSwtConfig/EthSwtPort	
BSW Parameter		**BSW Type**
EthSwtFramePreemptionEnable		ECUC-BOOLEAN-PARAM-DEF
BSW Description		

▽

△

Configures whether frame preemption for this EthSwtPort is enabled. If the Ethernet switch hardware supports frame preemption and this parameter is set TRUE, then frame preemption for the corresponding EthSwtPort is enabled. If for some traffic class(es) EthSwtTrafficClassToPreemptionStatusAssignment at the egress port queue is additionally configured to ETHSWT_TRAFFIC_CLASS_PREEMPTABLE, then frame preemption for the respective traffic class(es) at the correponding EthSwtEgressPort is possible.
Template Description
Defines whether frames handled by this CouplingPort may be preemted.
M2 Parameter
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingPortDetails.framePreemptionSupport

Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**

BSW Module	BSW Context	
EthSwt	EthSwt/EthSwtConfig	
BSW Parameter		**BSW Type**
EthSwtUnknownMacDestAddressConfig		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Definition to which EthSwtPorts an Ethernet frame shall be forwarded if the destination MAC address is not present in the address resolution lookup (ARL) table.		
Template Description		

▽

△

A CouplingElement is used to connect EcuInstances to the VLAN of an EthernetCluster. CouplingElements can reach from a simple hub to a complex managed switch or even devices with functionalities in higher layers. A CouplingElement that is not related to an EcuInstance occurs as a dedicated single device.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingElement	
Mapping Rule	**Mapping Type**
For each CouplingElement with couplingType=switch one EthSwtConfig shall be created.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthSwt_-00239]

BSW Module	**BSW Context**	
EthSwt	EthSwt/EthSwtConfig/EthSwtUnknownMacDestAddressConfig	
BSW Parameter		**BSW Type**
EthSwtDestPortsForUnknownMulticastMacDestAddressRef		ECUC-REFERENCE-DEF
BSW Description		
This parameter specifies the egress ports frames with unknown multicast MAC destination addresses (without a matching ARL entry) are forwarded on. Note that "Drop Unknown Multicast" behavior can be achieved by not referencing any EthSwtPort.		
Template Description		
Defines a set of macMulticastAddresses to be mapped to the CouplingPort.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingPort.macMulticastAddress, SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::MacAddressVlanMembership.macMulticastAddress		
Mapping Rule		**Mapping Type**
If a CouplingPort has a reference to a MacMulticastGroup (via CouplingPort.macAddressVlanAssignment.macMulticastAddress or CouplingPort.macMulticastAddress), then a reference to the EthSwtPort container which was created for that CouplingPort shall be added to the EthSwtMacForwardingTable container.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_EthSwt_-00241]

BSW Module	**BSW Context**	
EthSwt	EthSwt/EthSwtConfig/EthSwtUnknownMacDestAddressConfig	
BSW Parameter		**BSW Type**
EthSwtDestPortsForUnknownUnicastMacDestAddressRef		ECUC-REFERENCE-DEF
BSW Description		
This parameter specifies the egress ports frames with unknown unicast MAC destination addresses (without a matching ARL entry) are forwarded on. Note that "Flooding" can be achieved by referencing all EthSwtPorts.		
Template Description		
Defines a set of macMulticastAddresses to be mapped to the CouplingPort.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingPort.macMulticastAddress, SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::MacAddressVlanMembership.macMulticastAddress		
Mapping Rule		**Mapping Type**

▽

△

If a CouplingPort has a reference to a MacMulticastGroup (via CouplingPort.macAddressVlanAssignment.macMulticastAddress or CouplingPort.macMulticastAddress), then a reference to the EthSwtPort container which was created for that CouplingPort shall be added to the EthSwtMacForwardingTable container.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthSwt_-00240]

BSW Module	**BSW Context**	
EthSwt	EthSwt/EthSwtConfig/EthSwtUnknownMacDestAddressConfig	
BSW Parameter		**BSW Type**
EthSwtDestVlanForUnknownMacDestAddressRef		ECUC-REFERENCE-DEF
BSW Description		
Optional reference to a set of VLANs to define that the owning EthSwtUnknownMacDestAddressConfig is applicable for these VLANs only.		
Template Description		
Defines a set of VLANs the set of macMulticastAddress apply to.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::MacAddressVlanMembership.vlan		
Mapping Rule		**Mapping Type**
If a CouplingPort has a reference to an EthernetPhysicalChannel (representing a VLAN) via CouplingPort.macAddressVlanAssignment.vlan, then a reference to the EthSwtVlanMembership container which was created for that EthernetPhysicalChannel (VLAN) shall be added to the EthSwtMacForwardingTable container.		full
Mapping Status		**ECUC Parameter ID**

BSW Module	**BSW Context**	
EthTSyn	EthTSyn	
BSW Parameter		**BSW Type**
EthTSynGlobalTimeDomain		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This represents the existence of a global time domain on Ethernet. The EthTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains. If the EthTSyn exists it is assumed that at least one global time domain exists.		
Template Description		
This represents the ability to define a global time domain.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeDomain		
Mapping Rule		**Mapping Type**

▽

△

The container shall exist if a GlobalTimeDomain exists that has a slave or master that refers to a CommunicationConnector that in turn is aggregated by the EcuInstance for which the ECU configuration is created.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthTSyn_-00004]

BSW Module	**BSW Context**
EthTSyn	EthTSyn/EthTSynGlobalTimeDomain
BSW Parameter	**BSW Type**
EthTSynFramePrio	ECUC-INTEGER-PARAM-DEF
BSW Description	
This optional parameter, if present, indicates the priority of outgoing EthTSyn message (i.e., it equals the 3-bit PCP field of a tagged VLAN message). If a VLAN is not configured, this parameter is also not configured	
Template Description	
Defines which VLAN priority shall be assigned to a time sync message in case the message is sent using a VLAN tag.	
M2 Parameter	
SystemTemplate::GlobalTime::ETH::EthGlobalTimeDomainProps.vlanPriority	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthTSyn_-00034]

BSW Module	**BSW Context**
EthTSyn	EthTSyn/EthTSynGlobalTimeDomain
BSW Parameter	**BSW Type**
EthTSynGlobalTimeDebounceTime	ECUC-FLOAT-PARAM-DEF
BSW Description	
This represents the configuration of a TX debounce time for Sync, Follow_Up, and pDelay messages compared to a message before with the same PDU. Unit: seconds	
Template Description	
Defines the minimum amount of time between two time sync messages are transmitted.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeDomain.debounceTime	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthTSyn_-00048]

BSW Module	**BSW Context**
EthTSyn	EthTSyn/EthTSynGlobalTimeDomain
BSW Parameter	**BSW Type**
EthTSynGlobalTimeDomainId	ECUC-INTEGER-PARAM-DEF

▽

△

BSW Description	
The global time domain ID.	
Template Description	
This represents the ID of the GlobalTimeDomain used in the network messages sent on behalf of global time management.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeDomain.domainId	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthTSyn_-00005]

BSW Module	BSW Context	
EthTSyn	EthTSyn/EthTSynGlobalTimeDomain	
BSW Parameter		**BSW Type**
EthTSynGlobalTimeFollowUpDataIDList		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
The DataIDList for Follow_Up message ensures the identification of data elements due to CRC calculation and message authentication process.		
Template Description		
The DataIDList for FUP messages to calculate CRC.		
M2 Parameter		
SystemTemplate::GlobalTime::ETH::EthGlobalTimeDomainProps.fupDataIDList		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_EthTSyn_-00030]

BSW Module	BSW Context	
EthTSyn	EthTSyn/EthTSynGlobalTimeDomain/EthTSynGlobalTimeFollowUpDataIDList	
BSW Parameter		**BSW Type**
EthTSynGlobalTimeFollowUpDataIDListElement		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Element of the DataIDList for Follow_Up message ensures the identification of data elements due to CRC calculation and message authentication process.		
Template Description		
The DataIDList for FUP messages to calculate CRC.		
M2 Parameter		
SystemTemplate::GlobalTime::ETH::EthGlobalTimeDomainProps.fupDataIDList		
Mapping Rule		**Mapping Type**
Value shall be derived from element of the ordered fupDataIDList.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_EthTSyn_-00031]

BSW Module	BSW Context		
EthTSyn	EthTSyn/EthTSynGlobalTimeDomain/EthTSynPortConfig		
BSW Parameter		**BSW Type**	
EthTSynGlobalTimePortRole		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
Parameter to set the port behavior to Time Slave, Time Master or Dynamic (Time Slave or Time Master at runtime).			
Template Description			
This attribute defines the port behavior.			
M2 Parameter			
SystemTemplate::GlobalTime::ETH::EthGlobalTimeManagedCouplingPort.globalTimePortRole			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**

EthTSyn	EthTSyn/EthTSynGlobalTimeDomain/EthTSynPortConfig		
BSW Parameter		**BSW Type**	
EthTSynGlobalTimeRxIcvVerification		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container collects configuration that shall be used for ICV verification.			
Template Description			
Defines how an Integrity Check Value (ICV) shall be handled at the receiver.			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeSlave.icvVerification			
Mapping Rule			**Mapping Type**
Create this container if GlobalTimeSlave.icvVerification is defined as the value GlobalTimeIcv VerificationEnum. icvVerified or GlobalTimeIcvVerificationEnum.icvOptional.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_EthTSyn_-00104]

BSW Module	BSW Context	
EthTSyn	EthTSyn/EthTSynGlobalTimeDomain/EthTSynPortConfig/EthTSynGlobalTimeRxIcvVerification	
BSW Parameter		**BSW Type**
EthTSynIcvVerificationAttempts		ECUC-INTEGER-PARAM-DEF
BSW Description		
This parameter specifies the number of ICV verification attempts that are to be carried out when the verification of the ICV failed for a given secured Follow_Up message. If zero is set, then only one ICV verification attempt is done.		
Template Description		
This attribute defines the additional number of authentication attempts that are to be carried out when the generation of the authentication information failed for a given message. If zero is set than only one authentication attempt is done.		
M2 Parameter		
AdaptivePlatform::ServiceInstanceManifest::SecureCommunication::SecOcSecureComProps. authenticationVerifyAttempts

C.24 EthTrcv

BSW Module	BSW Context		
EthTrcv	EthTrcv/EthTrcvConfigSet/EthTrcvConfig		
BSW Parameter		**BSW Type**	
EthTrcvActAsSlavePassiveEnabled		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Specifies if the ECU is acting as a passive communication slave on the corresponding ComM channel (corresponding ComM channel has ComMNMVariant set to SLAVE_PASSIVE). If the parameter is set to TRUE, the Ethernet transceiver driver shall poll the maintained Ethernet hardware for a signaled Sleep.Indication (according to OA TC10) in the context of the EthTrcv_MainFunction.			
Template Description			
This attribute specifies if the EcuInstance is acting as a passive communication slave on the connected PhysicalChannel. This is used for EthernetCommunicationControllers that use Ethernet hardware which supports wake-up and sleep on the network (e.g. Open Alliance TC10 compliant Ethernet hardware).			
M2 Parameter

BSW Module	BSW Context		
EthTrcv	EthTrcv/EthTrcvConfigSet/EthTrcvConfig		
BSW Parameter		**BSW Type**	
EthTrcvSleepModeExecutionDelay		ECUC-FLOAT-PARAM-DEF	
BSW Description			
Specifies the time delay in seconds to execute a sleep (see OA TC10) for a Ethernet hardware (PHY), if a pending wake-up was detected while a ETH_MODE_DOWN was requested. The value shall be an integral multiple of EthTrcvMainFunctionPeriod.			
Template Description			
Delay in seconds to perform a sleep request if the Ethernet hardware (PHY) detect a pending wake-up. This is used to avoid the race condition, if a sleep was requested while a wake-up of a neighboring PHY was received via a local wake-up connection (e.g. I/O pin).			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetWakeupSleepOnDatalineConfig. `sleepModeExecutionDelay`

BSW Module	BSW Context		
EthTrcv	EthTrcv/EthTrcvConfigSet/EthTrcvConfig		
BSW Parameter		**BSW Type**	
EthTrcvSleepRequestNumberOfRepetitions		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Specifies the repetitions to trigger a Sleep.Request (according to OA TC10) if a release of the communication channel was triggered by the upper layer (ETH_MODE_DOWN) and a SleepFail.Indication was signaled. Thus, the Ethernet hardware (PHY) of the connected communication partner did not accept the Sleep.Request.			
Template Description			
Count of repetitions for a sleep on dataline. If a sleep is rejected by the linked communication partner, the sleep is repeated until the count of repetitions exceed. If count of repetitions exceed, the Ethernet hardware (PHY) transit to sleep without acknowledgement of the connected link partner.			
M2 Parameter

BSW Module	**BSW Context**
EthTrcv	EthTrcv/EthTrcvConfigSet/EthTrcvConfig
BSW Parameter	**BSW Type**
EthTrcvWakeUpRequestRepetitionPeriod	ECUC-FLOAT-PARAM-DEF
BSW Description	
Specifies the repetition period in seconds of a wake-up request, if an active communication request (ETH_MODE_ACTIVE_WITH_WAKEUP_REQUEST) was triggered by the upperlayer. The value shall be an integral multiple of EthTrcvMainFunctionPeriod.	
Template Description	
Delay in seconds for a repetition of a wake-up. This is used to increase the reliability in the network, such that an ECU which initiates the wake-up does repeat the wake-up and increase the probability that affected ECUs receive the wake-up.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetWakeupSleepOnDatalineConfig. wakeupRepetitionDelayOfWakeupRequest	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**

BSW Module	**BSW Context**
EthTrcv	EthTrcv/EthTrcvConfigSet/EthTrcvConfig
BSW Parameter	**BSW Type**
EthTrcvWakeupForwardLocalEnabled	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
Specifies if remote wake up forwarding is enabled (TRUE) or disabled (FALSE) for OA TC10 compliant Ethernet Transceiver. If the parameter is set to TRUE, the Ethernet hardware (PHY) activate a local wake up (e.g. via I/O pin), if a remote wake-up on data line (e.g. 100Base-T1) was received (either WUP or WUR).	
Template Description	
If enabled, then a remote wake-up received on the physical dataline (e.g. 100BASE-T1) is forwarded as local wake-up (e.g. via an I/O pin). If disabled, then a remote wake-up is not forwarded as local wake-up.	
M2 Parameter

BSW Module	BSW Context		
EthTrcv	EthTrcv/EthTrcvConfigSet/EthTrcvConfig		
BSW Parameter		**BSW Type**	
EthTrcvWakeupLocalEnabled		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Specifies if local wake-up is enabled (TRUE) or disabled (FALSE) for OA TC10 compliant Ethernet hardware (PHY). If the parameter is set to TRUE, the Ethernet hardware (PHY) is able to detect and react on a wake-up received by a neighboring PHY (e.g. via I/O pin).			
Template Description			
If enabled, then a local wake-up received via a local connection (e.g. I/O pin) shall be detected by the Ethernet hardware (PHY). If disabled, Ethernet hardware is not reacting on a local wake-up.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetWakeupSleepOnDatalineConfig. wakeupLocalEnabled			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**

BSW Module	BSW Context		
EthTrcv	EthTrcv/EthTrcvConfigSet/EthTrcvConfig		
BSW Parameter		**BSW Type**	
EthTrcvWakeupRemoteEnabled		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Specifies if remote wake-up is enabled (TRUE) or disabled (FALSE) for OA TC10 compliant Ethernet hardware (PHY). If the parameter is set to TRUE, the Ethernet hardware (PHY) wake up when receiving a remote wake-up (e.g. via 100Base-T1 data line) triggered by the connected communication partner.			

▽

△

Template Description	
If enabled, then a remote wake-up received via the physical dataline (e.g. 100BASE-T1) shall be detected by the Ethernet hardware (PHY). If disabled, Ethernet hardware is not reaction on a remote wake-up.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetWakeupSleepOnDatalineConfig. wakeupRemoteEnabled	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthTrcv_-00066]

BSW Module	BSW Context
EthTrcv	EthTrcv/EthTrcvConfigSet/EthTrcvConfig
BSW Parameter	**BSW Type**
EthTrcvWakeupRequestNumberOfRepetitions	ECUC-INTEGER-PARAM-DEF
BSW Description	
Specifies the repetitions to trigger a wake-up request (according to OA TC10), if an active communication request (ETH_MODE_ACTIVE_WITH_WAKEUP_REQUEST) was triggered by the upperlayer.	
Template Description	
Count of repetitions for a wake-up. This is used to increase the reliability in the network, such that an ECU which initiates the wake-up does repeat the wake-up and increase the probability that affected ECUs receive the wake-up.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetWakeupSleepOnDatalineConfig. wakeupRepetitionsOfWakeupRequest	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_EthTrcv_-00075]

BSW Module	BSW Context
EthTrcv	EthTrcv/EthTrcvConfigSet/EthTrcvConfig
BSW Parameter	**BSW Type**
EthTrcvWakeupSleepOnDatalineEnabled	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
Specifies if wake-up on data line according to OA TC10 is supported by the used Ethernet hardware (PHY) and if the functionality (wake-up and sleep on dataline) is enabled. If the parameter is configured, wake-up and sleep on data line is supported according to OA TC10 by the used Ethernet hardware (PHY). If the parameter is set to TRUE, the wake-up and sleep on data line functionality according to OA TC10 is enabled. If the parameter is set to FALSE, the wake-up and sleep on data line functionality according to OA TC10 is disabled. Note: Disabling of the wake-up and sleep functionality is used if Ethernet hardware (PHY) parts are connected, where one PHY do not support the OA TC10 wake-up and sleep on dataline functionality. This may needed for legacy scenarios, where ECUs are taken over from previous car lines and no OA TC10 Ethernet hardware (PHY) were used.	
Template Description	
Optional reference to EthernetWakeupSleepOnDatalineConfig.

BSW Module	**BSW Context**
Firewall	Firewall/FirewallRule/FirewallNetworkLayerFilterConfig
BSW Parameter	**BSW Type**
FirewallNetworkLayerIpv4FilterConfig	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Configuration of filter rules for IPv6 on the Network layer	
Template Description	
Configuration of filter rules on IPv4 level.	
M2 Parameter	
AdaptivePlatform::PlatformModuleDeployment::Firewall::Ipv4Rule	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Fw_00140]

BSW Module	**BSW Context**
Firewall	Firewall/FirewallRule/FirewallNetworkLayerFilterConfig/FirewallNetworkLayerIpv4FilterConfig
BSW Parameter	**BSW Type**
FirewallChecksumVerification	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
Defines whether checksum verification is performed or not.	
Template Description	

▽

△

TransportLayerRule.checksumVerification: Defines whether checksum verification is performed or not. **Ipv4Rule.checksumVerification:** Defines whether a Ipv4 header checksum verification is performed or not. **IcmpRule.checksumVerification:** Defines whether a Icmp header checksum verification is performed or not.		
M2 Parameter		
AdaptivePlatform::PlatformModuleDeployment::Firewall::TransportLayerRule.`checksumVerification`, AdaptivePlatform::PlatformModuleDeployment::Firewall::Ipv4Rule.`checksumVerification`, AdaptivePlatform::PlatformModuleDeployment::Firewall::IcmpRule.`checksumVerification`		
Mapping Rule		**Mapping Type**
depends on usage context		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Fw_00025]

BSW Module	**BSW Context**		
Firewall	Firewall/FirewallRule/FirewallNetworkLayerFilterConfig/FirewallNetworkLayerIpv4FilterConfig		
BSW Parameter		**BSW Type**	
FirewallDifferentiatedServiceCodePoint		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Filter to match packets with a DSCP value.			
Template Description			
Filter to match packets with a DSCP value.			
M2 Parameter			
AdaptivePlatform::PlatformModuleDeployment::Firewall::Ipv4Rule.`differentiatedServiceCodePoint`			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Fw_00040]

BSW Module	**BSW Context**		
Firewall	Firewall/FirewallRule/FirewallNetworkLayerFilterConfig/FirewallNetworkLayerIpv4FilterConfig		
BSW Parameter		**BSW Type**	
FirewallDoNotFragment		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Filter to match packets that have the doNotFragment bit in the Header set.			
Template Description			
Filter to match packets that have the doNotFragment bit in the Header set.			
M2 Parameter			
AdaptivePlatform::PlatformModuleDeployment::Firewall::Ipv4Rule.`doNotFragment`			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Fw_00041]

Firewall	Firewall/FirewallRule/FirewallNetworkLayerFilterConfig/FirewallNetworkLayerIpv4FilterConfig		
BSW Parameter		**BSW Type**	
FirewallExplicitCongestionNotification		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Filter to match packets with a ECN code point.			
Template Description			
Filter to match packets with a ECN code point.			
M2 Parameter			
AdaptivePlatform::PlatformModuleDeployment::Firewall::Ipv4Rule.explicitCongestionNotification			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Fw_00045]

BSW Module	BSW Context		
Firewall	Firewall/FirewallRule/FirewallNetworkLayerFilterConfig/FirewallNetworkLayerIpv4FilterConfig		
BSW Parameter		**BSW Type**	
FirewallFilterIPDestAddress		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Configuration of one IP destination filter.			
Template Description			
Ipv4Rule.destinationIpAddress: Filter to match packets with the destination IPv4 address. **Ipv4Rule.destinationNetworkMask:** Filter to match packets with the destination IPv4 address range. The destinationIpAddress with the destinationNetworkMask defines the IP address range. **Ipv6Rule.destinationIpAddress:** Filter to match packets with the destination IPv6 address. **Ipv6Rule.destinationNetworkMask:** Filter to match packets with the destination IPv6 address range. The destinationIpAddress with the destinationNetworkMask defines the MAC address range.			
M2 Parameter			
AdaptivePlatform::PlatformModuleDeployment::Firewall::Ipv4Rule.destinationIpAddress, AdaptivePlatform::PlatformModuleDeployment::Firewall::Ipv4Rule.destinationNetworkMask, AdaptivePlatform::PlatformModuleDeployment::Firewall::Ipv6Rule.destinationIpAddress, AdaptivePlatform::PlatformModuleDeployment::Firewall::Ipv6Rule.destinationNetworkMask

C.27 FrArTp

BSW Module	BSW Context		
FrArTp	FrArTp/FrArTpMultipleConfig		
BSW Parameter		**BSW Type**	
FrArTpChannel		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container contains the configuration (parameters) of one FlexRay TP channel.			
Template Description			
A channel is a group of connections sharing several properties. The FlexRay AutosarTransport Layer supports several channels. These channels can work concurrently, thus each of them requires its own state machine and management data structures and its own PDU-IDs.			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayArTpChannel			
Mapping Rule			**Mapping Type**
Create container for each FlexrayArTpChannel that exists in the Ecu Extract.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrArTp_00005]

BSW Module	BSW Context		
FrArTp	FrArTp/FrArTpMultipleConfig/FrArTpChannel		
BSW Parameter		**BSW Type**	
FrArTpAckType		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
This parameter defines the type of acknowledgement which is used for the specific channel.			
Template Description			
Type of Acknowledgement.			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayArTpChannel.ackType			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrArTp_00002]

BSW Module	BSW Context		
FrArTp	FrArTp/FrArTpMultipleConfig/FrArTpChannel		
BSW Parameter		**BSW Type**	
FrArTpAdrType		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
This parameter states the addressing type this connection has. The meanings of the values are one byte and two byte.			
Template Description			

▽

△

Adressing Type of this connection: true: Two Bytes false: One Byte	
M2 Parameter

BSW Module	**BSW Context**
FrArTp	FrArTp/FrArTpMultipleConfig/FrArTpChannel
BSW Parameter	**BSW Type**
FrArTpConnection	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container contains the configuration (parameters) of one FlexRay TP connection. A connection can only belong to one channel.	
Template Description	
M2 Parameter	
SystemTemplate::TransportProtocols::FlexrayArTpChannel.tpConnection	
Mapping Rule	**Mapping Type**
Create container for each existing FlexrayArTpConnection that is aggregated by FlexrayArTp Channel in the System description.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrArTp_-00010]

BSW Module	**BSW Context**
FrArTp	FrArTp/FrArTpMultipleConfig/FrArTpChannel/FrArTpConnection
BSW Parameter	**BSW Type**
FrArTpLa	ECUC-INTEGER-PARAM-DEF
BSW Description	
This parameter defines the Local Address for the respective connection. When the local instance is the sender, this is the Source Address within the TP frame. When the local instance is the receiver, this is the Target Address within the TP frame. Note that in case of 1 byte addressing only the values from 0x0000 - 0x00FF are valid. If this parameter is not configured, all related Rx N-SDUs must be configured to use the meta data item TARGET_ADDRESS_16, and all related Tx-N-SDUs must be configured to use the meta data item SOURCE_ADDRESS_16.	
Template Description	
M2 Parameter	
SystemTemplate::TransportProtocols::FlexrayArTpConnection.source	
Mapping Rule	**Mapping Type**
LocalAddress can be derived from the TpNode that is referenced by the FlexRayTpConnection as source.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrArTp_-00018]

BSW Module	BSW Context		
FrArTp	FrArTp/FrArTpMultipleConfig/FrArTpChannel/FrArTpConnection		
BSW Parameter		**BSW Type**	
FrArTpMultRec		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
This parameter defines, whether this connection is an 1:1 ('false') or an 1:n ('true') connection. Of course, if the channel to which the connection is configured has retry or acknowledgement enabled, no retry or acknowledgement will occur in case the connection is an 1:n connection.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayArTpConnection.multicast			
Mapping Rule			**Mapping Type**
If multicast is used set this attribute to true.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrArTp_-00027]

BSW Module	BSW Context		
FrArTp	FrArTp/FrArTpMultipleConfig/FrArTpChannel/FrArTpConnection		
BSW Parameter		**BSW Type**	
FrArTpRa		ECUC-INTEGER-PARAM-DEF	
BSW Description			
This parameter defines the Remote Address for the respective connection. When the local instance is the sender, this is the Target Address within the TP frame. When the local instance is the receiver, this is the Source Address within the TP frame. Note that in case of 1 byte addressing only the values from 0x0000 - 0x00FF are valid. If this parameter is not configured, all related Rx N-SDUs must be configured to use the meta data item SOURCE_ADDRESS_16, and all related Tx-N-SDUs must be configured to use the meta data item TARGET_ADDRESS_16.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayArTpConnection.target			
Mapping Rule			**Mapping Type**
RemoteAddress can be derived from the TpNode that is referenced by the FlexRayTpConnection as target.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrArTp_-00037]

BSW Module	BSW Context	
FrArTp	FrArTp/FrArTpMultipleConfig/FrArTpChannel/FrArTpConnection	
BSW Parameter		**BSW Type**
FrArTpRxSdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Describes the Rx N-SDU. This N-SDU can produce meta data items of type SOURCE_ADDRESS_16 and TARGET_ADDRESS_16.		
Template Description		
M2 Parameter		

▽

△

SystemTemplate::TransportProtocols::FlexrayArTpConnection.directTpSdu

△

This parameter defines the minimum amount of time between two succeeding CFs of a 1:1 segmented transmission in seconds. Valid values are 0, 100µs, 200µs .. 900µs, 1ms, 2ms .. 127ms. The value can be changed at runtime using the FrArTp_ChangeParameter interface. FrArTpStMin must be an integer multiple of the cycle length multiplied with the multiplexing factor, i.e. FrArTpStMin = n * FrIfGdCycle * m, where n is an integer >= 0 and m is the cycle multiplexor of those cycles where PDUs of the PDU pool are scheduled. Please note: Due to the scheduling strategies of FrArTp, FrArTpStMin can only be kept to a degree defined by the maximum temporal distance of the PDUs of a PDU pool within one FlexRay cycle.
Template Description
This attribute defines the minimum amount of time between two succeeding CFs of a 1:1 segmented transmission in seconds. Valid values are 0, 100µs, 200µs .. 900µs, 1ms, 2ms .. 127ms. The value can be changed at runtime using the FrArTp_ChangeParameter interface. The minimumSeparationTime shall be an integer multiple of the cycle length multiplied with the multiplexing factor, i.e. minimumSeparationTime = n * cycle * m, where n is an integer >=0, cycle is FlexrayCluster.cycle, and m is the cycle multiplexor of those cycles where PDUs of the PDU pool are scheduled. Please note: Due to the scheduling strategies of FrTp, minimumSeparationTime can only be kept to a degree defined by the maximum temporal distance of the PDUs of a PDU pool within one FlexRay cycle. Range: 0 .. 0.127

BSW Module	BSW Context	
FrIf	FrIf/FrIfConfig	
BSW Parameter		**BSW Type**
FrIfFrameStructure		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
The Frame structure specifies a Construction Plan how a Frame is assembled with PDUs and their respective Update-Bits.		
Template Description		
Data frame which is sent over a communication medium. This element describes the pure Layout of a frame sent on a channel.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::Frame		
Mapping Rule		**Mapping Type**
Create container for each FlexRay Frame that is transmitted or received by the regarded ECU. IPduToFrameMapping element in the System Template contains the construction plan.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrIf_05370]

BSW Module	BSW Context	
FrIf	FrIf/FrIfConfig/FrIfFrameStructure	
BSW Parameter		**BSW Type**
FrIfByteOrder		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
This parameter defines the ByteOrder of all Pdus that are mapped into the Frame. The absolute position of a Pdu in the Frame is determined by the definition of the ByteOrder parameter: If BIG_ENDIAN is specified, the FrIfPduOffset indicates the position of the most significant bit in the Frame. If LITTLE_ENDIAN is specified, the FrIfPduOffset indicates the position of the least significant bit in the Frame.		
Template Description		
This attribute defines the order of the bytes of the Pdu and the packing into the Frame. Please consider that [constr_3246] and [constr_3222] are restricting the usage of this attribute.

FrIfPdusInFrame	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container holds all the information about a PDU in a FlexRay Frame.	
Template Description	
A PduToFrameMapping defines the composition of Pdus in each frame.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::PduToFrameMapping	
Mapping Rule	**Mapping Type**
Container shall be created for each IPduToFrameMapping element inside the frame.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrIf_05371]

BSW Module	BSW Context
FrIf	FrIf/FrIfConfig/FrIfFrameStructure/FrIfPdusInFrame
BSW Parameter	**BSW Type**
FrIfPduOffset	ECUC-INTEGER-PARAM-DEF
BSW Description	
The value specifies the offset of the PDU within the Frame [bytes].	
Template Description	
This attribute describes the bitposition of a Pdu within a Frame. Please note that the absolute position of the Pdu in the Frame is determined by the definition of the packingByteOrder attribute. If Big Endian is specified, the start position indicates the bit position of the most significant bit in the Frame. If Little Endian is specified, the start position indicates the bit position of the least significant bit in the Frame. The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7. The Pdus are byte aligned in a Frame and only the values 0, 8, 16, 24,... (for little endian) and 7, 15, 23, ... (for big endian) are allowed.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::PduToFrameMapping.startPosition	
Mapping Rule	**Mapping Type**
Please note that the startPosition attribute is defined in bits and the FrIfPduOffset parameter is defined in bytes.	full
Mapping Status	**ECUC Parameter ID**

BSW Module	**BSW Context**
FrIf	FrIf/FrIfConfig/FrIfFrameStructure/FrIfPdusInFrame
BSW Parameter	**BSW Type**
FrIfPduUpdateBitOffset	ECUC-INTEGER-PARAM-DEF
BSW Description	
This value specifies where the PDU's Update-Bit is stored in the Frame (bit location of PDU's Update-Bit in the FlexRay Frame).	
Template Description	
Indication to the receivers that the corresponding Pdu was updated by the sender. This attribute describes the position of the update bit in the frame that aggregates this PDUToFrameMapping. Length is always one bit. Note that the exact bit position of the updateIndicationBitPosition is linked to the value of the attribute packingByteOrder because the method of finding the bit position is different for the values mostSignificantByteFirst and mostSignificantByte Last. This means that if the value of packingByteOrder is changed while the value of updateIndicationBitPosition remains unchanged the exact bit position of updateIndicationBitPosition within the enclosing Frame still undergoes a change. This attribute denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packingByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7.

Channel-specific parameter to enable the dynamic PNC-to-channel-mapping feature. False: Dynamic PNC-to-channel-mapping is disabled True: Dynamic PNC-to-channel-mapping is enabled		
Template Description		
Defines if this EcuInstance shall implement the dynamic PNC-to-channel-mapping functionality on this Communication Connector and its respective PhysicalChannel.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationConnector.dynamicPncToChannelMappingEnabled		
Mapping Rule		**Mapping Type**
1:1 mapping If M2 Parameter not defined then do not create FrNmDynamicPncToChannelMapping Enabled		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrNm_00092]

BSW Module	**BSW Context**	
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers	
BSW Parameter		**BSW Type**
FrNmNodeDetectionEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
This parameter is used to enable or disable node detection support for a FrNm Channel.		
Template Description		
Enables the Request Repeat Message Request support. Only valid if nmNodeIdEnabled is set to true.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmCluster.nmNodeDetectionEnabled		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrNm_00086]

BSW Module	**BSW Context**	
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers	
BSW Parameter		**BSW Type**
FrNmNodeId		ECUC-INTEGER-PARAM-DEF
BSW Description		
NM node identifier configured for the respective FlexRay Channel. It is used for identifying the respective NM node in the NM-cluster. It must be unique for each NM node within one NM cluster.		
Template Description		
Node identifier of local NmNode. Shall be unique in the NmCluster.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmNode.nmNodeId		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrNm_00017]

BSW Module	BSW Context	
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers	
BSW Parameter		**BSW Type**
FrNmPduScheduleVariant		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
This parameter defines the PDU scheduling variant that should be used for this channel. Option 1 NM-Vote and NM-Data in static segment (one PDU) Option 2 NM-Vote and NM-Data in dynamic segment (one PDU) Option 3 NM-Vote and NM-Data in static segment (separate PDU) Option 4 NM-Vote in static segment and NM-Data in dynamic segment Option 5 NM-Vote in dynamic segment and NM-Data in static segment Option 6 NM-Vote and NM-Data in dynamic segment (separate PDU) Option 7 Combined NM-Vote and CBV in static segment and NM-Data in dynamic segment		
Template Description		
FrNm schedule variant according to FrNm SWS.		
M2 Parameter		
SystemTemplate::NetworkManagement::FlexrayNmClusterCoupling.nmScheduleVariant		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrNm_00022]

BSW Module	BSW Context	
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers	
BSW Parameter		**BSW Type**
FrNmPnEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Enables or disables support of partial networking. false: Partial networking Range not supported true: Partial networking supported		
Template Description		
Defines whether this NmCluster contributes to the partial network mechanism.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmCluster.nmPncParticipation		
Mapping Rule		**Mapping Type**
If NmCluster.nmPncParticipation has the value "true" or is not defined then FrNmPnEnabled shall be set to true.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrNm_00072]

BSW Module	BSW Context	
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers	
BSW Parameter		**BSW Type**
FrNmRxPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container describes the FlexRay NM RX PDU:s.		
Template Description		
M2 Parameter		
SystemTemplate::NetworkManagement::NmNode.rxNmPdu		

▽

△

Mapping Rule	Mapping Type
Create Container if the regarded NmNode recieves a Pdu	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrNm_00010]

BSW Module	BSW Context	
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers/FrNmRxPdu	
BSW Parameter		**BSW Type**
FrNmRxPduContainsData		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
This parameter defines if the PDU contains NM Data.		
Template Description		
Defines if the Pdu contains NM Data. If the NmPdu does not aggregate any ISignalToIPduMappings it still may contain User Data that is set via Nm_SetUserData(). If the ISignalToIPduMapping exists then the nmDataInformation attribute shall be ignored.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.nmDataInformation, SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.iSignalToIPduMapping		
Mapping Rule		**Mapping Type**
Set to true if either the NmPdu aggregates one or more iSignalToIPduMappings, or - if none are aggregated - if nmDataInformation is true. Set to false in all other cases		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrNm_00027]

BSW Module	BSW Context	
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers/FrNmRxPdu	
BSW Parameter		**BSW Type**
FrNmRxPduContainsVote		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
This parameter defines if the PDU contains NM Vote information.		
Template Description		
Defines if the Pdu contains NM Vote information.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.nmVoteInformation		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrNm_00026]

BSW Module	BSW Context	
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers	
BSW Parameter		**BSW Type**
FrNmSourceNodeIdentifierEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		

▽

△

This parameter is used to enable or disable SourceNodeIdentifier support for a FrNm Channel.	
Template Description	
Enables the source node identifier.	
M2 Parameter	
SystemTemplate::NetworkManagement::NmCluster.nmNodeIdEnabled	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrNm_00085]

BSW Module	**BSW Context**	
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers	
BSW Parameter		**BSW Type**
FrNmSynchronizationPointEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
This parameter defines if this channel shall provide the synchronization point indication to the NM Interface.		
Template Description		
If this parameter is true, then this network is a synchronizing network for the NM coordination cluster which it belongs to. The network is expected to call Nm_SynchronizationPoint() at regular intervals.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmCluster.nmSynchronizingNetwork		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrNm_00021]

FrNmTxPduContainsData	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
This parameted defines if the PDU contains NM Data.	
Template Description	
Defines if the Pdu contains NM Data. If the NmPdu does not aggregate any ISignalToIPduMappings it still may contain User Data that is set via Nm_SetUserData(). If the ISignalToIPduMapping exists then the nmDataInformation attribute shall be ignored.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.nmDataInformation, SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.iSignalToIPduMapping	
Mapping Rule	**Mapping Type**
Set to true if either the NmPdu aggregates one or more iSignalToIPduMappings, or - if none are aggregated - if nmDataInformation is true. Set to false in all other cases	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrNm_00024]

BSW Module	**BSW Context**
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers/FrNmTxPdu
BSW Parameter	**BSW Type**
FrNmTxPduContainsVote	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
This parameted defines if the PDU contains NM Vote information.	
Template Description	
Defines if the Pdu contains NM Vote information.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.nmVoteInformation	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrNm_00023]

BSW Module	**BSW Context**
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelIdentifiers
BSW Parameter	**BSW Type**
FrNmUserDataTxPdu	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This optional container is used to configure the UserNm PDU. This container is only available if FrNmComUserDataSupport is enabled.	
Template Description	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.iSignalToIPduMapping	
Mapping Rule	**Mapping Type**
Create container for each NmPdu that aggregates the ISignalToIPduMapping element. The configuration for these Pdus (e.g. Transfer Properties) shall be derived from this information.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrNm_00055]

BSW Module	BSW Context		
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelTiming		
BSW Parameter		**BSW Type**	
FrNmDataCycle		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
Number of FlexRay Schedule Cycles needed to transmit the NM Data of all ECUs on the FlexRay bus			
Template Description			
Number of FlexRay Communication Cycles needed to transmit the Nm Data PDUs of all FlexRay Nm Ecus of this FlexRayNm Cluster.			
M2 Parameter			
SystemTemplate::NetworkManagement::FlexrayNmCluster.nmDataCycle			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrNm_00031]

BSW Module	BSW Context		
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelTiming		
BSW Parameter		**BSW Type**	
FrNmMainFunctionPeriod		ECUC-FLOAT-PARAM-DEF	
BSW Description			
This parameter defines the processing cycle of the main function of FrNm module in seconds.			
Template Description			
Defines the processing cycle of the main function of FrNm module.			
M2 Parameter			
SystemTemplate::NetworkManagement::FlexrayNmCluster.nmMainFunctionPeriod			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrNm_00035]

BSW Module	BSW Context		
FrNm	FrNm/FrNmChannelConfig/FrNmChannel/FrNmChannelTiming		
BSW Parameter		**BSW Type**	
FrNmReadySleepCnt		ECUC-INTEGER-PARAM-DEF	
BSW Description			
FrNm switches to bus sleep mode at the end of the FrNmReadySleepCnt+1 repetition cycle without any NM vote. E.g. on a value of "1", the NM-State Machine will leave the Ready Sleep State after two NM Repetition Cycles with no "keep awake" votes.			
Template Description			
The value of this attribute influences the shutdown behavior of the FlexRay NM. FrNm switches to bus sleep mode nmReady SleepTime seconds after the completion of the last repetition cycle containing a NM vote.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Flexray::FlexrayTopology::FlexrayCommunicationConnector.nmReadySleepTime			
Mapping Rule			**Mapping Type**
FrNmReadySleepCnt = ((Float2Int(nmReadySleepTime/cycle))/nmRepetitionCycle)-1			full

valid		[ECUC_FrNm_00048]

BSW Module	BSW Context		
FrNm	FrNm/FrNmGlobalConfig/FrNmGlobalFeatures		
BSW Parameter		**BSW Type**	
FrNmComUserDataSupport		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Preprocessor switch for enabling the Tx path of Com User Data. Use case: Setting of NMUserData via SWC.			
Template Description			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.iSignalToIPduMapping			
Mapping Rule			**Mapping Type**
If an NmPdu contains user data defined via the existence of NmPdu.iSignalToIPduMapping and is consequently handled via the PduR and Com this attribute shall be set to true.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrNm_00054]

BSW Module	BSW Context		
FrNm	FrNm/FrNmGlobalConfig/FrNmGlobalFeatures		
BSW Parameter		**BSW Type**	
FrNmDynamicPncToChannelMappingSupport		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Precompile time switch to enable the dynamic PNC-to-channel-mapping handling. False: Dynamic PNC-to-channel-mapping is disabled True: Dynamic PNC-to-channel-mapping is enabled			
Template Description			
Defines if this EcuInstance shall implement the dynamic PNC-to-channel-mapping functionality on this Communication Connector and its respective PhysicalChannel.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationConnector.dynamicPncToChannelMappingEnabled			
Mapping Rule			**Mapping Type**
If at least one dynamicPncToChannelMappingEnabled attribute is defined and if at least one CommunicationConnector of the EcuInstance has dynamicPncToChannelMappingEnabled set to true, then FrNmDynamicPncToChannelMappingSupport shall be set to true. Otherwise FrNm DynamicPncToChannelMappingSupport shall be set to false.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrNm_00090]

C.30 FrSM

BSW Module	BSW Context	
FrSM	FrSM/FrSMConfig/FrSMCluster	
BSW Parameter		**BSW Type**
FrSMIsColdstartEcu		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
True: The ECU is a coldstart node for this FlexRay cluster. False: The ECU is no coldstart node for this FlexRay cluster.		
Template Description		
FlexrayCommunicationController.keySlotID: ID of the slot used to transmit the startup frame, sync frame, or designated single slot frame. If the attributes keySlotUsedForStartUp, keySlotUsedForSync, or keySlotOnlyEnabled are set to true the key slot value is mandatory. **FlexrayCommunicationController.keySlotUsedForStartUp:** Flag indicating whether the Key Slot is used to transmit a startup frame.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Flexray::FlexrayTopology::FlexrayCommunicationController.keySlotID, SystemTemplate::Fibex::Fibex4Flexray::FlexrayTopology::FlexrayCommunicationController.keySlotUsedForStartUp		
Mapping Rule		**Mapping Type**
<= TRUE if keySlotId existing and valid (i.e. not 0) and keySlotUsedForStartUp set to true <= FALSE otherwise		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrSM_00068]

BSW Module	BSW Context	
FrSM	FrSM/FrSMConfig/FrSMCluster	
BSW Parameter		**BSW Type**
FrSMTrcvStdbyDelay		ECUC-FLOAT-PARAM-DEF
BSW Description		
The duration of timer t_TrcvStdbyDelay in seconds. The granularity of this parameter shall be restricted to full FlexRay cycles (FrIfGdCycle). A value of 0 shall imply that the timer is not used.		
Template Description		
The duration of timer t_TrcvStdbyDelay in seconds. The granularity of this parameter shall be restricted to full FlexRay cycles (cycle). The transceiver status setting to STANDBY shall be delayed by this value. Not specifying a value or a value of 0 shall imply that the timer is not used.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Flexray::FlexrayTopology::FlexrayCluster.tranceiverStandbyDelay		
Mapping Rule		**Mapping Type**
1:1 mapping		full

C.31 FrTSyn

BSW Module	BSW Context	
FrTSyn	FrTSyn	
BSW Parameter		**BSW Type**
FrTSynGlobalTimeDomain		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This represents the existence of a global time domain on Flexray. The FrTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains. If the FrTSyn exists it is assumed that at least one global time domain exists.		
Template Description		
This represents the ability to define a global time domain.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeDomain		
Mapping Rule		**Mapping Type**
The container shall exist if a GlobalTimeDomain exists that has a slave or master that refers to a CommunicationConnector that in turn is aggregated by the EcuInstance for which the ECU configuration is created.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrTSyn_-00004]

BSW Module	BSW Context	
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain	
BSW Parameter		**BSW Type**
FrTSynGlobalTimeDomainId		ECUC-INTEGER-PARAM-DEF
BSW Description		
The global time domain ID.		
Template Description		
This represents the ID of the GlobalTimeDomain used in the network messages sent on behalf of global time management.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeDomain.domainId		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrTSyn_-00005]

BSW Module	BSW Context	
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain	
BSW Parameter		**BSW Type**
FrTSynGlobalTimeMaster		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Configuration of the global time master. Each global time domain is required to have exactly one global time master. This master may or may not exist on the configured ECU.		
Template Description		

▽

△

This represents the generic concept of a global time master.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeMaster	
Mapping Rule	**Mapping Type**
The existence of the FrTSynGlobalTimeMaster is bound to the existence of a GlobalTimeMaster that refers to a CommunicationConnector that in turn in aggregated at the EcuInstance for which the ECU configuration exists,	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTSyn_-00006]

BSW Module	**BSW Context**
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeMaster
BSW Parameter	**BSW Type**
FrTSynCyclicMsgResumeTime	ECUC-FLOAT-PARAM-DEF
BSW Description	
Defines the time where the 1st regular cycle time based message transmission takes place, after an immediate transmission before. Unit: seconds	
Template Description	
Defines the minimum time between an "immediate" message and the next periodic message.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeMaster.immediateResumeTime	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTSyn_-00032]

BSW Module	**BSW Context**
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeMaster
BSW Parameter	**BSW Type**
FrTSynGlobalTimeDebounceTime	ECUC-FLOAT-PARAM-DEF
BSW Description	
This represents the configuration of a TX debounce time for SYNC messages compared to a message before with the same PDU. Unit: seconds	
Template Description	
Defines the minimum amount of time between two time sync messages are transmitted.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeDomain.debounceTime	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTSyn_-00033]

BSW Module	BSW Context		
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeMaster/FrTSynGlobalTimeMasterPdu		
BSW Parameter		**BSW Type**	
FrTSynGlobalTimePduRef		ECUC-REFERENCE-DEF	
BSW Description			
This represents the reference to the Pdu taken to transmit the global time information. The global time master of a global time domain acts as the sender of the Pdu while all the time slaves are supposed to receive the Pdu.			
Template Description			
This PduTriggering will be taken to transmit the global time information from a GlobalTimeMaster to a the associated Global TimeSlaves.			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeDomain.pduTriggering			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTSyn_-00020]

BSW Module	BSW Context		
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeMaster		
BSW Parameter		**BSW Type**	
FrTSynGlobalTimeTxCrcSecured		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
This represents the configuration of whether or not CRC is supported.			
Template Description			
Definition of whether or not CRC is supported. This is only relevant for selected bus systems.			
M2 Parameter			
SystemTemplate::GlobalTime::FR::GlobalTimeFrMaster.crcSecured			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTSyn_-00013]

BSW Module	BSW Context		
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeMaster/FrTSynGlobalTimeTxCrcSecured		
BSW Parameter		**BSW Type**	
CRC_NOT_SUPPORTED		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
This represents a configuration where CRC is not supported.			
Template Description			
This indicates that CRC is not supported			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeCrcSupportEnum.crcNotSupported			
Mapping Rule			**Mapping Type**
1:1 mapping			full

FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeMaster	
BSW Parameter		**BSW Type**
FrTSynGlobalTimeTxIcvGeneration		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container collects configuration that shall be used for ICV generation.		
Template Description		
Defines whether an Integrity Check Value (ICV) shall be added to the sent time sync messages.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeMaster.icvSecured		
Mapping Rule		**Mapping Type**
Create this container if GlobalTimeMaster.icvSecured is defined as the value GlobalTimeIcv SupportEnum.icvSupported.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrTSyn_-00049]

BSW Module	BSW Context	
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeMaster/FrTSynGlobalTimeTxIcvGeneration	
BSW Parameter		**BSW Type**
FrTSynIcvGenerationFvIdRef		ECUC-REFERENCE-DEF
BSW Description		
This represents the reference to the FV taken to generate the ICV generation.		
Template Description		
This attribute defines the Id of the Freshness Value for the Integrity Check Value (ICV) calculation and verification.		
M2 Parameter		

▽

△

SystemTemplate::GlobalTime::GlobalTimeDomain.icvFreshnessValueId	
Mapping Rule	**Mapping Type**
Reference to the StbMFreshnessValue created for this GlobalTimeMaster.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTSyn_-00050]

BSW Module	**BSW Context**
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeMaster/FrTSynGlobalTimeTxIcvGeneration
BSW Parameter	**BSW Type**
FrTSynIcvGenerationJobRef	ECUC-REFERENCE-DEF
BSW Description	
This represents the reference to the CSM job to fetch the CSM job ID.	
Template Description	
Defines whether an Integrity Check Value (ICV) shall be added to the sent time sync messages.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeMaster.icvSecured	
Mapping Rule	**Mapping Type**
If GlobalTimeMaster.icvSecured is set to the value icvSupported, then the referenced CsmJob needs to be configured.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTSyn_-00053]

BSW Module	**BSW Context**
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeMaster

FrTSyn	FrTSyn/FrTSynGlobalTimeDomain
BSW Parameter	**BSW Type**
FrTSynGlobalTimeNetworkSegmentId	ECUC-INTEGER-PARAM-DEF

▽

△

BSW Description	
This represents the numerical identifier of the network on system level scope where this Global Time has been communicated on.	
Template Description	
This attribute represents the numerical identifier of a PhysicalChannel on system level scope.	
M2 Parameter	
SystemTemplate::GlobalTime::NetworkSegmentIdentification.networkSegmentId	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTSyn_-00042]

BSW Module	BSW Context	
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain	
BSW Parameter		**BSW Type**
FrTSynGlobalTimeSlave		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This represents the time slave for the enclosing global time domain.		
Template Description		
This represents the generic concept of a global time slave.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeSlave		
Mapping Rule		**Mapping Type**
The existence of the FrTSynGlobalTimeSlave is bound to the existence of a GlobalTimeSlave that refers to a CommunicationConnector that in turn in aggregated at the EcuInstance for which the ECU configuration exists,		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrTSyn_-00010]

BSW Module	BSW Context	
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeSlave	
BSW Parameter		**BSW Type**
FrTSynGlobalTimeRxIcvVerification		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container collects configuration required for ICV verification.		
Template Description		
Defines how an Integrity Check Value (ICV) shall be handled at the receiver.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeSlave.icvVerification		
Mapping Rule		**Mapping Type**
Create this container if GlobalTimeSlave.icvVerification is defined as the value GlobalTimeIcv VerificationEnum. icvVerified or GlobalTimeIcvVerificationEnum.icvOptional.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrTSyn_-00056]

BSW Module	BSW Context		
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeSlave/FrTSynGlobalTimeRxIcvVerification		
BSW Parameter		**BSW Type**	
FrTSynIcvVerificationAttempts		ECUC-INTEGER-PARAM-DEF	
BSW Description			
This parameter specifies the number of ICV verification attempts that are to be carried out when the verification of the ICV failed for a given secured SYNC message. If zero is set, then only one ICV verification attempt is done.			
Template Description			
This attribute defines the additional number of authentication attempts that are to be carried out when the generation of the authentication information failed for a given message. If zero is set than only one authentication attempt is done.			
M2 Parameter			
AdaptivePlatform::ServiceInstanceManifest::SecureCommunication::SecOcSecureComProps.`authenticationVerifyAttempts`

FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeSlave/FrTSynGlobalTimeSlavePdu	
BSW Parameter		**BSW Type**
FrTSynGlobalTimePduRef		ECUC-REFERENCE-DEF
BSW Description		
This represents the reference to the Pdu taken to transmit the global time information. The global time master of a global time domain acts as the sender of the Pdu while all the time slaves are supposed to receive the Pdu.		
Template Description		
This PduTriggering will be taken to transmit the global time information from a GlobalTimeMaster to a the associated Global TimeSlaves.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeDomain.pduTriggering		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrTSyn_-00020]

BSW Module	**BSW Context**	
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeSlave	
BSW Parameter		**BSW Type**
FrTSynRxCrcValidated		ECUC-ENUMERATION-PARAM-DEF

▽

△

BSW Description	
This parameter controls whether or not CRC validation shall be supported.	
Template Description	
Definition of whether or not validation of the CRC is supported.	
M2 Parameter	
SystemTemplate::GlobalTime::FR::GlobalTimeFrSlave.crcValidated	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTSyn_-00017]

BSW Module	BSW Context
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeSlave/FrTSynRxCrcValidated
BSW Parameter	**BSW Type**
CRC_IGNORED	ECUC-ENUMERATION-LITERAL-DEF
BSW Description	
The Timesync module accepts Time Synchronization messages, which are CRC secured (without actually validating the CRC) and those, which are not CRC secured. That means, the Timesync module ignores the CRC.	
Template Description	
The CRC is supposed to be ignored	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeCrcValidationEnum.crcIgnored	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	

BSW Module	BSW Context
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeSlave/FrTSynRxCrcValidated
BSW Parameter	**BSW Type**
CRC_NOT_VALIDATED	ECUC-ENUMERATION-LITERAL-DEF
BSW Description	
The Timesync module accepts only Time Synchronization messages, which are not CRC secured. All other Time Synchronization messages are ignored.	
Template Description	
The CRC is not supposed to be present. If CRC is present the message is ignored.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeCrcValidationEnum.crcNotValidated	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	

BSW Module	BSW Context		
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeSlave/FrTSynRxCrcValidated		
BSW Parameter		**BSW Type**	
CRC_OPTIONAL		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
The Timesync module accepts only Time Synchronization messages which are not CRC secured and Time Synchronization messages which are CRC secured and have the correct CRC. All other Time Synchronization messages are ignored.			
Template Description			
Either the CRC is present and then shall be validated or the CRC is not present and no CRC check is done.			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeCrcValidationEnum.crcOptional			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			

BSW Module	BSW Context		
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeSlave/FrTSynRxCrcValidated		
BSW Parameter		**BSW Type**	
CRC_VALIDATED		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
The Timesync module accepts only Time Synchronization messages, which are CRC secured and have the correct CRC. All other Time Synchronization messages are ignored.			
Template Description			
This CRC is supposed to be validated.			
M2 Parameter			
SystemTemplate::GlobalTime::GlobalTimeCrcValidationEnum.crcValidated			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			

BSW Module	BSW Context		
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain		
BSW Parameter		**BSW Type**	
FrTSynGlobalTimeSyncDataIDList		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
The DataIDList for SYNC messages ensures the identification of data elements due to CRC calculation and message authentication process.			
Template Description			
The DataIDList for SYNC messages to calculate CRC.			
M2 Parameter			
SystemTemplate::GlobalTime::FR::FrGlobalTimeDomainProps.syncDataIDList			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTSyn_-00023]

BSW Module	BSW Context		
FrTSyn	FrTSyn/FrTSynGlobalTimeDomain/FrTSynGlobalTimeSyncDataIDList		
BSW Parameter		**BSW Type**	
FrTSynGlobalTimeSyncDataIDListElement		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Element of the DataIDList for SYNC messages ensures the identification of data elements due to CRC calculation and message authentication process.			
Template Description			
The DataIDList for SYNC messages to calculate CRC.			
M2 Parameter			
SystemTemplate::GlobalTime::FR::FrGlobalTimeDomainProps.syncDataIDList			
Mapping Rule			**Mapping Type**
Value shall be derived from element of the ordered syncDataIDList.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTSyn_00025]

C.32 FrTp

BSW Module	BSW Context		
FrTp	FrTp/FrTpGeneral		
BSW Parameter		**BSW Type**	
FrTpFullDuplexEnable		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Preprocessor switch for enabling full duplex mechanisms for all channels. True: Full duplex is enabled False: Fullduplex is disabled (Half duplex is enabled)			
Template Description			
The full duplex mechanisms is enabled if this attribute is set to true. Otherwise half duplex is enabled.			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpEcu.fullDuplexEnabled			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTp_00051]

BSW Module	BSW Context	
FrTp	FrTp/FrTpGeneral	
BSW Parameter		**BSW Type**
FrTpMainFuncCycle		ECUC-FLOAT-PARAM-DEF
BSW Description		
This parameter contains the calling period of the TPs Main Function. The parameter is specified in seconds.		
Template Description		

▽

△

The period between successive calls to the Main Function of the AUTOSAR TP. Specified in seconds.		
M2 Parameter		
SystemTemplate::TransportProtocols::FlexrayTpEcu.cycleTimeMainFunction		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrTp_00011]

BSW Module	**BSW Context**		
FrTp	FrTp/FrTpGeneral		
BSW Parameter		**BSW Type**	
FrTpTransmitCancellation		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Preprocessor switch for enabling Transmit Cancellation and Receive Cancellation. True: Transmit/Receive Cancellation is enabled False: Transmit/Receive Cancellation is disabled			
Template Description			
With this switch Tx and Rx Cancellation can be turned on or off.			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpEcu.cancellation			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTp_00036]

BSW Module	**BSW Context**		
FrTp	FrTp/FrTpMultipleConfig		
BSW Parameter		**BSW Type**	
FrTpConnection		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container contains the connection specific parameters to transfer N-PDUs via FlexRay TP.			
Template Description			
A connection identifies the sender and the receiver of this particular communication. The FlexRayTp module routes a Pdu through this connection. In a System Description the references to the PduPools are mandatory. In an ECU Extract these references can be optional: On unicast connections these references are always mandatory. On multicast the txPduPool is mandatory on the sender side. The rxPduPool is mandatory on the receiver side. On Gateway ECUs both references are mandatory.			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpConnection			
Mapping Rule			**Mapping Type**
Create container for each FlexRayTpConnection that is described in the ECU Extract.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTp_00006]

BSW Module	BSW Context		
FrTp	FrTp/FrTpMultipleConfig/FrTpConnection		
BSW Parameter		**BSW Type**	
FrTpBandwidthLimitation		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
This parameter indicates whether the connection requires a bandwidth limitation or not. If FrTpBandwidthLimitation=True the sender shall send a StartFrame always on the first PDU of a PDU-Pool.			
Template Description			
Specifies whether the connection requires a bandwidth limitation or not.			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpConnection.bandwidthLimitation			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTp_00050]

BSW Module	BSW Context		
FrTp	FrTp/FrTpMultipleConfig/FrTpConnection		
BSW Parameter		**BSW Type**	
FrTpConCtrlRef		ECUC-REFERENCE-DEF	
BSW Description			
FrTpConnectionControlReference: This parameter defines a reference to a connection control container.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpConnection.tpConnectionControl			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTp_00005]

BSW Module	BSW Context		
FrTp	FrTp/FrTpMultipleConfig/FrTpConnection		
BSW Parameter		**BSW Type**	
FrTpLa		ECUC-INTEGER-PARAM-DEF	
BSW Description			
This parameter defines the Local Address for the respective connection. When the local instance is the sender, this is the Source Address within the TP frame. When the local instance is the receiver, this is the Target Address within the TP frame. If this parameter is not configured, all related Rx N-SDUs must be configured to use the meta data item TARGET_ADDRESS_16, and all related Tx-N-SDUs must be configured to use the meta data item SOURCE_ADDRESS_16.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpConnection.transmitter, SystemTemplate::TransportProtocols::FlexrayTpConnection.receiver			
Mapping Rule			**Mapping Type**

▽

△

If the local address is the sender it shall be derived from FlexrayTpConnection.transmitter. If the remote address is the receiver it shall be derived from FlexrayTpConnection.receiver.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTp_00010]

BSW Module	**BSW Context**	
FrTp	FrTp/FrTpMultipleConfig/FrTpConnection	
BSW Parameter		**BSW Type**
FrTpMultipleReceiverCon		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
This parameter defines, whether this connection is an 1:1 ('false') or an 1:n ('true') connection. If data segmentation is required this parameter is used to check whether segmentation is possible or not. If the connection is 1:n segmentation is not possible and an error will occur.		
Template Description		
M2 Parameter		
SystemTemplate::TransportProtocols::FlexrayTpConnection.multicast		
Mapping Rule		**Mapping Type**
If FlexRayTpConnection contains a mulicast reference to TpAddress than set this parameter to true		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrTp_00019]

BSW Module	**BSW Context**	
FrTp	FrTp/FrTpMultipleConfig/FrTpConnection	
BSW Parameter		**BSW Type**
FrTpRa		ECUC-INTEGER-PARAM-DEF
BSW Description		
This parameter defines the Remote Address for the respective connection. When the local instance is the sender, this is the Target Address within the TP frame. When the local instance is the receiver, this is the Source Address within the TP frame. If this parameter is not configured, all related Rx N-SDUs must be configured to use the meta data item SOURCE_ADDRESS_16, and all related Tx-N-SDUs must be configured to use the meta data item TARGET_ADDRESS_16.		
Template Description		
M2 Parameter		
SystemTemplate::TransportProtocols::FlexrayTpConnection.transmitter, SystemTemplate::TransportProtocols::FlexrayTpConnection.receiver		
Mapping Rule		**Mapping Type**
If the local address is the sender it shall be derived from FlexrayTpConnection.transmitter. If the remote address is the receiver it shall be derived from FlexrayTpConnection.receiver.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_FrTp_00021]

BSW Module	**BSW Context**	
FrTp	FrTp/FrTpMultipleConfig/FrTpConnection	
BSW Parameter		**BSW Type**
FrTpRxPduPoolRef		ECUC-REFERENCE-DEF

▽

△

BSW Description	
This parameter defines a reference to a RxPduPool.	
Template Description	
M2 Parameter	
SystemTemplate::TransportProtocols::FlexrayTpConnection.rxPduPool, SystemTemplate::TransportProtocols::FlexrayTpConnection.txPduPool	
Mapping Rule	**Mapping Type**
Depending whether the regarded Ecu is the transmitter or the receiver this reference shall be created if the FlexrayTpPduPool element is referenced by the FlexrayTpConnection via the txPduPool or rxPduPool reference. If the regarded ECU is the transmitter then the txPduPool holds the sent NPdus and the rxPduPool holds the received NPdus. If the ECU is the receiver then the txPduPool holds the received NPdus and the rxPduPool holds the sent NPdus.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTp_00025]

BSW Module	BSW Context	
FrTp	FrTp/FrTpMultipleConfig/FrTpConnection	
BSW Parameter	**BSW Type**	
FrTpRxSdu	ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description		
This parameter defines the Rx Service Data Unit Identifier (Sdu Id) which uniquely identifies a data transfer (inter-module communication) between FrTp and PDUR. This N-SDU can produce meta data items of type SOURCE_ADDRESS_16 and TARGET_ADDRESS_16.		
Template Description		
M2 Parameter		
SystemTemplate::TransportProtocols::FlexrayTpConnection.directTpSdu		
Mapping Rule	**Mapping Type**	
Create container if an Rx Pdu is referenced by the FlexRayTpConnection	full	
Mapping Status	**ECUC Parameter ID**	
valid	[ECUC_FrTp_00027]	

BSW Module	BSW Context	
FrTp	FrTp/FrTpMultipleConfig/FrTpConnection	
BSW Parameter	**BSW Type**	
FrTpTxPduPoolRef	ECUC-REFERENCE-DEF	
BSW Description		
This parameter defines a reference to a TxPduPool.		
Template Description		
M2 Parameter		
SystemTemplate::TransportProtocols::FlexrayTpConnection.rxPduPool, SystemTemplate::TransportProtocols::FlexrayTpConnection.txPduPool		
Mapping Rule	**Mapping Type**	

▽

△

Depending whether the regarded Ecu is the transmitter or the receiver this reference shall be created if the FlexrayTpPduPool element is referenced by the FlexrayTpConnection via the txPdu Pool or rxPduPool reference. If the regarded ECU is the transmitter then the txPduPool holds the sent NPdus and the rxPduPool holds the received NPdus. If the ECU is the receiver then the txPduPool holds the received NPdus and the rxPduPool holds the sent NPdus.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTp_00039]

BSW Module	**BSW Context**		
FrTp	FrTp/FrTpMultipleConfig/FrTpConnection		
BSW Parameter		**BSW Type**	
FrTpTxSdu		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This parameter defines the Tx Service Data Unit Identifier (Sdu Id) which uniquely identifies a data transfer (inter-module communication) between FrTp and PDUR. This N-SDU can consume meta data items of type SOURCE_ADDRESS_16 and TARGET_ADDRESS_16.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpConnection.directTpSdu			
Mapping Rule			**Mapping Type**
Create container if an Tx Pdu is referenced by the FlexRayTpConnection			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTp_00041]

BSW Module	**BSW Context**		
FrTp	FrTp/FrTpMultipleConfig		
BSW Parameter		**BSW Type**	
FrTpConnectionControl		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container contains the configuration parameters to control a FlexRay TP connection.			
Template Description			
Configuration parameters to control a FlexRay TP connection.			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpConnectionControl			
Mapping Rule			**Mapping Type**
Create container for each FlexRayTpConnectionControl that is described in the ECU Extract.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTp_00007]

BSW Module	**BSW Context**	
FrTp	FrTp/FrTpMultipleConfig/FrTpConnectionControl	
BSW Parameter		**BSW Type**
FrTpAckType		ECUC-ENUMERATION-PARAM-DEF

▽

△

BSW Description	
This parameter defines the type of acknowledgement which is used for the specific channel.	
Template Description	
This parameter defines the type of acknowledgement which is used for the specific channel.	
M2 Parameter	
SystemTemplate::TransportProtocols::FlexrayTpConnectionControl.ackType	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTp_00003]

BSW Module	BSW Context		
FrTp	FrTp/FrTpMultipleConfig/FrTpConnectionControl		
BSW Parameter		**BSW Type**	
FrTpMaxRn		ECUC-INTEGER-PARAM-DEF	
BSW Description			
This parameter defines the maximum number of retries (if retry is configured).			
Template Description			
This parameter defines the maximum number of retries (if retry is configured for the particular channel).			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpConnectionControl.maxRetries			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTp_00017]

BSW Module	BSW Context		
FrTp	FrTp/FrTpMultipleConfig/FrTpConnectionControl		
BSW Parameter		**BSW Type**	
FrTpSCexp		ECUC-INTEGER-PARAM-DEF	
BSW Description			
This parameter is part of the ISO 10681-2 protocol's FlowControl parameter "Bandwidth Control (BC)". It represents the exponent to calculate the minimum number of "Separation Cycles" the sender has to wait for the next transmission of an FrTp N-Pdu.			
Template Description			
Exponent to calculate the minimum number of "Separation Cycles" the sender has to wait for the next transmission of an FrTp N-Pdu.			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpConnectionControl.separationCycleExponent			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_FrTp_00020]

BSW Module	BSW Context		
FrTp	FrTp/FrTpMultipleConfig/FrTpConnectionControl		
BSW Parameter		**BSW Type**	
FrTpTimeBr		ECUC-FLOAT-PARAM-DEF	
BSW Description			
This parameter defines the time in seconds the FrTp requires to transmit a corresponding FlowControl Frame. According to ISO 10681-2 this parameter is a performance requirement.			
Template Description			
Time (in seconds) until transmission of the next FlowControl N-PDU.			
M2 Parameter			
SystemTemplate::TransportProtocols::FlexrayTpConnectionControl.timeBr			
Mapping Rule			**Mapping Type**
1:1 mapping			full

Mapping Status	ECUC Parameter ID
valid	[ECUC_FrTp_00047]

BSW Module	BSW Context
FrTp	FrTp/FrTpMultipleConfig/FrTpConnectionControl
BSW Parameter	**BSW Type**
FrTpTimeCs	ECUC-FLOAT-PARAM-DEF
BSW Description	
This parameter defines the time in seconds between the sending of two CFs or between the sending of a CF and LF or between the reception of a FC and sending of the next CF.	
Template Description	
Time (in seconds) until transmission of the next ConsecutiveFrame NPdu / LastFrame NPdu.	
M2 Parameter	
SystemTemplate::TransportProtocols::FlexrayTpConnectionControl.timeCs	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTp_00056]

BSW Module	BSW Context
FrTp	FrTp/FrTpMultipleConfig/FrTpConnectionControl
BSW Parameter	**BSW Type**
FrTpTimeoutAr	ECUC-FLOAT-PARAM-DEF
BSW Description	
This parameter states the timeout in seconds between the PDU transmit request of the Transport Layer to the FlexRay Interface and the corresponding confirmation of the FlexRay Interface on the receiver side (for FC or AF).	
Template Description	
This parameter states the timeout between the PDU transmit request of the Transport Layer to the FlexRay Interface and the corresponding confirmation of the FlexRay Interface on the receiver side (for FC or AF). Specified in seconds.	
M2 Parameter	
SystemTemplate::TransportProtocols::FlexrayTpConnectionControl.timeoutAr	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_FrTp_00032]

BSW Module	BSW Context
FrTp	FrTp/FrTpMultipleConfig/FrTpConnectionControl
BSW Parameter	**BSW Type**
FrTpTimeoutAs	ECUC-FLOAT-PARAM-DEF
BSW Description	
This parameter specifies the timeout in seconds the FrIf shall confirm a transmitted Pdu to the FrTp via the LSduR.	
Template Description	

▽

△

This attribute states the timeout between the PDU transmit request for the first PDU of the group used in the current connection of the Transport Layer to the FlexRay Interface and the corresponding confirmation of the FlexRay Interface (when having sent the last PDU of the group used in this connection) on the sender side (SF-x, FF-x, CF or FC (in case of Transmit Cancellation)). Specified in seconds.
M2 Parameter
SystemTemplate::TransportProtocols::FlexrayTpConnectionControl.timeoutAs

Mapping Rule	**Mapping Type**

C.34 IEEE1722Tp

BSW Module	BSW Context		
IEEE1722Tp	IEEE1722Tp/IEEE1722TpConfig/IEEE1722TpStream		
BSW Parameter		**BSW Type**	
IEEE1722TpStbMSynchronizedTimeBaseRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to the StbMSynchronizedTimeBase from which the current synchronized time could be retrieved (e.g. determine avtp timestamp for transmission).			
Template Description			
Reference to the GlobalTimeDomain this IEEE1722TpConnection shall be synchronized with.			
M2 Parameter			
SystemTemplate::TransportProtocols::IEEE1722Tp::IEEE1722TpConnection.globalTimeDomain			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_-IEEE1722Tp_00100]

BSW Module	BSW Context		
IEEE1722Tp	IEEE1722Tp/IEEE1722TpConfig/IEEE1722TpStream		
BSW Parameter		**BSW Type**	
IEEE1722TpStreamMaxTransitTime		ECUC-FLOAT-PARAM-DEF	
BSW Description			
Definition of the max transit time for the stream. Value in seconds.			
Template Description			
IEEE1722TpAcfConnection.acfMaxTransitTime: Defines the time offset that is added to the current time at the producer in order to get the "presentation time" (in seconds) when content shall be presented at the consumers. **IEEE1722TpAvConnection.maxTransitTime:** Defines the time offset that is added to the current time at the producer in order to get the "presentation time" (in seconds) when content shall be presented at the consumers.			
M2 Parameter			
SystemTemplate::TransportProtocols::IEEE1722Tp::IEEE1722TpAcfConnection.acfMaxTransitTime, SystemTemplate::TransportProtocols::IEEE1722Tp::IEEE1722TpAvConnection.maxTransitTime			
Mapping Rule			**Mapping Type**

C.35 ISO15118Chrg

BSW Module	BSW Context		
ISO15118Chrg	ISO15118Chrg/ISO15118ChrgV2GTP		
BSW Parameter		**BSW Type**	
ISO15118ChrgV2GTPPdu		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Contains the configuration parameters of the ISO15118 module's Pdus that are exchanged between ISO15118 and the PduR.			
Template Description			
Represents the IPdus handled by Com. The ISignalIPdu assembled and disassembled in AUTOSAR COM consists of one or more signals. In case no multiplexing is performed this IPdu is routed to/from the Interface Layer. A maximum of one dynamic length signal per IPdu is allowed.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalIPdu			
Mapping Rule			**Mapping Type**
create container for each SignalIPdu that is transmitted by the regarded ECU.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_-ISO15118Chrg_-00035]

C.36 IdsM

BSW Module	BSW Context		
IdsM	IdsM/IdsMConfiguration/IdsMPdus/IdsMIfTxPdu		
BSW Parameter		**BSW Type**	
IdsMIfTxPduRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to the IF PDU used for transmission of the QSEvs.			
Template Description			
This element is used for AUTOSAR Pdus without attributes that are routed by the PduR. Please note that the category name of such Pdus is standardized in the AUTOSAR System Template.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::GeneralPurposeIPdu			
Mapping Rule			**Mapping Type**
IdsMIfTxPduRef shall reference the only one existing (M2) GeneralPurposeIPdu of category "IDS" which is not mapped by (M2) IPduMapping and not referenced by any (M2) TP configuration element.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_IdsM_00042]

BSW Module	BSW Context		
IdsM	IdsM/IdsMConfiguration/IdsMPdus/IdsMTpTxPdu		
BSW Parameter		**BSW Type**	
IdsMTpTxPduRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to the TP PDU used for transmission of the QSEvs.			
Template Description			
This element is used for AUTOSAR Pdus without attributes that are routed by the PduR. Please note that the category name of such Pdus is standardized in the AUTOSAR System Template.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::GeneralPurposeIPdu			
Mapping Rule			**Mapping Type**
IdsMTpTxPduRef shall reference the only one existing (M2) GeneralPurposeIPdu of category "IDS" which is not mapped by (M2) IPduMapping but referenced by the (M2) TP configuration element corresponding to the bus on which the IdsM shall send the IDS messages.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_IdsM_00045]

C.37 IpduM

BSW Module	BSW Context	
IpduM	IpduM/IpduMConfig/IpduMContainedRxPdu	
BSW Parameter		**BSW Type**
IpduMContainedPduOffset		ECUC-INTEGER-PARAM-DEF

▽

△

BSW Description	
Static offset (in bytes) of the ContainedPdu.	
Template Description	
Byte offset that describes the location of the ContainedPdu in the ContainerPdu if no header is used.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::ContainedIPduProps.offset	
Mapping Rule	**Mapping Type**
If the ContainerIPdu directly references the PduTriggering in the role ContainerIPdu.containedPdu Triggering then this attribute is derived from IPdu.containedIPduProps. If the ContainerIPdu indirectly references the PduTriggering via ContainerIPdu.containedIPduTriggeringProps then this attribute is derived from that ContainerIPdu.containedIPduTriggeringProps.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_IpduM_00206]

BSW Module	BSW Context
IpduM	IpduM/IpduMConfig/IpduMContainedRxPdu
BSW Parameter	**BSW Type**
IpduMContainedRxInContainerPduRef	ECUC-REFERENCE-DEF
BSW Description	
Optional reference to an IpduMContainerRxPdu this IpduMContainedRxPdu may be received in. If this IpduMContainedRxPdu shall be received in exactly one IpduMContainerRxPdu with IpduMContainerRxAccept ContainedPdu=IPDUM_ACCEPT_CONFIGURED then the IpduMContainedRxInContainerPduRef shall be defined. If this IpduMContainedRxPdu can be received in any IpduMContainerRxPdu with IpduMContainerRxAcceptContained Pdu=IPDUM_ACCEPT_ALL then the IpduMContainedRxInContainerPduRef shall NOT be defined.	
Template Description	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::ContainerIPdu.containedPduTriggering	
Mapping Rule	**Mapping Type**
In the SysT the ContainerPdu references all PduTriggerings which can be put inside this Container. In the EcuC each Contained Pdu refers to the Containers it can be transported in. In case of IPDUM_ACCEPT_ALL reception strategy: a set of IpduMContainedRxPdu without an IpduMContainedRxInContainerPduRef is derived. An IpduMContainedRxPdu shall only be derived once in this set of IPDUM_ACCEPT_ALL reception Pdus. The identity of an IpduMContainedRx Pdu in the set of IPDUM_ACCEPT_ALL reception Pdus is defined by the IpduMContainedRxPdu ShortHeaderId and IpduMContainedRxPduLongHeaderId.	partial
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_IpduM_00173]

BSW Module	BSW Context
IpduM	IpduM/IpduMConfig/IpduMContainedRxPdu
BSW Parameter	**BSW Type**
IpduMContainedRxPduLongHeaderId	ECUC-INTEGER-PARAM-DEF
BSW Description	
LongHeader Id which is part of the ContainerPdu when this ContainedPdu is inside.	
Template Description	
Defines the header id this IPdu shall have in case this IPdu is put inside a ContainerIPdu with headerType = longHeader.	

▽

△

IpduMContainedRxPduShortHeaderId		ECUC-INTEGER-PARAM-DEF
BSW Description		
ShortHeader Id which is part of the ContainerPdu when this ContainedPdu is inside.		
Template Description		
Defines the header id this IPdu shall have in case this IPdu is put inside a ContainerIPdu with headerType = shortHeader.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ContainedIPduProps.headerIdShortHeader		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_IpduM_00202]

BSW Module	BSW Context	
IpduM	IpduM/IpduMConfig/IpduMContainedRxPdu	
BSW Parameter		**BSW Type**
IpduMPduUpdateBitPosition		ECUC-INTEGER-PARAM-DEF
BSW Description		
This value specifies where the PDU's Update-Bit is stored in the Container PDU (bit location of PDU's Update-Bit in the Container PDU).		
Template Description		
The updateIndicationBit specifies the bit location of ContainedIPdu Update-Bit in the Container PDU. It indicates to the receivers that the ContainedIPdu in the ContainerIPdu was updated.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::ContainedIPduProps.updateIndicationBitPosition		
Mapping Rule		**Mapping Type**
If the ContainerIPdu directly references the PduTriggering in the role ContainerIPdu.containedPduTriggering then this attribute is derived from IPdu.containedIPduProps. If the ContainerIPdu indirectly references the PduTriggering via ContainerIPdu.containedIPduTriggeringProps then this attribute is derived from that ContainerIPdu.containedIPduTriggeringProps.		full

Mapping Status	**ECUC Parameter ID**
valid	[ECUC_IpduM_00047]

BSW Module	BSW Context
IpduM	IpduM/IpduMConfig/IpduMRxPathway/IpduMRxIndication
BSW Parameter	**BSW Type**
IpduMByteOrder	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
This parameter defines the ByteOrder for all segments (static and dynamic part) and for the selectorField within the MultiplexedPdu. The absolute position of a segment in the MultiplexedIPdu is determined by the definition of the ByteOrder parameter: If BIG_ENDIAN is specified, the SegmentPosition indicates the bit position of the most significant bit in an IPDU. If LITTLE_ENDIAN is specified, the SegmentPosition indicates the bit position of the least significant bit in an IPDU.	
Template Description	
MultiplexedIPdu.selectorFieldByteOrder: This attribute defines the order of the bytes of the selectorField and the packing into the MultiplexedIPdu. Please consider that [constr_3247] and [constr_3223] are restricting the usage of this attribute. In a complete System Description this attribute is mandatory. If a MultiplexedPdu is received by a Pdu Gateway and is not delivered to the IPduM but routed directly to a bus interface then the content of the MulitplexedPdu doesn't need to be described in the System Extract/Ecu Extract. To support this use case the multiplicity is set to 0..1. **SegmentPosition.segmentByteOrder:** This attribute defines the order of the bytes of the segment and the packing into the MultiplexedIPdu. Please consider that [constr_3247] and [constr_3224] are restricting the usage of this attribute.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::MultiplexedIPdu.selectorFieldByteOrder, SystemTemplate::Fibex::FibexCore::CoreCommunication::SegmentPosition.segmentByteOrder

IpduM	IpduM/IpduMConfig/IpduMRxPathway/IpduMRxIndication
BSW Parameter	**BSW Type**
IpduMRxDynamicPart	ECUC-PARAM-CONF-CONTAINER-DEF

▽

△

BSW Description	
This container contains the configuration for the dynamic part of incoming RxIndication calls. When an incoming received I-PDU's selector field matches the IpduMRxSelectorValue, the new outgoing I-PDU for the dynamic part is constructed as defined by the segments (defined in the IpduMDynamicSegment container) and sent out with the I-PDU ID referenced by IpduMOutgoingDynamicPduRef. In case no dynamic part shall be extracted from this received I-PDU this container does not exist. This use-case can occur in case a MultiplexedIPdu is received by an ECU which is only interested in the static part of the MultiplexedIPdu.	
Template Description	
One of the Com IPdu alternatives that are transmitted in the Dynamic Part of the MultiplexedIPdu. The selectorFieldCode specifies which Com IPdu is contained in the DynamicPart within a certain transmission of a multiplexed PDU.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::DynamicPartAlternative	
Mapping Rule	**Mapping Type**
Create container for each DynamicPartAlternative of the MultiplexedIPdu.	full

BSW Module	BSW Context
IpduM	IpduM/IpduMConfig/IpduMRxPathway/IpduMRxIndication
BSW Parameter	**BSW Type**
IpduMRxDynamicSegment	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
The dynamic part of the multiplexed incoming I-Pdu (referenced by IpduMRxIndicationPduRef) can be separated into several segments. For each segment one IpduMRxDynamicSegment container shall be created that contains the location and the length of the segment. Please note that each configured segment will be copied into the destination I-Pdu that is referenced in the IpduMRxDynamic Part container and will be copied from the same location in the multiplexed incoming I-Pdu. The segment layout for all dynamic Parts is always identical.	
Template Description	

▽

△

The StaticPart and the DynamicPart can be separated in multiple segments within the multiplexed PDU. The ISignalIPdus are copied bit by bit into the MultiplexedIPdu. If the space of the first segment is 5 bits large than the first 5 bits of the ISignalIPdu are copied into this first segment and so on.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::SegmentPosition	
Mapping Rule	**Mapping Type**
Shall be derived from segmentPosition elements that are aggregated by the DynamicPart.	full

IpduM	IpduM/IpduMConfig/IpduMRxPathway/IpduMRxIndication/IpduMRxDynamicSegment
BSW Parameter	**BSW Type**
IpduMSegmentPosition	ECUC-INTEGER-PARAM-DEF
BSW Description	
Segments bit position in the multiplexed Pdu.	
Template Description	
Segments bit position relatively to the beginning of a multiplexed IPdu. Note that the absolute position of the segment in the MultiplexedIPdu is determined by the definition of the segmentByteOrder attribute of the SegmentPosition. If Big Endian is specified, the start position indicates the bit position of the most significant bit in the IPdu. If Little Endian is specified, the start position indicates the bit position of the least significant bit in the IPdu. In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7.

Segments bit position in the multiplexed Pdu.		
Template Description		
Segments bit position relatively to the beginning of a multiplexed IPdu. Note that the absolute position of the segment in the MultiplexedIPdu is determined by the definition of the segmentByteOrder attribute of the SegmentPosition. If Big Endian is specified, the start position indicates the bit position of the most significant bit in the IPdu. If Little Endian is specified, the start position indicates the bit position of the least significant bit in the IPdu. In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7.		
M2 Parameter

△

Contains the configuration parameters transmitted I-PDUs by the IpduM module.		
Template Description		
A MultiplexedPdu (i.e. NOT a COM I-PDU) contains a DynamicPart, an optional StaticPart and a selectorField. In case of multiplexing this IPdu is routed between the Pdu Multiplexer and the Interface Layer. A multiplexer is used to define variable parts within an IPdu that may carry different signals. The receivers of such a IPdu can determine which signalPdus are transmitted by evaluating the selector field, which carries a unique selector code for each sub-part.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::MultiplexedIPdu		
Mapping Rule		**Mapping Type**
Create container for each transmitted multiplexed Ipdu (IPduTriggering that references the MultiplexedIPdu contains a reference to an "Out" Pdu Port.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_IpduM_00070]

BSW Module	**BSW Context**		
IpduM	IpduM/IpduMConfig/IpduMTxPathway		
BSW Parameter		**BSW Type**	
IpduMTxRequest		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container is used to specify the configuration for Transmit requests. There will be one instance of this container for each I-PDU that can be requested for transmission (the outgoing I-PDUs) by the IpduM.			
Template Description			
A MultiplexedPdu (i.e. NOT a COM I-PDU) contains a DynamicPart, an optional StaticPart and a selectorField. In case of multiplexing this IPdu is routed between the Pdu Multiplexer and the Interface Layer. A multiplexer is used to define variable parts within an IPdu that may carry different signals. The receivers of such a IPdu can determine which signalPdus are transmitted by evaluating the selector field, which carries a unique selector code for each sub-part.

BSW Module	BSW Context		
J1939Nm	J1939Nm/J1939NmConfigSet		
BSW Parameter		**BSW Type**	
J1939NmChannel		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Physical CAN channel handled by J1939Nm.			
Template Description			
J1939 specific NmCluster attributes			
M2 Parameter			
SystemTemplate::NetworkManagement::J1939NmCluster			
Mapping Rule			**Mapping Type**
Create Container for each existing J1939NmCluster.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_J1939Nm_-00005]

BSW Module	BSW Context		
J1939Nm	J1939Nm/J1939NmConfigSet/J1939NmChannel		
BSW Parameter		**BSW Type**	
J1939NmChannelUsesAddressArbitration		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Defines whether the nodes attached to this channel use an initial address claim, and whether they react to contending address claims of other nodes. True: The initial address claim is sent, and the node reacts to address claims of other nodes. False: The node only sends an address claim upon request, and does not react to other address claims.			
Template Description			
Defines the Address Configuration Capability of the J1939NmNode (corresponding to an SAE J1939 Controller Application, CA).			
M2 Parameter			
SystemTemplate::NetworkManagement::J1939NmNode.addressConfigurationCapability			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_J1939Nm_-00035]

J1939Nm	J1939Nm/J1939NmConfigSet/J1939NmChannel	
BSW Parameter		**BSW Type**
J1939NmChannelUsesDynamicAddressing		ECUC-BOOLEAN-PARAM-DEF
BSW Description		

▽

△

Defines whether fully dynamic address resolution according to SAE J1939-81 shall be supported on this channel. • True: The dynamically allocated addresses on the bus are matched at runtime to the configured addresses (see J1939Nm Node.J1939NmNodePreferredAddress and J1939NmExternalNode.J1939NmExternalNodePreferredAddress). J1939Nm Nodes with J1939NmAddressConfigurationCapability set to J1939NM_AAC will change their addresses dynamically in case of an address conflict. • False: The addresses on the bus resemble the configured addresses. J1939NmAddressConfigurationCapability shall not be set to J1939NM_AAC.	
Template Description	
Defines whether fully dynamic address resolution according to SAE J1939-81 shall be supported on this J1939NmCluster. • True: The dynamically allocated addresses on the bus are matched at runtime to the configured addresses. • False: The addresses on the bus resemble the configured addresses.

C.41 J1939Tp

BSW Module	BSW Context	
J1939Tp	J1939Tp/J1939TpConfiguration	
BSW Parameter		**BSW Type**
J1939TpRxChannel		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container describes a reception channel of the J1939Tp module. A channel referencing N-PDUs without MetaData is used for all N-SDUs that share the same source address (SA) and the same destination address (BAM: DA = 0xFF, CMDT: DA != 0xFF). A channel with N-PDUs with MetaData is used for all possible source and destination addresses.		
Template Description		
A J1939TpConnection represents an internal path for the transmission or reception of a Pdu via J1939Tp and describes the sender and the receiver of this particular communication. The J1939Tp module routes a Pdu (J1939 PGN) through the connection.		
M2 Parameter		
SystemTemplate::TransportProtocols::J1939TpConnection		
Mapping Rule		**Mapping Type**
Create container for each existing J1939TpConnection that is used to receive a NSdu.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_J1939Tp_-00053]

BSW Module	BSW Context	
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpRxChannel	
BSW Parameter		**BSW Type**
J1939TpRxCancellationSupport		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Enable receive cancellation using the API J1939Tp_CancelReceive() for this channel.		
Template Description		
Enable support for Tx/Rx cancellation.		
M2 Parameter		
SystemTemplate::TransportProtocols::J1939TpConnection.cancellation		
Mapping Rule		**Mapping Type**
Please note that in the System Template the cancellation support is defined per J1939Tp Connection. All J1939TpConnections in an ECU shall have the same value.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_J1939Tp_-00186]

BSW Parameter		**BSW Type**	
J1939TpRxChannelComMNetworkHandleRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to the channel defined by the ComMChannel providing access to the unique channel index ComMChannelId.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::J1939TpNode.connector			
Mapping Rule			**Mapping Type**
Create this reference for each CommunicationConnector that is referenced by a J1939TpNode that is available in the EcuExtract. The CommunicationConnector is referenced by a PhysicalChannel that is aggregated by the CommunicationCluster that corresponds to the ComMChannel in the Ecuc.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_J1939Tp_-00194]

BSW Module	BSW Context		
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpRxChannel		
BSW Parameter		**BSW Type**	
J1939TpRxCmNPdu		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This N-PDU represents the TP.CM frame of a J1939 transport protocol session. TP.CM is used both by BAM and CMDT to initialize the connection. For CMDT, it is also used to abort the connection. This N-PDU consumes a meta data item of type CAN_ID_32.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::J1939TpConnection.flowControlPdu			
Mapping Rule			**Mapping Type**
Information can be derived from a received directNPdu that is referenced by the J1939Tp Connection.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_J1939Tp_-00128]

J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpRxChannel	
BSW Parameter		**BSW Type**
J1939TpRxDynamicBlockCalculation		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Enable dynamic calculation of "number of packets that can be sent" value in TP.CM_CTS, based on the size of buffers in upper layers reported via StartOfReception and PduR_J1939TpCopyRxData.		
Template Description		
Enable support for dynamic block size calculation.		
M2 Parameter		
SystemTemplate::TransportProtocols::J1939TpConnection.dynamicBs		
Mapping Rule		**Mapping Type**
Please note that in the System Template the dynamic block size calculation support is defined per J1939TpConnection. All J1939TpConnections in an ECU shall have the same value.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_J1939Tp_-00187]

BSW Module	BSW Context	
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpRxChannel	
BSW Parameter		**BSW Type**
J1939TpRxDynamicBufferRatio		ECUC-INTEGER-PARAM-DEF
BSW Description		
Percentage of available buffer that shall be used for retry. This parameter is only applicable when "J1939TpRxRetrySupport" and "J1939TpRxDynamicBlockCalculation" are enabled.		
Template Description		
Defines usage of available data for dynamic block size calculation when protocol retry is enabled. This attribute describes in percent of available buffer that shall be used for retry.		
M2 Parameter		
SystemTemplate::TransportProtocols::J1939TpConnection.bufferRatio		
Mapping Rule		**Mapping Type**
Please note that in the System Template this attribute is defined per J1939TpConnection. All J1939TpConnections in an ECU shall have the same value.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_J1939Tp_-00188]

BSW Module	BSW Context		
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpRxChannel		
BSW Parameter		**BSW Type**	
J1939TpRxPacketsPerBlock		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Number of TP.DT frames the receiving J1939Tp module allows the sender to send before waiting for another TP.CM_CTS. This parameter is transmitted in the TP.CM_CTS frame, and is thus only relevant for reception of messages via CMDT. When J1939TpRxDynamicBlockCalculation is enabled, this parameter specifies a maximum for the calculated value. For further details on this parameter value see SAE J1939/21.			
Template Description			
Set maximum block size (number of packets in TP.CM_CTS).			
M2 Parameter			
SystemTemplate::TransportProtocols::J1939TpConnection.maxBs			
Mapping Rule			**Mapping Type**
Please note that in the System Template the maximum block size is defined per J1939Tp Connection. All J1939TpConnections in an ECU shall have the same value.			full
Mapping Status			**ECUC Parameter ID**

J1939TpTxChannelComMNetworkHandleRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to the channel defined by the ComMChannel providing access to the unique channel index ComMChannelId.	
Template Description	
M2 Parameter	
SystemTemplate::TransportProtocols::J1939TpNode.connector	
Mapping Rule	**Mapping Type**
Create this reference for each CommunicationConnector that is referenced by a J1939TpNode that is available in the EcuExtract. The CommunicationConnector is referenced by a PhysicalChannel that is aggregated by the CommunicationCluster that corresponds to the ComMChannel in the Ecuc.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_J1939Tp_-00195]

BSW Module	**BSW Context**
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpTxChannel
BSW Parameter	**BSW Type**
J1939TpTxCmNPdu	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This N-PDU represents the TP.CM frame of a J1939 transport protocol session. TP.CM is used both by BAM and CMDT to initialize the connection. For CMDT, it is also used to abort the connection. This N-PDU produces a meta data item of type CAN_ID_32.	
Template Description	
M2 Parameter	
SystemTemplate::TransportProtocols::J1939TpConnection.flowControlPdu	
Mapping Rule	**Mapping Type**
Information can be derived from a transmitted FlowControlNPdu that is referenced by the J1939Tp Connection.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_J1939Tp_-00138]

BSW Module	**BSW Context**
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpTxChannel
BSW Parameter	**BSW Type**
J1939TpTxDa	ECUC-INTEGER-PARAM-DEF
BSW Description	
Destination address (DA) of this channel. This parameter is only required for channels with fixed DA which use N-PDUs with MetaData containing the DA.	
Template Description	
The TP message is sent with variable destination address (DA). Otherwise, the destination address configured as receiver.tpAddress is always used. Only derived for the transmitting ECU.	
M2 Parameter	
SystemTemplate::TransportProtocols::J1939TpConnection.useVariableDA, SystemTemplate::TransportProtocols::J1939TpNode.tpAddress	
Mapping Rule	**Mapping Type**
If J1939TpConnection.acceptVariableDA is not set to a value or set to false then the this parameter shall be derived from J1939TpConnection.receiver..tpAddress. If J1939TpConnection.useVariableDA is set to true then this parameter shall not be set to a value.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_J1939Tp_-00180]

BSW Module	**BSW Context**
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpTxChannel
BSW Parameter	**BSW Type**
J1939TpTxDtNPdu	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This N-PDU represents the TP.DT frame of a J1939 transport protocol session. TP.DT is used both by BAM and CMDT to transfer the contents of an N-SDU. This N-PDU produces a meta data item of type CAN_ID_32.	
Template Description	
M2 Parameter	
SystemTemplate::TransportProtocols::J1939TpConnection.dataPdu	
Mapping Rule	**Mapping Type**
Information can be derived from a transmitted NPdu that is referenced by the J1939TpConnection.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_J1939Tp_-00142]

BSW Module	**BSW Context**
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpTxChannel
BSW Parameter	**BSW Type**
J1939TpTxDynamicBlockCalculation	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
Enable dynamic calculation of "maximum number of packets that can be sent" value in TP.CM_RTS, based on the available amount of data in upper layers reported via PduR_J1939TpCopyTxData.	
Template Description	
Enable support for dynamic block size calculation.	

▽

△

M2 Parameter	
SystemTemplate::TransportProtocols::J1939TpConnection.dynamicBs	
Mapping Rule	**Mapping Type**
Please note that in the System Template the dynamic block size calculation support is defined per J1939TpConnection. All J1939TpConnections in an ECU shall have the same value.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_J1939Tp_-00191]

BSW Module	BSW Context	
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpTxChannel	
BSW Parameter	**BSW Type**	
J1939TpTxMaxPacketsPerBlock	ECUC-INTEGER-PARAM-DEF	
BSW Description		
Maximum number of TP.DT frames the transmitting J1939Tp module is ready to send before waiting for another TP.CM_CTS. This parameter is transmitted in the TP.CM_RTS frame, and is thus only relevant for transmission of messages via CMDT. When J1939TpTxDynamicBlockCalculation is enabled, this parameter specifies a maximum for the calculated value. For further details on this parameter value see SAE J1939/21.		
Template Description		
Set maximum for expected block size (maximum number of packets in TP.CM_RTS).		
M2 Parameter		
SystemTemplate::TransportProtocols::J1939TpConnection.maxExpBs		
Mapping Rule		**Mapping Type**
Please note that in the System Template the maximum for expected block size is defined per J1939TpConnection. All J1939TpConnections in an ECU shall have the same value.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_J1939Tp_-00190]

BSW Module	BSW Context	
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpTxChannel	
BSW Parameter	**BSW Type**	
J1939TpTxPg	ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description		
Parameter group transmitted by the J1939 transport layer.		
Template Description		
A J1939TpPg represents one J1939 message (parameter group, PG) identified by the PGN (parameter group number) that can be received or transmitted via J1939Tp.		
M2 Parameter		
SystemTemplate::TransportProtocols::J1939TpPg		
Mapping Rule		**Mapping Type**
Create container for each Tx J1939TpPg that is available in the Ecu Extract.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_J1939Tp_-00070]

BSW Module	BSW Context		
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpTxChannel/J1939TpTxPg		
BSW Parameter		**BSW Type**	
J1939TpTxDirectNPdu		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This N-PDU represents the short frame that is used for a dynamic length PGN when it has a length of less that 8 bytes. This N-PDU produces a meta data item of type CAN_ID_32. Please note: This sub container is only necessary when J1939TpTxPgDynLength is TRUE.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::J1939TpPg.directPdu			
Mapping Rule			**Mapping Type**
Information can be derived from a transmitted directlNPdu that is referenced by the J1939TpPg.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_J1939Tp_-00140]

BSW Module	BSW Context		
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpTxChannel/J1939TpTxPg		
BSW Parameter		**BSW Type**	
J1939TpTxNSdu		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container describes the parameters that are relevant for the transmission of a specific N-SDU. This N-SDU consumes meta data items of type SOURCE_ADDRESS_16, TARGET_ADDRESS_16, and PRIORITY_8.			
Template Description			
M2 Parameter			
SystemTemplate::TransportProtocols::J1939TpPg.sdu			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_J1939Tp_-00147]

BSW Module	BSW Context	
J1939Tp	J1939Tp/J1939TpConfiguration/J1939TpTxChannel/J1939TpTxPg	
BSW Parameter		**BSW Type**
J1939TpTxPgDynLength		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
This flag is set to TRUE when the N-SDU refers to a PGN with variable length. Please note: When this attribute is TRUE, the sub container J1939TpTxDirectNPdu is required.		
Template Description		
The length of dynamic length signals is variable in run-time. Only a maximum length of such a signal is specified in the configuration (attribute length in ISignal element).		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::SystemSignal.dynamicLength		

▽

△

Mapping Rule	Mapping Type
If a tpSdu that is referenced by the J1939TpPg contains a dynamicLengthSignal than set this parameter to true.	full
Mapping Status	**ECUC Parameter ID**

C.42 LdCom

BSW Module	BSW Context
LdCom	LdCom/LdComConfig
BSW Parameter	**BSW Type**
LdComIPdu	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Contains the configuration parameters of the LdCom's signal (IPdu) inside LdCom.	
Template Description	
Represents the IPdus handled by Com. The ISignalIPdu assembled and disassembled in AUTOSAR COM consists of one or more signals. In case no multiplexing is performed this IPdu is routed to/from the Interface Layer. A maximum of one dynamic length signal per IPdu is allowed.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalIPdu	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_LdCom_-00006]

BSW Module	BSW Context
LdCom	LdCom/LdComConfig/LdComIPdu
BSW Parameter	**BSW Type**
LdComApiType	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
Defines if this I-PDU is a normal I-PDU that shall be sent unfragmented or if this is a large I-PDU that shall be sent via the Transport Protocol of the underlying bus. This setting is used by RTE to invoke the proper API.	
Template Description	
Contains all configuration elements for AUTOSAR TP.	
M2 Parameter	
SystemTemplate::TransportProtocols::TpConfig	
Mapping Rule	**Mapping Type**
If this LdComIPdu is mapped in the System Description by a TpConnection to NPdus then set Ld ComApiType to TP. Otherwise set LdComApiType to IF.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_LdCom_-00002]

BSW Module	**BSW Context**		
LdCom	LdCom/LdComConfig/LdComIPdu		
BSW Parameter		**BSW Type**	
LdComIPduDirection		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
The direction defines if this IPdu, and therefore the contributing signal, shall be sent or received.			
Template Description			
Communication Direction of the Connector Port (input or output Port).			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreTopology::CommConnectorPort.`communicationDirection`			
Mapping Rule			**Mapping Type**
Find IPduTriggering of the regarded SignalIPdu. The IPduTriggering contains a reference to an IPduPort that is aggegated by the regarded ECU. If the communicationDirection of the Comm ConnectorPort is "in" than the IPdu is received.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_LdCom_-00007]

BSW Module	**BSW Context**		
LdCom	LdCom/LdComConfig/LdComIPdu		
BSW Parameter		**BSW Type**	
LdComSystemTemplateSignalRef		ECUC-FOREIGN-REFERENCE-DEF	
BSW Description			
Reference to the ISignalToIPduMapping that contains a reference to the ISignal (System Template).			
Template Description			
An ISignalToIPduMapping describes the mapping of ISignals to ISignalIPdus and defines the position of the ISignal within an ISignalIPdu.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::`ISignalToIPduMapping`			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_LdCom_-00011]

C.43 Lin

BSW Module	**BSW Context**	
Lin	Lin/LinGlobalConfig	
BSW Parameter		**BSW Type**
LinChannel		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the configuration (parameters) of the LIN Controller(s).		

▽

△

Template Description	
A physical channel is the transmission medium that is used to send and receive information between communicating ECUs. Each CommunicationCluster has at least one physical channel. Bus systems like CAN and LIN only have exactly one PhysicalChannel. A FlexRay cluster may have more than one PhysicalChannels that may be used in parallel for redundant communication. An ECU is part of a cluster if it contains at least one controller that is connected to at least one channel of the cluster.#	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreTopology::PhysicalChannel	
Mapping Rule	**Mapping Type**
A LinChannel container is constructed per CommunicationConnector belonging to the CommunicationController associated with the owning Lin Module container	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Lin_00069]

BSW Module	BSW Context	
Lin	Lin/LinGlobalConfig/LinChannel	
BSW Parameter	**BSW Type**	
LinChannelBaudRate	ECUC-INTEGER-PARAM-DEF	
BSW Description		
Specifies the baud rate of the LIN channel		
Template Description		
Channels speed in bits/s.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationCluster.baudrate		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Lin_00180]

BSW Module	BSW Context	
Lin	Lin/LinGlobalConfig/LinChannel	
BSW Parameter	**BSW Type**	
LinChannelWakeupSupport	ECUC-BOOLEAN-PARAM-DEF	
BSW Description		
Specifies if the LIN hardware channel supports wake up functionality		
Template Description		
Defines whether the ECU shall be woken up by this CommunicationController. TRUE: wake up is possible FALSE: wake up is not supported Note: If wakeUpByControllerSupported is set to TRUE the feature shall be supported by both hardware and basic software.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationController.wakeUpByControllerSupported		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Lin_00182]

BSW Module	BSW Context	
Lin	Lin/LinGlobalConfig/LinChannel	
BSW Parameter		**BSW Type**
LinNodeType		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
Specifies the LIN node type of this channel.		
Template Description		
LinMaster: Describing the properties of the refering ecu as a LIN master. **LinSlave:** Describing the properties of the referring ecu as a LIN slave.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinTopology::LinMaster, SystemTemplate::Fibex::Fibex4Lin::LinTopology::LinSlave		
Mapping Rule		**Mapping Type**
Set to MASTER if the CommunicationController is defined as a LinMaster. Set to SLAVE if the CommunicationController is defined as a LinSlave. In the System Template the LinMaster/LinSlave is connected to the LinChannel via a CommunicationConnector.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Lin_00191]

C.44 LinIf

BSW Module	BSW Context	
LinIf	LinIf	
BSW Parameter		**BSW Type**
LinIfGeneral		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the general parameters of LIN Interface module.		
Template Description		
LIN specific attributes		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinTopology::LinCluster		
Mapping Rule		**Mapping Type**
Container shall be created if the ECU is connected to a LIN Cluster.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00019]

BSW Module	BSW Context	
LinIf	LinIf	
BSW Parameter		**BSW Type**
LinIfGlobalConfig		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the global configuration parameters of the LinIf.		

▽

△

Template Description	
LIN specific attributes	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Lin::LinTopology::LinCluster	
Mapping Rule	**Mapping Type**
Container shall be created if the ECU is connected to a LIN Cluster.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_LinIf_00020]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig	
BSW Parameter		**BSW Type**
LinIfChannel		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Describes each LIN channel the LinIf is connected to.		
Template Description		
The connection between the referencing ECU and the referenced channel via the referenced controller. Connectors are used to describe the bus interfaces of the ECUs and to specify the sending/receiving behavior. Each CommunicationConnector has a reference to exactly one communicationController. Note: Several CommunicationConnectors can be assigned to one PhysicalChannel in the scope of one ECU Instance.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationConnector		
Mapping Rule		**Mapping Type**
Container shall be created if the CommunicationConnector belonging to the ECU is connected to a LinChannel.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00364]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel	
BSW Parameter		**BSW Type**
LinIfBusIdleTimeoutPeriod		ECUC-FLOAT-PARAM-DEF
BSW Description		
Bus idle timeout in seconds. According to the LIN protocol specification, the bus idle timeout period shall be in range [4, 10] seconds.		
Template Description		
This attribute shall be used to set an idle timeout period for the enclosing LinPhysicalChannel.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinTopology::LinPhysicalChannel.busIdleTimeoutPeriod		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00655]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel	
BSW Parameter		**BSW Type**
LinIfFrame		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Generic container for all types of LIN frames.		
Template Description		
LIN specific attributes to the FrameTriggering		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::LinFrameTriggering		
Mapping Rule		**Mapping Type**
Create container for each LinFrameTriggering aggregated by the PhysicalChannel representing the regarded LIN channel.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00367]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfFrame	
BSW Parameter		**BSW Type**
LinIfChecksumType		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
Type of checksum that the frame is using. This parameter is optional because in case of sporadic frames it should not be set.		
Template Description		
Type of checksum that the frame is using. This attribute is optional because in case of sporadic frames it should not be set.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::LinFrameTriggering.linChecksum		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00005]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfFrame/LinIfFixedFrameSdu	
BSW Parameter		**BSW Type**
LinIfFixedFrameSduByte		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container represents a byte within the 8 byte array.		
Template Description		

▽

△

LinSlaveConfig: Node attributes of LIN slaves that are handled by the LinMaster. In the System Description LIN slaves may be described in the context of the Lin Master. In an ECU Extract of the LinMaster the LinSlave Ecus shall not be available. The information that is described here is necessary in the ECU Extract for the configuration of the LinMaster. The values of attributes of LinSlaveConfig and the corresponding LinSlave shall be identical (if both are defined in a System Description). **LinSlave:** Describing the properties of the referring ecu as a LIN slave.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Lin::LinTopology::`LinSlaveConfig`, SystemTemplate::Fibex::Fibex4Lin::LinTopology::`LinSlave`	
Mapping Rule	**Mapping Type**
For LinConfigurationEntry elements the byte array depends on the LinIfFrameType in the LinIf Entry. The parameters ConfiguredNad, SupplierId, and Function can be derived from the LinSlave Config that is referenced from the LinConfigurationEntry in the assignedLinSlaveConfig role or from the LinSlave referenced via assignedController. AssignFrameId/UnassignFrameId : Byte Array: ConfiguredNad, 0x06, 0xb1, LSB of SupplierId, MSB of SupplierId, LSB of MessageId, MSB of MessageId, protected identifier of LinFrame Triggering. The LinFrameTriggering is referenced by AssignFrameId/UnassignFrameId directly in the role assignedFrameTrriggering/unassignedFrameTriggering. The MessageId shall be derived in the following way: in case that the AssignFrameId/UnassignFrameId refers to a LinSlave in the role assigned Controller the messageId of the AssignFrameId/UnassignFrameId is located in the LinConfigurable Frame that references the same LinFrame as the LinFrameTriggering that is referenced by the AssignFrameId/UnassignFrameId and that is aggregated by the LinCommunicationConnector in role linConfigurableFrame that points to this LinSlave in the role commController. in case that the AssignFrameId/UnassignFrameId refers to a LinSlaveConfigIdent in the role assignedLinSlaveConfig the messageId is located in the LinConfigurableFrame that references the same LinFrame as the LinFrameTriggering that is referenced by the AssignFrameId/Unassign FrameId and that is aggregated by the referenced LinSlaveConfig. AssignFrameIdRange: Byte Array for Request: ConfiguredNad, 0x06, 0xB7, start index PID (index), PID (index+1), PID (index+2), PID (index+3), The four PID values shall be derived from AssignFrameIdRange.framePid element. The Frame Pid.index describes the Position of the pid value in the AssignFrameIdRange command. AssignNad: Byte Array for Request: initialNad, 0x06, 0xB0, Supplier ID LSB, Supplier ID MSB, Function ID LSB, Function ID MSB, newNad Byte Array for Response: initialNad, 0x01, 0xF0, 0x FF, 0xFF, 0xFF, 0xFF, 0xFF The intialNad shall be derived either: from the LinCommunicationConnector that references the LinSlave that in turn is referenced by the AssignNad in the role assignedController. from the LinSlaveConfig that is referenced by the Assign Nad LinConfigurationEntry in the role assignedLinSlaveConfig The newNad shall be derived from the AssignedNad LinConfigurationEntry element itself. ConditionalChangeNad: Byte Array for Request: ConfiguredNad, 0x06, 0xb3, Id, Byte, Mask, Invert, newNad The id, byte, mask, invert, newNad shall be derived from the ConditionalChangeNad Lin ConfigurationEntry element itself. DataDumpEntry: Byte Array for Request: ConfiguredNad, 0x06, 0xB4, Byte Value, Byte Value, Byte Value, Byte Value, Byte Value Byte Array for Response: ConfiguredNad, 0x06, 0xF4, Byte Value, Byte Value, Byte Value, Byte Value, Byte Value SaveConfigurationEntry: Byte Array for Request: ConfiguredNad, 0x01, 0xb6, 0xff, 0xff, 0xff, 0xff, 0xff Byte Array for Response: ConfiguredNad, 0x01, 0xF6, 0xff, 0xff, 0xff, 0xff, 0xff	full

LinIfFrameIndex		ECUC-INTEGER-PARAM-DEF
BSW Description		
PID index of the frame. This index is used in the AssignFrameIdentifierRange node configuration service to identify the frame(s) to which a new PID shall be assigned. It corresponds to the order of the frames in the configurable frames list in the node attributes section of the LDF / NCF of the slave node. Only relevant for LIN slave nodes.		
Template Description		
This attribute is used to order the elements and allows an assignment of Pids to ConfigurableFrames that are defined in the slave.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinTopology::LinOrderedConfigurableFrame.index		
Mapping Rule		**Mapping Type**
LinIfFrameIndex shall be derived from the list of LinOrderedConfigurableFrame elements that are ordered according to the index attribute. The LinIfFrameIndex = 0 shall be derived from the first element in the list. The LinIfFrameIndex = 1 shall be derived from the second element in the list and so on. Please note that the index settings in the System Description may contain gaps. In other words, if for example the System Description defines LinCommunicationConnector.linOrderedConfigurable Frame with index = 2 and a second linOrderedConfigurableFrame with index = 4 then the LinIf FrameIndex in the Ecuc needs to be set to 0 for the first Frame and to 1 for the second Frame.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00653]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfFrame	
BSW Parameter		**BSW Type**
LinIfFrameType		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
This parameter defines the type of frame (e.g. sporadic frame). For master nodes, all frame types are permitted. A sporadic slot may be used by a set of unconditional frames in the role of substitution frames. For slave nodes, only following types are permitted: Uncondtional, MRF, SRF, Event-triggered. An event-triggered slot may be used by a set of unconditional frames in the role of substitution frames.		
Template Description		
FrameTriggering: The FrameTriggering describes the instance of a frame sent on a channel and defines the manner of triggering (timing information) and identification of a frame on the channel, on which it is sent. For the same frame, if FrameTriggerings exist on more than one channel of the same cluster the fan-out/in is handled by the Bus interface. **LinUnconditionalFrame:** Unconditional frames carry signals. The master sends a frame header in a scheduled frame slot and the designated slave node fills the frame with data. **LinEventTriggeredFrame:** An event triggered frame is used as a placeholder to allow multiple slave nodes to provide its response. The header of an event triggered frame is transmitted when a frame slot allocated to the event triggered frame is processed. The publisher of an associated unconditional frame shall only transmit the response if at least one of the signals carried in its unconditional frame is updated. The LIN Master discovers and purges collisions with the collisionResolvingScheduleTable. The event controlled frame shall not contain any Pdus. **LinSporadicFrame:** A sporadic frame is a group of unconditional frames that share the same frame slot. The sporadic frame shall not contain any Pdus. **AssignFrameId:** Schedule entry for an Assign Frame Id master request. **UnassignFrameId:** Schedule entry for an Unassign Frame Id master request where the protected identifier is assigned the value 0x40. This will disable reception/transmission of a previously dynamically assigned frame identifier. **AssignNad:** Schedule entry for an Assign NAD master request. **FreeFormat:** Representing freely defined data. **ConditionalChangeNad:** Generates an conditional change NAD request. See ISO 17987 protocol specification for more information. **SaveConfigurationEntry:** This service is used to notify a slave node to store its configuration. **AssignFrameIdRange:** AssignFrameIdRange generates an assign frame PID range request.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::FrameTriggering, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::LinUnconditionalFrame, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::LinEventTriggeredFrame, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::LinSporadicFrame, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::AssignFrameId, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::UnassignFrameId, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::AssignNad, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::FreeFormat, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::ConditionalChangeNad, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::SaveConfigurationEntry, SystemTemplate::Fibex::Fibex4Lin::LinCommunication::AssignFrameIdRange

BSW Module	**BSW Context**	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel	
BSW Parameter		**BSW Type**
LinIfScheduleTable		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Describes a schedule table. Each LinIfChannel may have several schedule tables. Each schedule table can only be connected to one channel. Mandatory for LIN Master nodes. The SHORT-NAME of the LinIfScheduleTable container represents the symbolic name of the schedule table.		
Template Description		
The master task (in the master node) transmits frame headers based on a schedule table. The schedule table specifies the identifiers for each header and the interval between the start of a frame and the start of the following frame.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::LinScheduleTable		
Mapping Rule		**Mapping Type**
Create container for each ScheduleTable that is defined for this channel.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00365]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfScheduleTable	
BSW Parameter		**BSW Type**
LinIfEntry		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Describes an entry in the schedule table (also known as Frame Slot).		
Template Description		
Table entry in a LinScheduleTable. Specifies what will be done in the frame slot.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::ScheduleTableEntry		
Mapping Rule		**Mapping Type**
Each RelativelyScheduledTiming element in the System Description requires the creation of a LinIf Entry. RelativelyScheduledTiming.scheduleTablle decides to which schedule table the LinIfEntry belongs.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00366]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfScheduleTable/LinIfEntry	
BSW Parameter		**BSW Type**
LinIfCollisionResolvingRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to the schedule table, which resolves the collision. This parameter is only used if the referenced frames are event triggered frames.		
Template Description		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::LinEventTriggeredFrame.collisionResolvingSchedule		
Mapping Rule		**Mapping Type**
Emulate the reference from the System Description.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00007]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfScheduleTable/LinIfEntry	
BSW Parameter		**BSW Type**
LinIfDelay		ECUC-FLOAT-PARAM-DEF
BSW Description		
Delay to next entry in schedule table in seconds.		
Template Description		
Relative delay between this tableEntry and the start of the successor in the schedule table in seconds.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::ScheduleTableEntry.delay		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00009]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfScheduleTable/LinIfEntry	
BSW Parameter		**BSW Type**
LinIfEntryIndex		ECUC-INTEGER-PARAM-DEF
BSW Description		
Position of the Frame Entry in the Schedule Table. The first entry index in the schedule table is 0.		
Template Description		
Relative position in the schedule table. The first entry index in the schedule table is 0.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::ScheduleTableEntry.positionInTable		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00011]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfScheduleTable/LinIfEntry	
BSW Parameter		**BSW Type**
LinIfFrameRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to the frames that belong to this schedule table entry.		
Template Description		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::ApplicationEntry.frameTriggering		
Mapping Rule		**Mapping Type**
Emulate reference from the System Description		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00016]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfScheduleTable	
BSW Parameter		**BSW Type**
LinIfResumePosition		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
Defines where a RUN_CONTINUOUS schedule table shall proceed in case it has been interrupted by a RUN_ONCE table.		
Template Description		
Defines, where a schedule table shall be proceeded in case if it has been interrupted by a run-once table or MRF/SRF.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::LinScheduleTable.resumePosition		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00033]

BSW Module	BSW Context	
LinIf	LinIf/LinIfGlobalConfig/LinIfChannel/LinIfScheduleTable	
BSW Parameter		**BSW Type**
LinIfRunMode		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
The schedule table can be executed in two different modes.		
Template Description		
The schedule table can be executed in two different modes.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinCommunication::LinScheduleTable.runMode		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinIf_00034]

C.45 LinTp

BSW Module	BSW Context	
LinTp	LinTp	
BSW Parameter		**BSW Type**
LinTpGlobalConfig		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the global configuration parameters of the LinTp.		
Template Description		
TP Node (Sender or Receiver) provides the TP Address and the connection to the Topology description.		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpNode		
Mapping Rule		**Mapping Type**
Create container if the regarded ECU is a LinTpNode.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00056]

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig	
BSW Parameter		**BSW Type**
LinTpChannelConfig		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the channel specific configuration parameters of LinTp.		
Template Description		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpNode.connector		
Mapping Rule		**Mapping Type**

▽

△

Create this container for each CommunicationConnector that is referenced by a LinTpNode that is available in the EcuExtract. The CommunicationConnector is referenced by a PhysicalChannel that is aggregated by the CommunicationCluster that corresponds to the ComMChannel in the Ecuc that is referenced by the LinTpChannelRef in the LinTpChannelConfig.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_LinTp_00071]

BSW Module	**BSW Context**	
LinTp	LinTp/LinTpGlobalConfig/LinTpChannelConfig	
BSW Parameter		**BSW Type**
LinTpDropNotRequestedNad		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Configures if TP Frames of not requested LIN-Slaves are dropped or not. TRUE: Drop TP Frames of not requested LIN-Slaves FALSE: Keep TP Frames of not requested LIN-Slaves Only used for LIN Master nodes, ignored for slave nodes.		
Template Description		
Configures if TP Frames of not requested LIN-Slaves are dropped or not.		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpNode.dropNotRequestedNad		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00072]

BSW Module	**BSW Context**	
LinTp	LinTp/LinTpGlobalConfig/LinTpChannelConfig	
BSW Parameter		**BSW Type**
LinTpMaxNumberOfRespPendingFrames		ECUC-INTEGER-PARAM-DEF
BSW Description		
Configures the maximum number of allowed response pending frames. Only used for LIN Master nodes, ignored for slave nodes.		
Template Description		
Configures the maximum number of allowed response pending frames.		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpNode.maxNumberOfRespPendingFrames		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00624]

BSW Module	**BSW Context**	
LinTp	LinTp/LinTpGlobalConfig/LinTpChannelConfig	
BSW Parameter		**BSW Type**
LinTpP2Max		ECUC-FLOAT-PARAM-DEF

▽

△

BSW Description	
P2*max timeout when a response pending frame is expected in seconds. Note that the minimum value of LinTpP2Max shall be more than or equal to the value of LinTpP2Timing. Only used for LIN Master nodes, ignored for slave nodes.	
Template Description	
After reception of a response pending frame the P2 timeout counter is reloaded with the timeout time P2max.	
M2 Parameter	
SystemTemplate::TransportProtocols::LinTpNode.p2Max	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_LinTp_00622]

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig/LinTpChannelConfig	
BSW Parameter		**BSW Type**
LinTpP2Timing		ECUC-FLOAT-PARAM-DEF
BSW Description		
Definition of the P2max timeout observation parameter in seconds. Only used for LIN Master nodes, ignored for slave nodes.		
Template Description		
P2 timeout observation parameter.		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpNode.p2Timing		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00625]

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig	
BSW Parameter		**BSW Type**
LinTpDemEventParameterRefs		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Container for the references to DemEventParameter elements which shall be invoked using the API Dem_SetEventStatus in case the corresponding error occurs. The Event Id is taken from the referenced DemEventParameter's DemEventId symbolic value. The standardized errors are provided in this container and can be extended by vendor-specific error references.		
Template Description		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpNode.connector		
Mapping Rule		**Mapping Type**
Create this container for each CommunicationConnector that is referenced by a LinTpNode that is available in the EcuExtract. The CommunicationConnector is referenced by a PhysicalChannel that is aggregated by the CommunicationCluster that corresponds to the ComMChannel in the Ecuc that is referenced by the LinTpChannelRef in the LinTpChannelConfig.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00639]

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig	
BSW Parameter		**BSW Type**
LinTpRxNSdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container exists once for each received N-SDU on any channel the node is connected to. This N-SDU produces meta data items of type LIN_NAD_8.		
Template Description		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpConnection.linTpNSdu		
Mapping Rule		**Mapping Type**
Create container for each NSdu that is received by the regarded ECU.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00428]

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig/LinTpRxNSdu	
BSW Parameter		**BSW Type**
LinTpNcr		ECUC-FLOAT-PARAM-DEF
BSW Description		
Value in seconds of the N_Cr timeout. N_Cr is the time until reception of the next Consecutive Frame N_PDU.		
Template Description		
This attribute defines the timeout value for waiting for a CF or FF-x (in case of retry) after receiving the last CF or after sending an FC or AF on the receiver side. Specified in seconds.		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpConnection.timeoutCr		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00632]

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig/LinTpRxNSdu	
BSW Parameter		**BSW Type**
LinTpRxNSduNad		ECUC-INTEGER-PARAM-DEF
BSW Description		
A N-SDU transported on LIN is identified using the NAD for the specific slave.		
Template Description		
To distinguish LIN slaves that are used twice or more within the same cluster.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinTopology::LinSlave.configuredNad		
Mapping Rule		**Mapping Type**
Find connection from NSdu to CommunicationController		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00062]

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig	
BSW Parameter		**BSW Type**
LinTpTxNSdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container exists once for each transmitted N-SDU on any channel the node is connected to. This N-SDU consumes meta data items of type LIN_NAD_8.		
Template Description		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpConnection.linTpNSdu		
Mapping Rule		**Mapping Type**
Create container for each NSdu that is received by the regarded ECU.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00511]

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig/LinTpTxNSdu	
BSW Parameter		**BSW Type**
LinTpNas		ECUC-FLOAT-PARAM-DEF
BSW Description		
Value in seconds of the N_As timeout. N_As is the time for transmission of a LIN frame (any N_PDU) on the part of the sender.		
Template Description		
Time for transmission of the LIN frame (any N-PDU) on the sender side. Specified in seconds.		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpConnection.timeoutAs		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00633]

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig/LinTpTxNSdu	
BSW Parameter		**BSW Type**
LinTpNcs		ECUC-FLOAT-PARAM-DEF
BSW Description		
Value in seconds of the performance requirement of N_Cs. N_Cs is the time which elapses between the transmit request of a CF N-PDU until the transmit request of the next CF N-PDU.		
Template Description		
The attribute timeoutCs represents the time (in seconds) which elapses between the transmit request of a CF N-PDU until the transmit request of the next CF N-PDU.		
M2 Parameter		
SystemTemplate::TransportProtocols::LinTpConnection.timeoutCs		
Mapping Rule		**Mapping Type**
1:1 mapping		full

BSW Module	BSW Context	
LinTp	LinTp/LinTpGlobalConfig/LinTpTxNSdu	
BSW Parameter		**BSW Type**
LinTpTxNSduNad		ECUC-INTEGER-PARAM-DEF
BSW Description		
A N-SDU transported on LIN is identified using the NAD for the specific slave.		
Template Description		
To distinguish LIN slaves that are used twice or more within the same cluster.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Lin::LinTopology::LinSlave.configuredNad		
Mapping Rule		**Mapping Type**
Find connection from NSdu to CommunicationController		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTp_00066]

C.46 LinTrcv

BSW Module	BSW Context	
LinTrcv	LinTrcv/LinTrcvChannel	
BSW Parameter		**BSW Type**
LinTrcvWakeupByBusUsed		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Is wake up by bus supported? If LIN transceiver hardware does not support wake up by bus value is always FALSE. If LIN transceiver hardware supports wake up by bus value is TRUE or FALSE depending whether it is used or not. TRUE = Is used. FALSE = Is not used.		
Template Description		
Defines whether the ECU shall be woken up by this CommunicationController. TRUE: wake up is possible FALSE: wake up is not supported Note: If wakeUpByControllerSupported is set to TRUE the feature shall be supported by both hardware and basic software.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationController.wakeUpByControllerSupported		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_LinTrcv_00006]

BSW Module	BSW Context		
LinTrcv	LinTrcv/LinTrcvGeneral		
BSW Parameter		**BSW Type**	
LinTrcvWakeUpSupport		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Informs whether wake up is supported or not. In case wake up is not supported by LIN transceiver hardware the setting shall be false. The wake up ability may be switched on or off for each channel of one LIN transceiver by LinTrcvWakeupSourceRef. True: Is used False: Is not used			
Template Description			
Defines whether the ECU shall be woken up by this CommunicationController. TRUE: wake up is possible FALSE: wake up is not supported Note: If wakeUpByControllerSupported is set to TRUE the feature shall be supported by both hardware and basic software.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationController.wakeUpByControllerSupported			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_LinTrcv_-00107]

C.47 Mirror

BSW Module	BSW Context		
Mirror	Mirror/MirrorConfigSet		
BSW Parameter		**BSW Type**	
MirrorDestNetwork		ECUC-CHOICE-CONTAINER-DEF	
BSW Description			
Destination bus to which frames are sent by the Bus Mirroring module.			
Template Description			
This element defines a bus mirroring in which the traffic from one communication bus (sourceChannel) is forwarded to another one (targetChannel).			
M2 Parameter			
SystemTemplate::BusMirror::BusMirrorChannelMapping			
Mapping Rule			**Mapping Type**
Create a container for each BusMirrorChannel that is composed by an instance of a concrete subclass of BusMirrorChannelMapping in role targetChannel which is available in the System Extract.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mirror_00051]

BSW Module	BSW Context		
Mirror	Mirror/MirrorConfigSet/MirrorDestNetwork		
BSW Parameter		**BSW Type**	
MirrorDestNetworkCan		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Destination bus representing a CAN network.			
Template Description			
This element defines the bus mirroring between a CAN or LIN sourceChannel and a CAN targetChannel.			
M2 Parameter			
SystemTemplate::BusMirror::`BusMirrorChannelMappingCan`			
Mapping Rule			**Mapping Type**
Create a container for each BusMirrorChannel that is composed by an instance of a BusMirroChannelMappingCan in the role targetChannel which is available in the SystemExtract.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mirror_00052]

BSW Module	BSW Context		
Mirror	Mirror/MirrorConfigSet/MirrorDestNetwork/MirrorDestNetworkCan		
BSW Parameter		**BSW Type**	
MirrorComMNetworkHandleRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to the ComMChannel that represents the bus.			
Template Description			
Reference to PhysicalChannel that is used in the bus mirroring as sourceChannel or targetChannel.			
M2 Parameter			
SystemTemplate::BusMirror::BusMirrorChannel.`channel`			
Mapping Rule			**Mapping Type**
This reference shall be derived from the: - CanCluster that aggregates the AbstractCanPhysicalChannel that is referenced by the BusMirrorChannel in case that this reference is used in the MirrorDestNetworkCan container - FlexrayCluster that aggregates the PhysicalChannel that is referenced by the BusMirrorChannel in case that this reference is used in the MirrorDestNetworkFlexray container - EthernetPhysicalChannel that is referenced by the BusMirrorChannel in case that this reference is used in the MirrorDestNetworkIp container - UserDefinedCluster that aggregates the PhysicalChannel that is referenced by the BusMirrorChannel in case that this reference is used in the MirrorDestNetworkCdd container			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mirror_00064]

BSW Module	BSW Context	
Mirror	Mirror/MirrorConfigSet/MirrorDestNetwork/MirrorDestNetworkCan	
BSW Parameter		**BSW Type**
MirrorDestPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
I-PDU used for transmission of the mirrored frames on the destination bus.		
Template Description		

▽

△

Reference to the PduTriggering that is used for transmission of the mirrored frames on the targetChannel. Please note that on FlexRay several targetPduTriggerings may be used. For all other communication channels only a single targetPdu Triggering is supported.		
M2 Parameter		
SystemTemplate::BusMirror::BusMirrorChannelMapping.targetPduTriggering		
Mapping Rule		**Mapping Type**
Create container for the Pdu that is referenced by the PduTriggering that is referenced by the instance of the BusMirrorChannelMapping in the targetPduTriggering role.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Mirror_00055]

BSW Module	**BSW Context**		
Mirror	Mirror/MirrorConfigSet/MirrorDestNetwork/MirrorDestNetworkCan		
BSW Parameter		**BSW Type**	
MirrorNetworkId		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Network ID of the bus.			
Template Description			
This attribute defines the networkId of the communication channel.			
M2 Parameter			
SystemTemplate::BusMirror::BusMirrorChannel.busMirrorNetworkId			
Mapping Rule			**Mapping Type**
If this parameter is aggregated by MirrorDestNetworkCan container take the value from the Bus MirrorChannel that is aggregated in the role targetChannel by the instance of BusMirrorChannel MappingCan. If this parameter is aggregated by MirrorDestNetworkFlexray container take the value from the Bus MirrorChannel that is aggregated in the role targetChannel by the instance of BusMirrorChannel MappingFlexray. If this parameter is aggregated by MirrorDestNetworkIp container take the value from the BusMirror Channel that is aggregated in the role targetChannel by the instance of BusMirrorChannelMapping Ip. If this parameter is aggregated by MirrorDestNetworkCdd container take the value from the Bus MirrorChannel that is aggregated in the role targetChannel by the instance of BusMirrorChannel MappingUserDefined. If this parameter is aggregated by MirrorSourceNetworkCan container take the value from the Bus MirrorChannel that is aggregated in the role sourceChannel by the instance of BusMirrorChannel Mapping. If this parameter is aggregated by MirrorSourceNetworkFlexray container take the value from the BusMirrorChannel that is aggregated in the role sourceChannel by the instance of BusMirror ChannelMapping. If this parameter is aggregated by MirrorSourceNetworkLin container take the value from the Bus MirrorChannel that is aggregated in the role sourcetChannel by the instance of BusMirrorChannel Mapping.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mirror_00012]

Mirror	Mirror/MirrorConfigSet/MirrorDestNetwork/MirrorDestNetworkCanFD
BSW Parameter	**BSW Type**
MirrorComMNetworkHandleRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to the ComMChannel that represents the bus.	
Template Description	
Reference to PhysicalChannel that is used in the bus mirroring as sourceChannel or targetChannel.	
M2 Parameter	
SystemTemplate::BusMirror::BusMirrorChannel.channel	
Mapping Rule	**Mapping Type**
This reference shall be derived from the: - CanCluster that aggregates the AbstractCanPhysical Channel that is referenced by the BusMirrorChannel in case that this reference is used in the MirrorDestNetworkCan container - FlexrayCluster that aggregates the PhysicalChannel that is referenced by the BusMirrorChannel in case that this reference is used in the MirrorDestNetwork Flexray container - EthernetPhysicalChannel that is referenced by the BusMirrorChannel in case that this reference is used in the MirrorDestNetworkIp container - UserDefinedCluster that aggregates the PhysicalChannel that is referenced by the BusMirrorChannel in case that this reference is used in the MirrorDestNetworkCdd container	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Mirror_00064]

BSW Module	**BSW Context**
Mirror	Mirror/MirrorConfigSet/MirrorDestNetwork/MirrorDestNetworkCanFD
BSW Parameter	**BSW Type**
MirrorDestPdu	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
I-PDU used for transmission of the mirrored frames on the destination bus.	
Template Description	
Reference to the PduTriggering that is used for transmission of the mirrored frames on the targetChannel. Please note that on FlexRay several targetPduTriggerings may be used. For all other communication channels only a single targetPdu Triggering is supported.	
M2 Parameter	

▽

△

SystemTemplate::BusMirror::BusMirrorChannelMapping.targetPduTriggering	
Mapping Rule	**Mapping Type**
Create container for the Pdu that is referenced by the PduTriggering that is referenced by the instance of the BusMirrorChannelMapping in the targetPduTriggering role.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Mirror_00055]

BSW Module	**BSW Context**
Mirror	Mirror/MirrorConfigSet/MirrorDestNetwork/MirrorDestNetworkCanFD
BSW Parameter	**BSW Type**
MirrorDestTransmissionDeadline	ECUC-FLOAT-PARAM-DEF
BSW Description	
Time in seconds after which the collection of source frames into the destination frame stopped and the frame is sent at the latest. If omitted, destination frames are only sent when full or when the time stamp overflows after 655.35ms.	
Template Description	
BusMirrorChannelMappingFlexray.transmissionDeadline: Time in seconds after which the collection of source frames into the destination frame is stopped and the frame is sent at the latest. If omitted, destination frames are only sent when full or when the time stamp overflows. **BusMirrorChannelMappingIp.transmissionDeadline:** Time in seconds after which the collection of source frames into the destination frame is stopped and the frame is sent at the latest. If omitted, destination frames are only sent when full or when the time stamp overflows. **BusMirrorChannelMappingUserDefined.transmissionDeadline:** Time in seconds after which the collection of source frames into the destination frame is stopped and the frame is sent at the latest. If omitted, destination frames are only sent when full or when the time stamp overflows.	
M2 Parameter	
SystemTemplate::BusMirror::BusMirrorChannelMappingFlexray.transmissionDeadline, SystemTemplate::BusMirror::BusMirrorChannelMappingIp.transmissionDeadline, SystemTemplate::BusMirror::BusMirrorChannelMappingUserDefined.transmissionDeadline	
Mapping Rule	**Mapping Type**
Please note that this parameter is aggregated in different containers: - if aggregated by MirrorDestNetworkFlexRay take value from BusMirrorChannelMappingFlexray.transmissionDeadline - if aggregated by MirrorDestNetworkIp take value from BusMirrorChannelMappingIp.transmissionDeadline - if aggregated by MirrorDestNetworkCdd take value from BusMirrorChannelMappingUserDefined.transmissionDeadline	full

Mka	Mka/MkaCryptoAlgoConfig/MkaCipherSuites	
BSW Parameter		**BSW Type**
MkaMacSecCipherSuitePrio		ECUC-INTEGER-PARAM-DEF

▽

△

BSW Description	
In case the MKA instance acts as a Key Server, the priority is used to select the Cipher Suite to use with MACsec from the common supported Ciphers (with the client in the link). Value of 1 means the highest priority. Value of 4 means the lowest priority.	
Template Description	
In case the MKA instance acts as a Key Server, the priority is used to select the Cipher Suite to use with MACsec from the supported Ciphers.	
M2 Parameter	
SystemTemplate::SecureCommunication::MacSecCipherSuiteConfig.cipherSuitePriority	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Mka_00051]

BSW Module	BSW Context	
Mka	Mka/MkaCryptoAlgoConfig	
BSW Parameter		**BSW Type**
MkaMacSecCapability		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
MACsec capability to use for MACsec.		
Template Description		
This attribute defines the MACsec capability.		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecCryptoAlgoConfig.capability		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Mka_00025]

BSW Module	BSW Context	
Mka	Mka/MkaCryptoAlgoConfig/MkaMacSecCapability	
BSW Parameter		**BSW Type**
INTEGRITY_AND_CONFIDENTIALITY		ECUC-ENUMERATION-LITERAL-DEF
BSW Description		
Template Description		
Option that ensures confidentiality and integrity		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecCapabilityEnum.intergrityAndConfidentiality		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		

BSW Module	BSW Context	
Mka	Mka/MkaCryptoAlgoConfig/MkaMacSecCapability	
BSW Parameter		**BSW Type**
INTEGRITY_WITHOUT_CONFIDENTIALITY		ECUC-ENUMERATION-LITERAL-DEF
BSW Description		
Template Description		
Option that ensures integrity without confidentiality		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecCapabilityEnum.intergrityWithoutConfidentiality		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		

BSW Module	BSW Context	
Mka	Mka/MkaCryptoAlgoConfig	
BSW Parameter		**BSW Type**
MkaMacSecConfidentialityOffset		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
The confidentiality Offset is only applicable if "Integrity and confidentiality" with a non-XPN cipher suite is selected.		
Template Description		
The MACsec confidentiality offset specifies the number of bytes starting from the frame header. MACsec encrypts only the bytes after the offset in a frame.		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecCryptoAlgoConfig.confidentialityOffset		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Mka_00026]

BSW Module	BSW Context	
Mka	Mka/MkaCryptoAlgoConfig/MkaMacSecConfidentialityOffset	
BSW Parameter		**BSW Type**
CONFIDENTIALITY_OFFSET_0		ECUC-ENUMERATION-LITERAL-DEF
BSW Description		
Template Description		
confidentiality offset of 0.		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecConfidentialityOffsetEnum.ConfidentialityOffset_0		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		

BSW Module	BSW Context		
Mka	Mka/MkaCryptoAlgoConfig/MkaMacSecConfidentialityOffset		
BSW Parameter		**BSW Type**	
CONFIDENTIALITY_OFFSET_50		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
Template Description			
confidentiality offset of 50.			
M2 Parameter			
SystemTemplate::SecureCommunication::MacSecConfidentialityOffsetEnum.ConfidentialityOffset_50			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			

BSW Module	BSW Context		
Mka	Mka/MkaCryptoAlgoConfig		
BSW Parameter		**BSW Type**	
MkaMacSecReplayProtection		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
MACsec replay protection parameter for MACsec.\newline The Replay Protection parameter is defined in the IEEE 802.1AE-2018 document, on chapter 10.4. It enables the replay protection if a packet is received with PacketNumber outside of the Window = PN - ProtectionWindow.			
Template Description			
This attribute is used to configure the MACsec replay protection.			
M2 Parameter			
SystemTemplate::SecureCommunication::MacSecCryptoAlgoConfig.replayProtection			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mka_00027]

BSW Module	BSW Context		
Mka	Mka/MkaCryptoAlgoConfig		
BSW Parameter		**BSW Type**	
MkaMacSecReplayProtectionWindow		ECUC-INTEGER-PARAM-DEF	
BSW Description			
In case replay protection is active, replay protection window.The Protection Window is a positive integer between 0 and 2^32-1 (No XPN) or 2^30-1 (XPN).			
Template Description			
In case replay protection is active, this attribute defines the replay protection window.			
M2 Parameter			
SystemTemplate::SecureCommunication::MacSecCryptoAlgoConfig.replayProtectionWindow			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mka_00028]

BSW Module	BSW Context	
Mka	Mka/MkaPaeConfiguration	
BSW Parameter		**BSW Type**
MkaAutoStart		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Autostart or manual start of the PAE Instance. True := Autostart False := Manual Start If Autostart = False, the method Mka_StartPae is used to start the PAE instance.		
Template Description		
This attribute defines how the Port Access Entity (PAE) is started: • true := Autostart • false := Manual Start		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecProps.autoStart		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Mka_00012]

BSW Module	BSW Context	
Mka	Mka/MkaPaeConfiguration	
BSW Parameter		**BSW Type**
MkaSakRekeyTimeSpan		ECUC-FLOAT-PARAM-DEF
BSW Description		
Time [s] to trigger the rekey of an in use SAK. If set to 0, the rekey will not be triggered after a time span.		
Template Description		
Time in seconds to trigger the rekey of an in use SAK (Static Secure Association key). If set to 0, the rekey will not be triggered after a time span.		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecProps.sakRekeyTimeSpan		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Mka_00024]

BSW Module	BSW Context	
Mka	Mka	
BSW Parameter		**BSW Type**
MkaPaeInstance		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
MKA configuration of a controlled port.		
Template Description		
This meta-class allows to configure MACsec (Media access control security) and the MKA (MACsec Key Agreement) for the CouplingPort (PHY).		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecProps		
Mapping Rule		**Mapping Type**

▽

△

Create container for each existing MacSecProps element.	full

valid	[ECUC_Mka_00003]

BSW Module	**BSW Context**		
Mka	Mka/MkaPaeInstance		
BSW Parameter		**BSW Type**	
MkaEthIfControllerRef		ECUC-REFERENCE-DEF	
BSW Description			
A reference to the EthIfController which is used for transmitting / receiving EAP frames (to configure the controlled port).			
Template Description			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetCommunicationController.couplingPort			
Mapping Rule			**Mapping Type**
Derive container from EthernetCommunicationController that aggregates the CouplingPort that in turn aggregates MkaProps that corresponds to MkaPaeInstance.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mka_00013]

BSW Module	**BSW Context**		
Mka	Mka/MkaPaeInstance		
BSW Parameter		**BSW Type**	
MkaKay		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
MKA instance (KaY) for a controlled port (PaE).			
Template Description			
Properties to configure the MKA instance (KaY) for a controlled CouplingPort (PaE).			
M2 Parameter			
SystemTemplate::SecureCommunication::MacSecProps.macSecKayConfig			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mka_00017]

BSW Module	**BSW Context**	
Mka	Mka/MkaPaeInstance/MkaKay	
BSW Parameter		**BSW Type**
MkaBypassEtherType		ECUC-INTEGER-PARAM-DEF
BSW Description		
Bypassed EtherType. The EtherTypes included will not be MACsec protected.		
Template Description		
This attribute is used to define EtherTypes that are bypassed by MACsec. The providedEtherType will not be MACsec protected.		

▽

△

BSW Module	BSW Context	
Mka	Mka/MkaPaeInstance/MkaKay/MkaKayParticipant	
BSW Parameter		**BSW Type**
MkaCryptoAlgoRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to the cryptography to use (MkaAlgoConfiguration Container).		
Template Description		
Cryptography that is used by the MKA Participant.		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecKayParticipant.cryptoAlgoConfig		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Mka_00048]

BSW Module	BSW Context	
Mka	Mka/MkaPaeInstance/MkaKay/MkaKayParticipant	
BSW Parameter		**BSW Type**
MkaCryptoCknCakKeyRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to the CKN (min. 1 & max. 32 characters) assigned to the KaY Participant in the CSM.		
Template Description		
Reference to the key where the ckn (Connectivity Association key) is stored.		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecKayParticipant.ckn		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Mka_00040]

BSW Module	BSW Context	
Mka	Mka/MkaPaeInstance/MkaKay/MkaKayParticipant	
BSW Parameter	**BSW Type**	
MkaCryptoSakKeyRef	ECUC-REFERENCE-DEF	
BSW Description		
Reference to a CSM key where SAK shall be stored.		
Template Description		
Reference to the key where SAK shall be stored.		
M2 Parameter		
SystemTemplate::SecureCommunication::MacSecKayParticipant.sak		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**

MKA_PEER		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
Template Description			
Port acts in the peer role			
M2 Parameter			
SystemTemplate::SecureCommunication::MacSecRoleEnum.peer			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			

BSW Module	BSW Context		
Mka	Mka/MkaPaeInstance/MkaKay		
BSW Parameter		**BSW Type**	
MkaSrcMacAddress		ECUC-STRING-PARAM-DEF	
BSW Description			
Source MAC address to use by the MKA instance.			
Template Description			
This attribute defines the source MAC Address that is used to calculate the ICV (Integrity Check Value).			
M2 Parameter			
SystemTemplate::SecureCommunication::MacSecLocalKayProps.sourceMacAddress			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mka_00031]

BSW Module	BSW Context		
Mka	Mka/MkaPaeInstance		
BSW Parameter		**BSW Type**	
MkaOnFailPermissiveMode		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
Sets the behavior of the PAE in case MKA does not succeed when MKA is enabled.			
Template Description			
This attribute sets the behavior of the Port Access Entity in case MACsec does not succeed.			
M2 Parameter			
SystemTemplate::SecureCommunication::MacSecProps.onFailPermissiveMode			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Mka_00018]

Mka	Mka/MkaPaeInstance/MkaOnFailPermissiveMode		
BSW Parameter		**BSW Type**	
MKA_PERMISSIVE_MODE_NEVER		ECUC-ENUMERATION-LITERAL-DEF	
BSW Description			
The controlled port will never be set to enabled if the participants cannot establish and successfully use a MACsec Secure Channel.			
Template Description			
The controlled port will never be set to enabled if the participants cannot establish and successfully use a MACsec Secure Channel.			
M2 Parameter			
SystemTemplate::SecureCommunication::MacSecFailPermissiveModeEnum.never			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			

BSW Module	BSW Context	
Mka	Mka/MkaPaeInstance/MkaOnFailPermissiveMode	
BSW Parameter		**BSW Type**
MKA_PERMISSIVE_MODE_TIMEOUT		ECUC-ENUMERATION-LITERAL-DEF
BSW Description		
The controlled port will be set to enabled and MACsec will not be used in the referred port if the timeout value (MkaOnFail PermissiveModeTimeout) is reached and none MKA instance under the PAE instance could success the following conditions: - A participant belonging to the same CA was recognized and authenticated. - A secure channel could be established. - Both participants can transmit and receive MACsec protected traffic through the SC.		
Template Description		

▽

△

The controlled port will be set to enabled and MACsec will not be used in the port if the timeout value (onFailPermissiveMode Timeout) is reached and the following conditions apply: - A participant belonging to the same CA was recognized and authenticated. - A secure channel could be established. - Both participants can transmit and receive MACsec protected traffic through the SC.	
M2 Parameter	
SystemTemplate::SecureCommunication::MacSecFailPermissiveModeEnum.timeout	
Mapping Rule	**Mapping Type**

BSW Module	**BSW Context**
Mka	Mka/MkaPaeInstance
BSW Parameter	**BSW Type**
MkaSwitchPortRef	ECUC-REFERENCE-DEF
BSW Description	
A reference to the EthSwtPort enabled and set only in case PAE is attached to a switch port.	
Template Description	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingElement.couplingPort	
Mapping Rule	**Mapping Type**
Derive container from CouplingElement (SWITCH) that aggregates the CouplingPort that in turn aggregates MkaProps that corresponds to MkaPaeInstance.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Mka_00014]

C.49 Nm

BSW Module	BSW Context	
Nm	Nm	
BSW Parameter		**BSW Type**
NmChannelConfig		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container contains the configuration (parameters) of the bus channel(s). The channel parameter shall be harmonized within the whole communication stack.		
Template Description		
Set of NM nodes coordinated with use of the NM algorithm.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmCluster		
Mapping Rule		**Mapping Type**
Create Container for each existing NmCluster.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00197]

BSW Module	BSW Context	
Nm	Nm/NmChannelConfig	
BSW Parameter		**BSW Type**
NmActiveCoordinator		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
This parameter indicates whether a NM channel - part of a Nm Coordination cluster - will be coordinated actively (NmActive Coordinator = TRUE) or passively (NmActiveCoordinator = FALSE).		
Template Description		
This attribute indicates the role the NM Coordinator will have on this channel.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmNode.nmCoordinatorRole		
Mapping Rule		**Mapping Type**
If nmCoordinatorRole is set to Active then NmActiveCoordinator shall be present and set to true. If nmCoordinatorRole is set to Passive then NmActiveCoordinator shall be present and set to false.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00236]

BSW Module	BSW Context	
Nm	Nm/NmChannelConfig	
BSW Parameter		**BSW Type**
NmBusType		ECUC-CHOICE-CONTAINER-DEF
BSW Description		
Template Description

CanNmCluster: Can specific NmCluster attributes **FlexrayNmCluster:** FlexRay specific NM cluster attributes. **UdpNmCluster:** Udp specific NmCluster attributes	
M2 Parameter	
SystemTemplate::NetworkManagement::CanNmCluster, SystemTemplate::NetworkManagement::FlexrayNmCluster, SystemTemplate::NetworkManagement::UdpNmCluster	
Mapping Rule	**Mapping Type**
Bus Type can be derived from the BusNm Configuration in the System Description.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Nm_00218]

BSW Module	**BSW Context**
Nm	Nm/NmChannelConfig
BSW Parameter	**BSW Type**
NmChannelSleepMaster	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
This parameter shall be set to indicate if the sleep of this network can be absolutely decided by the local node only and that no other nodes can oppose that decision. If this parameter is set to TRUE, the Nm shall assume that the channel is always ready to go to sleep and that no calls to Nm_RemoteSleepIndication or Nm_RemoteSleepCancellation will be made from the <Bus>Nm representing this channel. If this parameter is set to FALSE, the Nm shall not assume that the network is ready to sleep until a call has been made to Nm_RemoteSleepCancellation.	
Template Description	
This parameter shall be set to indicate if the sleep of this network can be absolutely decided by the local node only and that no other nodes can oppose that decision.	
M2 Parameter	
SystemTemplate::NetworkManagement::NmCluster.nmChannelSleepMaster	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Nm_00227]

BSW Module	**BSW Context**
Nm	Nm/NmChannelConfig
BSW Parameter	**BSW Type**
NmComUserDataSupport	ECUC-BOOLEAN-PARAM-DEF
BSW Description	
This parameter indicates whether on a NM channel user data is accessed via Com signals or by SetUserData API.	
Template Description	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::NmPdu.iSignalToIPduMapping	
Mapping Rule	**Mapping Type**

▽

△

If an NmPdu contains user data defined via the existence of NmPdu.iSignalToIPduMapping (and is consequently handled via the PduR and Com) then NmComUserDataSupport shall be set to true.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Nm_00241]

BSW Module	**BSW Context**	
Nm	Nm/NmChannelConfig	
BSW Parameter		**BSW Type**
NmCoordClusterIndex		ECUC-INTEGER-PARAM-DEF
BSW Description		
If this parameter is undefined for a channel, the corresponding bus does not belong to an NM coordination cluster.		
Template Description		
NmCoordinationCluster identification number.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmNode.nmCoordCluster		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00221]

BSW Module	**BSW Context**	
Nm	Nm/NmChannelConfig	
BSW Parameter		**BSW Type**
NmDynamicPncToChannelMappingEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Channel-specific parameter to enable the dynamic PNC-to-channel-mapping feature. False: Dynamic PNC-to-channel-mapping is disabled True: Dynamic PNC-to-channel-mapping is enabled		
Template Description		
Defines if this EcuInstance shall implement the dynamic PNC-to-channel-mapping functionality on this Communication Connector and its respective PhysicalChannel.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationConnector.dynamicPncToChannelMappingEnabled		
Mapping Rule		**Mapping Type**
1:1 Mapping. If M2 Parameter not defined then do not create NmDynamicPncToChannelMapping Enabled.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00248]

BSW Module	**BSW Context**	
Nm	Nm/NmChannelConfig	
BSW Parameter		**BSW Type**
NmPassiveModeEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
This parameter indicates whether a NM channel is active,e.g. can request communication and keep the bus awake, or passive, e.g. can just be woken up and kept awake by other ECUs.		

▽

△

Template Description	
Enables support of the Passive Mode. The passive mode is configurable per channel.	
M2 Parameter	
SystemTemplate::NetworkManagement::NmNode.nmPassiveModeEnabled	
Mapping Rule	**Mapping Type**
1:1 mapping.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Nm_00242]

BSW Module	BSW Context	
Nm	Nm/NmChannelConfig	
BSW Parameter		**BSW Type**
NmPnEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
If this parameter is true, then this NM channel supports Partial Networking.		
Template Description		
Defines whether this NmCluster contributes to the partial network mechanism.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmCluster.nmPncParticipation		
Mapping Rule		**Mapping Type**
Set to true if the NmCluster has nmPncParticipation set to true.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00254]

BSW Module	BSW Context	
Nm	Nm/NmChannelConfig	
BSW Parameter		**BSW Type**
NmPnEraCalcEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Specifies if NmIf calculates the PN request information for external requests. (ERA)		
Template Description		
Defines whether this NmCluster contributes to the partial network mechanism.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmCluster.nmPncParticipation		
Mapping Rule		**Mapping Type**
Set to true if at least one NmCluster has nmPncParticipation set to true and pncGatewayType is not NONE. Otherwise set to FALSE.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00259]

BSW Module	BSW Context

valid			[ECUC_Nm_00256]

BSW Module	**BSW Context**		
Nm	Nm/NmChannelConfig/NmPnFilterMaskByte		
BSW Parameter		**BSW Type**	
NmPnFilterMaskByteValue		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Parameter to configure the filter mask byte.			
Template Description			
Bit mask for NM-Pdu Payload used to configure the NM filter mask for the Network Management.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationConnector.pncFilterArrayMask			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Nm_00257]

BSW Module	BSW Context		
Nm	Nm/NmChannelConfig		
BSW Parameter		**BSW Type**	
NmPncBitVectorLength		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Parameter to configure the length of the PNC bit request information in bytes, which is transmitted within NM PDU by the corresponding <Bus>Nm.			
Template Description			
System.pncVectorLength: Length of the partial networking request release information vector (in bytes). **NmCluster.pncClusterVectorLength:** Optionally defines the length of the PNC Vector per CommunicationCluster (and VLAN in case of UdpNm). If not defined then System.pncVectorLength applies. Should only make the PNC Vector shorter (or same length as defined in System.pncVectorLength).			
M2 Parameter			
SystemTemplate::System.pncVectorLength, SystemTemplate::NetworkManagement::NmCluster.pncClusterVectorLength			
Mapping Rule			**Mapping Type**
If NmCluster.pncClusterVectorLength is defined then the value is taken from NmCluster.pncCluster VectorLength, otherwise the value is taken from System.pncVectorLength.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Nm_00258]

BSW Module	BSW Context		
Nm	Nm/NmChannelConfig		
BSW Parameter		**BSW Type**	
NmSynchronizingNetwork		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
If this parameter is true, then this network is a synchronizing network for the NM coordination cluster which it belongs to. The network is expected to call Nm_SynchronizationPoint() at regular intervals.			
Template Description			
If this parameter is true, then this network is a synchronizing network for the NM coordination cluster which it belongs to. The network is expected to call Nm_SynchronizationPoint() at regular intervals.			
M2 Parameter			
SystemTemplate::NetworkManagement::NmCluster.nmSynchronizingNetwork

Nm	Nm/NmGlobalConfig/NmGlobalFeatures	
BSW Parameter		**BSW Type**
NmComControlEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Pre-processor switch for enabling the Communication Control support.		
Template Description		
Enables the Communication Control support.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmEcu.nmComControlEnabled		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00210]

BSW Module	**BSW Context**	
Nm	Nm/NmGlobalConfig/NmGlobalFeatures	
BSW Parameter		**BSW Type**
NmCoordinatorSupportEnabled		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Pre-processor switch for enabling NM Coordinator support.		
Template Description		
A NM coordinator is an ECU, which is connected to at least two busses, and where the requirement exists that shutdown of NM of at least two of these busses (also referred to as coordinated busses) has to be performed synchronously.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmCoordinator		
Mapping Rule		**Mapping Type**
If NmCoordinators are defined set this parameter to true.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00206]

BSW Module	BSW Context	
Nm	Nm/NmGlobalConfig/NmGlobalFeatures	
BSW Parameter		**BSW Type**
NmCoordinatorSyncSupport		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Enables/disables the coordinator synchronisation support.		
Template Description		
Switch for enabling NmCoordinatorSync (coordination of nested busses) support.		
M2 Parameter		
SystemTemplate::NetworkManagement::NmCoordinator.nmCoordSyncSupport		
Mapping Rule		**Mapping Type**
If NmCoordinator is present then the value of NmCoordinatorSyncSupport shall be set to the value of nmCoordSyncSupport.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00240]

BSW Module	BSW Context	
Nm	Nm/NmGlobalConfig/NmGlobalFeatures	
BSW Parameter		**BSW Type**
NmDynamicPncToChannelMappingSupport		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
Precompile time switch to enable the dynamic PNC-to-channel-mapping handling. False: Dynamic PNC-to-channel-mapping is disabled True: Dynamic PNC-to-channel-mapping is enabled		
Template Description		
Defines if this EcuInstance shall implement the dynamic PNC-to-channel-mapping functionality on this Communication Connector and its respective PhysicalChannel.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreTopology::CommunicationConnector.dynamicPncToChannelMappingEnabled		
Mapping Rule		**Mapping Type**
If at least one dynamicPncToChannelMappingEnabled attribute is defined and if at least one CommunicationConnector of the EcuInstance has dynamicPncToChannelMappingEnabled set to true, then NmDynamicPncToChannelMappingSupport shall be set to true. Otherwise NmDynamic PncToChannelMappingSupport shall be set to false		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Nm_00246]

BSW Module	BSW Context	
Nm	Nm/NmGlobalConfig/NmGlobalFeatures	
BSW Parameter		**BSW Type**
NmGlobalCoordinatorTime		ECUC-FLOAT-PARAM-DEF
BSW Description		
This parameter defines the maximum shutdown time of a connected and coordinated NM-Cluster. Note:This includes nested connections.		
Template Description		
This attribute defines the maximum shutdown time (in seconds) of a connected and coordinated NM-Cluster.		
M2 Parameter

NmPnShutdownMessageRetransmissionDuration	ECUC-FLOAT-PARAM-DEF
BSW Description	
Specifies the duration in seconds of the retransmission phase of a PN shutdown message. A retransmission shall be performed per affected NM channel, as long as the PN shutdown message could not be successfully sent and the retransmission timer is running. The value shall be a multiple integral NmMainFunctionPeriod.	
Template Description	
The period between successive calls to the Main Function of the NM Interface in seconds.	
M2 Parameter	
SystemTemplate::NetworkManagement::NmEcu.nmCycletimeMainFunction	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Nm_00260]

BSW Module	BSW Context
Nm	Nm/NmGlobalConfig/NmGlobalProperties
BSW Parameter	**BSW Type**
NmPncBitVectorOffset	ECUC-INTEGER-PARAM-DEF
BSW Description	
Parameter to configure the offset in bytes of the PNC bit vector that contains the PNC requests, which is transmitted within NM PDU by the corresponding <Bus>Nm.	
Template Description	
Absolute offset (with respect to the NM-PDU) of the partial networking request release information vector that is defined in bytes as an index starting with 0.	
M2 Parameter	
SystemTemplate::System.pncVectorOffset	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Nm_00252]

C.50 Os

BSW Module	BSW Context	
Os	Os	
BSW Parameter		**BSW Type**
OsTask		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container represents an ISO 17356 task.		
Template Description		
This meta-class represents a proxy for an OsTask in the System Description.		
M2 Parameter		
SystemTemplate::RteEventToOsTaskMapping::OsTaskProxy		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Os_00073]

BSW Module	BSW Context	
Os	Os/OsTask	
BSW Parameter		**BSW Type**
OsTaskPeriod		ECUC-FLOAT-PARAM-DEF
BSW Description		
This parameter specifies the period in seconds of this task in case of a cyclically activated task. If this parameter is not given the task can be activated sporadicly or cyclically with a unknown period value. This value is information, e.g. for time base calculations in the RTE in case TimingEvents are mapped onto this OsTask.Be aware, that this parameter is not supposed to be relevant for the OS! This information is given as part of the OS configuration to support configuration work flows using a fixed set of OsTasks.		
Template Description		
This attribute specifies the period in seconds of this task in case of a cyclically activated task. Please note that this attribute is informative and not directly relevant for the AUTOSAR OS. But the attribute value can be mapped into the OS configuration to support configuration work flows using a fixed set of OsTasks.		
M2 Parameter		
SystemTemplate::RteEventToOsTaskMapping::OsTaskProxy.period		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Os_00404]

BSW Module	BSW Context	
Os	Os/OsTask	
BSW Parameter		**BSW Type**
OsTaskPriority		ECUC-INTEGER-PARAM-DEF
BSW Description		
The priority of a task is defined by the value of this attribute. This value has to be understood as a relative value, i.e. the values show only the relative ordering of the tasks. ISO 17356-3 defines the lowest priority as zero (0); larger values correspond to higher priorities.		

▽

△

Template Description	
This attribute defines the priority of a task as a relative value, i.e. the values show only the relative ordering of the tasks.	
M2 Parameter	
SystemTemplate::RteEventToOsTaskMapping::OsTaskProxy.priority	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Os_00075]

BSW Module	BSW Context	
Os	Os/OsTask	
BSW Parameter		**BSW Type**
OsTaskSchedule		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
The OsTaskSchedule attribute defines the preemptability of the task. If this attribute is set to NON, no internal resources may be assigned to this task.		
Template Description		
This attribute defines the preemptability of the task.		
M2 Parameter		
SystemTemplate::RteEventToOsTaskMapping::OsTaskProxy.preemptability		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Os_00076]

C.51 PduR

BSW Module	BSW Context	
PduR	PduR/PduRRoutingPaths	
BSW Parameter		**BSW Type**
PduRRoutingPath		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container is a subcontainer of PduRRoutingTable and specifies the routing path of a PDU.		
Template Description		

▽

△

IPduMapping: Arranges those IPdus that are transferred by the gateway from one channel to the other in pairs and defines the mapping between them. **PduTriggering:** The PduTriggering describes on which channel the IPdu is transmitted. The Pdu routing by the PduR is only allowed for subclasses of IPdu. Depending on its relation to entities such channels and clusters it can be unambiguously deduced whether a fan-out is handled by the Pdu router or the Bus Interface. If the fan-out is specified between different clusters it shall be handled by the Pdu Router. If the fan-out is specified between different channels of the same cluster it shall be handled by the Bus Interface. **TpConfig:** Contains all configuration elements for AUTOSAR TP.
M2 Parameter
SystemTemplate::Fibex::Fibex4Multiplatform::IPduMapping, SystemTemplate::Fibex::FibexCore::CoreCommunication::PduTriggering, SystemTemplate::TransportProtocols::TpConfig

Mapping Rule	**Mapping Type**
For each MultiplatformGateway.pduMapping; for each SignalPdu-MultiplexedPdu Connection; for each IPduTriggering; for each TpConfig create one PduRRoutingPath.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_PduR_00248]

BSW Module	**BSW Context**
PduR	PduR/PduRRoutingPaths/PduRRoutingPath
BSW Parameter	**BSW Type**
PduRDefaultValue	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Specifies the default value of the I-PDU. Only required for gateway operation and if at least one PDU specified by PduRDest Pdu uses TriggerTransmit Data provision. Represented as an array of IntegerParamDef.	
Template Description	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Multiplatform::TargetIPduRef.defaultValue	
Mapping Rule	**Mapping Type**
Container should be created if PduMappingDefaulValue is described in the Sys-T	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_PduR_00299]

BSW Module	**BSW Context**
PduR	PduR/PduRRoutingPaths/PduRRoutingPath/PduRDefaultValue
BSW Parameter	**BSW Type**
PduRDefaultValueElement	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Each value element is represented by the element and the position in an array.	
Template Description	
The default value consists of a number of elements. Each element is one byte long and the number of elements is specified by SduLength.	
M2 Parameter	

▽

△

SystemTemplate::Fibex::Fibex4Multiplatform::DefaultValueElement	
Mapping Rule	**Mapping Type**
Container shall be created for each DefaultValueElement that is aggregated by PduMapping DefaultValue.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_PduR_00300]

BSW Module	**BSW Context**	
PduR	PduR/PduRRoutingPaths/PduRRoutingPath/PduRDefaultValue/PduRDefaultValueElement	
BSW Parameter		**BSW Type**
PduRDefaultValueElement		ECUC-INTEGER-PARAM-DEF
BSW Description		
The default value consists of a number of elements. Each element is one byte long and the number of elements is specified by SduLength. The position of this parameter in the container is specified by the PduRElementBytePosition parameter.		
Template Description		
The integer value of a freely defined data byte.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Multiplatform::DefaultValueElement.elementByteValue		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_PduR_00290]

BSW Module	**BSW Context**	
PduR	PduR/PduRRoutingPaths/PduRRoutingPath/PduRDefaultValue/PduRDefaultValueElement	
BSW Parameter		**BSW Type**
PduRDefaultValueElementBytePosition		ECUC-INTEGER-PARAM-DEF
BSW Description		
This parameter specifies the byte position of the element within the default value		
Template Description		
This attribute specifies the byte position of the element within the default value		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Multiplatform::DefaultValueElement.elementPosition		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_PduR_00292]

BSW Module	**BSW Context**	
PduR	PduR/PduRRoutingPaths/PduRRoutingPath	
BSW Parameter		**BSW Type**
PduRRoutingPathGroupRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to routing paths.		

▽

△

Template Description	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::PdurIPduGroup.iPdu	
Mapping Rule	**Mapping Type**
If the PduTriggering this PduRRoutingPath is derived from is the target of a PdurIPduGroup.iPdu reference then a PduRRoutingPathGroupRef shall be created at the PduRRoutingPath and the respective PduRRoutingPathGroup shall be referenced from the PduRRoutingPathGroupRef.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_PduR_00352]

BSW Module	BSW Context	
PduR	PduR/PduRRoutingPaths/PduRRoutingPath	
BSW Parameter		**BSW Type**
PduRTpThreshold		ECUC-INTEGER-PARAM-DEF
BSW Description		
This parameter is only relevant for TP routings. When configured, it enables on-the-fly routing and defines the number of bytes which must have been received before transmission on the destination bus may start. When omitted, direct TP routing is enforced. The PduRouter shall ensure that a buffer is allocated for this routing path which is at least as large as the threshold.		
Template Description		
Optionally defines the to be configured Pdu Router TpChunkSize for this routing relation.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Multiplatform::IPduMapping.pdurTpChunkSize		
Mapping Rule		**Mapping Type**
PduRTpThreshold shall only be configured by IpduMapping.pduRTpChunkSize if the following conditions hold: (1) The routing path uses the "Tp" API (2) The routing path only contains one single destination routing path.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_PduR_00320]

BSW Module	BSW Context	
PduR	PduR/PduRRoutingPaths	
BSW Parameter		**BSW Type**
PduRRoutingPathGroup		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container groups routing paths. By this grouping, it is possible to switch all routings related to one network, or to one kind of PDUs. PduRRoutingPaths link one source with one destination. Enabling and disabling of routing path groups is done using the PduR API.		
Template Description		
The AUTOSAR PduR will enable and disable the sending of configurable groups of IPdus during runtime according to the AUTOSAR PduR specification.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::PdurIPduGroup		
Mapping Rule		**Mapping Type**
Create container for each existing PduRIPduGroup that is connected to the regarded Ecu		full

▽

△

Mapping Status	ECUC Parameter ID
valid	[ECUC_PduR_00308]

C.52 Sd

BSW Module	BSW Context	
Sd	Sd/SdConfig/SdInstance	
BSW Parameter		**BSW Type**
SdClientService		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container specifies all parameters used by Client services.		
Template Description		
Service instances that are consumed by the ECU that is connected via the ApplicationEndpoint to a Communication Connector.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance		
Mapping Rule		**Mapping Type**
Create container for each existing ConsumedServiceInstance that is available in the Ecu Extract.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00005]

BSW Module	BSW Context	
Sd	Sd/SdConfig/SdInstance/SdClientService	
BSW Parameter		**BSW Type**
SdBlocklistedVersions		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Collection of blocklisted versions.		
Template Description		
Collection of blocklisted versions		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.blocklistedVersion		
Mapping Rule		**Mapping Type**
If at least one ConsumedServiceInstance.blocklistedVersion exists the container shall be derived.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00141]

BSW Module	BSW Context	
Sd	Sd/SdConfig/SdInstance/SdClientService/SdBlocklistedVersions	
BSW Parameter		**BSW Type**
SdBlocklistedMinorVersions		ECUC-INTEGER-PARAM-DEF
BSW Description		

▽

△

Blocklisted MinorVersions.	
Template Description	
Minor Version of the ServiceInterface.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SomeipServiceVersion.minorVersion	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00142]

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdClientService
BSW Parameter	**BSW Type**
SdClientCapabilityRecord	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
Sd uses capability records to store arbitrary name/value pairs conveying additional information about the named service. The following use cases are supported: 1) Key present, with no value (e.g. "passreq" -- password required for this service) 2) Key present, with empty value (e.g. "PlugIns=" server supports plugins, but none are presently installed) 3) Key present, with non-empty value (e.g. "PlugIns=JPEG,MPEG2,MPEG4")	
Template Description	
A sequence of records to store arbitrary name/value pairs conveying additional information about the named service.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::AbstractServiceInstance.capabilityRecord	
Mapping Rule	**Mapping Type**
1:1 mapping to ConsumedServiceInstance.capabilityRecord.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00072]

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdClientService/SdClientCapabilityRecord
BSW Parameter	**BSW Type**
SdClientServiceCapabilityRecordKey	ECUC-STRING-PARAM-DEF
BSW Description	
Defines a CapabilityRecord key.	
Template Description	
Defines a key.	
M2 Parameter	
GenericStructure::GeneralTemplateClasses::TagWithOptionalValue::TagWithOptionalValue.key	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00073]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService/SdClientCapabilityRecord		
BSW Parameter		**BSW Type**	
SdClientServiceCapabilityRecordValue		ECUC-STRING-PARAM-DEF	
BSW Description			
Defines the corresponding CapabilityRecord value.			
Template Description			
Defines the corresponding value.			
M2 Parameter			
GenericStructure::GeneralTemplateClasses::TagWithOptionalValue::TagWithOptionalValue.value			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00074]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService		
BSW Parameter		**BSW Type**	
SdClientServiceAllowedProvider		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
The container defines the allowed providers for this ClientService.			
Template Description			
NetworkEndpoint on which the ProvidedServiceInstance that is communicating with this ConsumedServiceInstance is allowed to be located so that the ACL check in the ServiceDiscovery is successful and the connection is allowed to be established.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.allowedServiceProvider			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Sd_00147]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService/SdClientServiceAllowedProvider		
BSW Parameter		**BSW Type**	
SdIpAddress		ECUC-STRING-PARAM-DEF	
BSW Description			
This parameter defines the IP Address of the remote communication partner.			
Template Description			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::ApplicationEndpoint.networkEndpoint			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Sd_00148]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService/SdClientServiceAllowedProvider		
BSW Parameter		**BSW Type**	
SdIpAddressType		ECUC-ENUMERATION-PARAM-DEF	
BSW Description			
This parameter defines the IP version that is used for communication with the remote communication partner.			
Template Description			
The network endpoint defines the network addressing (e.g. IP-Address or MAC multicast address).			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::NetworkEndpoint			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Sd_00149]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService		
BSW Parameter		**BSW Type**	
SdClientServiceAutoRequire		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
If existing and set to true, this Service will be set to "required" on start.			
Template Description			
Defines that this ConsumedServiceInstance shall be required (searched for) by the service discovery at ECU start.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.autoRequire			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00143]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService		
BSW Parameter		**BSW Type**	
SdClientServiceId		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Id to identify the service. This is unique for the service interface.			
Template Description			
This attribute represents the ability to describe the SOME/IP service ID that is searched.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.serviceIdentifier			
Mapping Rule			**Mapping Type**
Shall be derived from ConsumedServiceInstance.serviceIdentifier			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00020]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService		
BSW Parameter		**BSW Type**	
SdClientServiceInstanceId		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Configuration parameter to specify Instance Id of the service as used in SD entries.			
Template Description			
This attribute represents the ability to describe the required service instance ID.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.instanceIdentifier			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00022]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService		
BSW Parameter		**BSW Type**	
SdClientServiceMajorVersion		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Major version number of the Service as used in the SD entries.			
Template Description			
Major Version of the ServiceInterface. Value can be set to a number that represents the Major Version of the service.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::AbstractServiceInstance.majorVersion			
Mapping Rule			**Mapping Type**
Shall be derived from ConsumedServiceInstance.majorVersion			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00070]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService		
BSW Parameter		**BSW Type**	
SdClientServiceMinorVersion		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Minor version number of the Service as used in the SD Service Entries. If configured to 0xffffffff (any), SD will accept all Minor Versions.			
Template Description			
Minor Version of the ServiceInterface. Value can be set to a number that represents the Minor Version of the searched service or to ANY.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.minorVersion			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00071]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService		
BSW Parameter		**BSW Type**	
SdClientServiceMulticastRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to the SoAdSocketConnection representing the data path (UDP) for communication with the server. This element is also used to set the remote address of the server. This is used, if a ClientService subscribes with a Consumed Eventgroup multicast endpoint. This is an alternative to subscribe with a Consumed Eventgroup unicast endpoint (see SdClientServiceUdpRef). Please note: usage of this reference is mutually exclusive to SdClientServiceUdpRef.			
Template Description			
Multicast Address that is used by the client to subscribe to the server: This enables the multicast subscription feature.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance. eventMulticastSubscriptionAddress			
Mapping Rule			**Mapping Type**
This reference shall be derived from the ConsumedServiceInstance.eventMulticastSubscription Address reference to an ApplicationEndpoint that defines a multicast endpoint. If the Consumed ServiceInstance does not reference a multicast endpoint with the eventMulticastSubscription Address reference the SdClientServiceMulticastRef shall be skipped.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Sd_00145]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService		
BSW Parameter		**BSW Type**	
SdClientServiceTcpRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to the SoAdSocketConnection representing the data path (TCP) for communication with methods. This element is also used to set the remote address of the server and to open the TCP connection.			
Template Description			
The local address over which the CSI is consumed (udp, tcp or both).			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.localUnicastAddress			
Mapping Rule			**Mapping Type**
This reference shall be derived from the ConsumedServiceInstance.localUnicastAddress reference to an ApplicationEndpoint that defines a TCP Port. If the ConsumedServiceInstance does not reference a TCP Port with the localUnicastAddress reference the SdServerServiceTcp Ref shall be skipped.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00100]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdClientService		
BSW Parameter		**BSW Type**	
SdClientServiceTimerRef		ECUC-REFERENCE-DEF	
BSW Description			

▽

△

The reference of the SdClientTimer container for this service.	
Template Description	
Client specific configuration settings relevant for the SOME/IP service discovery.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.sdClientTimerConfig	
Mapping Rule	**Mapping Type**
The reference to the SdClientTimer shall be created pointing to the SdClientTimer container which was created based on the ConsumedServiceInstance.sdClientTimerConfig	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00103]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdClientService	
BSW Parameter		**BSW Type**
SdClientServiceUdpRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to the SoAdSocketConnection representing the data path (UDP) for communication with methods. This element is also used to set the remote address of the server. This is used, if a ClientService subscribes with a Consumed Eventgroup unicast endpoint. This is an alternative to subscribe with a Consumed Eventgroup multicast endpoint. (see SdClientServiceMulticastRef). Please note: usage of this reference is mutually exclusive to SdClientServiceMulticastRef.		
Template Description		
The local address over which the CSI is consumed (udp, tcp or both).		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.localUnicastAddress		
Mapping Rule		**Mapping Type**
This reference shall be derived from the ConsumedServiceInstance.localUnicastAddress reference to an ApplicationEndpoint that defines a UDP Port. If the ConsumedServiceInstance does not reference a UDP Port with the localUnicastAddress reference the SdServerServiceUdp Ref shall be skipped.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00101]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdClientService	
BSW Parameter		**BSW Type**
SdConsumedEventGroup		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
A Service may have event groups which can be consumed. A service consumer has to subscribe to the corresponding event-group. After the subscription the event consumer takes the role of a server and the event provider that of a client.		
Template Description		
This element represents an event-group to which the service consumer wants to subscribe.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedEventGroup		
Mapping Rule		**Mapping Type**

▽

△

Create container for every existing consumedEventGroup that is aggregated by the Consumed ServiceInstance	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00056]

BSW Module	**BSW Context**		
Sd	Sd/SdConfig/SdInstance/SdClientService/SdConsumedEventGroup		
BSW Parameter		**BSW Type**	
SdConsumedEventGroupAutoRequire		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
If existing and set to true, this EventGroup will be set to "required" on start.			
Template Description			
Defines that this ConsumedEventGroup shall be requested (subscribed) as soon as the corresponding ConsumedService Instance is requested. This could be at ECU start, if ConsumedServiceInstance.autoRequire is set to TRUE or as soon as the ConsumedServiceInstance is requested by the application, if ConsumedServiceInstance.autoRequire is set to FALSE.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedEventGroup.autoRequire			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00144]

BSW Module	**BSW Context**		
Sd	Sd/SdConfig/SdInstance/SdClientService/SdConsumedEventGroup		
BSW Parameter		**BSW Type**	
SdConsumedEventGroupId		ECUC-INTEGER-PARAM-DEF	
BSW Description			
The Eventgroup Id of this eventGroup as a unique identifier of the eventgroup in this service. This identifier is used for Event Group entries as well. Please note, that the Eventgroup ID 0x0000 is reserved.			
Template Description			
EventGroup ID. Shall be unique within one system to allow service discovery.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedEventGroup.eventGroupIdentifier			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00057]

BSW Module	**BSW Context**		
Sd	Sd/SdConfig/SdInstance/SdClientService/SdConsumedEventGroup		
BSW Parameter		**BSW Type**	
SdConsumedEventGroupMulticastActivationRef		ECUC-REFERENCE-DEF	
BSW Description			

▽

△

The reference of a Routing Group in order to activate and setup the Socket Connection for Multicast Events of this Event Group. The Multicast address from the received Multicast Option is setup by SoAd_RequestIpAddrAssignment. The local address is the same as for the unicast events; thus, it was sent in the UDP Endpoint option of the Subscribe Event Group entry. This is usually equal to the SdConsumedEventGroupUdpActivationRef.
Template Description
The ServiceDiscovery module is able to activate and deactivate the PDU routing for receiving events.
M2 Parameter
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedEventGroup.pduActivationRoutingGroup

Mapping Rule	**Mapping Type**
This container shall be created if the EventHandler aggregates a PduActivationRoutingGroup with eventGroupControlType = activationMulticast.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00106]

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdClientService/SdConsumedEventGroup
BSW Parameter	**BSW Type**
SdConsumedEventGroupMulticastGroupRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to the SoAdSocketConnectionGroup representing the multicast data path (UDP).	
Template Description	
This reference defines the multicast address or a multicast address resource where the events of the event group are received. If the multicast address is determined via configuration and not at runtime via service discovery this reference points to the multicast address over which the events will be received. If the multicast address is determined at runtime via service discovery this reference shall be used to define the necessary local multicast address resources, i.e. RAM space in the TcpIp module in which the multicast address is stored at runtime. Please note that in this case the referenced address may be defined as ANY UDP port and ANY IP address since the multicast address will be received at runtime. If several multicast addresses are considered to be used the ConsumedEvent Group shall point to different ApplicationEndpoint objects to reserve the necessary resources in the configuration.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedEventGroup.eventMulticastAddress	
Mapping Rule	**Mapping Type**
If SD is used then the Client receives the Multicast Address at runtime. In this case the Application Endpoint and the corresponding NetworkEndpoint that are referenced by eventMulticastAddress from the ConsumedEventGroup define the resource where the IP Multicast address that will be determined at runtime will be stored. In case of a static configuration the eventMulticastAddress will point to a concrete IP Multicast address that can be used in the configuration.	full

valid	[ECUC_SD_00119]

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdClientService/SdConsumedEventGroup
BSW Parameter	**BSW Type**
SdConsumedEventGroupTcpActivationRef	ECUC-REFERENCE-DEF

▽

△

BSW Description	
The reference of the Routing Group for activation of the data path for receiving TCP events. This element is also being used for getting the IP address and port number for building the TCP endpoint option for the Subscribe EventGroup entry. If no TCP methods are used in the service, this element is also being used for setting the remote address (TCP Endpoint option referenced by the Offer Service entry) and opening the TCP connection to the server before sending the Subscribe EventGroup entry. If multiple EventGroups of the same Service Instance are subscribed the TCP connection will be shared and must be opened only once.	
Template Description	
The ServiceDiscovery module is able to activate and deactivate the PDU routing for receiving events.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedEventGroup.pduActivationRoutingGroup	
Mapping Rule	**Mapping Type**
This container shall be created if the ConsumedEventGroup aggregates a PduActiationRoutingGroup with eventGroupControlType = activationUnicast or triggerUnicast or activationAndTriggerUnicast and this PduActiationRoutingGroup points with the iPduIdentifierTcp reference to a collection of SoConIPduIdentifiers.	full

SdConsumedEventGroupTimerRef	ECUC-REFERENCE-DEF
BSW Description	
The reference of the SdClientTimer container for this eventGroup.	
Template Description	
Client Timing configuration settings that are EventGroup specific.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedEventGroup.sdClientTimerConfig	
Mapping Rule	**Mapping Type**
The reference to the SdServerTimer shall be created pointing to the SdServerTimer container which was created based on the ConsumedEventGroup.sdClientTimerConfig	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00107]

BSW Module	BSW Context
Sd	Sd/SdConfig/SdInstance/SdClientService/SdConsumedEventGroup
BSW Parameter	**BSW Type**
SdConsumedEventGroupUdpActivationRef	ECUC-REFERENCE-DEF
BSW Description	
The reference of the Routing Group for activation of the data path for receiving UDP events. This element is also being used for getting the IP address and port number for building the UDP Endpoint option or Consumed Multicast option for the Subscribe EventGroup entry. If no UDP methods are used in the service, this element is also being used for setting the remote address (UDP Endpoint option referenced by the Offer Service entry). If multiple EventGroups of the same Service Instance are subscribed the UDP Socket Connection will be shared and must be set only once.	

▽

△

Template Description	
The ServiceDiscovery module is able to activate and deactivate the PDU routing for receiving events.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedEventGroup.pduActivationRoutingGroup	
Mapping Rule	**Mapping Type**
This container shall be created if the ConsumedEventGroup aggregates a PduActiationRouting Group with eventGroupControlType = activationUnicast or triggerUnicast or activationAndTrigger Unicast and this PduActiationRoutingGroup points with the iPduIdentifierUdp reference to a collection of SoConIPduIdentifiers.	full

BSW Parameter		**BSW Type**	
SdEventHandlerMulticast		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
The subcontainer including the Routing Group for Activation of Events sent over Multicast. The activation ref is also being used for identification of the related Socket Connection in order to find the Multicast Address used in the Multicast Option referenced by the Subscribe EventGroup Ack entry.			
Template Description			
The ServiceDiscovery module is able to activate and deactivate the PDU routing for events.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::EventHandler.pduActivationRoutingGroup			
Mapping Rule			**Mapping Type**
This container shall be created if the EventHandler aggregates a PduActivationRoutingGroup with eventGroupControlType = activationMulticast.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00094]

BSW Module	BSW Context	
Sd	Sd/SdConfig/SdInstance/SdServerService/SdEventHandler/SdEventHandlerMulticast	
BSW Parameter		**BSW Type**
SdEventActivationRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to a SoAdRoutingGroup for activation of the data path for a subscribed client (start sending events after subscribe). This is usually equal to the SdEventActivationRef referenced by SdEventHandlerUdp		
Template Description		

▽

△

This attribute defines the type of a RoutingGroup. There are RoutingGroups that activate the data path for unicast or multicast events of an event group. And there are RoutingGroups that activate the data path for initial events that are triggered, namely events that are sent out on the server side after a client got subscribed. Please note that this attribute is only valid for event communication (Sender Receiver communication) and shall be omitted in MethodActivationRoutingGroups.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::PduActivationRoutingGroup.eventGroupControlType		
Mapping Rule		**Mapping Type**
Create this reference in the SdEventHandlerUdp or SdEventHandlerTcp container if the event GroupControlType in the PduActivationRoutingGroup is set to activationUnicast or activationAnd TriggerUnicast. Create this reference in the SdEventHandlerMulticast container if the eventGroupControlType in the PduActivationRoutingGroup is set to activationMulticast.		full

BSW Module	**BSW Context**		
Sd	Sd/SdConfig/SdInstance/SdServerService/SdEventHandler/SdEventHandlerMulticast		
BSW Parameter		**BSW Type**	
SdMulticastEventSoConRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to the SoAdSocketConnection representing the Eventhandler Multicast data path (UDP).			
Template Description			
Multicast Address that is used for event communication in the IP-Multicast case. It is the destination address to which the server sends the multicast event messages if the mulicastThreshold is exceeded. This address is transmitted in the SD-SubscribeEventGroupAck Message to client (answer to SD-SubscribeEventGroup).			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::EventHandler.eventMulticastAddress			
Mapping Rule			**Mapping Type**
Create this reference if the EventHandler in the System Description contains an eventMulticast Address reference to an ApplicationEndpoint that points to a NetworkEndpoint that in turn defines an IP MulticastAddress.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00118]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdServerService/SdEventHandler	
BSW Parameter		**BSW Type**
SdEventHandlerMulticastThreshold		ECUC-INTEGER-PARAM-DEF
BSW Description		

▽

△

Specifies the number of subscribed clients with different endpoint information (see SWS_SD_00754) that triggers the Server to change the transmission of events via the Eventhandler Multicast connection. If configured to 0 only Consumed Evengroup unicast connections and Consumed Eventgroup multicast connections will be used. If configured to 1 the first client and all further subscribed clients will be served via the Eventhandler Multicast connection as configured in SdMulticastEventSoConRef. If configured to n up to n-1 clients with different endpoint information will be served via Consumed Evengroup unicast connections and Consumed Eventgroup multicast connections. As soon as the number of subscribed clients with different endpoint information reaches n, then all subscribed clients are served via the Eventhandler Multicast connection as configured in SdMulticastEventSoConRef. This does not influence the handling of initial events.
Template Description
Specifies the number of subscribed clients that trigger the server to change the transmission of events to multicast. If configured to 0 only unicast will be used. If configured to 1 the first client will be already served by multicast. If configured to 2 the first client will be server with unicast and as soon as the second client arrives both will be served by multicast. This does not influence the handling of initial events, which are served using unicast only.
M2 Parameter
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::EventHandler.multicastThreshold

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdServerService/SdEventHandler
BSW Parameter	**BSW Type**
SdEventHandlerTimerRef	ECUC-REFERENCE-DEF
BSW Description	
The reference of the SdServerTimer container for this EventGroup.	
Template Description	

▽

△

Server Timing configuration settings that are EventGroup specific.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::EventHandler.sdServerEgTimingConfig	
Mapping Rule	**Mapping Type**
The reference to the SdServerTimer shall be created pointing to the SdServerTimer container which was created based on the EventHandler.sdServerEgTimingConfig. If multiple Provided ServiceInstances reference the same SomeipSdServerServiceInstanceConfig, then one SdServer Timer shall be derived for those ProvidedServiceInstances which are referenced by the same ConsumedProvidedServiceInstanceGroup and for those which have ProvidedServiceInstance.auto Available set to true. For all other ProvidedServiceInstances an own SdServerTimer shall be derived and referenced by the corresponding SdServerService.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00113]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdServerService/SdEventHandler	
BSW Parameter		**BSW Type**
SdEventHandlerUdp		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
The subcontainer including the Routing Groups for Activation and Trigger Transmit for Events sent over UDP. The activation ref (or triggering ref if no activation ref exists) is also being used for identification of the related socket connections in order to set the remote address (either unicast address or multicast address) of the client or find the related client by iterating the SdEventHandlerUdp elements (remote address statically configured or automatically set by method call before subscription).		
Template Description		
The ServiceDiscovery module is able to activate and deactivate the PDU routing for events.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::EventHandler.pduActivationRoutingGroup		
Mapping Rule		**Mapping Type**
This container shall be created if the EventHandler aggregates a PduActiationRoutingGroup with eventGroupControlType = activationUnicast or triggerUnicast or activationAndTriggerUnicast and this PduActiationRoutingGroup points with the iPduIdentifierUdp reference to a collection of SoCon IPduIdentifiers.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00092]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdServerService/SdEventHandler/SdEventHandlerUdp	
BSW Parameter		**BSW Type**
SdEventActivationRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to a SoAdRoutingGroup for activation of the data path for a subscribed client (start sending events after subscribe). This is usually equal to the SdEventActivationRef referenced by SdEventHandlerUdp		
Template Description		
This attribute defines the type of a RoutingGroup. There are RoutingGroups that activate the data path for unicast or multicast events of an event group. And there are RoutingGroups that activate the data path for initial events that are triggered, namely events that are sent out on the server side after a client got subscribed. Please note that this attribute is only valid for event communication (Sender Receiver communication) and shall be omitted in MethodActivationRoutingGroups.		
M2 Parameter		

▽

△

SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::PduActivationRoutingGroup.eventGroupControlType	
Mapping Rule	**Mapping Type**
Create this reference in the SdEventHandlerUdp or SdEventHandlerTcp container if the event GroupControlType in the PduActivationRoutingGroup is set to activationUnicast or activationAnd TriggerUnicast. Create this reference in the SdEventHandlerMulticast container if the eventGroupControlType in the PduActivationRoutingGroup is set to activationMulticast.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00096]

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdServerService/SdEventHandler/SdEventHandlerUdp
BSW Parameter	**BSW Type**
SdEventTriggeringRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to a SoAdRoutingGroup that is used for triggered transmit. Triggering is needed to sent out initial events on the server side after a client got subscribed.	
Template Description	
This attribute defines the type of a RoutingGroup. There are RoutingGroups that activate the data path for unicast or multicast events of an event group. And there are RoutingGroups that activate the data path for initial events that are triggered, namely events that are sent out on the server side after a client got subscribed. Please note that this attribute is only valid for event communication (Sender Receiver communication) and shall be omitted in MethodActivationRoutingGroups.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::PduActivationRoutingGroup.eventGroupControlType	
Mapping Rule	**Mapping Type**
Create this reference if eventGroupControlType in the PduActivationRoutingGroup is set to trigger Unicast or activationAndTriggerUnicast.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00095]

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdServerService
BSW Parameter	**BSW Type**
SdMaxNumOfIpAddressesInAcl	ECUC-INTEGER-PARAM-DEF
BSW Description	
The maximum number of IP addresses to be saved in the ACL.	
Template Description	
Minor Version of the ServiceInterface.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SomeipServiceVersion.minorVersion	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Sd_00158]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdServerService		
BSW Parameter		**BSW Type**	
SdProvidedMethods		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Container element for representing the needed elements of the data path for the methods provided by the service.			
Template Description			
The ServiceDiscovery module is able to activate and deactivate the PDU routing for ClientServerOperations (SOME/IP methods).			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::AbstractServiceInstance.methodActivationRoutingGroup			
Mapping Rule			**Mapping Type**
If the ProvidedServiceInstance contains a methodActivationRoutingGroup then this container shall be created			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00087]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdServerService/SdProvidedMethods		
BSW Parameter		**BSW Type**	
SdServerServiceActivationRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to a SoAdRoutingGroup to activated and deactivate the data path for methods of the service.			
Template Description			
The ServiceDiscovery module is able to activate and deactivate the PDU routing for ClientServerOperations (SOME/IP methods).			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::AbstractServiceInstance.methodActivationRoutingGroup			
Mapping Rule			**Mapping Type**
If the ProvidedServiceInstance contains a methodActivationRoutingGroup then this reference shall be created			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00090]

BSW Module	BSW Context	
Sd	Sd/SdConfig/SdInstance/SdServerService	
BSW Parameter		**BSW Type**
SdServerCapabilityRecord		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Sd uses capability records to store arbitrary name/value pairs conveying additional information about the named service. The following use cases are supported: 1) Key present, with no value (e.g. "passreq" -- password required for this service) 2) Key present, with empty value (e.g. "PlugIns=" server supports plugins, but none are presently installed) 3) Key present, with non-empty value (e.g. "PlugIns=JPEG,MPEG2,MPEG4")		
Template Description		
A sequence of records to store arbitrary name/value pairs conveying additional information about the named service.		
M2 Parameter		

▽

△

SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::AbstractServiceInstance.capabilityRecord	
Mapping Rule	**Mapping Type**
1:1 mapping to ProvidedServiceInstance.capabilityRecord.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00032]

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdServerService/SdServerCapabilityRecord
BSW Parameter	**BSW Type**
SdServerCapabilityRecordKey	ECUC-STRING-PARAM-DEF
BSW Description	
Defines a CapabilityRecord key.	
Template Description	
Defines a key.	
M2 Parameter	
GenericStructure::GeneralTemplateClasses::TagWithOptionalValue::TagWithOptionalValue.key	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00033]

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdServerService/SdServerCapabilityRecord
BSW Parameter	**BSW Type**
SdServerCapabilityRecordValue	ECUC-STRING-PARAM-DEF
BSW Description	
Defines the corresponding CapabilityRecord value.	
Template Description	
Defines the corresponding value.	
M2 Parameter	
GenericStructure::GeneralTemplateClasses::TagWithOptionalValue::TagWithOptionalValue.value	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00034]

BSW Module	**BSW Context**
Sd	Sd/SdConfig/SdInstance/SdServerService
BSW Parameter	**BSW Type**
SdServerServiceAllowedConsumers	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container defines a list of consumers that are allowed to access this SdServerService.	
Template Description	

▽

△

NetworkEndpoints on which the ConsumedServiceInstances that are communicating with this ProvidedServiceInstance are allowed to be located so that the ACL check in the ServiceDiscovery is successful and the connection is allowed to be established.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.allowedServiceConsumer	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Sd_00155]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdServerService/SdServerServiceAllowedConsumers	
BSW Parameter		**BSW Type**
SdIpAddress		ECUC-STRING-PARAM-DEF
BSW Description		
This parameter defines the IP Address of the remote communication partner.		
Template Description		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::ApplicationEndpoint.networkEndpoint		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Sd_00148]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdServerService/SdServerServiceAllowedConsumers	
BSW Parameter		**BSW Type**
SdIpAddressType		ECUC-ENUMERATION-PARAM-DEF
BSW Description		
This parameter defines the IP version that is used for communication with the remote communication partner.		
Template Description		
The network endpoint defines the network addressing (e.g. IP-Address or MAC multicast address).		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::NetworkEndpoint		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Sd_00149]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdServerService	
BSW Parameter		**BSW Type**
SdServerServiceAutoAvailable		ECUC-BOOLEAN-PARAM-DEF

▽

△

BSW Description	
If existing and set to true, this Service will be set to "Available" on start.	
Template Description	
Defines that this ProvidedServiceInstance shall be offered by the service discovery at ECU start.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.autoAvailable	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00138]

BSW Module	BSW Context	
Sd	Sd/SdConfig/SdInstance/SdServerService	
BSW Parameter		**BSW Type**
SdServerServiceId		ECUC-INTEGER-PARAM-DEF
BSW Description		
Id to identify the service. This is unique for the service interface.		
Template Description		
This attribute represents the ability to describe the SOME/IP service ID that is offered.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.serviceIdentifier		
Mapping Rule		**Mapping Type**
Shall be derived from ProvidedServiceInstance.serviceIdentifier		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00009]

BSW Module	BSW Context	
Sd	Sd/SdConfig/SdInstance/SdServerService	
BSW Parameter		**BSW Type**
SdServerServiceInstanceId		ECUC-INTEGER-PARAM-DEF
BSW Description		
Configuration parameter to specify Instance Id of the Service implemented by the Server Service.		
Template Description		
Instance identifier. Can be used for e.g. service discovery to identify the instance of the service.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.instanceIdentifier		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00011]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdServerService		
BSW Parameter		**BSW Type**	
SdServerServiceLoadBalancingPriority		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Defines the value to be used for load balancing priority in the service offer. Lower value means higher priority.			
Template Description			
Defines the value to be used for load balancing priority in the service offer. Lower value means higher priority.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.loadBalancingPriority			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00129]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdServerService		
BSW Parameter		**BSW Type**	
SdServerServiceLoadBalancingWeight		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Defines the value to be used for load balancing weight in the service offer. Higher value means higher probability to be chosen.			
Template Description			
Defines the value to be used for load balancing weight in the service offer. Higher value means higher probability to be chosen.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.loadBalancingWeight			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00130]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdServerService		
BSW Parameter		**BSW Type**	
SdServerServiceMajorVersion		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Major version number of the Service as used in SD Entries.			
Template Description			
Major Version of the ServiceInterface. Value can be set to a number that represents the Major Version of the service.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::AbstractServiceInstance.majorVersion			
Mapping Rule			**Mapping Type**
Shall be derived from ProvidedServiceInstance.majorVersion			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00068]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdServerService		
BSW Parameter		**BSW Type**	
SdServerServiceMinorVersion		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Minor version number of the Service as used e.g. in Offer Service entries.			
Template Description			
Minor Version of the Service that is provided by this ProvidedServiceInstance.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.minorVersion			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00069]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdServerService		
BSW Parameter		**BSW Type**	
SdServerServiceTimerRef		ECUC-REFERENCE-DEF	
BSW Description			
The reference of the SdServerTimer container for this service.			
Template Description			
Server specific configuration settings relevant for the SOME/IP service discovery.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.sdServerTimerConfig			
Mapping Rule			**Mapping Type**
The reference to the SdServerTimer shall be created pointing to the SdServerTimer container which was created based on the ProvidedServiceInstance.sdServerTimerConfig.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00086]

BSW Module	BSW Context		
Sd	Sd/SdConfig/SdInstance/SdServerService		
BSW Parameter		**BSW Type**	
SdServerServiceUdpRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to SoAdSocketConnectionGroup used for methods. This is used to access the local IP address and port for building the endpoint option for offers of this service.			
Template Description			
The local address over which the CSI is consumed (udp, tcp or both).			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.localUnicastAddress			
Mapping Rule			**Mapping Type**

▽

△

This reference shall be derived from the ProvidedServiceInstance.localUnicastAddress reference to an ApplicationEndpoint that defines a UDP Port. If the ProvidedServiceInstance does not reference a UDP Port with the localUnicastAddress reference the SdServerServiceTcpRef shall be skipped.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SD_00089]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdServerService	
BSW Parameter		**BSW Type**
SdServiceGroupRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to the SdServiceGroupS this SdServerService belongs to.		
Template Description		
This reference assigns a set of ConsumedServiceInstances to the ConsumedProvidedServiceInstanceGroup.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedProvidedServiceInstanceGroup. providedServiceInstance		
Mapping Rule		**Mapping Type**
Find ConsumedProvidedServiceInstanceGroup that points to this ProvidedServiceInstance and create the reference.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00136]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance	
BSW Parameter		**BSW Type**
SdServerTimer		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container specifies all timers used by the Service Discovery module for Server Services.		
Template Description		
Server specific configuration settings relevant for the SOME/IP service discovery.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.sdServerTimerConfig		
Mapping Rule		**Mapping Type**
The Timing parameters can be derived from the SomeipSdServerServiceInstanceConfig attributes and the aggregated elements RequestResponseDelay and InitialSdDelayConfig.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00035]

BSW Module	**BSW Context**	
Sd	Sd/SdConfig/SdInstance/SdServerTimer	
BSW Parameter		**BSW Type**
SdServerTimerInitialOfferDelayMax		ECUC-FLOAT-PARAM-DEF
BSW Description		

▽

△

Max value in [s] to delay randomly the first offer. This parameter is mandatory for ServerService.		
Template Description		
Max Value in seconds to delay randomly the first offer (if aggregated by SdServerConfig) or the transmission of a find message (if aggregated by SdClientConfig).		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::InitialSdDelayConfig.initialDelayMaxValue		
Mapping Rule		**Mapping Type**
Take information from ProvidedServiceInstance.sdServerTimerConfig		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00039]

BSW Module	**BSW Context**		
Sd	Sd/SdConfig/SdInstance/SdServerTimer		
BSW Parameter		**BSW Type**	
SdServerTimerInitialOfferDelayMin		ECUC-FLOAT-PARAM-DEF	
BSW Description			
Min value in [s] to delay randomly the first offer. This parameter is mandatory for ServerService.			
Template Description			
Min Value in seconds to delay randomly the first offer or the transmission of a find message (if aggregated by SdClientConfig).			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::InitialSdDelayConfig.initialDelayMinValue			
Mapping Rule			**Mapping Type**
Take information from ProvidedServiceInstance.sdServerTimerConfig			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00038]

BSW Module	**BSW Context**		
Sd	Sd/SdConfig/SdInstance/SdServerTimer		
BSW Parameter		**BSW Type**	
SdServerTimerInitialOfferRepetitionBaseDelay		ECUC-FLOAT-PARAM-DEF	
BSW Description			
The base delay in [s] for offer repetitions. Successive offers have an exponential back off delay (1x base delay, 2x base delay, 4x base delay, ...). This parameter is mandatory for ServerService.			
Template Description			
The base delay for offer repetitions (if aggregated by SdServerConfig) or find repetitions (if aggregated by SdClientConfig). Successive find messages have an exponential back off delay.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::InitialSdDelayConfig.initialRepetitionsBaseDelay			
Mapping Rule			**Mapping Type**
Take information from ProvidedServiceInstance.sdServerTimerConfig			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00041]

BSW Module	**BSW Context**		
Sd	Sd/SdConfig/SdInstance/SdServerTimer		
BSW Parameter		**BSW Type**	
SdServerTimerInitialOfferRepetitionsMax		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Configure the maximum amount of offer repetition. This parameter is mandatory for ServerService.			
Template Description			
Describes the maximum amount of offer repetitions (if aggregated by SdServerConfig) or the maximum amount of find repetitions (if aggregated by SdClientConfig).			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::InitialSdDelayConfig.initialRepetitionsMax			
Mapping Rule			**Mapping Type**
Take information from ProvidedServiceInstance.sdServerTimerConfig			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00040]

BSW Module	**BSW Context**		
Sd	Sd/SdConfig/SdInstance/SdServerTimer		
BSW Parameter		**BSW Type**	
SdServerTimerOfferCyclicDelay		ECUC-FLOAT-PARAM-DEF	
BSW Description			
Interval between cyclic offers in the main phase. This parameter is mandatory for ServerService.			
Template Description			
Optional attribute to define cyclic offers. Cyclic offer is active, if the delay is set (in seconds) and greater then 0.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SomeipSdServerServiceInstanceConfig.offerCyclicDelay			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00076]

BSW Module	**BSW Context**		
Sd	Sd/SdConfig/SdInstance/SdServerTimer		
BSW Parameter		**BSW Type**	
SdServerTimerRequestResponseMaxDelay		ECUC-FLOAT-PARAM-DEF	
BSW Description			
Maximum allowable response delay to entries received by multicast in seconds.			
Template Description			
Maximum allowable response delay to entries received by multicast in seconds.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::RequestResponseDelay.maxValue			
Mapping Rule			**Mapping Type**
Take information from ProvidedServiceInstance.requestResponseDelay			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SD_00114]

BSW Module	BSW Context	
Sd	Sd/SdConfig/SdInstance/SdServerTimer	
BSW Parameter		**BSW Type**
SdServerTimerRequestResponseMinDelay		ECUC-FLOAT-PARAM-DEF
BSW Description		
Minimum allowable response delay to entries received by multicast in seconds.		
Template Description		
Minimum allowable response delay to entries received by multicast in seconds.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::RequestResponseDelay.minValue		
Mapping Rule		**Mapping Type**
Take information from ProvidedServiceInstance.requestResponseDelay		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00115]

BSW Module	BSW Context	
Sd	Sd/SdConfig/SdInstance/SdServerTimer	
BSW Parameter		**BSW Type**
SdServerTimerTTL		ECUC-INTEGER-PARAM-DEF
BSW Description		
Time to live for offer service.		
Template Description		
Defines the time in seconds the service offer is valid.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SomeipSdServerServiceInstanceConfig.serviceOfferTimeToLive		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00037]

BSW Module	BSW Context	
Sd	Sd/SdConfig	
BSW Parameter		**BSW Type**
SdServiceGroup		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Contains the configuration parameters of the AUTOSAR SD module's SdServiceGroupS.		
Template Description		
The AUTOSAR ServiceDiscovery is able to start and to stop ClientServices and ServerServices,respectively, at runtime. A SdServiceGroup contains several ClientServices and ServerServices, respectively.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedProvidedServiceInstanceGroup		
Mapping Rule		**Mapping Type**
Create container for each CoreCommunication::ConsumedProvidedServiceInstanceGroup that is contained in the ECU Extract.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SD_00134]

C.53 SecOC

BSW Module	BSW Context	
SecOC	SecOC	
BSW Parameter		**BSW Type**
SecOCRxPduProcessing		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Contains the parameters to configure the RxPdus to be verified by the SecOC module.		
Template Description		
If useAsCryptographicPdu is not set or set to false this IPdu contains the payload of an Authentic IPdu supplemented by additional Authentication Information (Freshness Counter and an Authenticator). If useAsCryptographicPdu is set to true this IPdu contains the Authenticator for a payload that is transported in a separate message. The separate Authentic IPdu is described by the Pdu that is referenced with the payload reference from this SecuredIPdu.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::SecuredIPdu		
Mapping Rule		**Mapping Type**
This container shall be created for every SecuredIPdu that is received by the regarded Ecu. The information whether the SecuredIPdu is transmitted or received by the Ecu shall be derived from PduTriggering.iPduPort reference. If an IPduPort of the Ecu with the communicationDirection = out is referenced then the SecuredIPdu is transmitted. If an IPduPort of the Ecu with the communicationDirection = in is referenced then the SecuredIPdu is received.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SecOC_-00011]

BSW Module	BSW Context	
SecOC	SecOC/SecOCRxPduProcessing	
BSW Parameter		**BSW Type**
SecOCAuthDataFreshnessLen		ECUC-INTEGER-PARAM-DEF
BSW Description		
The length of the external authentic PDU data in bits (uint16).		
Template Description		
This attribute defines the length in bits of the authentic PDU data that is passed to the SWC that verifies and generates the Freshness.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::SecureCommunicationProps.authDataFreshnessLength		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SecOC_-00082]

BSW Module	BSW Context	
SecOC	SecOC/SecOCRxPduProcessing	
BSW Parameter		**BSW Type**
SecOCAuthDataFreshnessStartPosition		ECUC-INTEGER-PARAM-DEF
BSW Description		

▽

△

This value determines the start position in bits (uint16) of the Authentic PDU that shall be passed on to the Freshness SWC. The bit counting is done according to TPS_SYST_01068 and the bit ordering is done according to TPS_SYST_01069.	
Template Description	
This value determines the start position in bits of the Authentic PDU that shall be passed on to the SWC that verifies and generates the Freshness. The bit counting is done according to TPS_SYST_01068.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::SecureCommunicationProps.authDataFreshnessStartPosition	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SecOC_-00081]

BSW Module	**BSW Context**	
SecOC	SecOC/SecOCRxPduProcessing	
BSW Parameter		**BSW Type**
SecOCAuthInfoTruncLength		ECUC-INTEGER-PARAM-DEF
BSW Description		
This parameter defines the length in bits of the authentication code to be included in the payload of the Secured I-PDU.		
Template Description		
This attribute defines the length in bits of the authentication code to be included in the payload of the authenticated Pdu.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::SecureCommunicationAuthenticationProps.authInfoTxLength		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SecOC_-00095]

BSW Module	**BSW Context**	
SecOC	SecOC/SecOCRxPduProcessing	
BSW Parameter		**BSW Type**
SecOCAuthenticationBuildAttempts		ECUC-INTEGER-PARAM-DEF
BSW Description		
This parameter specifies the number of authentication build attempts.		
Template Description		
This attribute specifies the number of authentication build attempts.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::SecureCommunicationProps.authenticationBuildAttempts		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SecOC_-00079]

SecOC	SecOC/SecOCRxPduProcessing		
BSW Parameter		**BSW Type**	
SecOCAuthenticationVerifyAttempts		ECUC-INTEGER-PARAM-DEF	
BSW Description			
This parameter specifies the number of authentication verify attempts that are to be carried out when the verification of the authentication information failed for a given Secured I-PDU. If zero is set, then only one authentication verification attempt is done.			
Template Description			
This attribute defines the additional number of authentication attempts that are to be carried out when the generation of the authentication information failed for a given SecuredIPdu. If zero is set than only one authentication attempt is done.			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::SecureCommunicationProps.authenticationRetries

SecOCAuthPduHeaderLength	ECUC-INTEGER-PARAM-DEF
BSW Description	
This parameter indicates the length (in bytes) of the Secured I-PDU Header in the Secured I-PDU. The length of zero means there's no header in the PDU.	
Template Description	
This attribute defines the size of the header which is inserted into the SecuredIPdu. If this attribute is set to anything but no Header, the SecuredIPdu contains the Secured I-PDU Header to indicate the length of the AuthenticIPdu. The AuthenticIPdu contains the original payload, i.e. the secured data.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::SecuredIPdu.useSecuredPduHeader	
Mapping Rule	**Mapping Type**
The SecOCAuthPduHeaderLength value shall be derived from useSecuredPduHeader in the following way: If useSecuredIPduHeader is set to "noHeader" the value shall be 0. If useSecured IPduHeader is set to "securedPduHeader08Bit" the value shall be 1. If useSecuredIPduHeader is set to "securedPduHeader16Bit" the value shall be 2. If useSecuredIPduHeader is set to "secured PduHeader32Bit" the value shall be 4.	full

SystemTemplate::Fibex::FibexCore::CoreCommunication::SecureCommunicationFreshnessProps.freshnessValueTxLength	
Mapping Rule	**Mapping Type**
1:1 mapping if value is set by SecureCommunicationFreshnessProps.freshnessValueTxLength. If the attribute is not set to a value the parameter value of 0 shall be assumed which means that no Freshness Value is included in the Secured I-PDU.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SecOC_-00094]

BSW Module	**BSW Context**	
SecOC	SecOC/SecOCTxPduProcessing	
BSW Parameter		**BSW Type**
SecOCTxAuthServiceConfigRef		ECUC-REFERENCE-DEF
BSW Description		
This reference is used to define which crypto service function is called for authentication. If PDUs with a dynamic length are used (e.g. CanTP or Dynamic Length PDUs) a MAC algorithm has to be chosen, that is not vulnerable to length extension attack (e.g. CMAC/HMAC).		
Template Description		
This reference identifies the crypto profile applicable to the usage (send, receive) of the also referenced SecuredIPdu. Obviously, this reference is only applicable if the Pdutriggering also references a SecuredIPdu in the role iPdu.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::PduTriggering.secOcCryptoMapping		
Mapping Rule		**Mapping Type**

BSW Module	**BSW Context**	
SecOC	SecOC/SecOCTxPduProcessing/SecOCTxSecuredPduLayer	
BSW Parameter		**BSW Type**
SecOCTxSecuredPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container specifies one Pdu that is transmitted by the SecOC module to the PduR after the Mac was generated. This Pdu contains the cryptographic information.		
Template Description		
If this attribute is set to true the SecuredIPdu contains the Authentication Information for an AuthenticIPdu that is transmitted in a separate message. The AuthenticIPdu contains the original payload, i.e. the secured data. If this attribute is set to false this SecuredIPdu contains the payload of an Authentic IPdu supplemented by additional Authentication Information.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::SecuredIPdu.useAsCryptographicIPdu		
Mapping Rule		**Mapping Type**
Create the SecOCTxSecuredPdu if the SecuredIPdu is sent by the regarded ECU and the attribute useAsCryptographicIPdu = false or not defined		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_SecOC_-00070]

BSW Module	**BSW Context**	
SecOC	SecOC/SecOCTxPduProcessing/SecOCTxSecuredPduLayer/SecOCTxSecuredPdu	
BSW Parameter		**BSW Type**
SecOCAuthPduHeaderLength		ECUC-INTEGER-PARAM-DEF
BSW Description		
This parameter indicates the length (in bytes) of the Secured I-PDU Header in the Secured I-PDU. The length of zero means there's no header in the PDU.		
Template Description		
This attribute defines the size of the header which is inserted into the SecuredIPdu. If this attribute is set to anything but no Header, the SecuredIPdu contains the Secured I-PDU Header to indicate the length of the AuthenticIPdu. The AuthenticIPdu contains the original payload, i.e. the secured data.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::SecuredIPdu.useSecuredPduHeader		
Mapping Rule		**Mapping Type**
The SecOCAuthPduHeaderLength value shall be derived from useSecuredPduHeader in the following way: If useSecuredIPduHeader is set to "noHeader" the value shall be 0. If useSecured IPduHeader is set to "securedPduHeader08Bit" the value shall be 1. If useSecuredIPduHeader is set to "securedPduHeader16Bit" the value shall be 2. If useSecuredIPduHeader is set to "secured PduHeader32Bit" the value shall be 4.		full

SoAdPduRoute		ECUC-PARAM-CONF-CONTAINER-DEF

▽

△

BSW Description	
Describes the path of a PDU from an upper layer of the SoAd to the socket in the TCP/IP stack for transmission. This PDU can consume meta data items of type SOCKET_CONNECTION_ID_16.	
Template Description	
Reference to a Pdu that is transmitted over a socket connection.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SoConIPduIdentifier.pduTriggering	
Mapping Rule	**Mapping Type**
The SoAdPduRoute container shall be created for every PduTriggering that is transmitted by the regarded ECU. The information whether the Pdu is received or transmitted over a Socket Connection shall be derived from the PduTriggering element. The PduTriggering element contains references to IPduPorts of an EcuInstance. The IPduPort element contains a communication Direction.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SoAd_00007]

BSW Module	BSW Context	
SoAd	SoAd/SoAdConfig/SoAdPduRoute	
BSW Parameter		**BSW Type**
SoAdPduRouteDest		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Specifies the PDU route destination.		
Template Description		
ApplicationEndpoint: An application endpoint is the endpoint on an Ecu in terms of application addressing (e.g. socket). The application endpoint represents e.g. the listen socket in client-server-based communication. **StaticSocketConnection.iPduIdentifier:** Assignment of IPduIdentifiers that are transmitted over the static SocketConnection.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::ApplicationEndpoint, SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::StaticSocketConnection.iPduIdentifier		
Mapping Rule		**Mapping Type**
SOME/IP communication: If the regarded EcuInstance that transmits the PduTriggering is referenced by an ApplicationEndpoint that in turn is referenced by a ProvidedServiceInstance that has a relationship to the PduTriggering via a PduActivationRoutingGroup and this ApplicationEndpoint contains a maxNumberOfConnections setting then this container shall be created as many times as the maxNumberOfConnections value indicates. StaticSocketConnection: If the PduTriggering that is transmitted by the Ecu has a relationship to a StaticSocketConnection via a SoConIPduIdentifier then this container shall be created once for this PduTriggering.		full
Mapping Status		**ECUC Parameter ID**

SoAdTxRoutingGroupRef	ECUC-REFERENCE-DEF	
BSW Description		
Reference to the routing group.		
Template Description		
Group of Pdus that can be activated or deactivated for transmission over a socket connection.		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::PduActivationRoutingGroup		
Mapping Rule	**Mapping Type**	
If the PduTriggering for which the SoAdPduRoute is created is referenced by a SoConIPdu Identifier that in turn has a relationship to a PduActivationRoutingGroup then this reference shall point to the SoAdRoutingGroup that is derived from the PduActivationRoutingGroup.	full	
Mapping Status	**ECUC Parameter ID**	
valid	[ECUC_SoAd_00123]	

BSW Module	BSW Context
SoAd	SoAd/SoAdConfig/SoAdPduRoute/SoAdPduRouteDest
BSW Parameter	**BSW Type**
SoAdTxSocketConnOrSocketConnBundleRef	ECUC-CHOICE-REFERENCE-DEF
BSW Description	
Choice Reference to a SocketConnection or to a SocketConnectionGroup on which the PDU is to be sent on. The reference to a SocketConnectionGroup shall only be used for upper layers with IF API.	
Template Description	
StaticSocketConnection: Definition of static SocketConnection between the Socket that is defined by the aggregating SocketAddress and the remote Address. **ProvidedServiceInstance.localUnicastAddress:** The local address over which the PSI is provided (udp, tcp or both). **ConsumedServiceInstance.localUnicastAddress:** The local address over which the CSI is consumed (udp, tcp or both).	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::StaticSocketConnection, SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.localUnicastAddress, SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.localUnicastAddress	

▽

△

Mapping Rule	Mapping Type
SOME/IP Communication: The PduTriggering for which the SoAdPduRoute is created is referenced by a SoConIPduIdentifier that in turn has a relationship to a PduActivationRoutingGroup. The PduActivationRoutingGroup is aggregated either by a ProvidedServiceInstance, a ConsumedServiceInstance, or an EventHandler. In the first two cases, the local address is determined by ProvidedServiceInstance.localUnicastAddress and ConsumedServiceInstance.localUnicastAddress. For EventHandlers the local address is determined from the local Address of the ProvidedServiceInstance which contains the EventHandler. StaticSocketConnection: The PduTriggering for which the SoAdPduRoute is created is referenced by a SoConIPduIdentifier that in turn has a relationship to a StaticSocketConnection. The static SoAdSocketConnection is aggregated by a SocketAddress for which the SoAdSocketConnectionGroup was created. If the SocketConnectionGroup contains two or more SocketConnections and the PDU shall be sent on all of them or the PDU shall be received from any of them, set the reference to the SoAdSocketConnectionGroup container. If the PDU shall be sent or received via exactly one SocketConnection of the SocketConnectionGroup, reference the corresponding SoAdSocketConnection container.	full

SoAdRoutingGroupTxTriggerable		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Specifies if the If-TxPDUs related to the PduRouteDest containers referenced by this routing group can be triggered via So Ad_IfRoutingGroupTransmit (TRUE) or not (FALSE).			
Template Description			
This attribute defines the type of a RoutingGroup. There are RoutingGroups that activate the data path for unicast or multicast events of an event group. And there are RoutingGroups that activate the data path for initial events that are triggered, namely events that are sent out on the server side after a client got subscribed. Please note that this attribute is only valid for event communication (Sender Receiver communication) and shall be omitted in MethodActivationRoutingGroups.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::PduActivationRoutingGroup.eventGroupControlType			
Mapping Rule			**Mapping Type**
The SoAdRoutingGroupTxTriggerable parameter shall be derived from the eventGroupControlType enumeration. If • PduActivationRoutingGroup is aggregated by an EventHandler in the role pduActivationRouting Group and • eventGroupControlType equals triggerUnicast or activationAndTriggerUnicast then SoAdRoutingGroupTxTriggerable shall be set to true. In all other cases SoAdRoutingGroupTx Triggerable shall be set to false.			full

SoAdSocketConnectionGroup		ECUC-PARAM-CONF-CONTAINER-DEF

▽

△

BSW Description	
Specifies the configuration of a socket connection group, i.e. specifies the socket connections belonging to the group and the parameters which are common for all socket connections of the group. A socket connection specifies how data can be received and transmited via a TCP or UDP socket.	
Template Description	
ProvidedServiceInstance.localUnicastAddress: The local address over which the PSI is provided (udp, tcp or both). **ConsumedServiceInstance.localUnicastAddress:** The local address over which the CSI is consumed (udp, tcp or both). **StaticSocketConnection:** Definition of static SocketConnection between the Socket that is defined by the aggregating SocketAddress and the remote Address.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.`localUnicastAddress`, SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.`localUnicastAddress`, SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::`StaticSocketConnection`	
Mapping Rule	**Mapping Type**
Unicast SocketConnectionGroup rules: - SOME/IP Communication without configured remote UnicastAddress: Collect all ProvidedServiceInstances and ConsumedServiceInstances that are pointing to the same localUnicastAddress of the regarded Ecu and create a SoAdConnectionGroup for the referenced SocketAddress. Each relevant SocketAddress aggregates the referenced ApplicationEndpoint and points with the connector reference to the Ecu for which the Ecu Configuration is created. - SOME/IP Communication with configured remoteUnicastAddress: Collect all ProvidedServiceInstances and ConsumedServiceInstances that are pointing to the same localUnicastAddress and to the same remoteUnicastAddress and create a SoAdConnectionGroup for the referenced SocketAddress. Each relevant SocketAddress aggregates the referenced ApplicationEndpoint that is referenced by the localUnicastAddress and points with the connector reference to the Ecu for which the Ecu Configuration is created. - StaticSocketConnection: Create a SocketConnectionGroup for each StaticSocketConnection that is aggregated by an ApplicationEndpoint of the regarded Ecu or points with the remoteUnicastAddress to an ApplicationEndpoint of the regarded Ecu. Multicast SocketConnectionGroup rules: - Server side: If a ProvidedServiceInstance points with the localUnicastAddress to an ApplicationEndpoint that in turn is aggregated by a SocketAddress that refers the regarded EcuInstance and this ProvidedServiceInstance contains an EventHandler that contains an eventMulticastAddress reference then a multicast SocketConnectionGroup shall be created. The local Address of the SocketConnectionGroup shall be the address that is derived from the ProvidedServiceInstance.localUnicast reference. The remote Address of the SocketConnectionGroup shall be the multicastAddress that is derived from EventHandler.eventMulticastAddress. - Client side: If a ConsumedServiceInstance points with the localUnicastAddress to an ApplicationEndpoint that in turn is aggregated by a SocketAddress that refers the regarded EcuInstance and this ConsumedServiceInstance contains a ConsumedEventGroup that contains an eventMulticastRef then a multicast SocketConnectionGroup shall be created. The local Address of the SocketConnectionGroup shall be derived from the ApplicationEndpoint that is referenced by the eventMulticastAddress reference. The remote Address shall be derived from the ApplicationEndpoint that is referenced by ProvidedServiceInstance.localUnicastAddress.	full

BSW Module	BSW Context	
SoAd	SoAd/SoAdConfig/SoAdSocketConnectionGroup	
BSW Parameter		**BSW Type**
SoAdPduHeaderEnable		ECUC-BOOLEAN-PARAM-DEF
BSW Description		

▽

△

Enables the transmission of the PDU header (ID, length) on this socket connection. TRUE: add SoAd PDU header before PDU data FALSE: No SoAd PDU header is used	
Template Description	
If multiple Pdus are transmitted over the same connection this headerId can be used to distinguish between the different Pdus. For the constraints on constructing the headerId for SOME/IP also see PRS_SOMEIP_00245.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SoConIPduIdentifier.headerId	
Mapping Rule	**Mapping Type**
If a SoConIPduIdentifier element has a headerId set to a value and this SoConIPduIdentifier is referenced by a PduActivationGroup that is aggregated by a relevant ProvidedServiceInstance/ ConsumedServiceInstance/EventHandler/ConsumedEventGroup then this parameter shall be set to true. If a StaticSocketConnection refers to a SoConIPduIdentifier element that has a headerId set to a value then this parameter shall be set to true.	full

BSW Module	**BSW Context**	
SoAd	SoAd/SoAdConfig/SoAdSocketConnectionGroup	
BSW Parameter		**BSW Type**
SoAdSocketConnection		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
Specifies the socket connection (Id and remote address information). Note: Parameters which are common to all socket connections of a socket connection group are specified directly at the group.		
Template Description		
ApplicationEndpoint.maxNumberOfConnections: This attribute defines the maximal number of clients the Server is able to deal with in case of Service Discovery. **StaticSocketConnection:** Definition of static SocketConnection between the Socket that is defined by the aggregating SocketAddress and the remote Address. **ProvidedServiceInstance.remoteMulticastSubscriptionAddress:** This reference defines the remote multicast subscribed addresses of service consumers. This reference shall ONLY be used if the remote address of the clients is determined from the configuration and not at runtime. **ProvidedServiceInstance.remoteUnicastAddress:** This reference defines the remote addresses of service consumers. This reference shall ONLY be used if the remote address of the clients is determined from the configuration and not at runtime. **EventHandler.eventMulticastAddress:** Multicast Address that is used for event communication in the IP-Multicast case. It is the destination address to which the server sends the multicast event messages if the mulicastThreshold is exceeded. This address is transmitted in the SD-SubscribeEventGroupAck Message to client (answer to SD-SubscribeEventGroup).		
M2 Parameter		
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::ApplicationEndpoint.maxNumberOfConnections, SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::StaticSocketConnection, SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.remoteMulticastSubscriptionAddress, SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.remoteUnicastAddress, SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::EventHandler.eventMulticastAddress		
Mapping Rule		**Mapping Type**

▽

△

The SoAdSocketConnectionGroup is created for an ApplicationEndpoint aggregated by a Socket Address that contains a connector reference to the regarded Ecu. This SoAdSocketConnection Group defines the context for the creation of the following SoAdSocketConnections. Unicast SoAdSocketConnections based on maxNumberOfConnections: The relevant Application Endpoint is referenced by the localUnicastAddress reference from ProvidedServiceInstances/ ConsumedServiceInstances or by the eventMulticastSubscriptionAddress from ConsumedService Instance. The relevant ApplicationEndpoint has the attribute maxNumberOfConnections that defines how many unicast SocketConnections inside the SoAdSocketConnectionGroup need to be created. If this attribute is not set then only a single unicast SoAdSocketConnection shall be created unless the ProvidedServiceInstance/ConsumedServiceInstance refer to statically known remote Addresses via remoteUnicastAddress and/or remoteMulticastSubscriptionAddress. The remotePort of each created SoAdSocketConnection shall be set to 0 and the IP Address to ANY. Unicast and multicast SoAdSocketConnections based on remoteUnicastAddress and/or remote MulticastSubscriptionAddress: The relevant ApplicationEndpoint is referenced by the localUnicast Address reference from ProvidedServiceInstances/ConsumedServiceInstances. For each ProvidedServiceInstance/ConsumedServiceInstance that has a remoteUnicastAddress and/or remoteMulticastSubscriptionAddress defined one single SoAdSocketConnection shall be defined. The remotePort of each created SoAdSocketConnection shall be derived from the Application Endpoint/NetworkEndpoint combination that is referenced by the remoteUnicastAddress / remote MulticastSubscriptionAddress. Multicast SoAdSocketConnection: For each unique (wrt. the multicast address and port values) ApplicationEndpoint that points to a multicast NetworkEndpoint that is referenced by an Event Handler.eventMulticastAddress that in turn is contained by a ProvidedServiceInstances which references the ApplicationEndpoint associated with the SoAdSocketConnectionGroup create one multicast SoAdSocketConnection. StaticSocketConnection: If the SocketConnectionBundle was created for a SocketAddress containing one or more StaticSocketConnections, one SoAdSocketConnection container shall be created for each of the contained StaticSocketConnections.	full

BSW Module	BSW Context
SoAd	SoAd/SoAdConfig/SoAdSocketConnectionGroup/SoAdSocketProtocol/SoAdSocketTcp
BSW Parameter	**BSW Type**
SoAdSocketTcpTlsConnectionRef	ECUC-REFERENCE-DEF
BSW Description	
If set the TCP socket is assigned to a TLS connection. The SoAd need to call Tcpip_ChangeParameter with the reference to the TLS connection as the parameter.	
Template Description	
This meta-class has the ability to represent a crypto service mapping for the socket-based configuration of Transport Layer Security (TLS).	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoServiceMapping	
Mapping Rule	**Mapping Type**
Create this reference if there is an associated TcpIpTlsConnection derived out of the TlsCrypto ServiceMapping.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_SoAd_00163]

BSW Module	BSW Context		
SoAd	SoAd/SoAdConfig/SoAdSocketConnectionGroup/SoAdSocketProtocol		
BSW Parameter		**BSW Type**	
SoAdSocketUdp		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
Specifies that UDP is used as transport protocol for the socket connection group and parameters only related to UDP socket connections.			
Template Description			
An application endpoint is the endpoint on an Ecu in terms of application addressing (e.g. socket). The application endpoint represents e.g. the listen socket in client-server-based communication.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::ApplicationEndpoint			
Mapping Rule			**Mapping Type**
Server Ecu: SoAdSocketTcp shall be derived from the ApplicationEndpoint (TpConfiguration) that is referenced by a ProvidedServiceInstance in the role localUnicastAddress. SoAdSocketTcp shall be created if TcpTp is used as Transport Protocol. Client Ecu: SoAdSocketTcp shall be derived from the ApplicationEndpoint (TpConfiguration) that is referenced by a ConsumedServiceInstance in the role localUnicastAddress. SoAdSocketTcp shall be created if TcpTp is used as Transport Protocol.			full

SoAd	SoAd/SoAdConfig/SoAdSocketConnectionGroup/SoAdSocketProtocol/SoAdSocketUdp		
BSW Parameter		**BSW Type**	
SoAdSocketUdpChecksumEnabled		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Specifies if UDP checksum calculation shall be enabled (TRUE) or skipped (FALSE) on the related socket. FALSE implies that the upper layer of the socket connection is either capable to handle malformed messages or applies a checksum mechanism itself.			
Template Description			
Specifies if UDP checksum handling shall be enabled (udpChecksumEnabled) or skipped (udpChecksumDisabled) on the related socket connection.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SocketAddress.udpChecksumHandling			
Mapping Rule			**Mapping Type**
If udpChecksumHandling.udpChecksumEnabled is set the value shall be TRUE; if udpChecksum Handling.udpChecksumDisabled is set the value shall be FALSE;			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_SoAd_00159]

BSW Module	BSW Context	
SoAd	SoAd/SoAdConfig/SoAdSocketConnectionGroup/SoAdSocketProtocol/SoAdSocketUdp	
BSW Parameter		**BSW Type**
SoAdSocketUdpTriggerTimeout		ECUC-FLOAT-PARAM-DEF
BSW Description		

▽

△

Specifies the timeout in [s] a nPduUdpTxBuffer is waiting for a PDU with TriggerMode = TRIGGER_ALWAYS, i.e. when the timeout expires the nPduUdpTxBuffer is transmitted. Timer is reset after each UDP transmission. This optional parameter is only relevant if a nPduUdpTxBuffer is used.
Template Description
Defines the time in seconds which shall pass before a socket with Pdu collection enabled shall be transmitted to the lower layer after the first Pdu has been put into the socket buffer.
M2 Parameter
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SocketAddress.pduCollectionTimeout

Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**

SoAd	SoAd/SoAdConfig/SoAdSocketConnectionGroup/SoAdSocketProtocol/SoAdSocketUdp

BSW Parameter	**BSW Type**
SoAdSocketnPduUdpTxBufferMin	ECUC-INTEGER-PARAM-DEF

BSW Description
Specifies the amount of data in bytes (PDU data provided by the upper layer and PDU Header if used) the SoAd shall be able to buffer for data transmission via this socket connection in case the UDP message shall be buffered for transmission of multiple PDUs per UDP. Note: in case of a UDP socket and an upper layer with TP API is configured, the required buffer size can be determined automatically. This optional parameter is only relevant if a nPduUdpTxBuffer is used.
Template Description
Defines the maximum buffer size in Byte which shall be filled before a socket with Pdu collection enabled shall be transmitted to the lower layer.
M2 Parameter
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SocketAddress.pduCollectionMaxBufferSize

Mapping Rule	**Mapping Type**

BSW Module	BSW Context		
SoAd	SoAd/SoAdConfig/SoAdSocketRoute		
BSW Parameter		**BSW Type**	
SoAdRxSocketConnOrSocketConnBundleRef		ECUC-CHOICE-REFERENCE-DEF	
BSW Description			
Choice Reference to a SocketConnection or to a SocketConnectionGroup on which the PDU was received. The reference to a SocketConnectionGroup shall only be used for upper layers with IF API.			
Template Description			
SocketAddress.staticSocketConnection: Definition of a static SocketConnection. **ConsumedServiceInstance.localUnicastAddress:** The local address over which the CSI is consumed (udp, tcp or both). **ProvidedServiceInstance.localUnicastAddress:** The local address over which the PSI is provided (udp, tcp or both). **ConsumedEventGroup.eventMulticastAddress:** This reference defines the multicast address or a multicast address resource where the events of the event group are received. If the multicast address is determined via configuration and not at runtime via service discovery this reference points to the multicast address over which the events will be received. If the multicast address is determined at runtime via service discovery this reference shall be used to define the necessary local multicast address resources, i.e. RAM space in the TcpIp module in which the multicast address is stored at runtime. Please note that in this case the referenced address may be defined as ANY UDP port and ANY IP address since the multicast address will be received at runtime. If several multicast addresses are considered to be used the ConsumedEvent Group shall point to different ApplicationEndpoint objects to reserve the necessary resources in the configuration.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances::SocketAddress.staticSocketConnection, System Template::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedServiceInstance.localUnicastAddress, System Template::Fibex::Fibex4Ethernet::ServiceInstances::ProvidedServiceInstance.localUnicastAddress, System Template::Fibex::Fibex4Ethernet::ServiceInstances::ConsumedEventGroup.eventMulticastAddress			
Mapping Rule			**Mapping Type**

▽

△

SOME/IP Communication: The PduTriggering for which the SoAdSocketRoute is created is referenced by a SoConIPduIdentifier that in turn has a relationship to a PduActivationRoutingGroup. The PduActivationRoutingGroup is aggregated either by a ProvidedServiceInstance, a ConsumedServiceInstance, or a ConsumedEventGroup. In the first two cases, the local address is determined by ProvidedServiceInstance.localUnicastAddress and ConsumedServiceInstance.localUnicastAddress. For PduActivationRoutingGroups of ConsumedEventGroups that have the eventGroupControlType set to "activationUnicast", "triggerUnicast" or "activationAndTriggerUnicast" the local address is determined by ConsumedServiceInstance.localUnicastAddress of the ConsumedServiceInstance containing the ConsumedEventGroup. In this case the SoAdTxSocketConnOrSocketConnBundleRef shall refer to the SocketConnectionGroup container that was created for the determined local address. For PduActivationRoutingGroups of ConsumedEventGroups that have the eventGroupControlType set to "activationMulticast", the local address is determined by ConsumedEventGroup.eventMulticastAddress. The reference parameter shall refer to the SocketConnectionGroup container that was created for the determined local address. StaticSocketConnection: The PduTriggering for which the SoAdSocketRoute is created is referenced by a SoConIPduIdentifier that in turn has a relationship to a StaticSocketConnection. The StaticSocketConnection is aggregated by a SocketAddress for which the SocketConnectionGroup was created. If the SocketConnectionGroup contains two or more SocketConnections and the PDU shall be sent on all of them or the PDU shall be received from any of them, set the reference to the SoAdSocketConnectionGroup container. If the PDU shall be sent or received via exactly one SocketConnection of the SocketConnectionGroup, reference the corresponding SoAdSocketConnection container.	full
Mapping Status	**ECUC Parameter ID**

This attribute describes the required number of updates to the Time Base where the time difference to the previous value has to remain below StbMTimeLeapPastThreshold/StbMTimeLeapFutureThreshold until the TIMELEAP_PAST/TIMELEAP_FUTURE bit within timeBaseStatus of the Time Base is cleared.	
Template Description	
Defines the required number of updates to the Time Base where the time difference to the previous received value has to remain within the bounds of timeLeapFutureThreshold and timeLeapPastThreshold until that Time Base is considered healed.	
M2 Parameter	
SystemTemplate::GlobalTime::GlobalTimeSlave.`timeLeapHealingCounter`	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_StbM_00037]

BSW Module	**BSW Context**	
StbM	StbM/StbMSynchronizedTimeBase	
BSW Parameter		**BSW Type**
StbMIsSystemWideGlobalTimeMaster		ECUC-BOOLEAN-PARAM-DEF
BSW Description		
This parameter shall be set to true for a Global Time Master that acts as a system-wide source of time information with respect to Global Time. It is possible that several Global Time Masters exist that have set this parameter set to true because the Global Time Masters exist once per Global Time Domain and one ECU may own several Global Time Domains on different buses it is connected to.		
Template Description		
If set to TRUE, the GlobalTimeMaster is supposed to act as the root of global time information.		
M2 Parameter		
SystemTemplate::GlobalTime::GlobalTimeMaster.`isSystemWideGlobalTimeMaster`		
Mapping Rule		**Mapping Type**
1:1 mapping		full
Mapping Status		**ECUC Parameter ID**

C.58 TcpIp

BSW Module	**BSW Context**
TcpIp	TcpIp/TcpIpConfig/TcpIpCtrl
BSW Parameter	**BSW Type**
TcpIpIpFramePrioDefault	ECUC-INTEGER-PARAM-DEF
BSW Description	
Specifies the default value for the priority for all outgoing frames. Note: the value can be changed for each socket individually via TcpIp_ChangeParameter() service. If this optional parameter is not available, 0 is used as default priority.	
Template Description	
Standard output-priority outgoing Frames will be tagged with. Defines the priority that received frames are assigned together with the VLAN Id (defaultVlan). The values from 0 (best effort) to 7 (highest) are allowed. In case modifyVlan and an already tagged received frame, the actual priority of the received frame is not modified.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::VlanMembership.defaultPriority	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**

TcpIpIpV6ReassemblyBufferCount		ECUC-INTEGER-PARAM-DEF
BSW Description		

▽

△

Number of buffers that can be used for fragment reassembly. In case of a reassembly error or if not all fragments are received in time this buffer will be blocked until the specified "Fragment Reassembly Timeout" has been exceeded. A value of 0 disables fragment reassembly. [RFC8200 5. Packet Size Issues] "In order to send a packet larger than a path's MTU, a node may use the IPv6 Fragment header to fragment the packet at the source and have it reassembled at the destination(s). However, the use of such fragmentation is discouraged in any application that is able to adjust its packets to fit the measured path MTU (i.e., down to 1280 octets)."
Template Description
Number of buffers that can be used for fragment reassembly. In case of a reassembly error or if not all fragments are received in time this buffer will be blocked until the specified "Fragment Reassembly Timeout" has been exceeded. A value of 0 disables fragment reassembly.

BSW Module	**BSW Context**
TcpIp	TcpIp/TcpIpConfig/TcpIpTcpConfig

BSW Parameter	**BSW Type**
TcpIpTcpRetransmissionTimeout	ECUC-FLOAT-PARAM-DEF

BSW Description
Timeout in [s] before an unacknowledged TCP segment is sent again. If the timeout is disabled or set to INF, no TCP segments shall be retransmitted. Value can be overwritten by TcpIp_ChangeParameter() API for a particular connection. If TcpIpTcpMaxRetransmissionTimeout is enabled then TcpIpTcpRetransmissionTimeout or value overwritten by TcpIp_ChangeParameter() API is considered as initial value for first retransmission before the next valid acknowledgment arrives.
Template Description
Timeout in [s] before an unacknowledged TCP segment is sent again. If the timeout is disabled, no TCP segments shall be retransmitted.
M2 Parameter
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::TcpProps.tcpRetransmissionTimeout

TcpIpTlsCertificateIdentity		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container provides information about the certificates used for ciphersuites.			
Template Description			
TlsCryptoCipherSuite.remoteCertificate: This reference identifies the applicable remote certificate. **TlsCryptoCipherSuite.certificate:** This reference identifies the applicable local certificate.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.remoteCertificate, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.certificate			
Mapping Rule			**Mapping Type**
Create one container for each local/remote certificate pair (or single local or remote certificate) referenced from a TlsCryptoCipherSuite.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00240]

BSW Module	**BSW Context**	
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsCertificateIdentity	
BSW Parameter		**BSW Type**
TcpIpTlsCipherKeyMLocalCertificate		ECUC-REFERENCE-DEF

▽

△

BSW Description	
Reference to a KeyM certificate used to address the local certificate.	
Template Description	
This reference identifies the applicable local certificate.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.certificate	
Mapping Rule	**Mapping Type**
Reference to Representation of Local Certificate in KeyM. For servers configured if key exchange cipher suite is used, for clients only if key exchange cipher suite is used and TcpIpTlsConnection/ TcpIpTlsUseClientAuthenticationRequest is set to true.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00286]

BSW Module	BSW Context
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsCertificateIdentity
BSW Parameter	**BSW Type**
TcpIpTlsServerNameIdentification	ECUC-STRING-PARAM-DEF
BSW Description	
Defines a server identification name. If present, the name will be added as an extension with the "TLS client hello" handshake message. The TLS server will check for the name to identify the server certificate.	
Template Description	
Server Name Indication (SNI) is needed if the IP address hosts multiple servers (on the same port), each of them using a different certificate. If the client sends the SNI to the Server in the client hello, the server looks the SNI up in its certificate list and uses the certificate identified by the SNI.	
M2 Parameter	
SystemTemplate::SecureCommunication::CryptoServiceCertificate.serverNameIdentification	
Mapping Rule	**Mapping Type**

▽

△

Retrieve the CryptoServiceCertificate representing the certificate of the server from TlsCrypto CipherSuite. Use CryptoServiceCertificate.serverNameIdentification to configure TcpIpTlsServerName Identification that hints to the server certificate which needs identification. Server Name Indication (SNI) is needed if the IP address hosts multiple servers (on the same port), each of them using a different certificate. If the client sends the SNI to the Server in the client hello, the server looks the SNI up in its certificate list and uses the certificate identified by the SNI.	full

valid		[ECUC_TcpIp_00261]

BSW Module	**BSW Context**	
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsCiphersuiteWorker	
BSW Parameter		**BSW Type**
TcpIpTlsCipherEncryptKeyLength		ECUC-INTEGER-PARAM-DEF
BSW Description		
Defines the key length used for en- or decryption. The key length is valid for (symmetric) encryption and decryption.		
Template Description		
TlsCryptoCipherSuite.cipherSuiteId: Identification of the CipherSuite according to the IANA assignments list. **TlsCryptoCipherSuite.encryption:** This reference identifies the crypto service primitive for the execution of encryption.		
M2 Parameter		
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.encryption		
Mapping Rule		**Mapping Type**
Configure the byte length of the keys used for message encryption if the cipher suite represented by TlsCryptoCipherSuite supports encryption.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_TcpIp_00253]

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsCiphersuiteWorker		
BSW Parameter		**BSW Type**	
TcpIpTlsCipherMacKeyLength		ECUC-INTEGER-PARAM-DEF	
BSW Description			
Specifies the length of the MAC key			
Template Description			
TlsCryptoCipherSuite.cipherSuiteId: Identification of the CipherSuite according to the IANA assignments list. **TlsCryptoCipherSuite.authentication:** This reference identifies the crypto service primitive for the generation and verification of MACs.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.authentication			
Mapping Rule			**Mapping Type**
Configure the byte length of the keys used for message authentication by the cipher suite represented by TlsCryptoCipherSuite.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00257]

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsCiphersuiteWorker		
BSW Parameter		**BSW Type**	
TcpIpTlsCiphersuiteDefinitionRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to a ciphersuite definition container			
Template Description			
This meta-class represents a cipher suite for describing cryptographic operations in the context of establishing a connection of ApplicationEndpoints that is protected by TLS.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite			
Mapping Rule			**Mapping Type**
Reference the TcpIpTlsCiphersuiteDefinition container that has been created for the TlsCryptoCipherSuite element the TcpIpTlsCiphersuiteWorker container has been created for as well.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00250]

BSW Module	BSW Context	
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsCiphersuiteWorker	
BSW Parameter		**BSW Type**
TcpIpTlsConnectionHandshakeRef		ECUC-REFERENCE-DEF
BSW Description		
References the container that contains the jobs and keys for handshake operation. Referencing multiple handshake containers allow to share them between workers and to choose the next unused during the handshake.		
Template Description		

▽

TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.signatureScheme:** This reference points to the properties of a TLS Signature Scheme. **TlsCryptoCipherSuite.ellipticCurve:** This references point to the properties of elliptic curves.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.signatureScheme, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.ellipticCurve	
Mapping Rule	**Mapping Type**
Reference all TcpIpTlsHandshake containers created for the TlsCryptoCiphersuite this container has been created for as well.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00249]

BSW Module	**BSW Context**
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites
BSW Parameter	**BSW Type**
TcpIpTlsHandshake	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container provides information that is needed to process a handshake. It contains the appropriate references to jobs and keys of the CSM to perform the key exchange cryptographic for the ciphersuite and involved certificates.	
Template Description	
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.ellipticCurve:** This references point to the properties of elliptic curves. **TlsCryptoCipherSuite.signatureScheme:** This reference points to the properties of a TLS Signature Scheme.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.ellipticCurve, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.signatureScheme	
Mapping Rule	**Mapping Type**
Create one container for each TlsCryptoCipherSuite that is aggregated by any TlsCryptoServiceMapping of the configured EcuInstance if the TlsCryptoCipherSuite does not use key exchange. Create one container for each supported curve/signature scheme combination supported by any TlsCryptoCipherSuite that is aggregated by any TlsCryptoServiceMapping of the configured EcuInstance if the TlsCryptoCipherSuite is using key exchange.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00239]

BSW Module	**BSW Context**
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake
BSW Parameter	**BSW Type**
TcpIpTlsCsmHashVerifyJobRef	ECUC-REFERENCE-DEF

△

BSW Description	
Reference to a CSM job to perform the hash operation for the whole handshake.	
Template Description	
TlsCryptoCipherSuite.cipherSuiteId: Identification of the CipherSuite according to the IANA assignments list. **TlsCryptoCipherSuite.keyExchange:** This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange	
Mapping Rule	**Mapping Type**
Reference into Csm: Job for calculating Hash of Handshake Payload, can be derived from cipher suite id: PRF P_SHA256 per default, unless the cipher suite explicitly specifies a different PRF.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00265]

BSW Module	BSW Context	
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake	
BSW Parameter		**BSW Type**
TcpIpTlsCsmKeyExchangeCalcPubValJobRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to a CSM job to perform the DH Key Exchange algorithm operation		
Template Description		
TlsCryptoCipherSuite.cipherSuiteId: Identification of the CipherSuite according to the IANA assignments list. **TlsCryptoCipherSuite.keyExchange:** This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase.		
M2 Parameter		
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange		
Mapping Rule		**Mapping Type**
Reference into Csm: Job for calculating Public and private Key Pair for DH Key Exchange.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_TcpIp_00267]

BSW Module	BSW Context	
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake	
BSW Parameter		**BSW Type**

▽

△

TcpIpTlsCsmKeyExchangeCalcSecretJobRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to a CSM job to perform the Key Exchange algorithm operation	
Template Description	
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.cipherSuiteId:** Identification of the CipherSuite according to the IANA assignments list.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId	
Mapping Rule	**Mapping Type**
Reference into Csm: Job for calculating shared secret in DH Key Exchange.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00269]

BSW Module	**BSW Context**
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake
BSW Parameter	**BSW Type**
TcpIpTlsCsmKeyExchangeDecryptJobRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to a CSM job to perform data decryption, e.g. with RSA key exchange operation.	
Template Description	
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.cipherSuiteId:** Identification of the CipherSuite according to the IANA assignments list.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId	
Mapping Rule	**Mapping Type**
Reference into Csm, only for ECDH_RSA, ECDHE_RSA cipher suite.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00276]

BSW Module	**BSW Context**
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake
BSW Parameter	**BSW Type**

▽

△

TcpIpTlsCsmKeyExchangeDecryptKeyRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to a CSM key to perform data decryption, e.g. with RSA, used for exchange operation.	
Template Description	
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.cipherSuiteId:** Identification of the CipherSuite according to the IANA assignments list.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId	
Mapping Rule	**Mapping Type**
Reference into Csm, only for ECDH_RSA, ECDHE_RSA cipher suite.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00277]

BSW Module	**BSW Context**
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake
BSW Parameter	**BSW Type**
TcpIpTlsCsmKeyExchangeEncryptJobRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to a CSM job to perform data encryption, e.g. with RSA key exchange operation.	
Template Description	
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.cipherSuiteId:** Identification of the CipherSuite according to the IANA assignments list.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId	
Mapping Rule	**Mapping Type**
Reference into Csm, only for ECDH_RSA, ECDHE_RSA cipher suite.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00274]

BSW Module	**BSW Context**

BSW Parameter	**BSW Type**

▽

△

TcpIpTlsCsmKeyExchangeEncryptKeyRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to a CSM key to perform data encryption, e.g. with RSA, used for exchange operation.	
Template Description	
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.cipherSuiteId:** Identification of the CipherSuite according to the IANA assignments list.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId	
Mapping Rule	**Mapping Type**
Reference into Csm, only for ECDH_RSA, ECDHE_RSA cipher suite.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00275]

BSW Module	**BSW Context**
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake
BSW Parameter	**BSW Type**
TcpIpTlsCsmKeyExchangeKeyRef	ECUC-REFERENCE-DEF
BSW Description	
Reference to a CSM key used for Diffie Hellman (DH) key exchange operation.	
Template Description	
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.cipherSuiteId:** Identification of the CipherSuite according to the IANA assignments list.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId	
Mapping Rule	**Mapping Type**
Reference into Csm: Key containing public/private Keys and Secret of DH Key Exchange.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00268]

BSW Module	**BSW Context**
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake

▽

△

TcpIpTlsCsmKeyExchangeSignatureGenerateJobRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to a CSM job to perform signature generation for DH operation		
Template Description		
TlsCryptoCipherSuite.signatureScheme: This reference points to the properties of a TLS Signature Scheme. **TlsCryptoCipherSuite.keyExchangeAuthentication:** This reference identifies the crypto service primitives for the generation and verification of signatures during the key exchange algorithm. **TlsCryptoServiceMapping.useClientAuthenticationRequest:** Defines if client authentication shall be applied for this TLS connection.		
M2 Parameter		
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.signatureScheme, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchangeAuthentication, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.useClientAuthenticationRequest		
Mapping Rule		**Mapping Type**
Configure this reference if the local node has to authenticate itself towards the remote node, taking into account the role of the local node (client or server) TlsCryptoServiceMapping.category and TlsCryptoServiceMapping.useClientAuthenticationRequest.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_TcpIp_00270]

BSW Module	**BSW Context**	
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake	
BSW Parameter		**BSW Type**
TcpIpTlsCsmKeyExchangeSignatureGenerateKeyRef		ECUC-REFERENCE-DEF
BSW Description		
Reference to a CSM key to perform signature generation for DH operation		
Template Description		
TlsCryptoCipherSuite.signatureScheme: This reference points to the properties of a TLS Signature Scheme. **TlsCryptoCipherSuite.keyExchangeAuthentication:** This reference identifies the crypto service primitives for the generation and verification of signatures during the key exchange algorithm. **TlsCryptoServiceMapping.useClientAuthenticationRequest:** Defines if client authentication shall be applied for this TLS connection.		
M2 Parameter		
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.signatureScheme, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchangeAuthentication, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.useClientAuthenticationRequest		
Mapping Rule		**Mapping Type**
Configure this reference if the local node has to authenticate itself towards the remote node, taking into account the role of the local node (client or server) TlsCryptoServiceMapping.category and TlsCryptoServiceMapping.useClientAuthenticationRequest.		full
Mapping Status		**ECUC Parameter ID**

TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake		
BSW Parameter		**BSW Type**	
TcpIpTlsCsmKeyExchangeSignatureVerifyJobRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to a CSM job to perform signature verification for DH operation			
Template Description			
TlsCryptoCipherSuite.signatureScheme: This reference points to the properties of a TLS Signature Scheme. **TlsCryptoCipherSuite.keyExchangeAuthentication:** This reference identifies the crypto service primitives for the generation and verification of signatures during the key exchange algorithm. **TlsCryptoServiceMapping.useClientAuthenticationRequest:** Defines if client authentication shall be applied for this TLS connection.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.signatureScheme, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchangeAuthentication, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.useClientAuthenticationRequest			
Mapping Rule			**Mapping Type**
Configure this reference if the local node has to verify the authenticity of the remote node, taking into account the role of the local node (client or server) TlsCryptoServiceMapping.category and TlsCryptoServiceMapping.useClientAuthenticationRequest.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00272]

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake		
BSW Parameter		**BSW Type**	
TcpIpTlsCsmKeyExchangeSignatureVerifyKeyRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to a CSM key to perform signature verification for DH operation			
Template Description			
TlsCryptoCipherSuite.signatureScheme: This reference points to the properties of a TLS Signature Scheme. **TlsCryptoCipherSuite.keyExchangeAuthentication:** This reference identifies the crypto service primitives for the generation and verification of signatures during the key exchange algorithm. **TlsCryptoServiceMapping.useClientAuthenticationRequest:** Defines if client authentication shall be applied for this TLS connection.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.signatureScheme, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchangeAuthentication, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.useClientAuthenticationRequest			
Mapping Rule			**Mapping Type**
Configure this reference if the local node has to verify the authenticity of the remote node, taking into account the role of the local node (client or server) TlsCryptoServiceMapping.category and TlsCryptoServiceMapping.useClientAuthenticationRequest.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00273]

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake		
BSW Parameter		**BSW Type**	
TcpIpTlsCsmMasterSecretKeyRef		ECUC-REFERENCE-DEF	
BSW Description			
This is the reference to the master key that is calculated during the session.			
Template Description			
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.cipherSuiteId:** Identification of the CipherSuite according to the IANA assignments list.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId			
Mapping Rule			**Mapping Type**
Reference into Csm: Master secret key derived from the shared (PreMaster) Secret.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00266]

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake		
BSW Parameter		**BSW Type**	
TcpIpTlsCsmPrfMacJobRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to a CSM job to perform the PRF hash operation			
Template Description			
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.cipherSuiteId:** Identification of the CipherSuite according to the IANA assignments list.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId			
Mapping Rule			**Mapping Type**
Reference into Csm: Job for calculating the MasterSecret from the PreMaster Secret.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00262]

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsHandshake		
BSW Parameter		**BSW Type**	
TcpIpTlsCsmPrfMacKeyRef		ECUC-REFERENCE-DEF	
BSW Description			
Reference to a CSM key associated to the CSM job that performs the PRF hash operation			
Template Description			
TlsCryptoCipherSuite.keyExchange: This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoServiceMapping.keyExchange:** This reference identifies the shared(i.e. applicable for each of the aggregated cipher suites) crypto service primitive for the execution of key exchange during the handshake phase. **TlsCryptoCipherSuite.cipherSuiteId:** Identification of the CipherSuite according to the IANA assignments list.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.keyExchange, SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.cipherSuiteId			
Mapping Rule			**Mapping Type**
Reference into Csm: Key that is used for deriving the Master secret from the PreMaster Secret.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00263]

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites		
BSW Parameter		**BSW Type**	
TcpIpTlsPskIdentity		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container provides information about static definition of pre-shared keys. It is used during the handshake to negotiate pre-shared keys between a client and a server. Note: The callbacks for pre-shared keys are an alternative to the static definition. The callbacks allow to define the associated keys at runtime if pre-shared keys are used but no static definition is available. The container definition is used for static configuration.			
Template Description			
Pre-shared key identity shared during the handshake among the communication parties, to establish a TLS connection if the handshake is based on the existence of a pre-shared key.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite.pskIdentity			
Mapping Rule			**Mapping Type**
Create one container for each TlsPskIdentity element aggregated by any TlsCryptoCipherSuite that in turn is aggregated by any TlsCryptoServiceMapping of the configured EcuInstance.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00241]

BSW Module	BSW Context	
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsPskIdentity	
BSW Parameter		**BSW Type**
TcpIpTlsPresharedKeyCsmKeyRef		ECUC-REFERENCE-DEF

▽

△

BSW Description	
Reference to a CSM key associated to the CSM job that performs the PRF hash operation	
Template Description	
This element is used to describe the pre-shared key shared during the handshake among the communication parties, to establish a TLS connection if the handshake is based on the existence of a pre-shared key.	
M2 Parameter	
SystemTemplate::SecureCommunication::TlsPskIdentity	
Mapping Rule	**Mapping Type**
Reference into the Csm: Pre-Shared symmetric Key.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_TcpIp_00280]

BSW Module	BSW Context	
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsPskIdentity	
BSW Parameter	**BSW Type**	
TcpIpTlsPresharedKeyIdentity	ECUC-STRING-PARAM-DEF	
BSW Description		
This item provides the key identification. The TLS client selects the pre-shared key based on the identification hint provided by the server and returns the key identification name back to the server.		
Template Description		
This attribute provides the key identification.		
M2 Parameter		
SystemTemplate::SecureCommunication::TlsPskIdentity.pskIdentity		
Mapping Rule	**Mapping Type**	
1:1 mapping	full	
Mapping Status	**ECUC Parameter ID**	
valid	[ECUC_TcpIp_00284]	

BSW Module	BSW Context	
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsCiphersuites/TcpIpTlsPskIdentity	
BSW Parameter	**BSW Type**	
TcpIpTlsPresharedKeyIdentityHint	ECUC-STRING-PARAM-DEF	
BSW Description		
Provides the identity hint for a pre-shared key. This information is transmitted by the TLS Server to provide its identification to the TLS client. The TLS client uses the same information to select the pre-shared key.		
Template Description		
This attribute provides the identity hint for a pre-shared key.		
M2 Parameter		
SystemTemplate::SecureCommunication::TlsPskIdentity.pskIdentityHint		
Mapping Rule	**Mapping Type**	
1:1 mapping	full	
Mapping Status	**ECUC Parameter ID**	
valid	[ECUC_TcpIp_00279]	

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig		
BSW Parameter		**BSW Type**	
TcpIpTlsConnection		ECUC-PARAM-CONF-CONTAINER-DEF	
BSW Description			
This container defines the properties of a TLS connection			
Template Description			
This meta-class has the ability to represent a crypto service mapping for the socket-based configuration of Transport Layer Security (TLS).			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoServiceMapping			
Mapping Rule			**Mapping Type**
Create one container for each TlsCryptoServiceMapping of the configured EcuInstance.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00223]

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsConnection		
BSW Parameter		**BSW Type**	
TcpIpTlsCertificateIdentityRef		ECUC-REFERENCE-DEF	
BSW Description			
References the container that contains the certificate and identity information.			
Template Description			
This aggregation represents the collection of supported cipher suites.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoServiceMapping.tlsCipherSuite.certificate			
Mapping Rule			**Mapping Type**
References to all TcpIpTlsCertificateIdentity containers that were created for the TlsCryptoService Mapping the TcpIpTlsConnection container was created for.			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_TcpIp_00235]

BSW Module	BSW Context		
TcpIp	TcpIp/TcpIpConfig/TcpIpTlsConfig/TcpIpTlsConnection		
BSW Parameter		**BSW Type**	
TcpIpTlsConnectionCiphersuiteWorkerRef		ECUC-REFERENCE-DEF	
BSW Description			
References the container that contains the jobs and keys to process the application data.			
Template Description			
This meta-class represents a cipher suite for describing cryptographic operations in the context of establishing a connection of ApplicationEndpoints that is protected by TLS.			
M2 Parameter			
SystemTemplate::SecureCommunication::TlsCryptoCipherSuite			
Mapping Rule			**Mapping Type**
References to all TcpIpTlsCiphersuiteWorker containers that were created for the TlsCrypto ServiceMapping the TcpIpTlsConnection container was created for.			full

BSW Module	**BSW Context**
UdpNm	UdpNm/UdpNmGlobalConfig/UdpNmChannelConfig
BSW Parameter	**BSW Type**
UdpNmPduCbvPosition	ECUC-ENUMERATION-PARAM-DEF
BSW Description	

Defines the position of the control bit vector within the NM PACKET.
The value of the parameter represents the location of the control bit vector in the NM PACKET (UDPNM_PDU_BYTE_0 means byte 0, UDPNM_PDU_BYTE_1 means byte 1, UDPNM_PDU_OFF means the control bit vector is not part of the NM PACKET)
See also UdpNmPduNidPosition
if (UdpNmPduCbvPosition != UDPNM_PDU_OFF && UdpNmPduNidPosition != UDPNM_PDU_OFF) then UdpNmPduCbv Position != UdpNmPduNidPosition
if (UdpNmPduCbvPosition != UDPNM_PDU_OFF && UdpNmPduNidPosition == UDPNM_PDU_OFF) then UdpNmPduCbv Position = UDPNM_PDU_BYTE0	

Template Description	
Defines the position of the control bit vector within the Nm Pdu (Byte position). If this attribute is not configured, the Control Bit Vector is not used.	
M2 Parameter	
SystemTemplate::NetworkManagement::UdpNmCluster.nmCbvPosition	
Mapping Rule	**Mapping Type**
Derive byte position from nmCbvPosition attribute. If this optional attribute is missing set UDPNM_PDU_OFF as value.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_UdpNm_-00026]

BSW Module	**BSW Context**
UdpNm	UdpNm/UdpNmGlobalConfig/UdpNmChannelConfig
BSW Parameter	**BSW Type**
UdpNmPduNidPosition	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
Defines the position of the source node identifier within the NM PACKET. ImplementationType: UdpNm_PduPositionType The value of the parameter represents the location of the source node identifier in the NM PACKET (UDPNM_PDU_BYTE_0 means byte 0, UDPNM_PDU_BYTE_1 means byte 1, UDPNM_PDU_OFF means source node identifier is not part of the NM PACKET) See also UdpNmPduCbvPosition if (UdpNmPduNidPosition!= UDPNM_PDU_OFF && UdpNmPduCbvPosition != UDPNM_PDU_OFF) then UdpNmPduNidPosition != UdpNmPduCbvPosition if (UdpNmPduNidPosition != UDPNM_PDU_OFF && UdpNmPduCbvPosition == UDPNM_PDU_OFF) then UdpNmPduNid Position = UDPNM_PDU_BYTE0	

▽

△

Template Description	
Defines the byte position of the source node identifier within the NmPdu. If this attribute is not configured, the Node Identification is not used.	
M2 Parameter	
SystemTemplate::NetworkManagement::UdpNmCluster.nmNidPosition	
Mapping Rule	**Mapping Type**
Derive byte position from nmNidPosition attribute. If this optional attribute is missing set UDPNM_PDU_OFF as value.	full

UdpNm	UdpNm/UdpNmGlobalConfig		
BSW Parameter		**BSW Type**	
UdpNmUserDataEnabled		ECUC-BOOLEAN-PARAM-DEF	
BSW Description			
Pre-processor switch for enabling user data support. This parameter shall be derived from NmUserDataEnabled.			
Template Description			
Switch for enabling user data support.			
M2 Parameter			
SystemTemplate::NetworkManagement::NmEcu.nmUserDataEnabled			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_UdpNm_-00004]

C.60 WEth

BSW Module	BSW Context		
WEth	WEth/WEthConfigSet/WEthCtrlConfig		
BSW Parameter		**BSW Type**	
WEthCtrlPhyAddress		ECUC-STRING-PARAM-DEF	
BSW Description			
Specifies the unique 48-bit physical address (MAC address) of the controller in network byte order.			
Template Description			
Media Access Control address (MAC address) that uniquely identifies each EthernetCommunicationController in the network.			
M2 Parameter			
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetCommunicationController.macUnicastAddress			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_WEth_00020]

C.61 WEthTrcv

BSW Module	BSW Context	
WEthTrcv	WEthTrcv/WEthTrcvConfigSet/WEthTrcvConfig	
BSW Parameter		**BSW Type**

▽

△

WEthTrcvPhysLayerType	ECUC-ENUMERATION-PARAM-DEF
BSW Description	
Specifies the physical layer type of the Wireless Ethernet transceiver link.	
Template Description	
Specifies the physical layer type of the CouplingPort.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::CouplingPort.physicalLayerType	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_WEthTrcv_-00024]

BSW Module	**BSW Context**
WEthTrcv	WEthTrcv/WEthTrcvConfigSet/WEthTrcvConfig/WEthTrcvPhysLayerType
BSW Parameter	**BSW Type**
TRCV_PHYS_LAYER_TYPE_80211_P	ECUC-ENUMERATION-LITERAL-DEF
BSW Description	
802.11p physical layer	
Template Description	
Ethernet Standard (IEEE 802.11p) to support wireless communication in vehicular environments.	
M2 Parameter	
SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology::EthernetPhysicalLayerTypeEnum.iEEE802-11P	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	

C.62 Xcp

BSW Module	**BSW Context**
Xcp	Xcp/XcpConfig
BSW Parameter	**BSW Type**
XcpCommunicationChannel	ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description	
This container represents the configuration of the communication channel of XCP.	
Template Description	
This meta-class allows to describe the relationship between several PduTriggerings that are defined on the same Physical Channel, e.g. to create a link between Rx and Tx Pdu that are used for request/response.	
M2 Parameter	
SystemTemplate::GeneralPurposeConnection::GeneralPurposeConnection	
Mapping Rule	**Mapping Type**

▽

△

For each GeneralPurposeConnection of category XcpChannel one XcpCommunicationChannel shall be created.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Xcp_00183]

BSW Module	**BSW Context**	
Xcp	Xcp/XcpConfig	
BSW Parameter		**BSW Type**
XcpPdu		ECUC-CHOICE-CONTAINER-DEF
BSW Description		
Contains PDU information. A PDU may be either a transmission PDU or a reception PDU.		
Template Description		
This element is used for AUTOSAR Pdus without attributes that are routed by the PduR. Please note that the category name of such Pdus is standardized in the AUTOSAR System Template.		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::GeneralPurposeIPdu		
Mapping Rule		**Mapping Type**
Create this container if a GeneralPurposeIPdu with the category "Xcp" is defined in the Ecu Extract.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Xcp_00100]

BSW Module	**BSW Context**	
Xcp	Xcp/XcpConfig/XcpPdu	
BSW Parameter		**BSW Type**
XcpRxPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container specifies received PDUs.		
Template Description		
M2 Parameter		
SystemTemplate::Fibex::FibexCore::CoreCommunication::PduTriggering.iPduPort		
Mapping Rule		**Mapping Type**
The direction of the Pdu can be derived from the PduTriggering that refers to the GeneralPurpose Pdu that represents the XcpPdu.		full
Mapping Status		**ECUC Parameter ID**
valid		[ECUC_Xcp_00105]

BSW Module	**BSW Context**	
Xcp	Xcp/XcpConfig/XcpPdu	
BSW Parameter		**BSW Type**
XcpTxPdu		ECUC-PARAM-CONF-CONTAINER-DEF
BSW Description		
This container specifies transmission PDUs.		
Template Description		

▽

△

M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::PduTriggering.iPduPort	
Mapping Rule	**Mapping Type**
The direction of the Pdu can be derived from the PduTriggering that refers to the GeneralPurpose Pdu that represents the XcpPdu.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Xcp_00101]

C.63 Xfrm

BSW Module	**BSW Context**		
Xfrm	Xfrm/XfrmImplementationMapping		
BSW Parameter		**BSW Type**	
XfrmCSTransactionHandleImplementationDataTypeRef		ECUC-FOREIGN-REFERENCE-DEF	
BSW Description			
Reference to the ImplementationDataType with category STRUCTURE which defines the type of the C/S transaction handle. Setting this parameter basically instructs the RTE to pass a reference to a variable of exactly this ImplementationDataType as an additional argument to the called transformer function.			
Template Description			
A TransformationTechnology is a transformer inside a transformer chain.			
M2 Parameter			
SystemTemplate::Transformer::TransformationTechnology			
Mapping Rule			**Mapping Type**
1:1 mapping			full
Mapping Status			**ECUC Parameter ID**
valid			[ECUC_Xfrm_00021]

BSW Module	**BSW Context**		
Xfrm	Xfrm/XfrmImplementationMapping/XfrmSignal/XfrmSignalChoice/XfrmISignalGroupRefChoice		
BSW Parameter		**BSW Type**	
XfrmISignalGroupRef		ECUC-FOREIGN-REFERENCE-DEF	
BSW Description			
Reference to the ISignalGroup in the system description that transports the transformed data.			
Template Description			
SignalGroup of the Interaction Layer. The RTE supports a "signal fan-out" where the same System Signal Group is sent in different SignalIPdus to multiple receivers. An ISignalGroup refers to a set of ISignals that shall always be kept together. A ISignalGroup represents a COM Signal Group. Therefore it is recommended to put the ISignalGroup in the same Package as ISignals (see atp.recommendedPackage)			
M2 Parameter			
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignalGroup			
Mapping Rule			**Mapping Type**

▽

△

1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Xfrm_00010]

BSW Module	**BSW Context**
Xfrm	Xfrm/XfrmImplementationMapping/XfrmSignal/XfrmSignalChoice/XfrmISignalRefChoice
BSW Parameter	**BSW Type**
XfrmISignalRef	ECUC-FOREIGN-REFERENCE-DEF
BSW Description	
Reference to the ISignal in the system description that transports the transformed data.	
Template Description	
Signal of the Interaction Layer. The RTE supports a "signal fan-out" where the same System Signal is sent in different Signal IPdus to multiple receivers. To support the RTE "signal fan-out" each SignalIPdu contains ISignals. If the same System Signal is to be mapped into several SignalIPdus there is one ISignal needed for each ISignalToIPduMapping. ISignals describe the Interface between the Precompile configured RTE and the potentially Postbuild configured Com Stack (see ECUC Parameter Mapping). In case of the SystemSignalGroup an ISignal shall be created for each SystemSignal contained in the SystemSignalGroup.	
M2 Parameter	
SystemTemplate::Fibex::FibexCore::CoreCommunication::ISignal	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Xfrm_00008]

BSW Module	**BSW Context**
Xfrm	Xfrm/XfrmImplementationMapping
BSW Parameter	**BSW Type**
XfrmTransformationTechnologyRef	ECUC-FOREIGN-REFERENCE-DEF
BSW Description	
Reference to the TransformationTechnology in the DataTransformation of the system description for which the implementation (BswModuleEntry) shall be mapped.	
Template Description	
A TransformationTechnology is a transformer inside a transformer chain.	
M2 Parameter	
SystemTemplate::Transformer::TransformationTechnology	
Mapping Rule	**Mapping Type**
1:1 mapping	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Xfrm_00003]

BSW Module	**BSW Context**
Xfrm	Xfrm/XfrmImplementationMapping
BSW Parameter	**BSW Type**

▽

△

XfrmVariableDataPrototypeInstanceRef	ECUC-INSTANCE-REFERENCE-DEF
BSW Description	
Instance Reference to a VariableDataPrototype in case a dedicated transformer BswModuleEntry is required per VariableDataPrototype access.	
Template Description	
This attribute defines whether the Transformer has an internal state or not.	
M2 Parameter	
SystemTemplate::Transformer::TransformationTechnology.hasInternalState	
Mapping Rule	**Mapping Type**
If an ISignal with dataTypePolicy set to transformingISignal - is received by this EcuInstance and - one of the TransformerTechnologys in the transformerChain has TransformationTechnology.hasInternalState set to true and - the corresponding VariableDataPrototype is consumed via multiple RPorts then this XfrmVariableDataPrototypeInstanceRef shall be used.	full
Mapping Status	**ECUC Parameter ID**
valid	[ECUC_Xfrm_00011]

D Glossary

Artifact This is a Work Product Definition that provides a description and definition for tangible work product types. Artifacts may be composed of other artifacts ([49]).

At a high level, an artifact is represented as a single conceptual file.

AUTOSAR Tool This is a software tool which supports one or more tasks defined as AUTOSAR tasks in the methodology. Depending on the supported tasks, an AUTOSAR tool can act as an authoring tool, a converter tool, a processor tool or as a combination of those (see separate definitions).

AUTOSAR Authoring Tool An AUTOSAR Tool used to create and modify AUTOSAR XML Descriptions. Example: System Description Editor.

AUTOSAR Converter Tool An AUTOSAR Tool used to create AUTOSAR XML files by converting information from other AUTOSAR XML files. Example: ECU Flattener

AUTOSAR Definition This is the definition of parameters which can have values. One could say that the parameter values are Instances of the definitions. But in the meta model hierarchy of AUTOSAR, definitions are also instances of the meta model and therefore considered as a description. Examples for AUTOSAR definitions are: PortPrototype, PostBuildVariantCriterion, SwSystemconst.

AUTOSAR XML Description In AUTOSAR this means "filled Template". In fact an AUTOSAR XML description is the XML representation of an AUTOSAR model.

The AUTOSAR XML description can consist of several files. Each individual file represents an AUTOSAR partial model and shall validate successfully against the AUTOSAR XML schema.

AUTOSAR Meta-Model This is an UML2.0 model that defines the language for describing AUTOSAR systems. The AUTOSAR meta-model is an UML representation of the AUTOSAR templates. UML2.0 class diagrams are used to describe the attributes and their interrelationships. Stereotypes, UML tags and OCL expressions (object constraint language) are used for defining specific semantics and constraints.

AUTOSAR Meta-Model Tool The AUTOSAR Meta-Model Tool is the tool that generates different views (class tables, list of constraints, diagrams, XML Schema etc.) on the AUTOSAR meta-model.

AUTOSAR Model This is a representation of an AUTOSAR product. The AUTOSAR model represents aspects suitable to the intended use according to the AUTOSAR methodology.

Strictly speaking, this is an instance of the AUTOSAR meta-model. The information contained in the AUTOSAR model can be anything that is representable according to the AUTOSAR meta-model.

AUTOSAR Partial Model In AUTOSAR, the possible partitioning of models is marked in the meta-model by ≪atpSplitable≫. One partial model is represented in an AUTOSAR XML description by one file. The partial model does not need to fulfill all semantic constraints applicable to an AUTOSAR model.

AUTOSAR Processor Tool An AUTOSAR Tool used to create non-AUTOSAR files by processing information from AUTOSAR XML files. Example: RTE Generator

AUTOSAR Specification Element An AUTOSAR Specification Element is a named element that is part of an AUTOSAR specification. Examples: requirement, constraint, specification item, class or attribute in the meta model, methodology, deliverable, methodology activity, model element, bsw module etc.

AUTOSAR Template The term "Template" is used in AUTOSAR to describe the format different kinds of descriptions. The term template comes from the idea, that AUTOSAR defines a kind of form which shall be filled out in order to describe a model. The filled form is then called the description.

In fact the AUTOSAR templates are now defined as a meta-model.

AUTOSAR Validation Tool A specialized `AUTOSAR Tool` which is able to check an AUTOSAR model against the rules defined by a profile.

AUTOSAR XML Schema This is a W3C XML schema that defines the language for exchanging AUTOSAR models. This Schema is derived from the AUTOSAR meta-model. The AUTOSAR XML Schema defines the AUTOSAR data exchange format.

Blueprint This is a model from which other models can be derived by copy and refinement. Note that in contrast to meta model resp. types, this process is *not* an instantiation.

Instance Generally this is a particular exemplar of a model or of a type.

Life Cycle Life Cycle is the course of development/evolutionary stages of a model element during its life time.

Meta-Model This defines the building blocks of a model. In that sense, a Meta-Model represents the language for building models.

Meta-Data This includes pertinent information about data, including information about the authorship, versioning, access-rights, timestamps etc.

Model A Model is an simplified representation of reality. The model represents the aspects suitable for an intended purpose.

Partial Model This is a part of a model which is intended to be persisted in one particular artifact.

Pattern in GST This is an approach to simplify the definition of the meta model by applying a model transformation. This transformation creates an enhanced model out of an annotated model.

Profile Authoring Support Data Data that is used for efficient authoring of a profile. E.g. list of referable constraints, meta-classes, meta-attributes or other reusable model assets (blueprints)

Profile Authoring Tool A specialized AUTOSAR Tool which focuses on the authoring of profiles for data exchange points. It e.g. provides support for the creation of profiles from scratch, modification of existing profiles or composition of existing profiles.

Profile Compatibility Checker Tool A specialized AUTOSAR Tool which focuses on checking the compatibility of profiles for data exchange. Note that this compatibility check includes manual compatibility checks by engineers and automated assistance using more formal algorithms.

Profile Consistency Checker Tool A specialized AUTOSAR Tool which focuses on checking the consistency of profiles.

Property A property is a structural feature of an object. As an example a "connector" has the properties "receive port" and "send port"

Properties are made variant by the ≪atpVariation≫.

Prototype This is the implementation of a role of a type within the definition of another type. In other words a type may contain Prototypes that in turn are typed by "Types". Each one of these prototypes becomes an instance when this type is instantiated.

Type A type provides features that can appear in various roles of this type.

Value This is a particular value assigned to a "Definition".

Variability Variability of a system is its quality to describe a set of variants. These variants are characterized by variant specific property settings and / or selections. As an example, such a system property selection manifests itself in a particular "receive port" for a connection.

This is implemented using the ≪atpVariation≫.

Variant A system variant is a concrete realization of a system, so that all its properties have been set respectively selected. The software system has no variability anymore with respect to the binding time.

This is implemented using EvaluatedVariantSet.

Variation Binding A variant is the result of a variation binding process that resolves the variability of the system by assigning particular values/selections to all the system's properties.

This is implemented by VariationPoint.

Variation Binding Time The variation binding time determines the step in the methodology at which the variability given by a set of variable properties is resolved.

This is implemented by vh.LatestBindingtime at the related properties.

Variation Definition Time The variation definition time determines the step in the methodology at which the variation points are defined.

Variation Point A variation point indicates that a property is subject to variation. Furthermore, it is associated with a condition and a binding time which define the system context for the selection / setting of a concrete variant.

This is implemented by VariationPoint.

E History of Constraints and Specification Items

[TPS_SYST_01074]	E2E Protection in the E2E Wrapper
[TPS_SYST_01109]	RTE fan-out support for a SystemSignal
[TPS_SYST_01137]	Several DataMappings may be defined for the same SystemSignal
[TPS_SYST_01139]	Ecu Extract derived from System Description or System Extract covers exactly one EcuInstance
[TPS_SYST_02073]	EndToEndTransformationDescription.profileName
[TPS_SYST_02092]	Size of Array Length Fields
[TPS_SYST_02123]	Size of a length field for a chosen array
[TPS_SYST_02194]	Identification of E2E protected data in case of PROFILE_04, PROFILE_05, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_04m, PROFILE_07m, and PROFILE_44
[TPS_SYST_02197]	Assigning communication graphs to RTE Implementation Plug-Ins
[TPS_SYST_02234]	SOME/IP Service search
[TPS_SYST_02235]	ConsumedServiceInstance deployment
[TPS_SYST_02272]	IPsec Internet Key Exchange protocol configuration
[TPS_SYST_03038]	Definition of transmission triggers for translations with different sources
[TPS_SYST_05016]	Assignment of TLV data ids
[TPS_SYST_05025]	Standardized values of CryptoServicePrimitive.algorithmFamily and CryptoServiceKey.algorithmFamily

Table E.55: Changed Specification Items in R20-11

E.13.3 Deleted Specification Items in R20-11

Number	Heading
[TPS_SYST_02105]	ISignalGroup and ISignal referenced from ISignalTriggering

Table E.56: Deleted Specification Items in R20-11

E.13.4 Added Constraints in R20-11

Number	Heading
[constr_3600]	Setting of EthernetCommunicationController.slaveActAsPassiveCommunicationSlave
[constr_3601]	Mandatory attributes of EthernetWakeupSleepOnDatalineConfig
[constr_3602]	Existence of wakeupForwardLocalEnabled
[constr_3603]	Existence of wakeupLocalDurationTime
[constr_3604]	Existence of wakeupForwardRemoteEnabled
[constr_3605]	Existence of wakeupLocalDetectionTime
[constr_3606]	Values of wakeupLocalDurationTime and wakeupLocalDetectionTime
[constr_3607]	Existence of sleepRepetitionDelayOfSleepRequest
[constr_3608]	Existence of wakeupRepetitionDelayOfWakeupRequest
[constr_3609]	Values of wakeupLocalDurationTime in the context of a CouplingElement
[constr_3610]	Values of wakeupLocalDetectionTime in the context of a CouplingElement
[constr_3611]	Existence of EthernetCommunicationController.slaveQualifiedUnexpectedLinkDownTime
[constr_3615]	Existence of EthernetCluster.couplingPortSwitchoffDelay
[constr_3616]	Value of EthernetCluster.couplingPortSwitchoffDelay
[constr_3617]	Existence of EthernetCluster.couplingPortStartupActiveTime
[constr_3618]	Value of EthernetCluster.couplingPortStartupActiveTime
[constr_3620]	GlobalTimeDomain.networkSegmentId only applicable to GlobalTime sub domains
[constr_3621]	Value range of GlobalTimeDomain.networkSegmentId
[constr_5106]	ISignalGroup and ISignal referenced from ISignalTriggering
[constr_5109]	Conditions for the explicit mapping of an ISignal to the pncVector
[constr_5110]	Search for a collection of ServiceInstances is not supported
[constr_5111]	Existence of references TlvDataIdDefinition.tlvArgument, TlvDataIdDefinition.tlvRecordElement, and TlvDataIdDefinition.tlvImplementationDataTypeElement
[constr_5112]	ImplementationDataType needs to be defined if a "new-world" variable-size ApplicationArrayDataType is mapped to a single SystemSignal
[constr_5113]	Mapping of "old-world" variable size arrays to a single SystemSignal is not supported.

[TPS_SYST_02391]	Mapping of MOST FIBEX elements to AUTOSAR elements
[TPS_SYST_03005]	VLAN re-tagging
[TPS_SYST_03015]	Offset time domain requires synchronized time domain

Table E.81: Deleted Specification Items in R24-11

E.17.4 Added Constraints in R24-11

Number	Heading
[constr_3763]	Allowed value for maxDeltaCounter in the context of a profileName
[constr_3764]	Applicability of CouplingPort.macAddressVlanAssignment
[constr_3765]	Applicability of MacAddressVlanMembership.vlan
[constr_3766]	Valid MacAddressVlanMembership.vlan target EthernetPhysicalChannel
[constr_3767]	NmNode.nmVariant setting to slavePassive
[constr_3768]	NmNode.nmVariant setting to slaveActive
[constr_3769]	NmNode.nmVariant setting to full
[constr_3770]	NmNode.nmVariant setting to passive
[constr_3771]	Range of NmCluster.nmLightTimeout
[constr_3779]	Number of ISignal.receptionDefaultValue elements
[constr_3780]	ISignal.receptionDefaultValue definition in case that the SOME/IP Serializer receives less data than expected
[constr_3781]	Each PNC assigned to multiple PhysicalChannels shall have a top level PNC-Coordinator
[constr_3782]	Consistent framePreemptionSupport setting in the scope of one CouplingPortConnection
[constr_3783]	Definition of CouplingPortFifo.trafficClassPreemptionSupport only in context of an Ethernet switch
[constr_3784]	Applicable CouplingPortFifo as predecessor for portScheduler = enhancedTrafficShaper
[constr_3785]	Exclusive definition of etsAvailableBandwidthInPercent or etsAvailableBandwidthInWeightValue
[constr_3786]	Consistent usage of either etsAvailableBandwidthInPercent or etsAvailableBandwidthInWeightValue for portScheduler = enhancedTrafficShaper
[constr_3787]	Existence of CouplingPortTrafficClassAssignment.trafficClass
[constr_3788]	Existence of CouplingPortFifo.assignedTrafficClass
[constr_3789]	Allowed values for CouplingPortFifo.assignedTrafficClass
[constr_3790]	Existence of CouplingPortDetails.defaultTrafficClass
[constr_3791]	Allowed values for CouplingPortDetails.defaultTrafficClass
[constr_3792]	FrameMapping between identical bus systems
[constr_9317]	StateDependentFirewall.firewallStateModeDeclaration reference restriction
[constr_9318]	Reception of CanFrameTriggerings with the same identifier by an EcuInstance
[constr_9319]	Value of BusMirrorChannelMappingCan.mirroringProtocol
[constr_9320]	Value of BusMirrorChannelMappingFlexray.mirroringProtocol
[constr_9321]	Same time base for all BusMirrorChannelMappings of one EcuInstance
[constr_9326]	Exclusive existence of ISignalTriggering.iSignal and ISignalTriggering.iSignalGroup

▽

△

Number	Heading
[constr_9330]	Derivation of network representation in case that several DataMappings are defined that map the same SystemSignal to different VariableDataPrototypes
[constr_9331]	E2E protection of a ClientServerOperation
[constr_9332]	Existence of J1939TpConnection.tpProtocolType
[constr_9333]	FibexElements in ECU_EXTRACT
[constr_9343]	Allowed J1939ProtectedIPdu.payload reference target
[constr_9346]	Existence of EthernetVlanTranslationTable.translatedVlanId
[constr_9347]	Range of EthernetVlanTranslationTable.ingressVlanId and EthernetVlanTranslationTable.translatedVlanId
[constr_9348]	EthernetVlanTranslationTable.translatedVlanId and vlanMembership

Table E.82: Added Constraints in R24-11

E.17.5 Changed Constraints in R24-11

Number	Heading
[constr_1001]	Value of dataId shall be unique
[constr_1002]	End-to-end protection does not support n:1 communication
[constr_3153]	E2E header field reservation required by COM Based transformer
[constr_3163]	EndToEndTransformationISignalProps.minDataLength and EndToEndTransformationISignalProps.maxDataLength in PROFILE_04, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_04m, PROFILE_07m, PROFILE_08m, PROFILE_44, PROFILE_44m, and PROFILE_76
[constr_3164]	EndToEndTransformationISignalProps.dataLength in PROFILE_04, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_04m, PROFILE_07m, PROFILE_08m, PROFILE_44, PROFILE_44m, and PROFILE_76
[constr_3167]	Effect of EndToEndTransformationDescription.upperHeaderBitsToShift value in PROFILE_04, PROFILE_05, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_04m, PROFILE_07m, PROFILE_08m, PROFILE_44, PROFILE_44m and PROFILE_76
[constr_3169]	EndToEndTransformationDescription.offset value in PROFILE_02, PROFILE_22 and PROFILE_76
[constr_3174]	EndToEndTransformationDescription settings not allowed in PROFILE_04, PROFILE_05, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_11, PROFILE_22, PROFILE_04m, PROFILE_07m, PROFILE_08m, PROFILE_44, PROFILE_44m and PROFILE_76
[constr_3186]	Multiplicity of EndToEndTransformationDescription.dataIdMode in PROFILE_02, PROFILE_04, PROFILE_05, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_22, PROFILE_04m, PROFILE_07m, PROFILE_08m, PROFILE_44, PROFILE_44m, PROFILE_76

▽

△

Number	Heading
[constr_3188]	Multiplicity of EndToEndTransformationDescription.counterOffset in PROFILE_02, PROFILE_04, PROFILE_05, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_22, PROFILE_04m, PROFILE_07m, PROFILE_08m, PROFILE_44, PROFILE_44m, PROFILE_76
[constr_3190]	Multiplicity of EndToEndTransformationDescription.crcOffset in PROFILE_02, PROFILE_04, PROFILE_05, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_22, PROFILE_04m, PROFILE_07m, PROFILE_08m, PROFILE_44, PROFILE_44m, PROFILE_76
[constr_3192]	Multiplicity of EndToEndTransformationDescription.dataIdNibbleOffset in PROFILE_02, PROFILE_04, PROFILE_05, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_22, PROFILE_04m, PROFILE_07m, PROFILE_08m, PROFILE_44, PROFILE_44m and PROFILE_76 or dataIdMode different from lower12Bit
[constr_3194]	Multiplicity of EndToEndTransformationDescription.offset in PROFILE_02, PROFILE_04, PROFILE_05, PROFILE_06, PROFILE_07, PROFILE_08, PROFILE_22, PROFILE_04m, PROFILE_07m, PROFILE_08m, PROFILE_44, PROFILE_44m, PROFILE_76
[constr_3257]	TimeSyncTechnology of servers and clients in a time synchronized network.
[constr_3267]	PduTriggerings in Service Discovery StaticSocketConnections
[constr_3268]	Service Discovery StaticSocketConnection aggregation by a SocketAddress
[constr_3269]	Service Discovery StaticSocketConnection remoteAddress reference to a TpPort
[constr_3270]	Service Discovery SocketConnection remoteAddress reference to an IP Address
[constr_3272]	SoConIPduIdentifier.headerId setting for SD StaticSocketConnections
[constr_3273]	Service Discovery multicast StaticSocketConnection's aggregation by an ApplicationEndpoint
[constr_3274]	Service Discovery unicast StaticSocketConnection's aggregation by an ApplicationEndpoint
[constr_3519]	Value of category of GlobalTimeDomain
[constr_3600]	Setting of EthernetCommunicationController.slaveActAsPassiveCommunicationSlave
[constr_3697]	Latest existence time of CanControllerXlConfiguration and CanControllerXlConfigurationRequirements
[constr_3714]	Multiple top level PNC-coordinators shall be allowed
[constr_3716]	SecuredIPdu.dynamicRuntimeLengthHandling for dynamic length Pdus
[constr_5049]	Ethernet switch packet to traffic class assignment restriction
[constr_5091]	Relevance of tcpRole attribute
[constr_5105]	Mapping of Pdu with dynamic length in a FlexrayFrame
[constr_5168]	pncGatewayType passive and connected ECUs
[constr_5221]	Multiplicity of EndToEndTransformationISignalProps.sourceId in PROFILE_01, PROFILE_02, PROFILE_04, PROFILE_05, PROFILE_06, PROFILE_07, PROFILE_11, PROFILE_22, and PROFILE_76

▽

F Mentioned Class Tables

For the sake of completeness, this chapter contains a set of class tables representing meta-classes mentioned in the context of this document but which are not contained directly in the scope of describing specific meta-model semantics.

Class	***ARElement*** (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::ARPackage			
Note	An element that can be defined stand-alone, i.e. without being part of another element (except for packages of course).			
Base	*ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Subclasses	AclObjectSet, AclOperation, AclPermission, AclRole, AliasNameSet, ApplicabilityInfoSet, ApplicationPartition, *AutosarDataType*, *BaseType*, BlueprintMappingSet, BswEntryRelationshipSet, BswModuleDescription, BswModuleEntry, BuildActionManifest, CalibrationParameterValueSet, ClientIdDefinitionSet, ClientServerInterfaceToBswModuleEntryBlueprintMapping, Collection, CompuMethod, ConsistencyNeedsBlueprintSet, ConstantSpecification, ConstantSpecificationMappingSet, CpSoftwareCluster, CpSoftwareClusterBinaryManifestDescriptor, CpSoftwareClusterMappingSet, CpSoftwareClusterResourcePool, CryptoEllipticCurveProps, CryptoServiceCertificate, CryptoServiceKey, CryptoServicePrimitive, CryptoServiceQueue, CryptoSignatureScheme, DataConstr, DataExchangePoint, DataTransformationSet, DataTypeMappingSet, DdsCpConfig, *DiagnosticCommonElement*, DiagnosticConnection, DiagnosticContributionSet, DltContext, DltEcu, Documentation, E2EProfileCompatibilityProps, EcucDefinitionCollection, EcucDestinationUriDefSet, EcucModuleConfigurationValues, EcucModuleDef, EcucValueCollection, EndToEndProtectionSet, EthIpProps, EthTcpIpIcmpProps, EthTcpIpProps, EvaluatedVariantSet, FMFeature, FMFeatureMap, FMFeatureModel, FMFeatureSelectionSet, FirewallRule, FlatMap, GeneralPurposeConnection, HwCategory, HwElement, HwType, *IEEE1722TpConnection*, IPSecConfigProps, IPv6ExtHeaderFilterSet, *IdsCommonElement*, IdsDesign, *Implementation*, ImpositionTimeDefinitionGroup, InterpolationRoutineMappingSet, J1939ControllerApplication, KeywordSet, LifeCycleInfoSet, LifeCycleStateDefinitionGroup, LogAndTraceMessageCollectionSet, MacSecGlobalKayProps, MacSecParticipantSet, McFunction, McGroup, ModeDeclarationGroup, ModeDeclarationMappingSet, OsTaskProxy, PhysicalDimension, PhysicalDimensionMappingSet, *PortInterface*, PortInterfaceMappingSet, PortPrototypeBlueprint, PostBuildVariantCriterion, PostBuildVariantCriterionValueSet, PredefinedVariant, RapidPrototypingScenario, SdgDef, *SecureComProps*, SignalServiceTranslationPropsSet, SomeipSdClientEventGroupTimingConfig, SomeipSdClientServiceInstanceConfig, SomeipSdServerEventGroupTimingConfig, SomeipSdServerServiceInstanceConfig, SwAddrMethod, SwAxisType, SwComponentMappingConstraints, *SwComponentType*, SwRecordLayout, SwSystemconst, SwSystemconstantValueSet, SwcBswMapping, System, SystemSignal, SystemSignalGroup, TDCpSoftwareClusterMappingSet, TcpOptionFilterSet, *TimingExtension*, TlsConnectionGroup, TlvDataIdDefinitionSet, TransformationPropsSet, Unit, UnitGroup, *UploadablePackageElement*, ViewMapSet			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
–	–	–	–	–

Table F.1: ARElement

Class	**ARPackage**			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::ARPackage			
Note	AUTOSAR package, allowing to create top level packages to structure the contained ARElements. ARPackages are open sets. This means that in a file based description system multiple files can be used to partially describe the contents of a package. This is an extended version of MSR's SW-SYSTEM.			
Base	*ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	ARPackage.arPackage, AUTOSAR.arPackage			
Attribute	**Type**	**Mult.**	**Kind**	**Note**

▽

△

Class	ARPackage			
arPackage	ARPackage	*	aggr	This represents a sub package within an ARPackage, thus allowing for an unlimited package hierarchy. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=arPackage.shortName, arPackage.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime xml.sequenceOffset=30
element	PackageableElement	*	aggr	Elements that are part of this package **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=element.shortName, element.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=20
referenceBase	ReferenceBase	*	aggr	This denotes the reference bases for the package. This is the basis for all relative references within the package. The base needs to be selected according to the base attribute within the references. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=referenceBase.shortLabel xml.sequenceOffset=10

Table F.2: ARPackage

Class	AUTOSAR			
Package	M2::AUTOSARTemplates::AutosarTopLevelStructure			
Note	Root element of an AUTOSAR description, also the root element in corresponding XML documents. **Tags:** xml.globalElement=true			
Base	*ARObject*			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
adminData	AdminData	0..1	aggr	This represents the administrative data of an Autosar file. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=adminData xml.sequenceOffset=10
arPackage	ARPackage	*	aggr	This is the top level package in an AUTOSAR model. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=arPackage.shortName, arPackage.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime xml.sequenceOffset=30
fileInfoComment	FileInfoComment	0..1	aggr	This represents a possibility to provide a structured comment in an AUTOSAR file. **Stereotypes:** atpStructuredComment **Tags:** xml.roleElement=true xml.sequenceOffset=-10 xml.typeElement=false

▽

△

Class	AUTOSAR			
introduction	DocumentationBlock	0..1	aggr	This represents an introduction on the Autosar file. It is intended for example to represent disclaimers and legal notes. **Tags:** xml.sequenceOffset=20

Table F.3: AUTOSAR

Class	**AdminData**			
Package	M2::MSR::AsamHdo::AdminData			
Note	AdminData represents the ability to express administrative information and custom extensions for an element. This administration information is to be treated as meta-data such as revision id or state of the file. There are basically the following kinds of meta-data • The language and/or used languages. • Revision information covering e.g. revision number, state, release date, changes. Note that this information can be given in general as well as related to a particular company. • Document meta-data specific for a company Beside that a custom extension of model-data is possible by • Special data			
Base	*ARObject*			
Aggregated by	AUTOSAR.adminData, *Describable*.adminData, *Identifiable*.adminData			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
docRevision (ordered)	DocRevision	*	aggr	This allows to denote information about the current revision of the object. Note that information about previous revisions can also be logged here. The entries shall be sorted descendant by date in order to reflect the history. Therefore the most recent entry representing the current version is denoted first. **Tags:** xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=50 xml.typeElement=false xml.typeWrapperElement=false
language	LEnum	0..1	attr	This attribute specifies the master language of the document or the document fragment. The master language is the one in which the document is maintained and from which the other languages are derived from. In particular in case of inconsistencies, the information in the master language is priority. **Tags:** xml.sequenceOffset=20
sdg	Sdg	*	aggr	This property allows to keep special data which is not represented by the standard model. It can be utilized to keep e.g. tool specific data. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=sdg.sdgCaption.shortName xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=60 xml.typeElement=false xml.typeWrapperElement=false

▽

△

Class	**AdminData**			
usedLanguages	MultiLanguagePlainText	0..1	aggr	This property specifies the languages which are provided in the document. Therefore it should only be specified in the top level admin data. For each language provided in the document there is one entry in MultilanguagePlain Text. The content of each entry can be used for illustration of the language. The used language itself depends on the language attribute in the entry. **Tags:** xml.sequenceOffset=30

Table F.4: AdminData

Class	**AnyInstanceRef**			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::AnyInstanceRef			
Note	Describes a reference to any instance in an AUTOSAR model. This is the most generic form of an instance ref. Refer to the superclass notes for more details.			
Base	*ARObject*, *AtpInstanceRef*			
Aggregated by	ApmcInstanceReferenceValue.value, ApmcUpstreamDocInstanceReferenceValue.value, ApmcUri InstanceReferenceValue.value, Collection.collectedInstance, Collection.sourceInstance, Documentation Context.feature, EcucInstanceReferenceValue.value, FlatInstanceDescriptor.ecuExtractReference, Flat InstanceDescriptor.upstreamReference, RptContainer.byPassPoint, RptHook.rptArHook, SecurityEvent ReportInstanceValue.object, ViewMap.firstElementInstance, ViewMap.secondElementInstance			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
base	AtpClassifier	1	ref	This is the base from which navigation path begins. **Stereotypes:** atpDerived
contextElement (ordered)	AtpFeature	*	ref	This is one step in the navigation path specified by the instance ref.
target	AtpFeature	1	ref	This is the target of the instance ref.

Table F.5: AnyInstanceRef

Class	**ApplicationArrayDataType**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	An application data type which is an array, each element is of the same application data type. **Tags:** atp.recommendedPackage=ApplicationDataTypes			
Base	*ARElement*, *ARObject*, *ApplicationCompositeDataType*, *ApplicationDataType*, *AtpBlueprint*, *Atp Blueprintable*, *AtpClassifier*, *AtpType*, *AutosarDataType*, *CollectableElement*, *Identifiable*, *Multilanguage Referrable*, *PackageableElement*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
dynamicArray SizeProfile	String	0..1	attr	Specifies the profile which the array will follow if it is a variable size array.
element	ApplicationArray Element	0..1	aggr	This association implements the concept of an array element. That is, in some cases it is necessary to be able to identify single array elements, e.g. as input values for an interpolation routine.

Table F.6: ApplicationArrayDataType

Class	***ApplicationCompositeDataType*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	Abstract base class for all application data types composed of other data types.			
Base	*ARElement*, *ARObject*, *ApplicationDataType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *AutosarDataType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Subclasses	ApplicationArrayDataType, ApplicationRecordDataType			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
–	–	–	–	–

Table F.7: ApplicationCompositeDataType

Class	***ApplicationCompositeElementDataPrototype*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	This class represents a data prototype which is aggregated within a composite application data type (record or array). It is introduced to provide a better distinction between target and context in instance Refs.			
Base	*ARObject*, *AtpFeature*, *AtpPrototype*, *DataPrototype*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	ApplicationArrayElement, ApplicationRecordElement			
Aggregated by	*AtpClassifier*.atpFeature			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
type	ApplicationDataType	0..1	tref	This represents the corresponding data type. **Stereotypes:** isOfType

Table F.8: ApplicationCompositeElementDataPrototype

Class	***ApplicationDataType*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	ApplicationDataType defines a data type from the application point of view. Especially it should be used whenever something "physical" is at stake. An ApplicationDataType represents a set of values as seen in the application model, such as measurement units. It does not consider implementation details such as bit-size, endianess, etc. It should be possible to model the application level aspects of a VFB system by using ApplicationData Types only.			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *AutosarDataType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Subclasses	*ApplicationCompositeDataType*, ApplicationPrimitiveDataType			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
–	–	–	–	–

Table F.9: ApplicationDataType

Class	**ApplicationError**
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface
Note	This is a user-defined error that is associated with an element of an AUTOSAR interface. It is specific for the particular functionality or service provided by the AUTOSAR software component.
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*

▽

△

Class	ApplicationError			
Aggregated by	ClientServerInterface.possibleError			
Attribute	Type	Mult.	Kind	Note
errorCode	Integer	0..1	attr	The RTE generator is forced to assign this value to the corresponding error symbol. Note that for error codes certain ranges are predefined (see RTE specification).

Table F.10: ApplicationError

Class	ApplicationPrimitiveDataType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	A primitive data type defines a set of allowed values. **Tags:** atp.recommendedPackage=ApplicationDataTypes			
Base	*ARElement*, *ARObject*, *ApplicationDataType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *AutosarDataType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table F.11: ApplicationPrimitiveDataType

Class	ApplicationRecordDataType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	An application data type which can be decomposed into prototypes of other application data types. **Tags:** atp.recommendedPackage=ApplicationDataTypes			
Base	*ARElement*, *ARObject*, *ApplicationCompositeDataType*, *ApplicationDataType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *AutosarDataType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
element (ordered)	ApplicationRecordElement	*	aggr	Specifies an element of a record. The aggregation of ApplicationRecordElement is subject to variability with the purpose to support the conditional existence of elements inside a ApplicationrecordDataType. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=element.shortName, element.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Table F.12: ApplicationRecordDataType

Class	ApplicationRecordElement
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes
Note	Describes the properties of one particular element of an application record data type.
Base	*ARObject*, *ApplicationCompositeElementDataPrototype*, *AtpFeature*, *AtpPrototype*, *DataPrototype*, *Identifiable*, *MultilanguageReferrable*, *Referrable*

▽

△

Class	**ApplicationRecordElement**			
Aggregated by	ApplicationRecordDataType.element, *AtpClassifier*.atpFeature			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
isOptional	Boolean	0..1	attr	This attribute represents the ability to declare the enclosing ApplicationRecordElement as optional. This means the that, at runtime, the ApplicationRecord Element may or may not have a valid value and shall therefore be ignored. The underlying runtime software provides means to set the ApplicationRecordElement as not valid at the sending end of a communication and determine its validity at the receiving end.

Table F.13: ApplicationRecordElement

Class	**ApplicationSwComponentType**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	The ApplicationSwComponentType is used to represent the application software. **Tags:** atp.recommendedPackage=SwComponentTypes			
Base	*ARElement*, *ARObject*, *AtomicSwComponentType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *Atp Type*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *Sw ComponentType*			
Aggregated by	ARPackage.element			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
–	–	–	–	–

Table F.14: ApplicationSwComponentType

Class	**ArgumentDataPrototype**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	An argument of an operation, much like a data element, but also carries direction information and is owned by a particular ClientServerOperation.			
Base	*ARObject*, *AtpFeature*, *AtpPrototype*, *AutosarDataPrototype*, *DataPrototype*, *Identifiable*, *Multilanguage Referrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, ClientServerOperation.argument			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
direction	ArgumentDirection Enum	0..1	attr	This attribute specifies the direction of the argument prototype.
serverArgument ImplPolicy	ServerArgumentImpl PolicyEnum	0..1	attr	This defines how the argument type of the servers RunnableEntity is implemented. If the attribute is not defined this has the same semantics as if the attribute is set to the value useArgumentType for primitive arguments and structures.

Table F.15: ArgumentDataPrototype

Enumeration	**ArgumentDirectionEnum**
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes
Note	Use cases: • Arguments in ClientServerOperation can have different directions that need to be formally indicated because they have an impact on how the function signature looks like eventually. • Arguments in BswModuleEntry already determine a function signature, but the direction is used to specify the semantics, especially of pointer arguments.
Aggregated by	ArgumentDataPrototype.direction, SwServiceArg.direction
Literal	*Description*
in	The argument value is passed to the callee. **Tags:** atp.EnumerationLiteralIndex=0
inout	The argument value is passed to the callee but also passed back from the callee to the caller. **Tags:** atp.EnumerationLiteralIndex=1
out	The argument value is passed from the callee to the caller. **Tags:** atp.EnumerationLiteralIndex=2

Table F.16: ArgumentDirectionEnum

Class	**ArrayValueSpecification**			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	Specifies the values for an array.			
Base	*ARObject*, *CompositeValueSpecification*, *ValueSpecification*			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element, CalibrationParameterValue.applInitValue, CalibrationParameterValue.implInitValue, CompositeRuleBasedValueSpecification.argument, ConstantSpecification.valueSpec, CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.receptionDefaultValue, ISignal.timeoutSubstitutionValue, NonqueuedReceiverComSpec.initValue, NonqueuedReceiverComSpec.timeoutSubstitutionValue, NonqueuedSenderComSpec.initValue, NvProvideComSpec.ramBlockInitValue, NvProvideComSpec.romBlockInitValue, NvRequireComSpec.initValue, ParameterDataPrototype.initValue, ParameterProvideComSpec.initValue, ParameterRequireComSpec.initValue, PersistencyDataRequiredComSpec.initValue, PersistencyKeyValuePair.initValue, PortDefinedArgumentValue.value, PortPrototypeBlueprintInitValue.value, RecordValueSpecification.field, SomeipEventDeployment.eventReceptionDefaultValue, *StateManagementCompareCondition*.compareValue, SwDataDefProps.invalidValue, UserDefinedEventDeployment.eventReceptionDefaultValue, VariableDataPrototype.initValue			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
element (ordered)	ValueSpecification	*	aggr	The value for a single array element. All ValueSpecifications aggregated by ArrayValueSpecification shall have the same structure. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=element, element.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
intendedPartialInitializationCount	PositiveInteger	0..1	attr	This attribute shall only have a meaning for dynamic arrays and shall be taken as a sanity check: the number filled in the attribute shall be identical to the number of ArrayValueSpecification.element. If the attribute does not exist it means that no partial initialization is intended.

Table F.17: ArrayValueSpecification

Class	**AssemblySwConnector**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	AssemblySwConnectors are exclusively used to connect SwComponentPrototypes in the context of a CompositionSwComponentType.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *SwConnector*			
Aggregated by	*AtpClassifier*.atpFeature, CompositionSwComponentType.connector			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
provider	AbstractProvidedPort Prototype	0..1	iref	Instance of providing port. **InstanceRef implemented by:** PPortInComposition InstanceRef
requester	AbstractRequiredPort Prototype	0..1	iref	Instance of requiring port. **InstanceRef implemented by:** RPortInComposition InstanceRef

Table F.18: AssemblySwConnector

Class	***AtomicSwComponentType*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	An atomic software component is atomic in the sense that it cannot be further decomposed and distributed across multiple ECUs.			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *SwComponentType*			
Subclasses	ApplicationSwComponentType, ComplexDeviceDriverSwComponentType, EcuAbstractionSwComponent Type, NvBlockSwComponentType, SensorActuatorSwComponentType, ServiceProxySwComponent Type, ServiceSwComponentType			
Aggregated by	ARPackage.element			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
internalBehavior	SwcInternalBehavior	0..1	aggr	The SwcInternalBehaviors owned by an AtomicSw ComponentType can be located in a different physical file. Therefore the aggregation is <<atpSplitable>>. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=internalBehavior.shortName, internal Behavior.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
symbolProps	SymbolProps	0..1	aggr	This represents the SymbolProps for the AtomicSw ComponentType. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=symbolProps.shortName

Table F.19: AtomicSwComponentType

Class	***AtpInstanceRef*** (abstract)
Package	M2::AUTOSARTemplates::GenericStructure::AbstractStructure
Note	An M0 instance of a classifier may be represented as a tree rooted at that instance, where under each node come the sub-trees representing the instances which act as features under that node. An instance ref specifies a navigation path from any M0 tree-instance of the base (which is a classifier) to a leaf (which is an instance of the target).
Base	*ARObject*

△

Class	***AtpInstanceRef*** (abstract)			
Subclasses	AnyInstanceRef, ApplicationCompositeElementInPortInterfaceInstanceRef, ComponentInCompositionInstanceRef, ComponentInSystemInstanceRef, *DataPrototypeInPortInterfaceInstanceRef*, DataPrototypeInSystemInstanceRef, InnerDataPrototypeGroupInCompositionInstanceRef, InnerPortGroupInCompositionInstanceRef, InnerRunnableEntityGroupInCompositionInstanceRef, InstanceEventInCompositionInstanceRef, ModeDeclarationGroupPrototypeInSystemInstanceRef, *ModeGroupInAtomicSwcInstanceRef*, ModeInBswModuleDescriptionInstanceRef, ModeInSwcInstanceRef, OperationArgumentInComponentInstanceRef, *OperationInAtomicSwcInstanceRef*, OperationInSystemInstanceRef, PModeInSystemInstanceRef, ParameterDataPrototypeInSystemInstanceRef, ParameterInAtomicSWCTypeInstanceRef, PortGroupInSystemInstanceRef, *PortInCompositionTypeInstanceRef*, RModeInAtomicSwcInstanceRef, RteEventInCompositionInstanceRef, RteEventInEcuInstanceRef, RteEventInSystemInstanceRef, RunnableEntityInCompositionInstanceRef, SwcServiceDependencyInSystemInstanceRef, *TriggerInAtomicSwcInstanceRef*, TriggerInSystemInstanceRef, VariableAccessInEcuInstanceRef, VariableDataPrototypeInCompositionInstanceRef, VariableDataPrototypeInSystemInstanceRef, VariableInAtomicSWCTypeInstanceRef, *VariableInAtomicSwcInstanceRef*, VariableInComponentInstanceRef			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
atpBase	AtpClassifier	1	ref	This is the base from which the navigaion path starts. **Stereotypes:** atpAbstract; atpDerived
atpContext Element (ordered)	AtpPrototype	*	ref	This is one particular step in the navigation path. **Stereotypes:** atpAbstract
atpTarget	AtpFeature	1	ref	This is the target of the instance ref. In other words it is the terminal of the navigation path. **Stereotypes:** atpAbstract

Table F.20: AtpInstanceRef

Class	***AutosarDataPrototype*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	Base class for prototypical roles of an AutosarDataType.			
Base	*ARObject*, *AtpFeature*, *AtpPrototype*, *DataPrototype*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	ArgumentDataPrototype, ParameterDataPrototype, VariableDataPrototype			
Aggregated by	*AtpClassifier*.atpFeature			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
type	AutosarDataType	0..1	tref	This represents the corresponding data type. **Stereotypes:** isOfType

Table F.21: AutosarDataPrototype

Class	***AutosarDataType*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	Abstract base class for user defined AUTOSAR data types for software.			
Base	*ARElement*, *ARObject*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Subclasses	*AbstractImplementationDataType*, *ApplicationDataType*			
Aggregated by	ARPackage.element			
Attribute	***Type***	***Mult.***	***Kind***	***Note***

▽

△

Class	*AutosarDataType* (abstract)			
swDataDef Props	SwDataDefProps	0..1	aggr	The properties of this AutosarDataType. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=swDataDefProps

Table F.22: AutosarDataType

Class	*BaseType* (abstract)			
Package	M2::MSR::AsamHdo::BaseTypes			
Note	This abstract meta-class represents the ability to specify a platform dependent base type.			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Packageable Element*, *Referrable*			
Subclasses	SwBaseType			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
baseType Definition	BaseTypeDefinition	1	aggr	This is the actual definition of the base type. **Tags:** xml.roleElement=false xml.roleWrapperElement=false xml.sequenceOffset=20 xml.typeElement=false xml.typeWrapperElement=false

Table F.23: BaseType

Class	**BaseTypeDirectDefinition**			
Package	M2::MSR::AsamHdo::BaseTypes			
Note	This BaseType is defined directly (as opposite to a derived BaseType)			
Base	*ARObject*, *BaseTypeDefinition*			
Aggregated by	*BaseType*.baseTypeDefinition			
Attribute	Type	Mult.	Kind	Note
baseType Encoding	BaseTypeEncoding String	0..1	attr	This specifies, how an object of the current BaseType is encoded, e.g. in an ECU within a message sequence. **Tags:** xml.sequenceOffset=90
baseTypeSize	PositiveInteger	0..1	attr	Describes the length of the data type specified in the container in bits. **Tags:** xml.sequenceOffset=70
byteOrder	ByteOrderEnum	0..1	attr	This attribute specifies the byte order of the base type. **Tags:** xml.sequenceOffset=110
memAlignment	PositiveInteger	0..1	attr	This attribute describes the alignment of the memory object in bits. E.g. "8" specifies, that the object in question is aligned to a byte while "32" specifies that it is aligned four byte. If the value is set to "0" the meaning shall be interpreted as "unspecified". **Tags:** xml.sequenceOffset=100

▽

△

Class	**BaseTypeDirectDefinition**			
native Declaration	NativeDeclarationString	0..1	attr	This attribute describes the declaration of such a base type in the native programming language, primarily in the Programming language C. This can then be used by a code generator to include the necessary declarations into a header file. For example BaseType with shortName: "MyUnsignedInt" native Declaration: "unsigned short" Results in typedef unsigned short MyUnsignedInt; If the attribute is not defined the referring Implementation DataTypes will not be generated as a typedef by RTE. If a nativeDeclaration type is given it shall fulfill the characteristic given by basetypeEncoding and baseType Size. This is required to ensure the consistent handling and interpretation by software components, RTE, COM and MCM systems. **Tags:** xml.sequenceOffset=120

Table F.24: BaseTypeDirectDefinition

Class	**BswInternalBehavior**			
Package	M2::AUTOSARTemplates::BswModuleTemplate::BswBehavior			
Note	Specifies the behavior of a BSW module or a BSW cluster w.r.t. the code entities visible by the BSW Scheduler. It is possible to have several different BswInternalBehaviors referring to the same BswModule Description.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *InternalBehavior*, *Multilanguage Referrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, BswModuleDescription.internalBehavior			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
arTypedPer Instance Memory	VariableDataPrototype	*	aggr	Defines an AUTOSAR typed memory-block that needs to be available for each instance of the Basic Software Module. The aggregation of arTypedPerInstanceMemory is subject to variability with the purpose to support variability in the Basic Software Module's implementations. Typically different algorithms in the implementation are requiring different number of memory objects. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=arTypedPerInstanceMemory.shortName, ar TypedPerInstanceMemory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
bswPerInstance MemoryPolicy	BswPerInstance MemoryPolicy	*	aggr	Policy for a arTypedPerInstanceMemory The policy selects the options of the Schedule Manager API generation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=bswPerInstanceMemoryPolicy, bswPer InstanceMemoryPolicy.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

▽

△

Class	**BswInternalBehavior**			
clientPolicy	BswClientPolicy	*	aggr	Policy for a requiredClientServerEntry. The policy selects the options of the Schedule Manager API generation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=clientPolicy, clientPolicy.variationPoint.short Label vh.latestBindingTime=preCompileTime
distinguished Partition	BswDistinguished Partition	*	aggr	Indicates an abstract partition context in which the enclosing BswModuleEntity can be executed. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=distinguishedPartition.shortName, distinguishedPartition.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=60
entity	BswModuleEntity	*	aggr	A code entity for which the behavior is described **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=entity.shortName, entity.variationPoint.short Label vh.latestBindingTime=preCompileTime xml.sequenceOffset=5
event	BswEvent	*	aggr	An event required by this module behavior. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=event.shortName, event.variationPoint.short Label vh.latestBindingTime=preCompileTime xml.sequenceOffset=10
exclusiveArea Policy	BswExclusiveArea Policy	*	aggr	Policy for an ExclusiveArea in this BswInternalBehavior. The policy selects the options of the Schedule Manager API generation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=exclusiveAreaPolicy, exclusiveArea Policy.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
includedData TypeSet	IncludedDataTypeSet	*	aggr	The includedDataTypeSet is used by a basic software module for its implementation. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=includedDataTypeSet
includedMode Declaration GroupSet	IncludedMode DeclarationGroupSet	*	aggr	This aggregation represents the included Mode DeclarationGroups **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=includedModeDeclarationGroupSet
internal TriggeringPoint	BswInternalTriggering Point	*	aggr	An internal triggering point. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=internalTriggeringPoint.shortName, internal TriggeringPoint.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=2

▽

△

Class	**BswInternalBehavior**			
internal TriggeringPoint Policy	BswInternalTriggering PointPolicy	*	aggr	Policy for an internalTriggeringPoint in this BswInternal Behavior.. The policy selects the options of the Schedule Manager API generation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=internalTriggeringPointPolicy, internal TriggeringPointPolicy.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
modeReceiver Policy	BswModeReceiver Policy	*	aggr	Implementation policy for the reception of mode switches. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=modeReceiverPolicy, modeReceiver Policy.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=25
modeSender Policy	BswModeSenderPolicy	*	aggr	Implementation policy for providing a mode group. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=modeSenderPolicy, modeSender Policy.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=20
parameterPolicy	BswParameterPolicy	*	aggr	Policy for a perInstanceParameter in this BswInternal Behavior. The policy selects the options of the Schedule Manager API generation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=parameterPolicy, parameterPolicy.variation Point.shortLabel vh.latestBindingTime=preCompileTime
perInstance Parameter	ParameterData Prototype	*	aggr	Describes a read only memory object containing characteristic value(s) needed by this BswInternal Behavior. The role name perInstanceParameter is chosen in analogy to the similar role in the context of SwcInternal Behavior. In contrast to constantMemory, this object is not allocated locally by the module's code, but by the BSW Scheduler and it is accessed from the BSW module via the BSW Scheduler API. The main use case is the support of software emulation of calibration data. The aggregation is subject to variability with the purpose to support implementation variants. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=perInstanceParameter.shortName, per InstanceParameter.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=45
receptionPolicy	BswDataReception Policy	*	aggr	Data reception policy for inter-partition and/or inter-core communication. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=receptionPolicy, receptionPolicy.variation Point.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=55

▽

△

Class	**BswInternalBehavior**			
releasedTrigger Policy	BswReleasedTrigger Policy	*	aggr	Policy for a releasedTrigger. The policy selects the options of the Schedule Manager API generation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=releasedTriggerPolicy, releasedTrigger Policy.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
schedulerName Prefix	BswSchedulerName Prefix	*	aggr	Optional definition of one or more prefixes to be used for the BswScheduler. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=schedulerNamePrefix.shortName, scheduler NamePrefix.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=50
sendPolicy	BswDataSendPolicy	*	aggr	Policy for a providedData. The policy selects the options of the Schedule Manager API generation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=sendPolicy, sendPolicy.variationPoint.short Label vh.latestBindingTime=preCompileTime
service Dependency	BswService Dependency	*	aggr	Defines the requirements on AUTOSAR Services for a particular item. The aggregation is subject to variability with the purpose to support the conditional existence of ServiceNeeds. The aggregation is splitable in order to support that ServiceNeeds might be provided in later development steps. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=serviceDependency.ident.shortName, serviceDependency.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=40
triggerDirect Implementation	BswTriggerDirect Implementation	*	aggr	Specifies a trigger to be directly implemented via OS calls. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=triggerDirectImplementation, triggerDirect Implementation.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=15
variationPoint Proxy	VariationPointProxy	*	aggr	Proxy of a variation points in the C/C++ implementation. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=variationPointProxy.shortName

Table F.25: BswInternalBehavior

Class	CalibrationParameterValue			
Package	M2::AUTOSARTemplates::SWComponentTemplate::MeasurementAndCalibration::CalibrationParameter Values			
Note	Specifies instance specific calibration parameter values used to initialize the memory objects implementing calibration parameters in the generated RTE code. RTE generator will use the implInitValue to override the initial values specified for the DataPrototypes of a component type. The applInitValue is used to exchange init values with the component vendor not publishing the transformation algorithm between ApplicationDataTypes and ImplementationDataTypes or defining an instance specific initialization of components which are only defined with ApplicationDataTypes. Note: If both representations of init values are available these need to represent the same content. Note further that in this case an explicit mapping of ValueSpecification is not implemented because calibration parameters are delivered back after the calibration phase.			
Base	*ARObject*			
Aggregated by	CalibrationParameterValueSet.calibrationParameterValue			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
applInitValue	ValueSpecification	0..1	aggr	This is the initial value specification structured according to the ApplicationDataType
implInitValue	ValueSpecification	0..1	aggr	This is the initial value specification structured according to the ImplementationDataType
initialized Parameter	FlatInstanceDescriptor	0..1	ref	This represents the parameter that is initialized by the CalibrationParameterValue.

Table F.26: CalibrationParameterValue

Class	CanXlFrameTriggeringProps			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Can::CanCommunication			
Note	This element indicates the frame being CAN XL and contains further CAN XL specific attributes.			
Base	*ARObject*			
Aggregated by	CanFrameTriggering.canXlFrameTriggeringProps			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
acceptance Field	PositiveInteger	0..1	attr	Acceptance field of a CAN XL message.
priorityId	PositiveInteger	0..1	attr	Priority ID of a CAN XL message.
sduType	PositiveInteger	0..1	attr	SDU type of a CAN XL message.
vcid	PositiveInteger	0..1	attr	Virtual CAN network ID of a CAN XL message.

Table F.27: CanXlFrameTriggeringProps

Class	ClientServerInterface			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	A client/server interface declares a number of operations that can be invoked on a server by a client. **Tags:** atp.recommendedPackage=PortInterfaces			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *PortInterface*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**

▽

△

Class	**ClientServerInterface**			
operation	ClientServerOperation	*	aggr	ClientServerOperation(s) of this ClientServerInterface. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=operation.shortName, operation.variation Point.shortLabel vh.latestBindingTime=blueprintDerivationTime
possibleError	ApplicationError	*	aggr	Application errors that are defined as part of this interface.

Table F.28: ClientServerInterface

Class	**ClientServerOperation**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	An operation declared within the scope of a client/server interface.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	ApplicationInterface.command, *AtpClassifier*.atpFeature, ClientServerInterface.operation, Diagnostic DataElementInterface.read, DiagnosticDataIdentifierInterface.read, DiagnosticDataIdentifierInterface.write, DiagnosticRoutineInterface.requestResult, DiagnosticRoutineInterface.start, DiagnosticRoutine Interface.stop, PhmRecoveryActionInterface.recovery, ServiceInterface.method			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
argument (ordered)	ArgumentDataPrototype	*	aggr	An argument of this ClientServerOperation **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=argument.shortName, argument.variation Point.shortLabel vh.latestBindingTime=blueprintDerivationTime
diagArgIntegrity	Boolean	0..1	attr	This attribute shall only be used in the implementation of diagnostic routines to support the case where input and output arguments are allocated in a shared buffer and might unintentionally overwrite input arguments by tentative write operations to output arguments. This situation can happen during sliced execution or while output parameters are arrays (call by reference). The value true means that the ClientServerOperation is aware of the usage of a shared buffer and takes precautions to avoid unintentional overwrite of input arguments. If the attribute does not exist or is set to false the Client ServerOperation does not have to consider the usage of a shared buffer.
possibleError	ApplicationError	*	ref	Possible errors that may by raised by the referring operation.

Table F.29: ClientServerOperation

Class	**Collection**			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::ElementCollection			
Note	This meta-class specifies a collection of elements. A collection can be utilized to express additional aspects for a set of elements. Note that Collection is an ARElement. Therefore it is applicable e.g. for EvaluatedVariant, even if this is not obvious. Usually the category of a Collection is "SET". On the other hand, a Collection can also express an arbitrary relationship between elements. This is denoted by the category "RELATION" (see also [TPS_GST_00347]). In this case the collection represents an association from "sourceElement" to "targetElement" in the role "role". **Tags:** atp.recommendedPackage=Collections			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Packageable Element*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
autoCollect	AutoCollectEnum	0..1	attr	This attribute reflects how far the referenced objects are part of the collection. **Tags:** xml.sequenceOffset=20
collected Instance	AtpFeature	*	iref	This instance ref supports the use case that a particular instance is part of the collection. **Tags:** xml.sequenceOffset=60 **InstanceRef implemented by:** AnyInstanceRef
collection Semantics	NameToken	0..1	attr	Provides the ability to express the semantics of a Collection depending on the intended use case. The collectionSemantics is specified as a NameToken which must be agreed by all stakeholders. **Tags:** xml.sequenceOffset=25
element	Identifiable	*	ref	This is an element in the collection. Note that Collection itself is collectable. Therefore collections can be nested. In case of category="RELATION" this represents the target end of the relation. **Tags:** xml.sequenceOffset=40
elementRole	Identifier	0..1	attr	This attribute allows to denote a particular role of the collection. Note that the applicable semantics shall be mutually agreed between the two parties. In particular it denotes the role of element in the context of sourceElement. **Tags:** xml.sequenceOffset=30
sourceElement	Identifiable	*	ref	Only if Category = "RELATION". This represents the source of a relation. **Tags:** xml.sequenceOffset=50
sourceInstance	AtpFeature	*	iref	Only if Category = "RELATION". This represents the source instance of a relation. **Tags:** xml.sequenceOffset=70 **InstanceRef implemented by:** AnyInstanceRef

Table F.30: Collection

Class	ComplexDeviceDriverSwComponentType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	The ComplexDeviceDriverSwComponentType is a special AtomicSwComponentType that has direct access to hardware on an ECU and which is therefore linked to a specific ECU or specific hardware. The ComplexDeviceDriverSwComponentType introduces the possibility to link from the software representation to its hardware description provided by the ECU Resource Template. **Tags:** atp.recommendedPackage=SwComponentTypes			
Base	*ARElement*, *ARObject*, *AtomicSwComponentType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *SwComponentType*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
hardwareElement	HwDescriptionEntity	*	ref	Reference from the ComplexDeviceDriverSwComponentType to the description of the used HwElements.

Table F.31: ComplexDeviceDriverSwComponentType

Class	CompositeRuleBasedValueSpecification			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	This meta-class represents rule-based values for DataPrototypes typed by composite AutosarDataTypes.			
Base	*ARObject*, *AbstractRuleBasedValueSpecification*, *ValueSpecification*			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element, CalibrationParameterValue.applInitValue, CalibrationParameterValue.implInitValue, ConstantSpecification.valueSpec, CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.receptionDefaultValue, ISignal.timeoutSubstitutionValue, NonqueuedReceiverComSpec.initValue, NonqueuedReceiverComSpec.timeoutSubstitutionValue, NonqueuedSenderComSpec.initValue, NvProvideComSpec.ramBlockInitValue, NvProvideComSpec.romBlockInitValue, NvRequireComSpec.initValue, ParameterDataPrototype.initValue, ParameterProvideComSpec.initValue, ParameterRequireComSpec.initValue, PersistencyDataRequiredComSpec.initValue, PersistencyKeyValuePair.initValue, PortDefinedArgumentValue.value, PortPrototypeBlueprintInitValue.value, RecordValueSpecification.field, SomeipEventDeployment.eventReceptionDefaultValue, *StateManagementCompareCondition*.compareValue, SwDataDefProps.invalidValue, UserDefinedEventDeployment.eventReceptionDefaultValue, VariableDataPrototype.initValue			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
argument (ordered)	CompositeValueSpecification	*	aggr	This represents the collection of aggregated ValueSpecifications. The last ValueSpecification in the collection shall be taken to execute the filling rule. **Tags:** xml.sequenceOffset=30
compoundPrimitiveArgument (ordered)	CompositeRuleBasedValueArgument	*	aggr	This represents the collection of aggregated ValueSpecifications for compound primitive data type. The last ValueSpecification in the collection shall be taken to execute the filling rule. **Tags:** xml.sequenceOffset=35
maxSizeToFill	PositiveInteger	0..1	attr	If a rule is chosen which does not fill until the end, this determines until which size the rule shall fill the values. **Tags:** xml.sequenceOffset=40
rule	Identifier	0..1	attr	This denotes the name of the rule of the RuleBasedValueSpecification. The rule determines the calculation specification according which the arguments are used to calculated the values. **Tags:** xml.sequenceOffset=20

Table F.32: CompositeRuleBasedValueSpecification

Class	CompuConstTextContent			
Package	M2::MSR::AsamHdo::ComputationMethod			
Note	This meta-class represents the textual content of a scale.			
Base	*ARObject*, *CompuConstContent*			
Aggregated by	CompuConst.compuConstContentType			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
vt	VerbatimString	0..1	attr	This represents a textual constant in the computation method.

Table F.33: CompuConstTextContent

Class	CompuMethod			
Package	M2::MSR::AsamHdo::ComputationMethod			
Note	This meta-class represents the ability to express the relationship between a physical value and the mathematical representation. Note that this is still independent of the technical implementation in data types. It only specifies the formula how the internal value corresponds to its physical pendant. **Tags:** atp.recommendedPackage=CompuMethods			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *CollectableElement*, *Identifiable*, *Multilanguage Referrable*, *PackageableElement*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
compuInternal ToPhys	Compu	0..1	aggr	This specifies the computation from internal values to physical values. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=compuInternalToPhys xml.sequenceOffset=80
compuPhysTo Internal	Compu	0..1	aggr	This represents the computation from physical values to the internal values. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=compuPhysToInternal xml.sequenceOffset=90
displayFormat	DisplayFormatString	0..1	attr	This property specifies, how the physical value shall be displayed e.g. in documents or measurement and calibration tools. **Tags:** xml.sequenceOffset=20
unit	Unit	0..1	ref	This is the physical unit of the Physical values for which the CompuMethod applies. **Tags:** xml.sequenceOffset=30

Table F.34: CompuMethod

Class	CompuScale			
Package	M2::MSR::AsamHdo::ComputationMethod			
Note	This meta-class represents the ability to specify one segment of a segmented computation method.			
Base	*ARObject*			
Aggregated by	CompuScales.compuScale			
Attribute	**Type**	**Mult.**	**Kind**	**Note**

▽

△

Class	**CompuScale**			
a2lDisplayText	String	0..1	attr	The value of this attribute shall be taken for generating one display text (specifically the OutVal) within the equivalent of the enclosing CompuMethod in A2L.
compuInverseValue	CompuConst	0..1	aggr	This is the inverse value of the constraint. This supports the case that the scale is not reversible per se. **Tags:** xml.sequenceOffset=60
compuScaleContents	CompuScaleContents	0..1	aggr	This represents the computation details of the scale. **Tags:** xml.roleElement=false xml.roleWrapperElement=false xml.sequenceOffset=70 xml.typeElement=false xml.typeWrapperElement=false
desc	MultiLanguageOverviewParagraph	0..1	aggr	<desc> represents a general but brief description of the object in question. **Tags:** xml.sequenceOffset=30
lowerLimit	Limit	0..1	attr	This specifies the lower limit of the scale. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime xml.sequenceOffset=40
mask	PositiveUnlimitedInteger	0..1	attr	In difference to all the other computational methods every COMPU-SCALE will be applied including the bit MASK. Therefore it is allowed for this type of COMPU-METHOD, that COMPU-SCALES overlap. To calculate the string reverse to a value, the string has to be split and the according value for each substring has to be summed up. The sum is finally transmitted. The processing has to be done in order of the COMPU-SCALE elements. **Tags:** xml.sequenceOffset=35
shortLabel	Identifier	0..1	attr	This element specifies a short name for the particular scale. The name can for example be used to derive a programming language identifier. **Tags:** xml.sequenceOffset=20
symbol	CIdentifier	0..1	attr	The symbol, if provided, is used by code generators to get a C identifier for the CompuScale. The name will be used as is for the code generation, therefore it needs to be unique within the generation context. **Tags:** xml.sequenceOffset=25
upperLimit	Limit	0..1	attr	This specifies the upper limit of a of the scale. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime xml.sequenceOffset=50

Table F.35: CompuScale

Class	«atpMixedString» **ConditionByFormula**			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling			
Note	This class represents a condition which is computed based on system constants according to the specified expression. The expected result is considered as boolean value. The result of the expression is interpreted as a condition. • "0" represents "false"; • a value other than zero is considered "true"			
Base	*ARObject*, *FormulaExpression*, *SwSystemconstDependentFormula*			
Aggregated by	VariationPoint.swSyscond, VariationPointProxy.conditionAccess			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
bindingTime	BindingTimeEnum	1	attr	This attribute specifies the point in time when condition may be evaluated at earliest. At this point in time all referenced system constants shall have a value. **Tags:** xml.attribute=true

Table F.36: ConditionByFormula

Enumeration	**CouplingPortRoleEnum**
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::EthernetTopology
Note	Defines the role a CouplingPort takes in the context of a CouplingElement.
Aggregated by	CouplingPort.couplingPortRole
Literal	**Description**
hostPort	The hostPort is connected to an ECU (host ecu). The host ECU controls the connected Coupling Element (e.g. Ethernet switch). **Tags:** atp.EnumerationLiteralIndex=0
standardPort	A CouplingPort can be a standardPort that is used to connect the CouplingElement with Coupling Ports outside the ECU. **Tags:** atp.EnumerationLiteralIndex=2
upLinkPort	A CouplingPort can be connected to another CouplingPort of a CouplingElement located on the same ECU (CouplingElement.ecuInstance) using the CouplingPortConnection. This is used to model a cascaded switch. **Tags:** atp.EnumerationLiteralIndex=1

Table F.37: CouplingPortRoleEnum

Class	***DataPrototype*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	Base class for prototypical roles of any data type.			
Base	*ARObject*, *AtpFeature*, *AtpPrototype*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	*ApplicationCompositeElementDataPrototype*, *AutosarDataPrototype*			
Aggregated by	*AtpClassifier*.atpFeature			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
swDataDef Props	SwDataDefProps	0..1	aggr	This property allows to specify data definition properties which apply on data prototype level. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=swDataDefProps

Table F.38: DataPrototype

Class	DataPrototypeInSystemInstanceRef			
Package	M2::AUTOSARTemplates::DiagnosticExtract::InstanceRefs			
Note				
Base	*ARObject*, *AtpInstanceRef*			
Aggregated by	DiagnosticEnvDataElementCondition.dataPrototype, DiagnosticServiceDataMapping.mappedDataElement			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
base	System	0..1	ref	This represents the base of the InstanceRef **Stereotypes:** atpDerived **Tags:** xml.sequenceOffset=10
contextComponent (ordered)	SwComponentPrototype	*	ref	**Tags:** xml.sequenceOffset=30
contextDataPrototype (ordered)	ApplicationCompositeElementDataPrototype	*	ref	**Tags:** xml.sequenceOffset=50
contextPort	PortPrototype	0..1	ref	This represents the PortPrototype that is contained in the InstanceRef. **Tags:** xml.sequenceOffset=40
contextRootComposition	RootSwCompositionPrototype	0..1	ref	**Tags:** xml.sequenceOffset=20
rootDataPrototype	AutosarDataPrototype	0..1	ref	**Tags:** xml.sequenceOffset=45
targetDataPrototype	DataPrototype	0..1	ref	This represents the target of the InstanceRef **Tags:** xml.sequenceOffset=60

Table F.39: DataPrototypeInSystemInstanceRef

Class	DataPrototypeMapping			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	Defines the mapping of two particular VariableDataPrototypes, ParameterDataPrototypes or ArgumentDataPrototypes with non-equal shortNames, non-equal structure (specific condition is described by [constr_1187]), and/or non-equal semantic (resolution or range) in context of two different SenderReceiverInterface, NvDataInterface or ParameterInterface or Operations. If the semantic is unequal, the following rules apply: The textTableMapping is only applicable if the referred DataPrototypes are typed by AutosarDataType referring to CompuMethods of category TEXTTABLE, SCALE_LINEAR_AND_TEXTTABLE or BITFIELD_TEXTTABLE. In the case that the DataPrototypes are typed by AutosarDataType either referring to CompuMethods of category LINEAR, IDENTICAL or referring to no CompuMethod (which is similar as IDENTICAL) the linear conversion factor is calculated out of the factorSiToUnit and offsetSiToUnit attributes of the referred Units and the CompuRationalCoeffs of a compuInternalToPhys of the referred CompuMethods.			
Base	*ARObject*			
Aggregated by	ClientServerOperationMapping.argumentMapping, VariableAndParameterInterfaceMapping.dataMapping			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
firstDataPrototype	AutosarDataPrototype	0..1	ref	First to be mapped DataPrototype in context of a SenderReceiverInterface, NvDataInterface, ParameterInterface or Operation.

▽

△

Class	**DataPrototypeMapping**			
firstToSecond Data Transformation	DataTransformation	0..1	ref	This reference defines the need to execute the Data Transformation <Mip>_<transformerId> functions of the transformation chain when communicating from the Data PrototypeMapping.firstDataPrototype to the Data PrototypeMapping.secondDataPrototype. This reference also specifies the reverse Data Transformation <Mip>_Inv_<transformerId> functions of the transformation chain (i.e. from the DataPrototype Mapping.secondDataPrototype to the DataPrototype Mapping.firstDataPrototype) if the referenced Data Transformation is symmetric, i.e. attribute Data Transformation.dataTransformationKind is set to symmetric.
secondData Prototype	AutosarDataPrototype	0..1	ref	Second to be mapped DataPrototype in context of a SenderReceiverInterface, NvDataInterface, Parameter Interface or Operation.
secondToFirst Data Transformation	DataTransformation	0..1	ref	This defines the need to execute the reverse Data Transformation <Mip>_Inv_<transformerId> functions of the transformation chain when communicating from the DataPrototypeMapping.secondDataPrototype to the Data PrototypeMapping.firstDataPrototype.
subElement Mapping	SubElementMapping	*	aggr	This represents the owned SubelementMapping. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=subElementMapping
textTable Mapping	TextTableMapping	0..2	aggr	Applied TextTableMapping(s)

Table F.40: DataPrototypeMapping

Enumeration	**DataTransformationErrorHandlingEnum**
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::PortAPIOptions
Note	This enumeration defines different ways how a RunnableEntity shall handle transformer errors.
Aggregated by	PortAPIOption.errorHandling
Literal	*Description*
noTransformerError Handling	A runnable does not handle transformer errors. **Tags:** atp.EnumerationLiteralIndex=0
transformerError Handling	The runnable implements the handling of transformer errors. **Tags:** atp.EnumerationLiteralIndex=1

Table F.41: DataTransformationErrorHandlingEnum

Enumeration	**DataTransformationStatusForwardingEnum**
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::PortAPIOptions
Note	This enumeration defines different ways how a RunnableEntity shall be able to forward status code into the transformer chain.
Aggregated by	PortAPIOption.transformerStatusForwarding
Literal	*Description*
noTransformer StatusForwarding	The RunnableEntity is not able to forward a transformer status code. **Tags:** atp.EnumerationLiteralIndex=0
transformerStatus Forwarding	The RunnableEntity is able to forward a transformer status code. **Tags:** atp.EnumerationLiteralIndex=1

Table F.42: DataTransformationStatusForwardingEnum

Class	**DataTypeMap**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	This class represents the relationship between ApplicationDataType and its implementing Abstract ImplementationDataType.			
Base	*ARObject*			
Aggregated by	DataTypeMappingSet.dataTypeMap			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
applicationDataType	ApplicationDataType	0..1	ref	This is the corresponding ApplicationDataType
implementationDataType	AbstractImplementationDataType	0..1	ref	This is the corresponding AbstractImplementationDataType.

Table F.43: DataTypeMap

Class	**DataTypeMappingSet**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes			
Note	This class represents a list of mappings between ApplicationDataTypes and ImplementationDataTypes. In addition, it can contain mappings between ImplementationDataTypes and ModeDeclarationGroups. **Tags:** atp.recommendedPackage=DataTypeMappingSets			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
dataTypeMap	DataTypeMap	*	aggr	This is one particular association between an ApplicationDataType and its AbstractImplementationDataType.
modeRequestTypeMap	ModeRequestTypeMap	*	aggr	This is one particular association between an ModeDeclarationGroup and its AbstractImplementationDataType.

Table F.44: DataTypeMappingSet

Class	**DelegationSwConnector**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	A delegation connector delegates one inner PortPrototype (a port of a component that is used inside the composition) to a outer PortPrototype of compatible type that belongs directly to the composition (a port that is owned by the composition).			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *SwConnector*			
Aggregated by	*AtpClassifier*.atpFeature, CompositionSwComponentType.connector			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
innerPort	PortPrototype	0..1	iref	The port that belongs to the ComponentPrototype in the composition **Tags:** xml.typeElement=true **InstanceRef implemented by:** PortInCompositionTypeInstanceRef
outerPort	PortPrototype	0..1	ref	The port that is located on the outside of the CompositionType

Table F.45: DelegationSwConnector

Class	***Describable*** (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable			
Note	This meta-class represents the ability to add a descriptive documentation to non identifiable elements.			
Base	*ARObject*			
Subclasses	CyclicTiming, EventControlledTiming, HwElementConnector, HwPinConnector, HwPinGroupConnector, IPduTiming, Ipv4DhcpServerConfiguration, Ipv6DhcpServerConfiguration, PncMapping, SocketConnection, *TransformationComSpecProps*, *TransformationDescription*, *TransformationISignalProps*			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
adminData	AdminData	0..1	aggr	This represents the administrative data for the describable object. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=adminData xml.sequenceOffset=-20
category	CategoryString	0..1	attr	The category is a keyword that specializes the semantics of the Describable. It affects the expected existence of attributes and the applicability of constraints. **Tags:** xml.sequenceOffset=-50
desc	MultiLanguageOverviewParagraph	0..1	aggr	This represents a general but brief (one paragraph) description what the object in question is about. It is only one paragraph! Desc is intended to be collected into overview tables. This property helps a human reader to identify the object in question. More elaborate documentation, (in particular how the object is built or used) should go to "introduction". **Tags:** xml.sequenceOffset=-60
introduction	DocumentationBlock	0..1	aggr	This represents more information about how the object in question is built or is used. Therefore it is a DocumentationBlock. **Tags:** xml.sequenceOffset=-30

Table F.46: Describable

Class	**DltApplication**			
Package	M2::AUTOSARTemplates::LogAndTraceExtract			
Note	This meta-class represents the application from which the log and trace message originates.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	DltEcu.application			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
applicationDescription	String	0..1	attr	This attribute can be used to describe the applicationId that is used in the log and trace message in more detail.
applicationId	String	0..1	attr	This attribute identifies the SW-C/BSW module in the log and trace message.
context	DltContext	*	ref	Definition of ContextIds for the Application. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=context.dltContext, context.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime

Table F.47: DltApplication

Class	DltContext			
Package	M2::AUTOSARTemplates::LogAndTraceExtract			
Note	This meta-class represents the Context that groups Log and Trace Messages that are generated by an application. **Tags:** atp.recommendedPackage=DltContexts			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *UploadableDesignElement*, *UploadablePackageElement*			
Aggregated by	ARPackage.element			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
contextDescription	String	0..1	attr	This attribute can be used to describe the contextId that is used in the log and trace message in more detail.
contextId	String	0..1	attr	This attribute is used to group log and trace messages produced by an application to distinguish functionality.
dltMessage	DltMessage	*	ref	Group of Log and Trace Messages assigned to the Dlt Context **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=dltMessage.dltMessage, dltMessage.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime

Table F.48: DltContext

Class	DltEcu			
Package	M2::AUTOSARTemplates::LogAndTraceExtract			
Note	This element represents an Ecu or Machine that produces logging and tracing information. **Tags:** atp.recommendedPackage=DltEcus			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *UploadableDesignElement*, *UploadablePackageElement*			
Aggregated by	ARPackage.element			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
application	DltApplication	*	aggr	Application on DltEcu that provides log or trace data. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=application.shortName, application.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime
ecuId	String	0..1	attr	This attribute defines the name of the ECU for use within the Dlt protocol.

Table F.49: DltEcu

Class	DltMessage			
Package	M2::AUTOSARTemplates::LogAndTraceExtract			
Note	This element defines a DltMessage.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	LogAndTraceMessageCollectionSet.dltMessage			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
dltArgument (ordered)	DltArgument	*	aggr	Ordered collection of DltArguments in the DltMessage.
messageId	PositiveInteger	0..1	attr	This attribute defines the unique Id for the DltMessage.

▽

△

Class	DltMessage			
messageLine Number	PositiveInteger	0..1	attr	This attribute describes the position in the source file in which this log message was called.
messageSource File	String	0..1	attr	This attribute describes the source file in which this log message was called.
messageType Info	String	0..1	attr	This attribute describes the message Type
privacyLevel	PrivacyLevel	0..1	aggr	The Privacy Level helps to identify the Log and Trace content towards the degree of privacy to it.

Table F.50: DltMessage

Class	DoIpActivationLineNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	A DoIP entity needs to be informed when an external tester is attached or activated. The DoIpActivation ServiceNeeds specifies the trigger for such an event. Examples would be a Pdu via a regular communication bus, a PWM signal, or an I/O. For details please refer to the ISO 13400.			
Base	*ARObject*, *DoIpServiceNeeds*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *ServiceNeeds*			
Aggregated by	BswServiceDependency.serviceNeeds, SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table F.51: DoIpActivationLineNeeds

Class	DoIpGidNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	The DoIpGidNeeds indicates that the software-component owning this ServiceNeeds is providing the GID number either after a GID Synchronisation or by other means like e.g. flashed EEPROM parameter. This need can be used independent from DoIpGidSynchronizationNeeds and is necessary if the GID can not be provided out of the DoIP configuration options.			
Base	*ARObject*, *DoIpServiceNeeds*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *ServiceNeeds*			
Aggregated by	BswServiceDependency.serviceNeeds, SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table F.52: DoIpGidNeeds

Class	DoIpGidSynchronizationNeeds			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	The DoIpGidSynchronizationNeeds indicates that the software-component owning this ServiceNeeds is triggered by the DoIP entity to start a synchronization of the GID (Group Identification) on the DoIP service 0x0001, 0x0002, 0x0003 or before announcement via service 0x0004 according to ISO 13400-2:2012 if necessary. Note that this need is only relevant for DoIP synchronization masters.			
Base	*ARObject*, *DoIpServiceNeeds*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *ServiceNeeds*			
Aggregated by	BswServiceDependency.serviceNeeds, SwcServiceDependency.serviceNeeds			
Attribute	Type	Mult.	Kind	Note
–	–	–	–	–

Table F.53: DoIpGidSynchronizationNeeds

Class	**DoIpPowerModeStatusNeeds**			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	The DoIpPowerModeStatusNeeds indicates that the software-component owning this ServiceNeeds is providing the PowerModeStatus for the DoIP service 0x4003 according to ISO 13400-2:2012.			
Base	*ARObject*, *DoIpServiceNeeds*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *ServiceNeeds*			
Aggregated by	BswServiceDependency.serviceNeeds, SwcServiceDependency.serviceNeeds			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
–	–	–	–	–

Table F.54: DoIpPowerModeStatusNeeds

Class	***DoIpServiceNeeds*** (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	This represents an abstract base class for ServiceNeeds related to DoIP.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *ServiceNeeds*			
Subclasses	DoIpActivationLineNeeds, DoIpGidNeeds, DoIpGidSynchronizationNeeds, DoIpPowerModeStatusNeeds, DoIpRoutingActivationAuthenticationNeeds, DoIpRoutingActivationConfirmationNeeds, FurtherActionByteNeeds			
Aggregated by	BswServiceDependency.serviceNeeds, SwcServiceDependency.serviceNeeds			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
–	–	–	–	–

Table F.55: DoIpServiceNeeds

Class	**EcuAbstractionSwComponentType**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	The ECUAbstraction is a special AtomicSwComponentType that resides between a software-component that wants to access ECU periphery and the Microcontroller Abstraction. The EcuAbstractionSwComponentType introduces the possibility to link from the software representation to its hardware description provided by the ECU Resource Template. **Tags:** atp.recommendedPackage=SwComponentTypes			
Base	*ARElement*, *ARObject*, *AtomicSwComponentType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *SwComponentType*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
hardwareElement	HwDescriptionEntity	*	ref	Reference from the EcuAbstractionComponentType to the description of the used HwElements.

Table F.56: EcuAbstractionSwComponentType

Class	***EcucContainerDef*** (abstract)			
Package	M2::AUTOSARTemplates::ECUCParameterDefTemplate			
Note	Base class used to gather common attributes of configuration container definitions.			
Base	*ARObject*, *AtpDefinition*, *EcucDefinitionElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	EcucChoiceContainerDef, EcucParamConfContainerDef			
Aggregated by	EcucDestinationUriPolicy.container, EcucModuleDef.container, EcucParamConfContainerDef.subContainer			
Attribute	**Type**	**Mult.**	**Kind**	**Note**

▽

△

Class	***EcucContainerDef*** (abstract)			
destinationUri	EcucDestinationUriDef	*	ref	Several destinationUris can be defined for an Ecuc ContainerDef. With such destinationUris an Ecuc ContainerDef is applicable for several EcucUriReference Defs. **Stereotypes:** atpUriDef
multiplicity ConfigClass	EcucMultiplicity ConfigurationClass	*	aggr	Specifies which MultiplicityConfigurationClass this container is available for which ConfigurationVariant. This aggregation is optional if the surrounding EcucModuleDef has the Category STANDARDIZED_MODULE_DEFINITION. If the category attribute of the EcucModule Def is set to VENDOR_SPECIFIC_MODULE_DEFINITION and if the upperMultiplicity is greater than the lowerMultiplicity then this aggregation is mandatory. **Tags:** xml.namePlural=MULTIPLICITY-CONFIG-CLASSES
origin	String	0..1	attr	This attribute specifies whether this configuration container is an AUTOSAR standardized container or whether it is vendor-specific.
postBuildVariant Multiplicity	Boolean	0..1	attr	Indicates if a container may have different number of instances in different post-build variants (previously known as post-build selectable configuration sets). TRUE means yes, FALSE means no.
requiresIndex	Boolean	0..1	attr	Used to define whether the value element for this definition shall be provided with an index.

Table F.57: EcucContainerDef

Class	**EcucContainerValue**			
Package	M2::AUTOSARTemplates::ECUCDescriptionTemplate			
Note	Represents a Container definition in the ECU Configuration Description.			
Base	*ARObject*, *EcucIndexableValue*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	EcucContainerValue.subContainer, EcucModuleConfigurationValues.container			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
definition	EcucContainerDef	0..1	ref	Reference to the definition of this Container in the ECU Configuration Parameter Definition. **Tags:** xml.sequenceOffset=-10
parameterValue	EcucParameterValue	*	aggr	Aggregates all ECU Configuration Values within this Container. atpVariation: [RS_ECUC_00079] **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=parameterValue, parameterValue.variationPoint.shortLabel vh.latestBindingTime=postBuild
referenceValue	EcucAbstractReference Value	*	aggr	Aggregates all References with this container. atpVariation: [RS_ECUC_00079] **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=referenceValue, referenceValue.variationPoint.shortLabel vh.latestBindingTime=postBuild

▽

△

Class	EcucContainerValue			
subContainer	EcucContainerValue	*	aggr	Aggregates all sub-containers within this container. atpVariation: [RS_ECUC_00078] **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=subContainer.shortName, sub Container.variationPoint.shortLabel vh.latestBindingTime=postBuild

Table F.58: EcucContainerValue

Class	EcucValueCollection			
Package	M2::AUTOSARTemplates::ECUCDescriptionTemplate			
Note	This represents the anchor point of the ECU configuration description. **Tags:** atp.recommendedPackage=EcucValueCollections			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Packageable Element*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
ecucValue	EcucModule ConfigurationValues	*	ref	References to the configuration of individual software modules that are present on this ECU. atpVariation: [RS_ECUC_00079] **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=ecucValue.ecucModuleConfigurationValues, ecucValue.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
ecuExtract	System	0..1	ref	Represents the extract of the System Configuration that is relevant for the ECU configured with that ECU Configuration Description.

Table F.59: EcucValueCollection

Class	EndToEndProtectionVariablePrototype			
Package	M2::AUTOSARTemplates::SWComponentTemplate::EndToEndProtection			
Note	It is possible to protect the data exchanged between software components. For this purpose, for each communication to be protected, the user defines a separate EndToEndProtection (specifying a set of protection settings) and refers to a variableDataPrototype in the role of sender and to one or many variableDataPrototypes in the role of receiver. For details, see EndToEnd Library. Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach. **Tags:** atp.Status=obsolete			
Base	*ARObject*			
Aggregated by	EndToEndProtection.endToEndProtectionVariablePrototype			
Attribute	**Type**	**Mult.**	**Kind**	**Note**

▽

△

Class	EndToEndProtectionVariablePrototype			
receiver	VariableDataPrototype	*	iref	This represents the receiver. Note that 1:n communication is supported for this use case. **Tags:** atp.Status=obsolete **InstanceRef implemented by:** VariableDataPrototypeInSystemInstanceRef
sender	VariableDataPrototype	0..1	iref	This represents the sender. Can be optional if an ecu extract is provided and the sender is part of the extract. **Tags:** atp.Status=obsolete **InstanceRef implemented by:** VariableDataPrototypeInSystemInstanceRef
shortLabel	Identifier	0..1	attr	This serves as part of the split key in case of more than one EndToEndProtectionVariablePrototype is aggregated in the bound model. **Stereotypes:** atpIdentityContributor **Tags:** atp.Status=obsolete

Table F.60: EndToEndProtectionVariablePrototype

Class	**EndToEndTransformationComSpecProps**			
Package	M2::AUTOSARTemplates::SystemTemplate::Transformer			
Note	The class EndToEndTransformationIComSpecProps specifies port specific configuration properties for EndToEnd transformer attributes.			
Base	*ARObject*, *Describable*, *TransformationComSpecProps*			
Aggregated by	ClientComSpec.transformationComSpecProps, *ReceiverComSpec*.transformationComSpecProps, ServerComSpec.transformationComSpecProps			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
clearFromValidToInvalid	Boolean	0..1	attr	Clear monitoring window on transition from state Valid to state Invalid.
disableEndToEndCheck	Boolean	0..1	attr	Disables/Enables the E2E check. The E2Eheader is removed from the payload independent from the setting of this attribute.
disableEndToEndStateMachine	Boolean	0..1	attr	Disables the E2EStateMachine (only E2E check functionality is performed)
e2eProfileCompatibilityProps	E2EProfileCompatibilityProps	0..1	ref	Reference to additional settings for the E2E state machine.
maxDeltaCounter	PositiveInteger	0..1	attr	Maximum allowed difference between two counter values of two consecutively received valid messages. For example, if the receiver gets data with counter 1 and MaxDeltaCounter is 3, then at the next reception the receiver can accept Counters with values 2, 3 or 4.
maxErrorStateInit	PositiveInteger	0..1	attr	Maximal number of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last WindowSize checks, for the state E2E_SM_INIT. The minimum value is 0.
maxErrorStateInvalid	PositiveInteger	0..1	attr	Maximal number of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last WindowSize checks, for the state E2E_SM_INVALID. The minimum value is 0.

▽

△

Class	**EndToEndTransformationComSpecProps**			
maxErrorState Valid	PositiveInteger	0..1	attr	Maximal number of checks in which ProfileStatus equal to E2E_P_ERROR was determined, within the last Window Size checks, for the state E2E_SM_VALID. The minimum value is 0.
maxNoNewOr RepeatedData	PositiveInteger	0..1	attr	EndToEndTransformationDescription holds these attributes which are profile specific and have the same value for all E2E transformers.
minOkStateInit	PositiveInteger	0..1	attr	Minimal number of checks in which ProfileStatus equal to E2E_P_OK was determined, within the last WindowSize checks, for the state E2E_SM_INIT. The minimum value is 1.
minOkState Invalid	PositiveInteger	0..1	attr	Minimal number of checks in which ProfileStatus equal to E2E_P_OK was determined, within the last WindowSize checks, for the state E2E_SM_INVALID. The minimum value is 1.
minOkState Valid	PositiveInteger	0..1	attr	Minimal number of checks in which ProfileStatus equal to E2E_P_OK was determined, within the last WindowSize checks, for the state E2E_SM_VALID. The minimum value is 1.
syncCounterInit	PositiveInteger	0..1	attr	EndToEndTransformationDescription holds these attributes which are profile specific and have the same value for all E2E transformers.
windowSizeInit	PositiveInteger	0..1	attr	Size of the monitoring window of state Init for the E2E state machine.
windowSize Invalid	PositiveInteger	0..1	attr	Size of the monitoring window of state Invalid for the E2E state machine.
windowSize Valid	PositiveInteger	0..1	attr	Size of the monitoring window of state Valid for the E2E state machine.

Table F.61: EndToEndTransformationComSpecProps

Class	**EvaluatedVariantSet**			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling			
Note	This meta class represents the ability to express if a set of ARElements is able to support one or more particular variants. In other words, for a given set of evaluatedElements this meta class represents a table of evaluated variants, where each PredefinedVariant represents one column. In this column each descendant sw SystemconstantValue resp. postbuildVariantCriterionValue represents one entry. In a graphical representation each swSystemconstantValueSet / postBuildVariantCriterionValueSet could be used as an intermediate headline in the table column. If the approvalStatus is "APPROVED" it expresses that the collection of CollectableElements is known be valid for the given evaluatedVariants. Note that the EvaluatedVariantSet is a CollectableElement. This allows to establish a hierarchy of EvaluatedVariantSets. **Tags:** atp.recommendedPackage=EvaluatedVariantSets			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Packageable Element*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**

▽

△

Class	**EvaluatedVariantSet**			
approvalStatus	NameToken	1	attr	Defines the approval status of a predefined variant. Two values are predefined: "APPROVED" and "REJECTED": • Approved variants are known to work. • Rejected variants are known NOT to work. Further values can be approved on a per-company basis; within AUTOSAR only "APPROVED" and "REJECTED" should be recognized.
evaluated Element	CollectableElement	*	ref	This represents a particular element which is evaluated in context of the EvaluatedVariants. The approvalStatus applies to this element (and all of its descendants). In other words, the referenced elements are those that were considered when the predefined variant was evaluated.
evaluated Variant	PredefinedVariant	*	ref	This metaclass represents one particular variant which was evaluated. LowerMultiplicity is set to 0 to support a stepwise approach.

Table F.62: EvaluatedVariantSet

Class	***ExecutableEntity*** (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::InternalBehavior			
Note	Abstraction of executable code.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	*BswModuleEntity*, RunnableEntity			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
activation Reason	ExecutableEntity ActivationReason	*	aggr	If the ExecutableEntity provides at least one activation Reason element the RTE resp. BSW Scheduler shall provide means to read the activation vector of this executable entity execution. If no activationReason element is provided the feature of being able to determine the activating RTEEvent is disabled for this ExecutableEntity.
canEnter	ExclusiveArea	*	ref	This means that the executable entity can enter/leave the referenced exclusive area through explicit API calls. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=canEnter.exclusiveArea, canEnter.variation Point.shortLabel vh.latestBindingTime=preCompileTime
exclusiveArea NestingOrder	ExclusiveAreaNesting Order	*	ref	This represents the set of ExclusiveAreaNestingOrders recognized by this ExecutableEntity.
minimumStart Interval	TimeValue	0..1	attr	Specifies the time in seconds by which two consecutive starts of an ExecutableEntity are guaranteed to be separated.
reentrancyLevel	ReentrancyLevelEnum	0..1	attr	The reentrancy level of this ExecutableEntity. See the documentation of the enumeration type ReentrancyLevel Enum for details. Please note that nonReentrant interfaces can have also reentrant or multicoreReentrant implementations, and reentrant interfaces can also have multicoreReentrant implementations.

▽

△

Class	***ExecutableEntity*** (abstract)			
runsInside	ExclusiveArea	*	ref	The executable entity runs completely inside the referenced exclusive area. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=runsInside.exclusiveArea, runsInside.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
swAddrMethod	SwAddrMethod	0..1	ref	Addressing method related to this code entity. Via an association to the same SwAddrMethod, it can be specified that several code entities (even of different modules or components) shall be located in the same memory without already specifying the memory section itself.

Table F.63: ExecutableEntity

Class	***ExecutionTime*** (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::ResourceConsumption::ExecutionTime			
Note	Base class for several means how to describe the ExecutionTime of software. The required context information is provided through this class.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	AnalyzedExecutionTime, MeasuredExecutionTime, RoughEstimateOfExecutionTime, SimulatedExecutionTime			
Aggregated by	ResourceConsumption.executionTime			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
exclusiveArea	ExclusiveArea	0..1	ref	Reference to the ExclusiveArea this execution time is provided for.
executableEntity	ExecutableEntity	0..1	ref	The executable entity for which this execution time is described.
hardwareConfiguration	HardwareConfiguration	0..1	aggr	Provides information on the HardwareConfiguration used to specify this ExecutionTime.
hwElement	HwElement	0..1	ref	The hardware element (e.g. type of ECU) for which the execution time is specified.
includedLibrary	DependencyOnArtifact	*	ref	If this dependency is specified, the execution time of the library code is included in the execution time data for the runnable.
memorySectionLocation	MemorySectionLocation	*	aggr	Provides information on the MemorySectionLocation which is involved in the ExecutionTime description.
softwareContext	SoftwareContext	0..1	aggr	Provides information on the detailed SoftwareContext used to provide the ExecutionTime description.

Table F.64: ExecutionTime

Class	***FibexElement*** (abstract)
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore
Note	ASAM FIBEX elements specifying Communication and Topology.
Base	*ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*

▽

△

Class	***FibexElement*** (abstract)			
Subclasses	*BusMirrorChannelMapping*, *CommunicationCluster*, ConsumedProvidedServiceInstanceGroup, CouplingElement, EcuInstance, EthernetWakeupSleepOnDatalineConfigSet, *Frame*, Gateway, GlobalTimeDomain, ISignal, ISignalGroup, ISignalIPduGroup, NmConfig, *Pdu*, PdurIPduGroup, SecureCommunicationPropsSet, ServiceInstanceCollectionSet, SoAdRoutingGroup, SocketConnectionIpduIdentifierSet, *TpConfig*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
–	–	–	–	–

Table F.65: FibexElement

Class	***HeapUsage*** (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::ResourceConsumption::HeapUsage			
Note	Describes the heap memory usage of a SW-Component.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	MeasuredHeapUsage, RoughEstimateHeapUsage, WorstCaseHeapUsage			
Aggregated by	ResourceConsumption.heapUsage			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
hardwareConfiguration	HardwareConfiguration	0..1	aggr	Contains information about the hardware context this heap usage is describing.
hwElement	HwElement	0..1	ref	Specifies for which hardware element (e.g. ECU) this heap usage usage is given.
softwareContext	SoftwareContext	0..1	aggr	Contains details about the software context this heap usage is provided for.

Table F.66: HeapUsage

Class	**HwElement**			
Package	M2::AUTOSARTemplates::EcuResourceTemplate			
Note	This represents the ability to describe Hardware Elements on an instance level. The particular types of hardware are distinguished by the category. This category determines the applicable attributes. The possible categories and attributes are defined in HwCategory. **Tags:** atp.recommendedPackage=HwElements			
Base	*ARElement*, *ARObject*, *CollectableElement*, *HwDescriptionEntity*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
hwElementConnection	HwElementConnector	*	aggr	This represents one particular connection between two hardware elements. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=hwElementConnection, hwElementConnection.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=110

▽

△

Class	**HwElement**			
hwPinGroup	HwPinGroup	*	aggr	This aggregation is used to describe the connection facilities of a hardware element. Note that hardware element has no pins but only pingroups. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=hwPinGroup.shortName, hwPinGroup.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=90
nestedElement	HwElement	*	ref	This association is used to establish hierarchies of hw elements. Note that one particular HwElement can be target of this association only once. I.e. multiple instantiation of the same HwElement is not supported (at any hierarchy level). **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=nestedElement.hwElement, nestedElement.variationPoint.shortLabel vh.latestBindingTime=systemDesignTime xml.sequenceOffset=70

Table F.67: HwElement

Class	**HwPinGroup**			
Package	M2::AUTOSARTemplates::EcuResourceTemplate			
Note	This meta-class represents the ability to describe groups of pins which are used to connect hardware elements. This group acts as a bundle of pins. Thereby they allow to describe high level connections. Pin groups can even be nested.			
Base	*ARObject*, *HwDescriptionEntity*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	HwElement.hwPinGroup, HwPinGroupContent.hwPinGroup			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
hwPinGroupContent	HwPinGroupContent	0..1	aggr	This aggregation describes the contained pins/pin groups.

Table F.68: HwPinGroup

Class	***Identifiable*** (abstract)
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable
Note	Instances of this class can be referred to by their identifier (within the namespace borders). In addition to this, Identifiables are objects which contribute significantly to the overall structure of an AUTOSAR description. In particular, Identifiables might contain Identifiables.
Base	*ARObject*, *MultilanguageReferrable*, *Referrable*

Attribute	***Type***	***Mult.***	***Kind***	***Note***
adminData	AdminData	0..1	aggr	This represents the administrative data for the identifiable object. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=adminData xml.sequenceOffset=-40

▽

△

Class	***Identifiable*** (abstract)			
annotation	Annotation	*	aggr	Possibility to provide additional notes while defining a model element (e.g. the ECU Configuration Parameter Values). These are not intended as documentation but are mere design notes. **Tags:** xml.sequenceOffset=-25
category	CategoryString	0..1	attr	The category is a keyword that specializes the semantics of the Identifiable. It affects the expected existence of attributes and the applicability of constraints. **Tags:** xml.sequenceOffset=-50
desc	MultiLanguageOverview Paragraph	0..1	aggr	This represents a general but brief (one paragraph) description what the object in question is about. It is only one paragraph! Desc is intended to be collected into overview tables. This property helps a human reader to identify the object in question. More elaborate documentation, (in particular how the object is built or used) should go to "introduction". **Tags:** xml.sequenceOffset=-60
introduction	DocumentationBlock	0..1	aggr	This represents more information about how the object in question is built or is used. Therefore it is a DocumentationBlock. **Tags:** xml.sequenceOffset=-30
uuid	String	0..1	attr	The purpose of this attribute is to provide a globally unique identifier for an instance of a meta-class. The values of this attribute should be globally unique strings prefixed by the type of identifier. For example, to include a DCE UUID as defined by The Open Group, the UUID would be preceded by "DCE:". The values of this attribute may be used to support merging of different AUTOSAR models. The form of the UUID (Universally Unique Identifier) is taken from a standard defined by the Open Group (was Open Software Foundation). This standard is widely used, including by Microsoft for COM (GUIDs) and by many companies for DCE, which is based on CORBA. The method for generating these 128-bit IDs is published in the standard and the effectiveness and uniqueness of the IDs is not in practice disputed. If the id namespace is omitted, DCE is assumed. An example is "DCE:2fac1234-31f8-11b4-a222-08002b34c003". The uuid attribute has no semantic meaning for an AUTOSAR model and there is no requirement for AUTOSAR tools to manage the timestamp. **Tags:** xml.attribute=true

Table F.69: Identifiable

Class	***Implementation*** (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::Implementation			
Note	Description of an implementation a single software component or module.			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Packageable Element*, *Referrable*			
Subclasses	BswImplementation, SwcImplementation			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**

▽

△

Class	***Implementation*** (abstract)			
buildAction Manifest	BuildActionManifest	0..1	ref	A manifest specifying the intended build actions for the software delivered with this implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=buildActionManifest.buildActionManifest, buildActionManifest.variationPoint.shortLabel vh.latestBindingTime=codeGenerationTime
codeDescriptor	Code	*	aggr	Specifies the provided implementation code.
compiler	Compiler	*	aggr	Specifies the compiler for which this implementation has been released
generated Artifact	DependencyOnArtifact	*	aggr	Relates to an artifact that will be generated during the integration of this Implementation by an associated generator tool. Note that this is an optional information since it might not always be in the scope of a single module or component to provide this information. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=generatedArtifact.shortName, generated Artifact.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
hwElement	HwElement	*	ref	The hardware elements (e.g. the processor) required for this implementation.
linker	Linker	*	aggr	Specifies the linker for which this implementation has been released.
mcSupport	McSupportData	0..1	aggr	The measurement & calibration support data belonging to this implementation. The measurement & calibration support data belonging to this implementation. The aggregation is <<atpSplitable>> because in case of an already existing BSW Implementation model, this description will be added later in the process, namely at code generation time. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=mcSupport
programming Language	Programminglanguage Enum	0..1	attr	Programming language the implementation was created in.
requiredArtifact	DependencyOnArtifact	*	aggr	Specifies that this Implementation depends on the existence of another artifact (e.g. a library). This aggregation of DependencyOnArtifact is subject to variability with the purpose to support variability in the implementations. Different algorithms in the implementation might cause different dependencies, e.g. the number of used libraries. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=requiredArtifact.shortName, required Artifact.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
required GeneratorTool	DependencyOnArtifact	*	aggr	Relates this Implementation to a generator tool in order to generate additional artifacts during integration. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=requiredGeneratorTool.shortName, required GeneratorTool.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

▽

△

Class	**Implementation** (abstract)			
resource Consumption	ResourceConsumption	0..1	aggr	All static and dynamic resources for each implementation are described within the ResourceConsumption class. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=resourceConsumption.shortName
swcBsw Mapping	SwcBswMapping	0..1	ref	This allows a mapping between an SWC and a BSW behavior to be attached to an implementation description (for AUTOSAR Service, ECU Abstraction and Complex Driver Components). It is up to the methodology to define whether this reference has to be set for the Swc- or Bsw Implementtion or for both.
swVersion	RevisionLabelString	0..1	attr	Software version of this implementation. The numbering contains three levels (like major, minor, patch), its values are vendor specific.
usedCode Generator	String	0..1	attr	Optional: code generator used.
vendorId	PositiveInteger	0..1	attr	Vendor ID of this Implementation according to the AUTOSAR vendor list

Table F.70: Implementation

Class	**ImplementationDataType**			
Package	M2::AUTOSARTemplates::CommonStructure::ImplementationDataTypes			
Note	Describes a reusable data type on the implementation level. This will typically correspond to a typedef in C-code. **Tags:** atp.recommendedPackage=ImplementationDataTypes			
Base	*ARElement*, *ARObject*, *AbstractImplementationDataType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *AutosarDataType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Packageable Element*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
dynamicArray SizeProfile	String	0..1	attr	Specifies the profile which the array will follow in case this data type is a variable size array.
isStructWith Optional Element	Boolean	0..1	attr	This attribute is only valid if the attribute category is set to STRUCTURE. If set to true, this attribute indicates that the ImplementationDataType has been created with the intention to define at least one element of the structure as optional.
subElement (ordered)	ImplementationData TypeElement	*	aggr	Specifies an element of an array, struct, or union data type. The aggregation of ImplementionDataTypeElement is subject to variability with the purpose to support the conditional existence of elements inside a Implementation DataType representing a structure. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=subElement.shortName, sub Element.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
symbolProps	SymbolProps	0..1	aggr	This represents the SymbolProps for the Implementation DataType. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=symbolProps.shortName

▽

△

Class	ImplementationDataType			
typeEmitter	NameToken	0..1	attr	This attribute is used to control which part of the AUTOSAR toolchain is supposed to trigger data type definitions.

Table F.71: ImplementationDataType

Class	ImplementationDataTypeElement			
Package	M2::AUTOSARTemplates::CommonStructure::ImplementationDataTypes			
Note	Declares a data object which is locally aggregated. Such an element can only be used within the scope where it is aggregated. This element either consists of further subElements or it is further defined via its swDataDefProps. There are several use cases within the system of ImplementationDataTypes fur such a local declaration: • It can represent the elements of an array, defining the element type and array size • It can represent an element of a struct, defining its type • It can be the local declaration of a debug element.			
Base	*ARObject*, *AbstractImplementationDataTypeElement*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, ImplementationDataType.subElement, ImplementationDataTypeElement.subElement			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
arrayImplPolicy	ArrayImplPolicyEnum	0..1	attr	This attribute controls the implementation of the payload of an array. It shall only be used if the enclosing ImplementationDataType constitutes an array.
arraySize	PositiveInteger	0..1	attr	The existence of this attributes (if bigger than 0) defines the size of an array and declares that this ImplementationDataTypeElement represents the type of each single array element. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime
arraySizeHandling	ArraySizeHandlingEnum	0..1	attr	The way how the size of the array is handled in case of a variable size array.
arraySizeSemantics	ArraySizeSemanticsEnum	0..1	attr	This attribute controls the meaning of the value of the array size.
isOptional	Boolean	0..1	attr	This attribute represents the ability to declare the enclosing ImplementationDataTypeElement as optional. This means that, at runtime, the ImplementationDataTypeElement may or may not have a valid value and shall therefore be ignored. The underlying runtime software provides means to set the CppImplementationDataTypeElement as not valid at the sending end of a communication and determine its validity at the receiving end.

▽

△

Class	**ImplementationDataTypeElement**			
subElement (ordered)	ImplementationDataTypeElement	*	aggr	Element of an array, struct, or union in case of a nested declaration (i.e. without using "typedefs"). The aggregation of ImplementionDataTypeElement is subject to variability with the purpose to support the conditional existence of elements inside a Implementation DataType representing a structure. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=subElement.shortName, subElement.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
swDataDefProps	SwDataDefProps	0..1	aggr	The properties of this ImplementationDataTypeElement.

Table F.72: ImplementationDataTypeElement

Class	***ImplementationProps*** (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::Implementation			
Note	Defines a symbol to be used as (depending on the concrete case) either a complete replacement or a prefix when generating code artifacts.			
Base	*ARObject*, *Referrable*			
Subclasses	BswSchedulerNamePrefix, ExecutableEntityActivationReason, SectionNamePrefix, SymbolProps, SymbolicNameProps			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
symbol	CIdentifier	0..1	attr	The symbol to be used as (depending on the concrete case) either a complete replacement or a prefix.

Class	***InternalBehavior*** (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::InternalBehavior			
Note	Common base class (abstract) for the internal behavior of both software components and basic software modules/clusters.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	BswInternalBehavior, SwcInternalBehavior			
Aggregated by	*AtpClassifier*.atpFeature			
Attribute	***Type***	***Mult.***	***Kind***	***Note***

▽

△

Class	***InternalBehavior*** (abstract)			
constant Memory	ParameterData Prototype	*	aggr	Describes a read only memory object containing characteristic value(s) implemented by this Internal Behavior. The shortName of ParameterDataPrototype has to be equal to the "C' identifier of the described constant. The characteristic value(s) might be shared between Sw ComponentPrototypes of the same SwComponentType. The aggregation of constantMemory is subject to variability with the purpose to support variability in the software component or module implementations. Typically different algorithms in the implementation are requiring different number of memory objects. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=constantMemory.shortName, constant Memory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
constantValue Mapping	ConstantSpecification MappingSet	*	ref	Reference to the ConstantSpecificationMapping to be applied for the particular InternalBehavior **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=constantValueMapping
dataType Mapping	DataTypeMappingSet	*	ref	Reference to the DataTypeMapping to be applied for the particular InternalBehavior **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=dataTypeMapping
exclusiveArea	ExclusiveArea	*	aggr	This specifies an ExclusiveArea for this InternalBehavior. The exclusiveArea is local to the component resp. module. The aggregation of ExclusiveAreas is subject to variability. Note: the number of ExclusiveAreas might vary due to the conditional existence of RunnableEntities or BswModuleEntities. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=exclusiveArea.shortName, exclusive Area.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
exclusiveArea NestingOrder	ExclusiveAreaNesting Order	*	aggr	This represents the set of ExclusiveAreaNestingOrder owned by the InternalBehavior. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=exclusiveAreaNestingOrder.shortName, exclusiveAreaNestingOrder.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

▽

△

Class	InternalBehavior (abstract)			
staticMemory	VariableDataPrototype	*	aggr	Describes a read and writeable static memory object representing measurerment variables implemented by this software component. The term "static" is used in the meaning of "non-temporary" and does not necessarily specify a linker encapsulation. This kind of memory is only supported if supportsMultipleInstantiation is FALSE. The shortName of the VariableDataPrototype has to be equal with the ''C' identifier of the described variable. The aggregation of staticMemory is subject to variability with the purpose to support variability in the software component's implementations. Typically different algorithms in the implementation are requiring different number of memory objects. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=staticMemory.shortName, static Memory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Table F.74: InternalBehavior

Class	**MemorySection**			
Package	M2::AUTOSARTemplates::CommonStructure::ResourceConsumption::MemorySectionUsage			
Note	Provides a description of an abstract memory section used in the Implementation for code or data. It shall be declared by the Implementation Description of the module or component, which actually allocates the memory in its code. This means in case of data prototypes which are allocated by the RTE, that the generated Implementation Description of the RTE shall contain the corresponding MemorySections. The attribute "symbol" (if symbol is missing: "shortName") defines the module or component specific section name used in the code. For details see the document "Specification of Memory Mapping". Typically the section name is build according the pattern: <SwAddrMethod shortName>[_<further specialization nominator>][_<alignment>] where • **[<SwAddrMethod shortName>]** is the shortName of the referenced SwAddrMethod • **[_<further specialization nominator>]** is an optional infix to indicate the specialization in the case that several MemorySections for different purpose of the same Implementation Description referring to the same or equally named SwAddrMethods. • **[_<alignment>]** is the alignment attributes value and is only applicable in the case that the memory AllocationKeywordPolicy value of the referenced SwAddrMethod is set to addrMethodShortNameAnd Alignment MemorySection used to Implement the code of RunnableEntitys and BswSchedulableEntitys shall have a symbol (if missing: shortName) identical to the referred SwAddrMethod to conform to the generated RTE header files. In addition to the section name described above, a prefix is used in the corresponding macro code in order to define a name space. This prefix is by default given by the shortName of the BswModule Description resp. the SwComponentType. It can be superseded by the prefix attribute.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	ResourceConsumption.memorySection			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
alignment	AlignmentType	0..1	attr	The attribute describes the typical alignment of objects within this memory section.

▽

△

Class	**MemorySection**			
executableEntity	ExecutableEntity	*	ref	Reference to the ExecutableEntitites located in this section. This allows to locate different Executable Entitities in different sections even if the associated Sw Addrmethod is the same. This is applicable to code sections only.
option	Identifier	*	attr	The service (in AUTOSAR: BswModuleEntry) is implemented in a way that it either resolves to aninline function or to a standard function depending on conditions set at a later point in time. The following two values are standardized (to be used for code sections only and exclusively to each other): • INLINE - The code section is declared with the keyword "inline". • LOCAL_INLINE - The code section is declared with the keyword "static inline". In both cases (INLINE and LOCAL_INLINE) the inline expansion depends on the compiler. Depending on this, the code section either corresponds to an actual section in memory or is put into the section of the caller.
prefix	SectionNamePrefix	0..1	ref	The prefix used to set the memory section's namespace in the code. The existence of a prefix element supersedes rules for a default prefix (such as the Bsw ModuleDescription's shortName). This allows the user to define several name spaces for memory sections within the scope of one module, cluster or SWC.
size	PositiveInteger	0..1	attr	The size in bytes of the section.
swAddrmethod	SwAddrMethod	0..1	ref	This association indicates that this module specific (abstract) memory section is part of an overall SwAddr Method, referred by the upstream declarations (e.g. calibration parameters, data element prototypes, code entities) which share a common addressing strategy. This can be evaluated for the ECU configuration of the build support. This association shall always be declared by the Implementation description of the module or component, which allocates the memory in its code. This means in case of data prototypes which are allocated by the RTE, that the software components only declare the grouping of its data prototypes to SwAddrMethods, and the generated Implementation Description of the RTE actually sets up this association.
symbol	Identifier	0..1	attr	Defines the section name as explained in the main description. By using this attribute for code generation (instead of the shortName) it is possible to define several different MemorySections having the same name - e.g. symbol = CODE - but using different sectionName Prefixes.

Table F.75: MemorySection

Class	**MetaDataItem**
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface
Note	This meta-class represents a single meta-data item.
Base	*ARObject*
Aggregated by	MetaDataItemSet.metaDataItem

▽

△

Class	MetaDataItem			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
length	PositiveInteger	0..1	attr	This attribute determines the length of the MetaDataItem at run-time.
metaDataItem Type	TextValueSpecification	0..1	aggr	This aggregation contributes the specification of the concrete meta-data item type.

Table F.76: MetaDataItem

Class	MetaDataItemSet			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	This meta-class represents the ability to define a set of meta-data items to be used in SenderReceiver Interfaces.			
Base	*ARObject*			
Aggregated by	SenderReceiverInterface.metaDataItemSet			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
dataElement	VariableDataPrototype	*	ref	This reference identifies the dataElement for which the ordered list of meta-data items is defined.
metaDataItem (ordered)	MetaDataItem	*	aggr	This aggregation represents the ordered definition of meta-data items.

Table F.77: MetaDataItemSet

Class	ModeDeclaration			
Package	M2::AUTOSARTemplates::CommonStructure::ModeDeclaration			
Note	Declaration of one Mode. The name and semantics of a specific mode is not defined in the meta-model.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, ModeDeclarationGroup.modeDeclaration			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
value	PositiveInteger	0..1	attr	The RTE shall take the value of this attribute for generating the source code representation of this Mode Declaration.

Table F.78: ModeDeclaration

Class	ModeDeclarationGroup			
Package	M2::AUTOSARTemplates::CommonStructure::ModeDeclaration			
Note	A collection of Mode Declarations. Also, the initial mode is explicitly identified. **Tags:** atp.recommendedPackage=ModeDeclarationGroups			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *UploadableDesignElement*, *UploadablePackageElement*			
Aggregated by	ARPackage.element			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
initialMode	ModeDeclaration	0..1	ref	The initial mode of the ModeDeclarationGroup. This mode is active before any mode switches occurred.

▽

△

Class	ModeDeclarationGroup			
mode Declaration	ModeDeclaration	*	aggr	The ModeDeclarations collected in this ModeDeclaration Group. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=modeDeclaration.shortName, mode Declaration.variationPoint.shortLabel vh.latestBindingTime=blueprintDerivationTime
modeManager ErrorBehavior	ModeErrorBehavior	0..1	aggr	This represents the ability to define the error behavior expected by the mode manager in case of errors on the mode user side (e.g. terminated mode user).
modeTransition	ModeTransition	*	aggr	This represents the avaliable ModeTransitions of the ModeDeclarationGroup
modeUserError Behavior	ModeErrorBehavior	0..1	aggr	This represents the definition of the error behavior expected by the mode user in case of errors on the mode manager side (e.g. terminated mode manager).
onTransition Value	PositiveInteger	0..1	attr	The value of this attribute shall be taken into account by the RTE generator for programmatically representing a value used for the transition between two statuses.

Table F.79: ModeDeclarationGroup

Class	ModeDeclarationGroupPrototype			
Package	M2::AUTOSARTemplates::CommonStructure::ModeDeclaration			
Note	The ModeDeclarationGroupPrototype specifies a set of Modes (ModeDeclarationGroup) which is provided or required in the given context.			
Base	*ARObject*, *AtpFeature*, *AtpPrototype*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, BswModuleDescription.providedModeGroup, BswModuleDescription.required ModeGroup, FirewallStateSwitchInterface.firewallStateMachine, FunctionGroupSet.functionGroup, Mode SwitchInterface.modeGroup, Process.processStateMachine, StateManagementStateNotification.state Machine			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
swCalibration Access	SwCalibrationAccess Enum	0..1	attr	This allows for specifying whether or not the enclosing ModeDeclarationGroupPrototype can be measured at run-time.
type	ModeDeclarationGroup	0..1	tref	The "collection of ModeDeclarations" (= ModeDeclaration Group) supported by a component **Stereotypes:** isOfType

Table F.80: ModeDeclarationGroupPrototype

Class	ModeSwitchInterface			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	A mode switch interface declares a ModeDeclarationGroupPrototype to be sent and received. **Tags:** atp.recommendedPackage=PortInterfaces			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *PortInterface*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
modeGroup	ModeDeclarationGroup Prototype	0..1	aggr	The ModeDeclarationGroupPrototype of this mode interface.

Table F.81: ModeSwitchInterface

Enumeration	**NmVariantEnum**
Package	M2::AUTOSARTemplates::SystemTemplate::NetworkManagement
Note	Supported NmCoordinator roles.
Aggregated by	*NmNode*.nmVariant
Literal	*Description*
full	AUTOSAR NM is available **Tags:** atp.EnumerationLiteralIndex=3
light	No AUTOSAR NM is available, but functionality to shut down a channel **Tags:** atp.EnumerationLiteralIndex=1
none	No NM available **Tags:** atp.EnumerationLiteralIndex=0
passive	AUTOSAR NM running in passive mode available **Tags:** atp.EnumerationLiteralIndex=2
slaveActive	No NM is available. This is used for e.g. LIN slaves **Tags:** atp.EnumerationLiteralIndex=4
slavePassive	No NM is available. This used for e.g. Ethernet communication channels with OA TC10 compliant hardware **Tags:** atp.EnumerationLiteralIndex=5

Table F.82: NmVariantEnum

Class	**NonqueuedReceiverComSpec**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Communication attributes specific to non-queued receiving.			
Base	*ARObject*, *RPortComSpec*, *ReceiverComSpec*			
Aggregated by	*AbstractRequiredPortPrototype*.requiredComSpec, PortPrototypeBlueprint.requiredComSpec			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
aliveTimeout	TimeValue	0..1	attr	Specify the amount of time (in seconds) after which the software component (via the RTE) needs to be notified if the corresponding data item have not been received according to the specified timing description. If the aliveTimeout attribute is 0 no timeout monitoring shall be performed.
enableUpdate	Boolean	0..1	attr	This attribute controls whether application code is entitled to check whether the value of the corresponding Variable DataPrototype has been updated.
filter	DataFilter	0..1	aggr	The applicable filter algorithm for filtering the value of the corresponding dataElement.
handleData Status	Boolean	0..1	attr	If this attribute is set to true, then the Rte_IStatus API shall exist. If the attribute does not exist or is set to false, then the Rte_IStatus API may still exist in response to the existence of further conditions.

▽

△

Class	**NonqueuedReceiverComSpec**			
handleNever Received	Boolean	0..1	attr	This attribute specifies whether for the corresponding VariableDataPrototype the "never received" flag is available. If yes, the RTE is supposed to assume that initially the VariableDataPrototype has not been received before. After the first reception of the corresponding VariableDataPrototype the flag is cleared. • If the value of this attribute is set to "true" the flag is required. • If set to "false", the RTE shall not support the "never received" functionality for the corresponding Variable DataPrototype.
handleTimeout Type	HandleTimeoutEnum	0..1	attr	This attribute controls the behavior with respect to the handling of timeouts.
initValue	ValueSpecification	0..1	aggr	Initial value to be used in case the sending component is not yet initialized. If the sender also specifies an initial value, then the receiver's value will be used.
timeout Substitution Value	ValueSpecification	0..1	aggr	This attribute represents the substitution value applicable in the case of a timeout.

Table F.83: NonqueuedReceiverComSpec

Class	**NumericalValueSpecification**			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	A numerical ValueSpecification which is intended to be assigned to a Primitive data element. Note that the numerical value is a variant, it can be computed by a formula.			
Base	*ARObject*, *ValueSpecification*			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element, CalibrationParameterValue.applInitValue, CalibrationParameterValue.implInitValue, ConstantSpecification.valueSpec, CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.receptionDefaultValue, ISignal.timeoutSubstitutionValue, NonqueuedReceiverComSpec.initValue, NonqueuedReceiverComSpec.timeoutSubstitutionValue, NonqueuedSenderComSpec.initValue, NvProvideComSpec.ramBlockInitValue, NvProvideComSpec.romBlockInitValue, NvRequireComSpec.initValue, ParameterDataPrototype.initValue, ParameterProvideComSpec.initValue, ParameterRequireComSpec.initValue, PersistencyDataRequiredComSpec.initValue, PersistencyKeyValuePair.initValue, PortDefinedArgumentValue.value, PortPrototypeBlueprintInitValue.value, RecordValueSpecification.field, SomeipEventDeployment.eventReceptionDefaultValue, *StateManagementCompareCondition*.compareValue, SwDataDefProps.invalidValue, UserDefinedEventDeployment.eventReceptionDefaultValue, VariableDataPrototype.initValue			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
value	Numerical	0..1	attr	This is the value itself. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime

Table F.84: NumericalValueSpecification

Class	**NvBlockSwComponentType**
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components
Note	The NvBlockSwComponentType defines non volatile data which data can be shared between SwComponentPrototypes. The non volatile data of the NvBlockSwComponentType are accessible via provided and required ports. **Tags:** atp.recommendedPackage=SwComponentTypes

▽

△

Class	NvBlockSwComponentType			
Base	*ARElement*, *ARObject*, *AtomicSwComponentType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *SwComponentType*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
bulkNvDataDescriptor	BulkNvDataDescriptor	*	aggr	This aggregation formally defines the bulk Nv Blocks that are provided to the application software by the enclosing NvBlockSwComponentType. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=bulkNvDataDescriptor.shortName, bulkNvDataDescriptor.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
nvBlockDescriptor	NvBlockDescriptor	*	aggr	Specification of the properties of exactly one NVRAM Block. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=nvBlockDescriptor.shortName, nvBlockDescriptor.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Table F.85: NvBlockSwComponentType

Class	NvDataInterface			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	A non volatile data interface declares a number of VariableDataPrototypes to be exchanged between non volatile block components and atomic software components. **Tags:** atp.recommendedPackage=PortInterfaces			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *DataInterface*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *PortInterface*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
nvData	VariableDataPrototype	*	aggr	The VariableDataPrototype of this nv data interface.

Table F.86: NvDataInterface

Class	PPortPrototype			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	Component port providing a certain port interface.			
Base	*ARObject*, *AbstractProvidedPortPrototype*, *AtpBlueprintable*, *AtpFeature*, *AtpPrototype*, *Identifiable*, *MultilanguageReferrable*, *PortPrototype*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, *SwComponentType*.port			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
providedInterface	PortInterface	0..1	tref	The interface that this port provides. **Stereotypes:** isOfType

Table F.87: PPortPrototype

Class	PRPortPrototype			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	This kind of PortPrototype can take the role of both a required and a provided PortPrototype.			
Base	*ARObject*, *AbstractProvidedPortPrototype*, *AbstractRequiredPortPrototype*, *AtpBlueprintable*, *AtpFeature*, *AtpPrototype*, *Identifiable*, *MultilanguageReferrable*, *PortPrototype*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, *SwComponentType*.port			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
providedRequiredInterface	PortInterface	0..1	tref	This represents the PortInterface used to type the PRPortPrototype **Stereotypes:** isOfType

Table F.88: PRPortPrototype

Class	*PackageableElement* (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::ARPackage			
Note	This meta-class specifies the ability to be a member of an AUTOSAR package.			
Base	*ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	*ARElement*, EnumerationMappingTable, *FibexElement*			
Aggregated by	ARPackage.element

Table F.89: PackageableElement

Class	ParameterDataPrototype			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	A ParameterDataPrototype represents a formalized generic piece of information that is typically immutable by the application software layer, but mutable by measurement and calibration tools. ParameterDataPrototype is used in various contexts and the specific context gives the otherwise generic ParameterDataPrototype a dedicated semantics.			
Base	*ARObject*, *AtpFeature*, *AtpPrototype*, *AutosarDataPrototype*, *DataPrototype*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, BswInternalBehavior.perInstanceParameter, *InternalBehavior*.constantMemory, NvBlockDescriptor.romBlock, ParameterInterface.parameter, SwcInternalBehavior.perInstanceParameter, SwcInternalBehavior.sharedParameter			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
initValue	ValueSpecification	0..1	aggr	Specifies initial value(s) of the ParameterDataPrototype

Table F.90: ParameterDataPrototype

Class	ParameterInterface			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	A parameter interface declares a number of parameter and characteristic values to be exchanged between parameter components and software components. **Tags:** atp.recommendedPackage=PortInterfaces			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *DataInterface*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *PortInterface*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
parameter	ParameterDataPrototype	*	aggr	The ParameterDataPrototype of this ParameterInterface.

Table F.91: ParameterInterface

Class	ParameterSwComponentType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	The ParameterSwComponentType defines parameters and characteristic values accessible via provided Ports. The provided values are the same for all connected SwComponentPrototypes **Tags:** atp.recommendedPackage=SwComponentTypes			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *SwComponentType*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
constant Mapping	ConstantSpecification MappingSet	*	ref	Reference to the ConstantSpecificationMapping to be applied for the particular ParameterSwComponentType **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=constantMapping
dataType Mapping	DataTypeMappingSet	*	ref	Reference to the DataTypeMapping to be applied for the particular ParameterSwComponentType **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=dataTypeMapping
instantiation DataDefProps	InstantiationDataDef Props	*	aggr	The purpose of this is that within the context of a given SwComponentType some data def properties of individual instantiations can be modified. The aggregation of InstantiationDataDefProps is subject to variability with the purpose to support the conditional existence of PortPrototypes **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=instantiationDataDefProps, instantiationData DefProps.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Table F.92: ParameterSwComponentType

Class	PassThroughSwConnector			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	This kind of SwConnector can be used inside a CompositionSwComponentType to connect two delegation PortPrototypes.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *SwConnector*			
Aggregated by	*AtpClassifier*.atpFeature, CompositionSwComponentType.connector			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
providedOuter Port	AbstractProvidedPort Prototype	0..1	ref	This represents the provided outer delegation Port Prototype of the PassThroughSwConnector.
requiredOuter Port	AbstractRequiredPort Prototype	0..1	ref	This represents the required outer delegation Port Prototype of the PassThroughSwConnector.

Table F.93: PassThroughSwConnector

Class	PhysConstrs
Package	M2::MSR::AsamHdo::Constraints::GlobalConstraints
Note	This meta-class represents the ability to express physical constraints. Therefore it has (in opposite to InternalConstrs) a reference to a Unit.
Base	*ARObject*
Aggregated by	DataConstrRule.physConstrs

▽

△

Class	**PhysConstrs**			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
lowerLimit	Limit	0..1	attr	This specifies the lower limit of the constraint. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime xml.sequenceOffset=20
maxDiff	Numerical	0..1	attr	Maximum difference that is permitted between two consecutive values if the constraint is applied to an axis. **Tags:** xml.sequenceOffset=60
maxGradient	Numerical	0..1	attr	This element specifies the maximum slope that may be used in curves and maps. **Tags:** xml.sequenceOffset=50
monotony	MonotonyEnum	0..1	attr	This specifies the monotony constraints on the data object. Note that this applies only to curves and maps. **Tags:** xml.sequenceOffset=70
scaleConstr (ordered)	ScaleConstr	*	aggr	This is one particular scale which contributes to the data constraints. **Tags:** atp.Status=obsolete xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=40 xml.typeElement=false xml.typeWrapperElement=false
unit	Unit	0..1	ref	This is the unit to which the physical constraints relate to. In particular, it is the physical unit of the specified limits. **Tags:** xml.sequenceOffset=80
upperLimit	Limit	0..1	attr	This specifies the upper limit of the constraint. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime xml.sequenceOffset=30

Table F.94: PhysConstrs

Class	**PncMappingIdent**			
Package	M2::AUTOSARTemplates::SystemTemplate::PncMapping			
Note	This meta-class is created to add the ability to become the target of a reference to the non-Referrable PncMapping.			
Base	*ARObject*, *Referrable*			
Aggregated by	PncMapping.ident			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
–	–	–	–	–

Table F.95: PncMappingIdent

Class	PortAPIOption			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::PortAPIOptions			
Note	Options how to generate the signatures of calls for an AtomicSwComponentType in order to communicate over a PortPrototype (for calls into a RunnableEntity as well as for calls from a Runnable Entity to the PortPrototype).			
Base	*ARObject*			
Aggregated by	SwcInternalBehavior.portAPIOption			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
enableTake Address	Boolean	0..1	attr	If set to true, the software-component is able to use the API reference for deriving a pointer to an object.
errorHandling	DataTransformation ErrorHandlingEnum	0..1	attr	This specifies whether a RunnableEntity accessing a Port Prototype that is referenced by this PortAPIOption shall specifically handle transformer errors or not.
indirectAPI	Boolean	0..1	attr	If set to true this attribute specifies an "indirect API" to be generated for the associated port which means that the software-component is able to access the actions on a port via a pointer to an object representing a port. This allows e.g. iterating over ports in a loop. This option has no effect for PPortPrototypes of client/server interfaces.
port	PortPrototype	0..1	ref	The option is valid for generated functions related to communication over this port
portArgValue (ordered)	PortDefinedArgument Value	*	aggr	An argument value defined by this port.
supported Feature	SwcSupportedFeature	*	aggr	This collection specifies which features are supported by the RunnableEntitys which access a PortPrototype that it referenced by this PortAPIOption.
transformer Status Forwarding	DataTransformation StatusForwardingEnum	0..1	attr	This attribute specifies whether a RunnableEntity accessing a PortPrototype that is referenced by this Port APIOption shall be able to forward a status code to the transformer chain.

Table F.96: PortAPIOption

Class	PortGroup			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	Group of ports which share a common functionality. Example: need specific network resources. This information shall be available on the VFB level in order to delegate it properly via compositions. When propagated into the ECU extract, this information is used as input for the configuration of Services like the Communication Manager. A PortGroup is defined locally in a component (which can be a composition) and refers to the "outer" ports belonging to the group as well as to the "inner" groups which propagate this group into the components which are part of a composition. A PortGroup within an atomic SWC cannot be linked to inner groups.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, *SwComponentType*.portGroup			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
innerGroup	PortGroup	*	iref	Links a PortGroup in a composition to another PortGroup, that is defined in a component which is part of this CompositionSwComponentType. **InstanceRef implemented by:** InnerPortGroupIn CompositionInstanceRef

▽

△

Class	**PortGroup**			
outerPort	PortPrototype	*	ref	Outer PortPrototype of this AtomicSwComponentType which belongs to the group. A port can belong to several groups or to no group at all. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=outerPort.portPrototype, outerPort.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Table F.97: PortGroup

Class	***PortInterface*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	Abstract base class for an interface that is either provided or required by a port of a software component.			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Subclasses	ClientServerInterface, *DataInterface*, ModeSwitchInterface, TriggerInterface			
Aggregated by	ARPackage.element			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
isService	Boolean	0..1	attr	This flag is set if the PortInterface is to be used for communication between an • ApplicationSwComponentType or • ServiceProxySwComponentType or • SensorActuatorSwComponentType or • ComplexDeviceDriverSwComponentType • ServiceSwComponentType • EcuAbstractionSwComponentType and a ServiceSwComponentType (namely an AUTOSAR Service) located on the same ECU. Otherwise the flag is not set. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=blueprintDerivationTime
serviceKind	ServiceProviderEnum	0..1	attr	This attribute provides further details about the nature of the applied service.

Table F.98: PortInterface

Class	***PortInterfaceMapping*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	Specifies one PortInterfaceMapping to support the connection of Ports typed by two different Port Interfaces with PortInterface elements having unequal names and/or unequal semantic (resolution or range).			
Base	*ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	ClientServerInterfaceMapping, ModeInterfaceMapping, TriggerInterfaceMapping, VariableAndParameterInterfaceMapping			
Aggregated by	PortInterfaceMappingSet.portInterfaceMapping

Table F.99: PortInterfaceMapping

Class	*PortPrototype* (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	Base class for the ports of an AUTOSAR software component. The aggregation of PortPrototypes is subject to variability with the purpose to support the conditional existence of ports.			
Base	*ARObject*, *AtpBlueprintable*, *AtpFeature*, *AtpPrototype*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	*AbstractProvidedPortPrototype*, *AbstractRequiredPortPrototype*			
Aggregated by	*AtpClassifier*.atpFeature, *SwComponentType*.port			
Attribute	Type	Mult.	Kind	Note
clientServerAnnotation	ClientServerAnnotation	*	aggr	Annotation of this PortPrototype with respect to client/server communication.
delegatedPortAnnotation	DelegatedPortAnnotation	0..1	aggr	Annotations on this delegated port.
ioHwAbstractionServerAnnotation	IoHwAbstractionServerAnnotation	*	aggr	Annotations on this IO Hardware Abstraction port.
modePortAnnotation	ModePortAnnotation	*	aggr	Annotations on this mode port.
nvDataPortAnnotation	NvDataPortAnnotation	*	aggr	Annotations on this non voilatile data port.
parameterPortAnnotation	ParameterPortAnnotation	*	aggr	Annotations on this parameter port.
senderReceiverAnnotation	SenderReceiverAnnotation	*	aggr	Collection of annotations of this ports sender/receiver communication.
triggerPortAnnotation	TriggerPortAnnotation	*	aggr	Annotations on this trigger port.

Table F.100: PortPrototype

Class	PostBuildVariantCriterion			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling			
Note	This class specifies one particular PostBuildVariantSelector. **Tags:** atp.recommendedPackage=PostBuildVariantCriterions			
Base	*ARElement*, *ARObject*, *AtpDefinition*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	Type	Mult.	Kind	Note
compuMethod	CompuMethod	1	ref	The compuMethod specifies the possible values for the variant criterion serving as an enumerator.

Table F.101: PostBuildVariantCriterion

Class	RPortPrototype			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	Component port requiring a certain port interface.			
Base	*ARObject*, *AbstractRequiredPortPrototype*, *AtpBlueprintable*, *AtpFeature*, *AtpPrototype*, *Identifiable*, *MultilanguageReferrable*, *PortPrototype*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, *SwComponentType*.port			
Attribute	Type	Mult.	Kind	Note

▽

△

Class	**RPortPrototype**			
mayBe Unconnected	Boolean	0..1	attr	If set to true, this attribute indicates that the enclosing RPortPrototype may be left unconnected and that this aspect has explicitly been considered in the software-component's design.
required Interface	PortInterface	0..1	tref	The interface that this port requires. **Stereotypes:** isOfType

Table F.102: RPortPrototype

Class	***ReceiverComSpec*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Receiver-specific communication attributes (RPortPrototype typed by SenderReceiverInterface).			
Base	*ARObject*, *RPortComSpec*			
Subclasses	NonqueuedReceiverComSpec, QueuedReceiverComSpec			
Aggregated by	*AbstractRequiredPortPrototype*.requiredComSpec, PortPrototypeBlueprint.requiredComSpec			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
composite Network Representation	CompositeNetwork Representation	*	aggr	This represents a CompositeNetworkRepresentation defined in the context of a ReceiverComSpec. The purpose of this aggregation is to be able to specify the network representation of leaf elements of Application CompositeDataTypes. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=compositeNetworkRepresentation
dataElement	AutosarDataPrototype	0..1	ref	Data element these attributes belong to.
handleOutOf Range	HandleOutOfRange Enum	0..1	attr	This attribute controls how values that are out of the specified range are handled according to the values of HandleOutOfRangeEnum.
handleOutOf RangeStatus	HandleOutOfRange StatusEnum	0..1	attr	Control the way how return values are created in case of an out-of-range situation.
maxDelta CounterInit	PositiveInteger	0..1	attr	Initial maximum allowed gap between two counter values of two consecutively received valid Data, i.e. how many subsequent lost data is accepted. For example, if the receiver gets Data with counter 1 and MaxDeltaCounter Init is 1, then at the next reception the receiver can accept Counters with values 2 and 3, but not 4. Note that if the receiver does not receive new Data at a consecutive read, then the receiver increments the tolerance by 1. Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach. **Stereotypes:** atpVariation **Tags:** atp.Status=obsolete vh.latestBindingTime=preCompileTime

▽

△

Class	***ReceiverComSpec*** (abstract)			
maxNoNewOrRepeatedData	PositiveInteger	0..1	attr	The maximum amount of missing or repeated Data which the receiver does not expect to exceed under normal communication conditions. Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach. **Tags:** atp.Status=obsolete
networkRepresentation	SwDataDefProps	0..1	aggr	A networkRepresentation is used to define how the dataElement is mapped to a communication bus. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=networkRepresentation
receptionProps	ReceptionComSpecProps	0..1	aggr	"This aggregation represents the definition transmission props in the context of the enclosing ReceiverComSpec.
replaceWith	VariableAccess	0..1	aggr	This aggregation is used to identify the AutosarDataPrototype to be taken for sourcing an external replacement in the out-of-range and invalidValue handling.
syncCounterInit	PositiveInteger	0..1	attr	Number of Data required for validating the consistency of the counter that shall be received with a valid counter (i.e. counter within the allowed lock-in range) after the detection of an unexpected behavior of a received counter. Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach. **Tags:** atp.Status=obsolete
transformationComSpecProps	TransformationComSpecProps	*	aggr	This references the TransformationComSpecProps which define port-specific configuration for data transformation.
usesEndToEndProtection	Boolean	0..1	attr	This indicates whether the corresponding dataElement shall be transmitted using end-to-end protection. Caveat: The E2E wrapper approach involves technologies that are not subjected to the AUTOSAR standard and is superseded by the superior E2E transformer approach (which is fully standardized by AUTOSAR). Hence, new projects (without legacy constraints due to carry-over parts) shall use the fully standardized E2E transformer approach. **Stereotypes:** atpVariation **Tags:** atp.Status=obsolete vh.latestBindingTime=preCompileTime

Table F.103: ReceiverComSpec

Class	**RecordValueSpecification**			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	Specifies the values for a record.			
Base	*ARObject*, *CompositeValueSpecification*, *ValueSpecification*			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element, CalibrationParameterValue.applInitValue, CalibrationParameterValue.implInitValue, CompositeRuleBasedValueSpecification.argument, ConstantSpecification.valueSpec, CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.receptionDefaultValue, ISignal.timeoutSubstitutionValue, NonqueuedReceiverComSpec.initValue, NonqueuedReceiverComSpec.timeoutSubstitutionValue, NonqueuedSenderComSpec.initValue, NvProvideComSpec.ramBlockInitValue, NvProvideComSpec.romBlockInitValue, NvRequireComSpec.initValue, ParameterDataPrototype.initValue, ParameterProvideComSpec.initValue, ParameterRequireComSpec.initValue, PersistencyDataRequiredComSpec.initValue, PersistencyKeyValuePair.initValue, PortDefinedArgumentValue.value, PortPrototypeBlueprintInitValue.value, RecordValueSpecification.field, SomeipEventDeployment.eventReceptionDefaultValue, *StateManagementCompareCondition*.compareValue, SwDataDefProps.invalidValue, UserDefinedEventDeployment.eventReceptionDefaultValue, VariableDataPrototype.initValue			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
field (ordered)	ValueSpecification	*	aggr	The value for a single record field. This could also be mapped explicitly to a record element of the data type using the shortName of the ValueSpecification. But this would introduce a relationship to the data type that is too strong. As of now, it is only important that the structure of the data type matches the structure of the ValueSpecification independently of the shortNames. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=field, field.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Table F.104: RecordValueSpecification

Class	***Referrable*** (abstract)			
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::Identifiable			
Note	Instances of this class can be referred to by their identifier (while adhering to namespace borders).			
Base	*ARObject*			
Subclasses	*AtpDefinition*, BswDistinguishedPartition, *BswModuleCallPoint*, BswModuleClientServerEntry, BswVariableAccess, CouplingPortTrafficClassAssignment, *DiagnosticEnvModeElement*, EthernetPriorityRegeneration, ExclusiveAreaNestingOrder, *HwDescriptionEntity*, *ImplementationProps*, LinSlaveConfigIdent, ModeTransition, *MultilanguageReferrable*, PncMappingIdent, *SingleLanguageReferrable*, SoConIPduIdentifier, SocketConnectionBundle, TimeSyncServerConfiguration, TpConnectionIdent			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
shortName	Identifier	1	attr	This specifies an identifying shortName for the object. It needs to be unique within its context and is intended for humans but even more for technical reference. **Stereotypes:** atpIdentityContributor **Tags:** xml.enforceMinMultiplicity=true xml.sequenceOffset=-100
shortName Fragment	ShortNameFragment	*	aggr	This specifies how the Referrable.shortName is composed of several shortNameFragments. **Tags:** xml.sequenceOffset=-90

Table F.105: Referrable

Class	RoleBasedPortAssignment			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::ServiceMapping			
Note	This class specifies an assignment of a role to a particular service port (RPortPrototype or PPort Prototype) of an AtomicSwComponentType. With this assignment, the role of the service port can be mapped to a specific ServiceNeeds element, so that a tool is able to create the correct connector.			
Base	*ARObject*			
Aggregated by	NvBlockDescriptor.clientServerPort, SwcServiceDependency.assignedPort			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
portPrototype	PortPrototype	0..1	ref	Service PortPrototype used in the assigned role. This PortPrototype shall either belong to the same AtomicSw ComponentType as the SwcInternalBehavior which owns the ServiceDependency or to the same NvBlockSw ComponentType as the NvBlockDescriptor.
role	Identifier	0..1	attr	This is the role of the assigned Port in the given context. The value shall be a shortName of the Blueprint of a Port Interface as standardized in the Software Specification of the related AUTOSAR Service.

Table F.106: RoleBasedPortAssignment

Class	RunnableEntity			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior			
Note	A RunnableEntity represents the smallest code-fragment that is provided by an AtomicSwComponent Type and are executed under control of the RTE. RunnableEntities are for instance set up to respond to data reception or operation invocation on a server.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *ExecutableEntity*, *Identifiable*, *Multilanguage Referrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, SwcInternalBehavior.runnable			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
argument (ordered)	RunnableEntity Argument	*	aggr	This represents the formal definition of a an argument to a RunnableEntity.
asynchronous ServerCall ResultPoint	AsynchronousServer CallResultPoint	*	aggr	The server call result point admits a runnable to fetch the result of an asynchronous server call. The aggregation of AsynchronousServerCallResultPoint is subject to variability with the purpose to support the conditional existence of client server PortPrototypes and the variant existence of server call result points in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=asynchronousServerCallResultPoint.short Name, asynchronousServerCallResultPoint.variation Point.shortLabel vh.latestBindingTime=preCompileTime
canBeInvoked Concurrently	Boolean	0..1	attr	If the value of this attribute is set to "true" the enclosing RunnableEntity can be invoked concurrently (even for one instance of the corresponding AtomicSwComponent Type). This implies that it is the responsibility of the implementation of the RunnableEntity to take care of this form of concurrency.

▽

△

Class	**RunnableEntity**			
dataRead Access	VariableAccess	*	aggr	RunnableEntity has implicit read access to dataElement of a sender-receiver PortPrototype or nv data of a nv data PortPrototype. The aggregation of dataReadAccess is subject to variability with the purpose to support the conditional existence of sender receiver ports or the variant existence of dataReadAccess in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=dataReadAccess.shortName, dataRead Access.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
dataReceive PointBy Argument	VariableAccess	*	aggr	RunnableEntity has explicit read access to dataElement of a sender-receiver PortPrototype or nv data of a nv data PortPrototype. The result is passed back to the application by means of an argument in the function signature. The aggregation of dataReceivePointByArgument is subject to variability with the purpose to support the conditional existence of sender receiver PortPrototype or the variant existence of data receive points in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=dataReceivePointByArgument.shortName, dataReceivePointByArgument.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
dataReceive PointByValue	VariableAccess	*	aggr	RunnableEntity has explicit read access to dataElement of a sender-receiver PortPrototype or nv data of a nv data PortPrototype. The result is passed back to the application by means of the return value. The aggregation of dataReceivePointBy Value is subject to variability with the purpose to support the conditional existence of sender receiver ports or the variant existence of data receive points in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=dataReceivePointByValue.shortName, data ReceivePointByValue.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
dataSendPoint	VariableAccess	*	aggr	RunnableEntity has explicit write access to dataElement of a sender-receiver PortPrototype or nv data of a nv data PortPrototype. The aggregation of dataSendPoint is subject to variability with the purpose to support the conditional existence of sender receiver PortPrototype or the variant existence of data send points in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=dataSendPoint.shortName, dataSend Point.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

▽

△

Class	**RunnableEntity**			
dataWrite Access	VariableAccess	*	aggr	RunnableEntity has implicit write access to dataElement of a sender-receiver PortPrototype or nv data of a nv data PortPrototype. The aggregation of dataWriteAccess is subject to variability with the purpose to support the conditional existence of sender receiver ports or the variant existence of dataWriteAccess in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=dataWriteAccess.shortName, dataWrite Access.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
external TriggeringPoint	ExternalTriggeringPoint	*	aggr	The aggregation of ExternalTriggeringPoint is subject to variability with the purpose to support the conditional existence of trigger ports or the variant existence of external triggering points in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=externalTriggeringPoint.ident.shortName, externalTriggeringPoint.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
internal TriggeringPoint	InternalTriggeringPoint	*	aggr	The aggregation of InternalTriggeringPoint is subject to variability with the purpose to support the variant existence of internal triggering points in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=internalTriggeringPoint.shortName, internal TriggeringPoint.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
modeAccess Point	ModeAccessPoint	*	aggr	The runnable has a mode access point. The aggregation of ModeAccessPoint is subject to variability with the purpose to support the conditional existence of mode ports or the variant existence of mode access points in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=modeAccessPoint.ident.shortName, mode AccessPoint.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
modeSwitch Point	ModeSwitchPoint	*	aggr	The runnable has a mode switch point. The aggregation of ModeSwitchPoint is subject to variability with the purpose to support the conditional existence of mode ports or the variant existence of mode switch points in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=modeSwitchPoint.shortName, modeSwitch Point.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

▽

△

Class	**RunnableEntity**			
parameter Access	ParameterAccess	*	aggr	The presence of a ParameterAccess implies that a RunnableEntity needs read only access to a Parameter DataPrototype which may either be local or within a Port Prototype. The aggregation of ParameterAccess is subject to variability with the purpose to support the conditional existence of parameter ports and component local parameters as well as the variant existence of Parameter Access (points) in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=parameterAccess.shortName, parameter Access.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
readLocal Variable	VariableAccess	*	aggr	The presence of a readLocalVariable implies that a RunnableEntity needs read access to a VariableData Prototype in the role of implicitInterRunnableVariable or explicitInterRunnableVariable. The aggregation of readLocalVariable is subject to variability with the purpose to support the conditional existence of implicitInterRunnableVariable and explicit InterRunnableVariable or the variant existence of read LocalVariable (points) in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=readLocalVariable.shortName, readLocal Variable.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
serverCallPoint	ServerCallPoint	*	aggr	The RunnableEntity has a ServerCallPoint. The aggregation of ServerCallPoint is subject to variability with the purpose to support the conditional existence of client server PortPrototypes or the variant existence of server call points in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=serverCallPoint.shortName, serverCall Point.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
symbol	CIdentifier	0..1	attr	The symbol describing this RunnableEntity's entry point. This is considered the API of the RunnableEntity and is required during the RTE contract phase.
waitPoint	WaitPoint	*	aggr	The WaitPoint associated with the RunnableEntity.
writtenLocal Variable	VariableAccess	*	aggr	The presence of a writtenLocalVariable implies that a RunnableEntity needs write access to a VariableData Prototype in the role of implicitInterRunnableVariable or explicitInterRunnableVariable. The aggregation of writtenLocalVariable is subject to variability with the purpose to support the conditional existence of implicitInterRunnableVariable and explicit InterRunnableVariable or the variant existence of written LocalVariable (points) in the implementation. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=writtenLocalVariable.shortName, written LocalVariable.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

Table F.107: RunnableEntity

Class	***SenderComSpec*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	Communication attributes for a sender port (PPortPrototype typed by SenderReceiverInterface).			
Base	*ARObject*, *PPortComSpec*			
Subclasses	NonqueuedSenderComSpec, QueuedSenderComSpec			
Aggregated by	*AbstractProvidedPortPrototype*.providedComSpec, PortPrototypeBlueprint.providedComSpec			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
composite Network Representation	CompositeNetwork Representation	*	aggr	This represents a CompositeNetworkRepresentation defined in the context of a SenderComSpec. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=compositeNetworkRepresentation
dataElement	AutosarDataPrototype	0..1	ref	Data element these quality of service attributes apply to.
handleOutOf Range	HandleOutOfRange Enum	0..1	attr	This attribute controls how out-of-range values shall be dealt with.
network Representation	SwDataDefProps	0..1	aggr	A networkRepresentation is used to define how the data Element is mapped to a communication bus. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=networkRepresentation
transmission Acknowledge	Transmission Acknowledgement Request	0..1	aggr	Requested transmission acknowledgement for data element.
transmission Props	TransmissionComSpec Props	0..1	aggr	This aggregation represents the definition transmission props in the context of the enclosing SenderComSpec.
usesEndToEnd Protection	Boolean	0..1	attr	This indicates whether the corresponding dataElement shall be transmitted using end-to-end protection. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime

Table F.108: SenderComSpec

Class	**SenderReceiverInterface**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	A sender/receiver interface declares a number of data elements to be sent and received. **Tags:** atp.recommendedPackage=PortInterfaces			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *DataInterface*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *PortInterface*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
dataElement	VariableDataPrototype	*	aggr	The data elements of this SenderReceiverInterface.
invalidation Policy	InvalidationPolicy	*	aggr	InvalidationPolicy for a particular dataElement
metaDataItem Set	MetaDataItemSet	*	aggr	This aggregation defines fixed sets of meta-data items associated with dataElements of the enclosing Sender ReceiverInterface.

Table F.109: SenderReceiverInterface

Class	**SensorActuatorSwComponentType**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	The SensorActuatorSwComponentType introduces the possibility to link from the software representation of a sensor/actuator to its hardware description provided by the ECU Resource Template. **Tags:** atp.recommendedPackage=SwComponentTypes			
Base	*ARElement*, *ARObject*, *AtomicSwComponentType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *SwComponentType*

Attribute	**Type**	**Mult.**	**Kind**	**Note**
sensorActuator	HwDescriptionEntity	0..1	ref	Reference from the Sensor Actuator Software Component Type to the description of the actual hardware.

Table F.110: SensorActuatorSwComponentType

Class	***ServerCallPoint*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::ServerCall			
Note	If a RunnableEntity owns a ServerCallPoint it is entitled to invoke a particular ClientServerOperation of a specific RPortPrototype of the corresponding AtomicSwComponentType			
Base	*ARObject*, *AbstractAccessPoint*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	AsynchronousServerCallPoint, SynchronousServerCallPoint			
Aggregated by	*AtpClassifier*.atpFeature, RunnableEntity.serverCallPoint			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
operation	ClientServerOperation	0..1	iref	The operation that is called by this runnable. **InstanceRef implemented by:** ROperationInAtomicSwcInstanceRef
timeout	TimeValue	0..1	attr	Time in seconds before the server call times out and returns with an error message. It depends on the call type (synchronous or asynchronous) how this is reported.

Table F.111: ServerCallPoint

Class	***ServiceNeeds*** (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::ServiceNeeds			
Note	This expresses the abstract needs that a Software Component or Basic Software Module has on the configuration of an AUTOSAR Service to which it will be connected. "Abstract needs" means that the model abstracts from the Configuration Parameters of the underlying Basic Software.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	BswMgrNeeds, ChargeManagerNeeds, ComMgrUserNeeds, CryptoKeyManagementNeeds, CryptoServiceJobNeeds, CryptoServiceNeeds, *DiagnosticCapabilityElement*, DltUserNeeds, *DoIpServiceNeeds*, EcuStateMgrUserNeeds, ErrorTracerNeeds, FunctionInhibitionAvailabilityNeeds, FunctionInhibitionNeeds, GeneralPurposeTimerServiceNeeds, GlobalSupervisionNeeds, HardwareTestNeeds, IdsMgrCustomTimestampNeeds, IdsMgrNeeds, IndicatorStatusNeeds, J1939DcmDm19Support, J1939RmIncomingRequestServiceNeeds, J1939RmOutgoingRequestServiceNeeds, NvBlockNeeds, SecureOnBoardCommunicationNeeds, SupervisedEntityCheckpointNeeds, SupervisedEntityNeeds, SyncTimeBaseMgrUserNeeds, V2xDataManagerNeeds, V2xFacUserNeeds, V2xMUserNeeds, VendorSpecificServiceNeeds			
Aggregated by	BswServiceDependency.serviceNeeds, SwcServiceDependency.serviceNeeds			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
–	–	–	–	–

Table F.112: ServiceNeeds

Class	ServiceProxySwComponentType			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	This class provides the ability to express a software-component which provides access to an internal service for remote ECUs. It acts as a proxy for the service providing access to the service. An important use case is the request of vehicle mode switches: Such requests can be communicated via sender-receiver interfaces across ECU boundaries, but the mode manager being responsible to perform the mode switches is an AUTOSAR Service which is located in the Basic Software and is not visible in the VFB view. To handle this situation, a ServiceProxySwComponentType will act as proxy for the mode manager. It will have R-Ports to be connected with the mode requestors on VFB level and Service-Ports to be connected with the local mode manager at ECU integration time. Apart from the semantics, a ServiceProxySwComponentType has these specific properties: • A prototype of it can be mapped to more than one ECUs in the system description. • Exactly one additional instance of it will be created in the ECU-Extract per ECU to which the prototype has been mapped. • For remote communication, it can have only R-Ports with sender-receiver interfaces and 1:n semantics. • There shall be no connectors between two prototypes of any ServiceProxySwComponentType. **Tags:** atp.recommendedPackage=SwComponentTypes			
Base	*ARElement*, *ARObject*, *AtomicSwComponentType*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *SwComponentType*

Table F.114: ServiceSwComponentType

Enumeration	ServiceVersionAcceptanceKindEnum
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances
Note	Defined the possible acceptance kinds for required service instances.
Aggregated by	ConsumedServiceInstance.versionDrivenFindBehavior, RequiredSomeipServiceInstance.versionDrivenFindBehavior
Literal	**Description**
exactOrAnyMinorVersion	Search for ANY or specific minor version service instance and select either ALL returned service instances (in case of ANY) or exactly the specific minor version service instances defined in required MinorVersion. **Tags:** atp.EnumerationLiteralIndex=0

▽

△

Enumeration	**ServiceVersionAcceptanceKindEnum**
minimumMinor Version	Search for ANY minor version service instance and select only those service instances which have an equal or greater minor version than given in requiredMinorVersion. **Tags:** atp.EnumerationLiteralIndex=1

Table F.115: ServiceVersionAcceptanceKindEnum

Class	***SignalPathConstraint*** (abstract)			
Package	M2::AUTOSARTemplates::SystemTemplate::SignalPaths			
Note	Additional guidelines for the System Generator, which specific way a signal between two Software Components should take in the network without defining in which frame and with which timing it is transmitted.			
Base	*ARObject*			
Subclasses	CommonSignalPath, ForbiddenSignalPath, PermissibleSignalPath, SeparateSignalPath			
Aggregated by	SystemMapping.signalPathConstraint			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
introduction	DocumentationBlock	1	aggr	This represents introductory documentation about the signal path constraint.

Table F.116: SignalPathConstraint

Class	**SoAdRoutingGroup**			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::ObsoleteModel			
Note	Routing of Pdus in the SoAd can be activated or deactivated. The ShortName of this element shall contain the RoutingGroupId. **Tags:** atp.Status=obsolete atp.recommendedPackage=SoAdRoutingGroups			
Base	*ARObject*, *CollectableElement*, *FibexElement*, *Identifiable*, *MultilanguageReferrable*, *Packageable Element*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
eventGroup ControlType	EventGroupControlType Enum	0..1	attr	This attribute defines the type of a RoutingGroup. There are RoutingGroups that activate the data path for unicast or multicast events of an event group. And there are RoutingGroups that activate the data path for initial events that are triggered, namely events that are sent out on the server side after a client got subscribed. Please note that this attribute is only valid for event communication (Sender Receiver communication) and shall be omitted in MethodActivationRoutingGroups.

Table F.117: SoAdRoutingGroup

Class	**SocketConnection**
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::ObsoleteModel
Note	The SoAd serves as a (De)Multiplexer between different PDU sources and the TCP/IP stack. **Tags:** atp.Status=obsolete
Base	*ARObject*, *Describable*
Aggregated by	SoAdConfig.connection, SocketConnectionBundle.bundledConnection

▽

△

Class	SocketConnection			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
clientIpAddrFromConnectionRequest	Boolean	0..1	attr	If set to true the Server "learns" the client IP address on connection request. This means that the statically configured IP Address of the related client shall be ignored. If set to false the Server only accepts statically configured IP address, e.g. 192.168.1.2. This means that the statically configured IP Address of the Client shall be used.
clientPort	SocketAddress	0..1	ref	Client Port for TCP/UDP connection in an abstract communication sense. The client is the major requester of the communication. Please note that the client may also produce data. **Tags:** atp.Status=obsolete
clientPortFromConnectionRequest	Boolean	0..1	attr	If set to true the Server "learns" the client Port on connection request. This means that the statically configured Port of the related client shall be ignored. If set to false the Server only accepts statically configured Port. This means that the statically configured Port of the Client shall be used.
pdu	SocketConnectionIpduIdentifier	*	aggr	PDUs handed over by the PDU Router (Transmission over the Ethernet) or PDUs handed over by SoAd (Reception over Ethernet). Multiple IPdus can be transmitted over one socket connection. **Tags:** atp.Status=obsolete
pduCollectionMaxBufferSize	PositiveInteger	0..1	attr	Defines the maximum buffer size in Byte which shall be filled before a socket with Pdu collection enabled shall be transmitted to the lower layer.
pduCollectionTimeout	TimeValue	0..1	attr	Defines the time in seconds which shall pass before a socket with Pdu collection enabled shall be transmitted to the lower layer after the first Pdu has been put into the socket buffer.
runtimeIpAddressConfiguration	RuntimeAddressConfigurationEnum	0..1	attr	This attribute determines which protocol is used by the client to obtain the IP Address information. If this attribute is not set to none the value determines the service used by the client to obtain the IP Address information for the SocketConnection. If this attribute is set to none the client used the statically configured IP Address information.
runtimePortConfiguration	RuntimeAddressConfigurationEnum	0..1	attr	This attribute determines which protocol is used by the client to obtain the Port information. If this attribute is not set to none the value determines the service used by the client to obtain the Port information for the SocketConnection. If this attribute is set to none the client uses the statically configured Port information.
shortLabel	Identifier	0..1	attr	This attribute specifies an identifying shortName for the SocketConnection. It shall be unique within its context.

Table F.118: SocketConnection

Class	SomeipSdClientServiceInstanceConfig
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances
Note	Client specific settings that are relevant for the configuration of SOME/IP Service-Discovery. **Tags:** atp.recommendedPackage=SomeipSdTimingConfigs
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*, *UploadableDesignElement*, *UploadablePackageElement*
Aggregated by	ARPackage.element

▽

△

Class	SomeipSdClientServiceInstanceConfig			
Attribute	Type	Mult.	Kind	Note
initialFind Behavior	InitialSdDelayConfig	0..1	aggr	Controls initial find behavior of clients.
priority	PositiveInteger	0..1	attr	This attribute defines the VLAN frame priority for Service Discovery messages that result from RequiredSomeip ServiceInstances that are referncing this SomeipSdClient ServiceInstanceConfig (Find, SubscribeEventGroup, Stop SubscribeEventgroup). Values from 0 (best effort) to 7 (highest) are allowed.
serviceFind TimeToLive	PositiveInteger	0..1	attr	This attribute represents the ability to define the time in seconds the service find is valid. Note! The TTL value for FindService entries is not used and shall be ignored by the server service. This configuration is only kept for backward compatibility. Default value if not specified shall be 0xFFFFFF.

Table F.119: SomeipSdClientServiceInstanceConfig

Class	SomeipServiceVersion			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances			
Note	This meta-class represents the ability to describe a version of a SOME/IP Service.			
Base	*ARObject*			
Aggregated by	ConsumedServiceInstance.blocklistedVersion, RequiredSomeipServiceInstance.blocklistedVersion, SomeipServiceInterfaceDeployment.serviceInterfaceVersion			
Attribute	Type	Mult.	Kind	Note
majorVersion	PositiveInteger	0..1	attr	Major Version of the ServiceInterface. **Tags:** xml.sequenceOffset=10
minorVersion	PositiveInteger	0..1	attr	Minor Version of the ServiceInterface. **Tags:** xml.sequenceOffset=20

Table F.120: SomeipServiceVersion

Class	*StackUsage* (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::ResourceConsumption::StackUsage			
Note	Describes the stack memory usage of a software.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	MeasuredStackUsage, RoughEstimateStackUsage, WorstCaseStackUsage			
Aggregated by	ResourceConsumption.stackUsage			
Attribute	Type	Mult.	Kind	Note
executableEntity	ExecutableEntity	0..1	ref	The executable entity for which this stack usage is described.
hardware Configuration	HardwareConfiguration	0..1	aggr	Contains information about the hardware context this stack usage is describing.
hwElement	HwElement	0..1	ref	Specifies for which hardware element (e.g. ECU) this stack usage is given.
softwareContext	SoftwareContext	0..1	aggr	Contains details about the software context this stack usage is provided for.

Table F.121: StackUsage

Primitive	**String**
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes
Note	This represents a String in which white-space shall be normalized before processing. For example: in order to compare two Strings: • leading and trailing white-space needs to be removed • consecutive white-space (blank, cr, lf, tab) needs to be replaced by one blank. **Tags:** xml.xsd.customType=STRING xml.xsd.type=string

Table F.122: String

Table F.123: SwBaseType

Class	***SwComponentType*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	Base class for AUTOSAR software components.			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Subclasses	*AtomicSwComponentType*, CompositionSwComponentType, ParameterSwComponentType			
Aggregated by	ARPackage.element			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
consistency Needs	ConsistencyNeeds	*	aggr	This represents the collection of ConsistencyNeeds owned by the enclosing SwComponentType. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=consistencyNeeds.shortName, consistency Needs.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
port	PortPrototype	*	aggr	The PortPrototypes through which this SwComponent Type can communicate. The aggregation of PortPrototype is subject to variability with the purpose to support the conditional existence of PortPrototypes. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=port.shortName, port.variationPoint.short Label vh.latestBindingTime=preCompileTime

▽

△

Class	***SwComponentType*** (abstract)			
portGroup	PortGroup	*	aggr	A port group being part of this component. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=portGroup.shortName, portGroup.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
swcMapping Constraint	SwComponentMapping Constraints	*	ref	Reference to constraints that are valid for this SwComponentType.
swComponent Documentation	SwComponent Documentation	0..1	aggr	This adds a documentation to the SwComponentType. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=swComponentDocumentation, swComponentDocumentation.variationPoint.shortLabel vh.latestBindingTime=preCompileTime xml.sequenceOffset=-10
unitGroup	UnitGroup	*	ref	This allows for the specification of which UnitGroups are relevant in the context of referencing SwComponentType.

Table F.124: SwComponentType

Class	***SwConnector*** (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Composition			
Note	The base class for connectors between ports. Connectors have to be identifiable to allow references from the system constraint template.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Subclasses	AssemblySwConnector, DelegationSwConnector, PassThroughSwConnector			
Aggregated by	*AtpClassifier*.atpFeature, CompositionSwComponentType.connector			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
mapping	PortInterfaceMapping	0..1	ref	Reference to a PortInterfaceMapping specifying the mapping of unequal named PortInterface elements of the two different PortInterfaces typing the two PortPrototypes which are referenced by the ConnectorPrototype.

Table F.125: SwConnector

Class	«atpVariation» **SwDataDefProps**			
Package	M2::MSR::DataDictionary::DataDefProperties			
Note	This class is a collection of properties relevant for data objects under various aspects. One could consider this class as a "pattern of inheritance by aggregation". The properties can be applied to all objects of all classes in which SwDataDefProps is aggregated. Note that not all of the attributes or associated elements are useful all of the time. Hence, the process definition (e.g. expressed with an OCL or a Document Control Instance MSR-DCI) has the task of implementing limitations. SwDataDefProps covers various aspects: • Structure of the data element for calibration use cases: is it a single value, a curve, or a map, but also the recordLayouts which specify how such elements are mapped/converted to the DataTypes in the programming language (or in AUTOSAR). This is mainly expressed by properties like swRecordLayout and swCalprmAxisSet • Implementation aspects, mainly expressed by swImplPolicy, swVariableAccessImplPolicy, swAddr Method, swPointerTagetProps, baseType, implementationDataType and additionalNativeTypeQualifier • Access policy for the MCD system, mainly expressed by swCalibrationAccess • Semantics of the data element, mainly expressed by compuMethod and/or unit, dataConstr, invalid Value • Code generation policy provided by swRecordLayout **Tags:** vh.latestBindingTime=codeGenerationTime			
Base	*ARObject*			
Aggregated by	*AutosarDataType*.swDataDefProps, CompositeNetworkRepresentation.networkRepresentation, Cpp ImplementationDataTypeElement.swDataDefProps, *DataPrototype*.swDataDefProps, DataPrototype TransformationProps.networkRepresentationProps, DiagnosticDataElement.swDataDefProps, Diagnostic EnvDataElementCondition.swDataDefProps, DltArgument.networkRepresentation, FlatInstance Descriptor.swDataDefProps, ImplementationDataTypeElement.swDataDefProps, InstantiationDataDef Props.swDataDefProps, ISignal.networkRepresentationProps, McDataInstance.resultingProperties, ParameterAccess.swDataDefProps, PerInstanceMemory.swDataDefProps, *ReceiverComSpec*.network Representation, SecurityEventContextDataElement.networkRepresentation, *SenderComSpec*.network Representation, SomeipDataPrototypeTransformationProps.networkRepresentation, SwPointerTarget Props.swDataDefProps, SwServiceArg.swDataDefProps, SwSystemconst.swDataDefProps, System Signal.physicalProps			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
additionalNative TypeQualifier	NativeDeclarationString	0..1	attr	This attribute is used to declare native qualifiers of the programming language which can neither be deduced from the baseType (e.g. because the data object describes a pointer) nor from other more abstract attributes. Examples are qualifiers like "volatile", "strict" or "enum" of the C-language. All such declarations have to be put into one string. **Tags:** xml.sequenceOffset=235
annotation	Annotation	*	aggr	This aggregation allows to add annotations (yellow pads ...) related to the current data object. **Tags:** xml.roleElement=true xml.roleWrapperElement=true xml.sequenceOffset=20 xml.typeElement=false xml.typeWrapperElement=false
baseType	SwBaseType	0..1	ref	Base type associated with the containing data object. **Tags:** xml.sequenceOffset=50
compuMethod	CompuMethod	0..1	ref	Computation method associated with the semantics of this data object. **Tags:** xml.sequenceOffset=180

▽

△

Class	«atpVariation» **SwDataDefProps**			
dataConstr	DataConstr	0..1	ref	Data constraint for this data object. **Tags:** xml.sequenceOffset=190
displayFormat	DisplayFormatString	0..1	attr	This property describes how a number is to be rendered e.g. in documents or in a measurement and calibration system. **Tags:** xml.sequenceOffset=210
display Presentation	DisplayPresentation Enum	0..1	attr	This attribute controls the presentation of the related data for measurement and calibration tools.
implementation DataType	AbstractImplementation DataType	0..1	ref	This association denotes the ImplementationDataType of a data declaration via its aggregated SwDataDefProps. It is used whenever a data declaration is not directly referring to a base type. Especially • redefinition of an ImplementationDataType via a "typedef" to another ImplementationDatatype • the target type of a pointer (see SwPointerTarget Props), if it does not refer to a base type directly • the data type of an array or record element within an ImplementationDataType, if it does not refer to a base type directly • the data type of an SwServiceArg, if it does not refer to a base type directly **Tags:** xml.sequenceOffset=215
invalidValue	ValueSpecification	0..1	aggr	Optional value to express invalidity of the actual data element. **Tags:** xml.sequenceOffset=255
stepSize	Float	0..1	attr	This attribute can be used to define a value which is added to or subtracted from the value of a DataPrototype when using up/down keys while calibrating.
swAddrMethod	SwAddrMethod	0..1	ref	Addressing method related to this data object. Via an association to the same SwAddrMethod it can be specified that several DataPrototypes shall be located in the same memory without already specifying the memory section itself. **Tags:** xml.sequenceOffset=30
swAlignment	AlignmentType	0..1	attr	The attribute describes the intended typical alignment of the DataPrototype. If the attribute is not defined the alignment is determined by the swBaseType size and the memoryAllocationKeywordPolicy of the referenced Sw AddrMethod. **Tags:** xml.sequenceOffset=33
swBit Representation	SwBitRepresentation	0..1	aggr	Description of the binary representation in case of a bit variable. **Tags:** xml.sequenceOffset=60
swCalibration Access	SwCalibrationAccess Enum	0..1	attr	Specifies the read or write access by MCD tools for this data object. **Tags:** xml.sequenceOffset=70
swCalprmAxis Set	SwCalprmAxisSet	0..1	aggr	This specifies the properties of the axes in case of a curve or map etc. This is mainly applicable to calibration parameters. **Tags:** xml.sequenceOffset=90

▽

△

Class	«atpVariation» **SwDataDefProps**			
swComparison Variable	SwVariableRefProxy	*	aggr	Variables used for comparison in an MCD process. **Tags:** xml.sequenceOffset=170 xml.typeElement=false
swData Dependency	SwDataDependency	0..1	aggr	Describes how the value of the data object has to be calculated from the value of another data object (by the MCD system). **Tags:** xml.sequenceOffset=200
swHostVariable	SwVariableRefProxy	0..1	aggr	Contains a reference to a variable which serves as a host-variable for a bit variable. Only applicable to bit objects. **Tags:** xml.sequenceOffset=220 xml.typeElement=false
swImplPolicy	SwImplPolicyEnum	0..1	attr	Implementation policy for this data object. **Tags:** xml.sequenceOffset=230
swIntended Resolution	Numerical	0..1	attr	The purpose of this element is to describe the requested quantization of data objects early on in the design process. The resolution ultimately occurs via the conversion formula present (compuMethod), which specifies the transition from the physical world to the standardized world (and vice-versa) (here, "the slope per bit" is present implicitly in the conversion formula). In the case of a development phase without a fixed conversion formula, a pre-specification can occur through swIntendedResolution. The resolution is specified in the physical domain according to the property "unit". **Tags:** xml.sequenceOffset=240
swInterpolation Method	Identifier	0..1	attr	This is a keyword identifying the mathematical method to be applied for interpolation. The keyword needs to be related to the interpolation routine which needs to be invoked. **Tags:** xml.sequenceOffset=250
swIsVirtual	Boolean	0..1	attr	This element distinguishes virtual objects. Virtual objects do not appear in the memory, their derivation is much more dependent on other objects and hence they shall have a swDataDependency . **Tags:** xml.sequenceOffset=260
swPointerTarget Props	SwPointerTargetProps	0..1	aggr	Specifies that the containing data object is a pointer to another data object. **Tags:** xml.sequenceOffset=280
swRecord Layout	SwRecordLayout	0..1	ref	Record layout for this data object. **Tags:** xml.sequenceOffset=290

▽

△

Class	«atpVariation» **SwDataDefProps**			
swRefresh Timing	MultidimensionalTime	0..1	aggr	This element specifies the frequency in which the object involved shall be or is called or calculated. This timing can be collected from the task in which write access processes to the variable run. But this cannot be done by the MCD system. So this attribute can be used in an early phase to express the desired refresh timing and later on to specify the real refresh timing. **Tags:** xml.sequenceOffset=300
swTextProps	SwTextProps	0..1	aggr	the specific properties if the data object is a text object. **Tags:** xml.sequenceOffset=120
swValueBlock Size	Numerical	0..1	attr	This represents the size of a Value Block **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime xml.sequenceOffset=80
swValueBlock SizeMult (ordered)	Numerical	*	attr	This attribute is used to specify the dimensions of a value block (VAL_BLK) for the case that that value block has more than one dimension. The dimensions given in this attribute are ordered such that the first entry represents the first dimension, the second entry represents the second dimension, and so on. For one-dimensional value blocks the attribute swValue BlockSize shall be used and this attribute shall not exist. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime
unit	Unit	0..1	ref	Physical unit associated with the semantics of this data object. This attribute applies if no compuMethod is specified. If both units (this as well as via compuMethod) are specified the units shall be compatible. **Tags:** xml.sequenceOffset=350
valueAxisData Type	ApplicationPrimitive DataType	0..1	ref	The referenced ApplicationPrimitiveDataType represents the primitive data type of the value axis within a compound primitive (e.g. curve, map). It supersedes CompuMethod, Unit, and BaseType. **Tags:** xml.sequenceOffset=355

Table F.126: SwDataDefProps

Enumeration	**SwImplPolicyEnum**
Package	M2::MSR::DataDictionary::DataDefProperties
Note	Specifies the implementation strategy with respect to consistency mechanisms of variables.
Aggregated by	BswInternalTriggeringPoint.swImplPolicy, InternalTriggeringPoint.swImplPolicy, SwDataDefProps.sw ImplPolicy, Trigger.swImplPolicy
Literal	***Description***
const	forced implementation such that the running software within the ECU shall not modify it. For example implemented with the "const" modifier in C. This can be applied for parameters (not for those in NVRAM) as well as argument data prototypes. **Tags:** atp.EnumerationLiteralIndex=0

▽

△

Enumeration	**SwImplPolicyEnum**
fixed	This data element is fixed. In particular this indicates, that it might also be implemented e.g. as in place data, (#DEFINE). **Tags:** atp.EnumerationLiteralIndex=1
measurementPoint	The data element is created for measurement purposes only. The data element is never read directly within the ECU software. In contrast to a "standard" data element in an unconnected provide port is, this unconnection is guaranteed for measurementPoint data elements. **Tags:** atp.EnumerationLiteralIndex=2
queued	The content of the data element is queued and the data element has 'event' semantics, i.e. data elements are stored in a queue and all data elements are processed in 'first in first out' order. The queuing is intended to be implemented by RTE Generator. This value is not applicable for parameters. **Tags:** atp.EnumerationLiteralIndex=3
standard	This is applicable for all kinds of data elements. For variable data prototypes the 'last is best' semantics applies. For parameter there is no specific implementation directive. **Tags:** atp.EnumerationLiteralIndex=4

Table F.127: SwImplPolicyEnum

Class	**SwRecordLayout**			
Package	M2::MSR::DataDictionary::RecordLayout			
Note	Defines how the data objects (variables, calibration parameters etc.) are to be stored in the ECU memory. As an example, this definition specifies the sequence of axis points in the ECU memory. Iterations through axis values are stored within the sub-elements swRecordLayoutGroup. **Tags:** atp.recommendedPackage=SwRecordLayouts			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Packageable Element*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
swRecord LayoutGroup	SwRecordLayoutGroup	0..1	aggr	This is the top level record layout group. **Tags:** xml.roleElement=true xml.roleWrapperElement=false xml.sequenceOffset=20 xml.typeElement=false xml.typeWrapperElement=false

Table F.128: SwRecordLayout

Class	**SwRecordLayoutGroup**			
Package	M2::MSR::DataDictionary::RecordLayout			
Note	Specifies how a record layout is set up. Using SwRecordLayoutGroup it recursively models iterations through axis values. The subelement swRecordLayoutGroupContentType may reference other Sw RecordLayouts, SwRecordLayoutVs and SwRecordLayoutGroups for the modeled record layout.			
Base	*ARObject*			
Aggregated by	SwRecordLayout.swRecordLayoutGroup, SwRecordLayoutGroupContent.swRecordLayoutGroup			
Attribute	*Type*	*Mult.*	*Kind*	*Note*

▽

△

Class	**SwRecordLayoutGroup**			
category	AsamRecordLayoutSemantics	0..1	attr	This attribute denotes the semantics in particular in terms of the corresponding A2L-Keyword. This is to support the mapping of the more general record layouts in AUTOSAR/MSR to the specific A2l keywords. It is possible to express the specific semantics of A2l recordlayout keywords in swRecordlayoutGroup but not always vice versa. Therefore the mapping is provided in this optional attribute. **Tags:** xml.sequenceOffset=5
desc	MultiLanguageOverviewParagraph	0..1	aggr	This aggregation allows a brief description about the particular record layout group which can help to identify the entry. In-depth documentation should be added to the introduction of the surrounding record layout. **Tags:** xml.sequenceOffset=20
shortLabel	Identifier	0..1	attr	This attribute specifies a name which can be used e.g. when ECU code is generated from the record layout group. **Tags:** xml.sequenceOffset=3
swGenericAxisParamType	SwGenericAxisParamType	0..1	ref	This association allows to specify record layout groups to iterate over generic axis parameters. For example, if the generic axis parameter is an array, the record layout group will iterate over this array. Obviously, the axis referred to by swRecordLayoutGroupAxis shall be a generic axis in which the referenced SwGenericAxisType is aggregated. **Tags:** xml.sequenceOffset=50
swRecordLayoutComponent	Identifier	0..1	attr	This attribute is used to denote the component to which the group in question applies. Thus, the record layout supports structured objects. This secures independence from the sequence of components, because they can be referred to via name. **Tags:** xml.sequenceOffset=90
swRecordLayoutGroupAxis	AxisIndexType	0..1	attr	This attribute specifies the iteration axis number for a SwRecordLayoutGroup. The current record layout group then refers exactly to the axis with this number. This means that the values are taken by iterating along the thus referenced axis. **Tags:** xml.sequenceOffset=30
swRecordLayoutGroupContentType	SwRecordLayoutGroupContent	0..1	aggr	This is the contents of the recordLayout which is produced for every step of iteration. **Tags:** xml.roleElement=false xml.roleWrapperElement=false xml.sequenceOffset=100 xml.typeElement=false xml.typeWrapperElement=false
swRecordLayoutGroupFrom	RecordLayoutIteratorPoint	0..1	attr	This attribute specifies the iterator index for the point in the axis from which a record layout group is commenced. Negative values are also possible, i.e. the value -4 counts from the fourth value from the end. If this property is missing, the iteration starts with '1'. **Tags:** xml.sequenceOffset=60

▽

△

Class	**SwRecordLayoutGroup**			
swRecord LayoutGroup Index	NameToken	0..1	attr	This attribute attributes a symbolic name to the iterator of the superimposed record layout group. This can be referenced as a loop index in contained SwRecordLayout V elements. **Tags:** xml.sequenceOffset=40
swRecord LayoutGroup Step	Integer	0..1	attr	This attribute specifies the step width for the iterator index that is used for the current record layout group. Note that negative values are also possible, in case of the starting point is higher than the endpoint. If the property is missing, the step width is "1". **Tags:** xml.sequenceOffset=80
swRecord LayoutGroupTo	RecordLayoutIterator Point	0..1	attr	This attribute specifies the end point for the iteration. Negative values are also possible, i.e. the value -4 counts up to the fourth value from the end. If this property is not there, the iteration ends at "-1" which is the last element. Note that depending on the arraySizeSemantics of Sw TextProps the iteration ends at the value specified in sw MaxTextSize. **Tags:** xml.sequenceOffset=70

Table F.129: SwRecordLayoutGroup

Class	**SwSystemconst**			
Package	M2::MSR::DataDictionary::SystemConstant			
Note	This element defines a system constant which serves an input to select a particular variation point. In particular a system constant serves as an operand of the binding function (swSyscond) in a Variation point. Note that the binding process can only happen if a value was assigned to to the referenced system constants. **Tags:** atp.recommendedPackage=SwSystemconsts			
Base	*ARElement*, *ARObject*, *AtpDefinition*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
swDataDef Props	SwDataDefProps	0..1	aggr	This denotes the data definition properties of the system constant. This supports to express the limits and optionally a conversion within the internal to physical values by a compu method. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=swDataDefProps xml.sequenceOffset=40

Table F.130: SwSystemconst

Class	**SwSystemconstValue**
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling
Note	This meta-class assigns a particular value to a system constant.
Base	*ARObject*
Aggregated by	SwSystemconstantValueSet.swSystemconstantValue

▽

△

Class	SwSystemconstValue			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
annotation	Annotation	*	aggr	This provides the ability to add information why the value is set like it is. **Tags:** xml.sequenceOffset=30
swSystemconst	SwSystemconst	1	ref	This is the system constant to which the value applies. **Tags:** xml.sequenceOffset=10
value	Numerical	1	attr	This is the particular value of a system constant. It is specified as Numerical. Further restrictions may apply by the definition of the system constant. The value attribute defines the internal value of the Sw Systemconst as it is processed in the Formula Language. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime xml.sequenceOffset=20

Table F.131: SwSystemconstValue

Class	SwSystemconstantValueSet			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling			
Note	This meta-class represents the ability to specify a set of system constant values. **Tags:** atp.recommendedPackage=SwSystemconstantValueSets

sw Systemconstant Value	SwSystemconstValue	*	aggr	This is one particular value of a system constant.

Table F.132: SwSystemconstantValueSet

Class	SwcImplementation			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcImplementation			
Note	This meta-class represents a specialization of the general Implementation meta-class with respect to the usage in application software. **Tags:** atp.recommendedPackage=SwcImplementations			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *Implementation*, *MultilanguageReferrable*, *PackageableElement*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	***Type***	***Mult.***	***Kind***	***Note***
behavior	SwcInternalBehavior	0..1	ref	The internal behavior implemented by this Implementation.

▽

△

Class	**SwcImplementation**			
perInstance MemorySize	PerInstanceMemory Size	*	aggr	Allows a definition of the size of the per-instance memory for this implementation. The aggregation of PerInstance MemorySize is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects, in this case PerInstanceMemory. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=perInstanceMemorySize, perInstance MemorySize.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
required RTEVendor	String	0..1	attr	Identify a specific RTE vendor. This information is potentially important at the time of integrating (in particular: linking) the application code with the RTE. The semantics is that (if the association exists) the corresponding code has been created to fit to the vendor-mode RTE provided by this specific vendor. Attempting to integrate the code with another RTE generated in vendor mode is in general not possible.

Table F.133: SwcImplementation

Class	**SwcInternalBehavior**			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior			
Note	The SwcInternalBehavior of an AtomicSwComponentType describes the relevant aspects of the software-component with respect to the RTE, i.e. the RunnableEntities and the RTEEvents they respond to.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *InternalBehavior*, *Multilanguage Referrable*, *Referrable*			
Aggregated by	*AtomicSwComponentType*.internalBehavior, *AtpClassifier*.atpFeature			
Attribute	*Type*	*Mult.*	*Kind*	*Note*
arTypedPer Instance Memory	VariableDataPrototype	*	aggr	Defines an AUTOSAR typed memory-block that needs to be available for each instance of the SW-component. This is typically only useful if supportsMultipleInstantiation is set to "true" or if the component defines NVRAM access via permanent blocks. The aggregation of arTypedPerInstanceMemory is subject to variability with the purpose to support variability in the software component's implementations. Typically different algorithms in the implementation are requiring different number of memory objects. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=arTypedPerInstanceMemory.shortName, ar TypedPerInstanceMemory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

▽

△

Class	**SwcInternalBehavior**			
event	RTEEvent	*	aggr	This is a RTEEvent specified for the particular Swc InternalBehavior. The aggregation of RTEEvent is subject to variability with the purpose to support the conditional existence of RTE events. Note: the number of RTE events might vary due to the conditional existence of PortPrototypes using Data ReceivedEvents or due to different scheduling needs of algorithms. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=event.shortName, event.variationPoint.short Label vh.latestBindingTime=preCompileTime
exclusiveArea Policy	SwcExclusiveArea Policy	*	aggr	Options how to generate the ExclusiveArea related APIs. When no SwcExclusiveAreaPolicy is specified for an ExclusiveArea the default values apply. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=exclusiveAreaPolicy, exclusiveArea Policy.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
explicitInter Runnable Variable	VariableDataPrototype	*	aggr	Implement state message semantics for establishing communication among runnables of the same component. The aggregation of explicitInterRunnable Variable is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=explicitInterRunnableVariable.shortName, explicitInterRunnableVariable.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
implicitInter Runnable Variable	VariableDataPrototype	*	aggr	Implement state message semantics for establishing communication among runnables of the same component. The aggregation of implicitInterRunnable Variable is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=implicitInterRunnableVariable.shortName, implicitInterRunnableVariable.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
includedData TypeSet	IncludedDataTypeSet	*	aggr	The includedDataTypeSet is used by a software component for its implementation. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=includedDataTypeSet
includedMode Declaration GroupSet	IncludedMode DeclarationGroupSet	*	aggr	This aggregation represents the included Mode DeclarationGroups **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=includedModeDeclarationGroupSet

▽

△

Class	**SwcInternalBehavior**			
instantiationDataDefProps	InstantiationDataDefProps	*	aggr	The purpose of this is that within the context of a given SwComponentType some data def properties of individual instantiations can be modified. The aggregation of InstantiationDataDefProps is subject to variability with the purpose to support the conditional existence of PortPrototypes and component local memories like "perInstanceParameter" or "arTypedPerInstanceMemory". **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=instantiationDataDefProps, instantiationDataDefProps.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
perInstanceMemory	PerInstanceMemory	*	aggr	Defines a per-instance memory object needed by this software component. The aggregation of PerInstanceMemory is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=perInstanceMemory.shortName, perInstanceMemory.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
perInstanceParameter	ParameterDataPrototype	*	aggr	Defines parameter(s) or characteristic value(s) that needs to be available for each instance of the software-component. This is typically only useful if supportsMultipleInstantiation is set to "true". The aggregation of perInstanceParameter is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=perInstanceParameter.shortName, perInstanceParameter.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
portAPIOption	PortAPIOption	*	aggr	Options for generating the signature of port-related calls from a runnable to the RTE and vice versa. The aggregation of PortPrototypes is subject to variability with the purpose to support the conditional existence of ports. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=portAPIOption, portAPIOption.variationPoint.shortLabel vh.latestBindingTime=preCompileTime

▽

△

Class	**SwcInternalBehavior**			
runnable	RunnableEntity	*	aggr	This is a RunnableEntity specified for the particular Swc InternalBehavior. The aggregation of RunnableEntity is subject to variability with the purpose to support the conditional existence of RunnableEntities. Note: the number of RunnableEntities might vary due to the conditional existence of Port Prototypes using DataReceivedEvents or due to different scheduling needs of algorithms. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=runnable.shortName, runnable.variation Point.shortLabel vh.latestBindingTime=preCompileTime
service Dependency	SwcService Dependency	*	aggr	Defines the requirements on AUTOSAR Services for a particular item. The aggregation of SwcServiceDependency is subject to variability with the purpose to support the conditional existence of ports as well as the conditional existence of ServiceNeeds. The SwcServiceDependency owned by an SwcInternal Behavior can be located in a different physical file in order to support that SwcServiceDependency might be provided in later development steps or even by different expert domain (e.g OBD expert for Obd related Service Needs) tools. Therefore the aggregation is <<atp Splitable>>. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=serviceDependency.shortName, service Dependency.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
shared Parameter	ParameterData Prototype	*	aggr	Defines parameter(s) or characteristic value(s) shared between SwComponentPrototypes of the same Sw ComponentType The aggregation of sharedParameter is subject to variability with the purpose to support variability in the software components implementations. Typically different algorithms in the implementation are requiring different number of memory objects. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=sharedParameter.shortName, shared Parameter.variationPoint.shortLabel vh.latestBindingTime=preCompileTime
supports Multiple Instantiation	Boolean	0..1	attr	Indicate whether the corresponding software-component can be multiply instantiated on one ECU. In this case the attribute will result in an appropriate component API on programming language level (with or without instance handle).
variationPoint Proxy	VariationPointProxy	*	aggr	Proxy of a variation points in the C/C++ implementation. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=variationPointProxy.shortName

Table F.134: SwcInternalBehavior

Class	SymbolProps			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Components			
Note	This meta-class represents the ability to attach with the symbol attribute a symbolic name that is conform to C language requirements to another meta-class, e.g. AtomicSwComponentType, that is a potential subject to a name clash on the level of RTE source code.			
Base	*ARObject*, *ImplementationProps*, *Referrable*			
Aggregated by	Allocator.namespace, ApApplicationErrorDomain.namespace, *AtomicSwComponentType*.symbolProps, *CppImplementationDataType*.namespace, ImplementationDataType.symbolProps, *PortInterface*.namespace, SecurityEventDefinition.eventSymbolName			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
–	–	–	–	–

Table F.135: SymbolProps

Class	SynchronousServerCallPoint			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::ServerCall			
Note	This means that the RunnableEntity is supposed to perform a blocking wait for a response from the server.			
Base	*ARObject*, *AbstractAccessPoint*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *ServerCallPoint*			
Aggregated by	*AtpClassifier*.atpFeature, RunnableEntity.serverCallPoint			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
calledFromWithinExclusiveArea	ExclusiveAreaNestingOrder	0..1	ref	This indicates that the call point is located at the deepest level inside one or more ExclusiveAreas that are nested in the given order.

Table F.136: SynchronousServerCallPoint

Enumeration	TcpRoleEnum
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::Fibex4Ethernet::ServiceInstances
Note	This enumeration defines whether a TCP node has the tcp server role or the client role.
Aggregated by	StaticSocketConnection.tcpRole
Literal	**Description**
connect	Connects the client to a remote TCP host. **Tags:** atp.EnumerationLiteralIndex=0
listen	Socket is put into the server mode (listen for connections). **Tags:** atp.EnumerationLiteralIndex=1

Table F.137: TcpRoleEnum

Class	TextValueSpecification
Package	M2::AUTOSARTemplates::CommonStructure::Constants
Note	The purpose of TextValueSpecification is to define the labels that correspond to enumeration values.
Base	*ARObject*, *ValueSpecification*

▽

△

Class	TextValueSpecification			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element, CalibrationParameterValue.applInitValue, CalibrationParameterValue.implInitValue, ConstantSpecification.valueSpec, CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.receptionDefaultValue, ISignal.timeoutSubstitutionValue, MetaDataItem.metaDataItemType, NonqueuedReceiverComSpec.initValue, NonqueuedReceiverComSpec.timeoutSubstitutionValue, NonqueuedSenderComSpec.initValue, NvProvideComSpec.ramBlockInitValue, NvProvideComSpec.romBlockInitValue, NvRequireComSpec.initValue, ParameterDataPrototype.initValue, ParameterProvideComSpec.initValue, ParameterRequireComSpec.initValue, PersistencyDataRequiredComSpec.initValue, PersistencyKeyValuePair.initValue, PortDefinedArgumentValue.value, PortPrototypeBlueprintInitValue.value, RecordValueSpecification.field, SomeipEventDeployment.eventReceptionDefaultValue, *StateManagementCompareCondition*.compareValue, SwDataDefProps.invalidValue, UserDefinedEventDeployment.eventReceptionDefaultValue, VariableDataPrototype.initValue			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
value	VerbatimString	0..1	attr	This is the value itself. Note that vt uses the | operator to separate the values for the different bitfield masks in case that the semantics of the related DataPrototype is described by means of a BITFIELD_TEXTTABLE in the associated CompuMethod.

Table F.138: TextValueSpecification

Class	*TransformationComSpecProps* (abstract)			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	TransformationComSpecProps holds all the attributes for transformers that are port specific.			
Base	*ARObject*, *Describable*			
Subclasses	EndToEndTransformationComSpecProps, UserDefinedTransformationComSpecProps			
Aggregated by	ClientComSpec.transformationComSpecProps, *ReceiverComSpec*.transformationComSpecProps, ServerComSpec.transformationComSpecProps			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
–	–	–	–	–

Table F.139: TransformationComSpecProps

Class	TransmissionComSpecProps			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Communication			
Note	This meta-class defines a set of transmission attributes which the application software is assumed to implement.			
Base	*ARObject*			
Aggregated by	*SenderComSpec*.transmissionProps			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
dataUpdatePeriod	TimeValue	0..1	attr	This attribute defines the period in which the application is assumed to transmit the respective data.
minimumSendInterval	TimeValue	0..1	attr	This attribute defines the minimum interval between two consecutive transmissions of the respective data the application is assumed to ensure.
onChangeDataPrototype	DataPrototypeReference	*	aggr	This reference defines which DataPrototypes trigger the onChange transmission of the data.
transmissionMode	TransmissionModeDefinitionEnum	0..1	attr	The attribute defines the mode in which the application is assumed to transmit the respective data.

Table F.140: TransmissionComSpecProps

Class	Trigger			
Package	M2::AUTOSARTemplates::CommonStructure::TriggerDeclaration			
Note	A trigger which is provided (i.e. released) or required (i.e. used to activate something) in the given context.			
Base	*ARObject*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, BswModuleDescription.releasedTrigger, BswModuleDescription.requiredTrigger, ServiceInterface.trigger, TriggerInterface.trigger			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
swImplPolicy	SwImplPolicyEnum	0..1	attr	This attribute, when set to value queued, allows for a queued processing of Triggers.
triggerPeriod	MultidimensionalTime	0..1	aggr	Optional definition of a period in case of a periodically (time or angle) driven external trigger.

Table F.141: Trigger

Class	TriggerInterface			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	A trigger interface declares a number of triggers that can be sent by an trigger source. **Tags:** atp.recommendedPackage=PortInterfaces			
Base	*ARElement*, *ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *AtpClassifier*, *AtpType*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *PackageableElement*, *PortInterface*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
trigger	Trigger	*	aggr	The Trigger of this trigger interface.

Table F.142: TriggerInterface

Class	*ValueSpecification* (abstract)			
Package	M2::AUTOSARTemplates::CommonStructure::Constants			
Note	Base class for expressions leading to a value which can be used to initialize a data object.			
Base	*ARObject*			
Subclasses	*AbstractRuleBasedValueSpecification*, ApplicationValueSpecification, *CompositeValueSpecification*, ConstantReference, NotAvailableValueSpecification, NumericalValueSpecification, ReferenceValueSpecification, TextValueSpecification			
Aggregated by	ApplicationAssocMapElementValueSpecification.key, ApplicationAssocMapElementValueSpecification.value, ArrayValueSpecification.element, CalibrationParameterValue.applInitValue, CalibrationParameterValue.implInitValue, ConstantSpecification.valueSpec, CryptoServiceKey.developmentValue, DiagnosticEnvDataCondition.compareValue, DiagnosticEnvDataElementCondition.compareValue, FieldSenderComSpec.initValue, ISignal.initValue, ISignal.receptionDefaultValue, ISignal.timeoutSubstitutionValue, NonqueuedReceiverComSpec.initValue, NonqueuedReceiverComSpec.timeoutSubstitutionValue, NonqueuedSenderComSpec.initValue, NvProvideComSpec.ramBlockInitValue, NvProvideComSpec.romBlockInitValue, NvRequireComSpec.initValue, ParameterDataPrototype.initValue, ParameterProvideComSpec.initValue, ParameterRequireComSpec.initValue, PersistencyDataRequiredComSpec.initValue, PersistencyKeyValuePair.initValue, PortDefinedArgumentValue.value, PortPrototypeBlueprintInitValue.value, RecordValueSpecification.field, SomeipEventDeployment.eventReceptionDefaultValue, *StateManagementCompareCondition*.compareValue, SwDataDefProps.invalidValue, UserDefinedEventDeployment.eventReceptionDefaultValue, VariableDataPrototype.initValue			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
shortLabel	Identifier	0..1	attr	This can be used to identify particular value specifications for human readers, for example elements of a record type.

Table F.143: ValueSpecification

Class	VariableAccess			
Package	M2::AUTOSARTemplates::SWComponentTemplate::SwcInternalBehavior::DataElements			
Note	The presence of a VariableAccess implies that a RunnableEntity needs access to a VariableData Prototype. The kind of access is specified by the role in which the class is used.			
Base	*ARObject*, *AbstractAccessPoint*, *AtpClassifier*, *AtpFeature*, *AtpStructureElement*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	*AtpClassifier*.atpFeature, *ReceiverComSpec*.replaceWith, RunnableEntity.dataReadAccess, RunnableEntity.dataReceivePointByArgument, RunnableEntity.dataReceivePointByValue, RunnableEntity.dataSendPoint, RunnableEntity.dataWriteAccess, RunnableEntity.readLocalVariable, RunnableEntity.writtenLocalVariable			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
accessedVariable	AutosarVariableRef	0..1	aggr	This denotes the accessed variable.
scope	VariableAccessScopeEnum	0..1	attr	This attribute allows for constraining the scope of the corresponding communication. For example, it possible to express whether the communication is intended to cross the boundary of an ECU or whether it is intended not to cross the boundary of a single partition.

Table F.144: VariableAccess

Class	VariableAndParameterInterfaceMapping			
Package	M2::AUTOSARTemplates::SWComponentTemplate::PortInterface			
Note	Defines the mapping of VariableDataPrototypes or ParameterDataPrototypes in context of two different SenderReceiverInterfaces, NvDataInterfaces or ParameterInterfaces.			
Base	*ARObject*, *AtpBlueprint*, *AtpBlueprintable*, *Identifiable*, *MultilanguageReferrable*, *PortInterfaceMapping*, *Referrable*			
Aggregated by	PortInterfaceMappingSet.portInterfaceMapping			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
dataMapping	DataPrototypeMapping	*	aggr	Defines the mapping of two particular VariableData Prototypes or ParameterDataPrototypes with unequal names and/or unequal semantic (resolution or range) in context of two different SenderReceiverInterfaces, Nv DataInterfaces or ParameterInterfaces **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=dataMapping

Table F.145: VariableAndParameterInterfaceMapping

Class	VariableDataPrototype			
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::DataPrototypes			
Note	A VariableDataPrototype represents a formalized generic piece of information that is typically mutable by the application software layer. VariableDataPrototype is used in various contexts and the specific context gives the otherwise generic VariableDataPrototype a dedicated semantics.			
Base	*ARObject*, *AtpFeature*, *AtpPrototype*, *AutosarDataPrototype*, *DataPrototype*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	ApplicationInterface.indication, *AtpClassifier*.atpFeature, BswInternalBehavior.arTypedPerInstanceMemory, BswModuleDescription.providedData, BswModuleDescription.requiredData, BulkNvDataDescriptor.bulkNvBlock, *InternalBehavior*.staticMemory, NvBlockDescriptor.ramBlock, NvDataInterface.nvData, SenderReceiverInterface.dataElement, ServiceInterface.event, SwcInternalBehavior.arTypedPerInstanceMemory, SwcInternalBehavior.explicitInterRunnableVariable, SwcInternalBehavior.implicitInterRunnableVariable			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
initValue	ValueSpecification	0..1	aggr	Specifies initial value(s) of the VariableDataPrototype

Table F.146: VariableDataPrototype

Class	**VariationPoint**			
Package	M2::AUTOSARTemplates::GenericStructure::VariantHandling			
Note	This meta-class represents the ability to express a "structural variation point". The container of the variation point is part of the selected variant if swSyscond evaluates to true and each postBuildVariant Criterion is fulfilled.			
Base	*ARObject*			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
blueprint Condition	DocumentationBlock	0..1	aggr	This represents a description that documents how the variation point shall be resolved when deriving objects from the blueprint. Note that variationPoints are not allowed within a blueprintCondition. **Tags:** xml.sequenceOffset=28
desc	MultiLanguageOverview Paragraph	0..1	aggr	This allows to describe shortly the purpose of the variation point. **Tags:** xml.sequenceOffset=20
formalBlueprint Generator	BlueprintGenerator	0..1	aggr	This represents a description that documents how the variation point shall be resolved when deriving objects from the blueprint by using ARMQL. Note that variationPoints are not allowed within a formal BlueprintGenerator. **Tags:** atp.Status=draft xml.sequenceOffset=30
postBuildVariant Condition	PostBuildVariant Condition	*	aggr	This is the set of post build variant conditions which all shall be fulfilled in order to (postbuild) bind the variation point. **Tags:** xml.sequenceOffset=40
sdg	Sdg	0..1	aggr	An optional special data group is attached to every variation point. These data can be used by external software systems to attach application specific data. For example, a variant management system might add an identifier, an URL or a specific classifier. **Tags:** xml.sequenceOffset=50
shortLabel	Identifier	0..1	attr	This provides a name to the particular variation point to support the RTE generator. It is necessary for supporting splitable aggregations and if binding time is later than codeGenerationTime, as well as some RTE conditions. It needs to be unique with in the enclosing Identifiables with the same ShortName. **Stereotypes:** atpIdentityContributor **Tags:** xml.sequenceOffset=10
swSyscond	ConditionByFormula	0..1	aggr	This condition acts as Binding Function for the Variation Point. Note that the multiplicity is 0..1 in order to support pure postBuild variants. **Tags:** xml.sequenceOffset=30

Table F.147: VariationPoint

Class	**ViewMap**			
Package	M2::AUTOSARTemplates::GenericStructure::ViewMapSet			
Note	The ViewMap allows to relate any number of elements on the "first" side to any number of elements on the "second" side. Since the ViewMap does not address a specific mapping use-case the roles "first" and "second" shall imply this generality. This mapping allows to trace transformations of artifacts within the AUTOSAR environment. The references to the mapped elements can be plain references and/or InstanceRefs.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	ViewMapSet.viewMap			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
firstElement	Referrable	*	ref	Reference to identifiable elements on the first "side". **Tags:** xml.sequenceOffset=20
firstElement Instance	AtpFeature	*	iref	InstanceRefs to elements on the first "side". **Tags:** xml.sequenceOffset=50 **InstanceRef implemented by:** AnyInstanceRef
role	Identifier	0..1	attr	This attribute is used to describe specific mapping scenarios, e.g. the mappings: • AR_AbstractSystemDescription_SystemDescription • AR_SystemDescription_SystemExtract **Tags:** xml.sequenceOffset=10
secondElement	Referrable	*	ref	Reference to identifiable elements on the second "side". **Tags:** xml.sequenceOffset=30
secondElement Instance	AtpFeature	*	iref	InstanceRefs to elements on the second "side". **Tags:** xml.sequenceOffset=60 **InstanceRef implemented by:** AnyInstanceRef

Table F.148: ViewMap

Class	**ViewMapSet**			
Package	M2::AUTOSARTemplates::GenericStructure::ViewMapSet			
Note	Collection of ViewMaps that are used to establish relationships between different AUTOSAR artifacts. **Tags:** atp.recommendedPackage=ViewMapSets			
Base	*ARElement*, *ARObject*, *CollectableElement*, *Identifiable*, *MultilanguageReferrable*, *Packageable Element*, *Referrable*			
Aggregated by	ARPackage.element			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
viewMap	ViewMap	*	aggr	ViewMaps that are collected by the ViewMapSet.

Table F.149: ViewMapSet

G Splitable Elements in the Scope of this Document

This chapter contains a table of all model elements stereotyped ≪atpSplitable≫ in the scope of this document.

Each entry in following table consists of the identification of the specific model element itself and the applicable value of the tagged value `atp.Splitkey`.

For more information about the concept of splitable model elements and how these shall be treated please refer to [1].

Name of splitable element	***Splitkey***
AbstractServiceInstance.capabilityRecord	capabilityRecord, capabilityRecord.variationPoint.shortLabel
AbstractServiceInstance.methodActivationRoutingGroup	methodActivationRoutingGroup.shortName, methodActivationRoutingGroup.variationPoint.shortLabel
AliasNameSet.aliasName	aliasName.shortLabel, aliasName.variationPoint.shortLabel
BusMirrorChannel.channel	channel.physicalChannel, channel.variationPoint.shortLabel
BusMirrorChannelMapping.ecuInstance	ecuInstance.ecuInstance, ecuInstance.variationPoint.shortLabel
BusMirrorChannelMapping.globalTimeDomain	globalTimeDomain.globalTimeDomain, globalTimeDomain.variationPoint.shortLabel
BusMirrorChannelMapping.sourceChannel	sourceChannel
BusMirrorChannelMapping.targetChannel	targetChannel
BusMirrorChannelMapping.targetPduTriggering	targetPduTriggering.pduTriggering, targetPduTriggering.variationPoint.shortLabel
CanTpConfig.tpAddress	tpAddress.shortName, tpAddress.variationPoint.shortLabel
CanTpConfig.tpChannel	tpChannel.shortName, tpChannel.variationPoint.shortLabel
CanTpConfig.tpConnection	tpConnection, tpConnection.variationPoint.shortLabel
CanTpConfig.tpEcu	tpEcu, tpEcu.variationPoint.shortLabel
CanTpConfig.tpNode	tpNode.shortName, tpNode.variationPoint.shortLabel
ClientIdDefinitionSet.clientIdDefinition	clientIdDefinition.shortName, clientIdDefinition.variationPoint.shortLabel
ComManagementMapping.comManagementGroup	comManagementGroup
ComManagementMapping.comManagementPortGroup	comManagementPortGroup.contextComposition, comManagementPortGroup.contextComponent, comManagementPortGroup.target
CommunicationCluster.physicalChannel	<Not applicable due to atpVariation (PropertySet Pattern)>
CommunicationConnector.ecuCommPortInstance	ecuCommPortInstance.shortName, ecuCommPortInstance.variationPoint.shortLabel
ConsumedEventGroup.eventMulticastAddress	eventMulticastAddress.applicationEndpoint, eventMulticastAddress.variationPoint.shortLabel
ConsumedEventGroup.sdClientTimerConfig	sdClientTimerConfig.someipSdClientEventGroupTimingConfig, sdClientTimerConfig.variationPoint.shortLabel
ConsumedProvidedServiceInstanceGroup.consumedServiceInstance	consumedServiceInstance.consumedServiceInstance, consumedServiceInstance.variationPoint.shortLabel

▽

△

Name of splitable element	***Splitkey***
ConsumedProvidedServiceInstanceGroup.providedServiceInstance	providedServiceInstance.providedServiceInstance, providedServiceInstance.variationPoint.shortLabel
ConsumedServiceInstance.allowedServiceProvider	allowedServiceProvider.networkEndpoint, allowed ServiceProvider.variationPoint.shortLabel
ConsumedServiceInstance.consumedEventGroup	consumedEventGroup.shortName, consumedEvent Group.variationPoint.shortLabel
ConsumedServiceInstance.eventMulticastSubscriptionAddress	eventMulticastSubscriptionAddress.application Endpoint, eventMulticastSubscription Address.variationPoint.shortLabel
ConsumedServiceInstance.localUnicastAddress	localUnicastAddress.applicationEndpoint, local UnicastAddress.variationPoint.shortLabel
ConsumedServiceInstance.remoteUnicastAddress	remoteUnicastAddress.applicationEndpoint, remote UnicastAddress.variationPoint.shortLabel
ConsumedServiceInstance.sdClientTimerConfig	sdClientTimerConfig.someipSdClientService InstanceConfig, sdClientTimerConfig.variation Point.shortLabel
CouplingElement.couplingElementDetails	couplingElementDetails.shortName, coupling ElementDetails.variationPoint.shortLabel
CouplingElement.couplingPort	couplingPort.shortName, couplingPort.variation Point.shortLabel
CouplingPort.macAddressVlanAssignment	macAddressVlanAssignment.shortName, mac AddressVlanAssignment.variationPoint.shortLabel
CouplingPort.pncMapping	pncMapping
CouplingPortConnection.nodePort	nodePort.couplingPort, nodePort.variation Point.shortLabel
CpSoftwareCluster.swComponentAssignment	swComponentAssignment, swComponent Assignment.variationPoint.shortLabel
CpSoftwareCluster.swComposition	swComposition.compositionSwComponentType, sw Composition.variationPoint.shortLabel
CpSoftwareClusterMappingSet.portElementToComResource Mapping	portElementToComResourceMapping.shortName, portElementToComResourceMapping.variation Point.shortLabel
CpSoftwareClusterMappingSet.resourceToApplicationPartition Mapping	resourceToApplicationPartitionMapping.shortName, resourceToApplicationPartitionMapping.variation Point.shortLabel
CpSoftwareClusterMappingSet.softwareClusterToResourceMapping	softwareClusterToResourceMapping.shortName, softwareClusterToResourceMapping.variation Point.shortLabel
CpSoftwareClusterMappingSet.swcToApplicationPartitionMapping	swcToApplicationPartitionMapping.shortName, swc ToApplicationPartitionMapping.variationPoint.short Label
CpSoftwareClusterResourcePool.ecuScope	ecuScope
CpSoftwareClusterResourcePool.resource	resource.shortName
CpSoftwareClusterToEcuInstanceMapping.swCluster	swCluster.cpSoftwareCluster, swCluster.variation Point.shortLabel
DataPrototypeTransformationProps.networkRepresentationProps	networkRepresentationProps
DataTransformationSet.dataTransformation	dataTransformation.shortName, data Transformation.variationPoint.shortLabel
DataTransformationSet.transformationTechnology	transformationTechnology.shortName, transformationTechnology.variationPoint.shortLabel
DdsCpConsumedServiceInstance.consumedDdsOperation	consumedDdsOperation, consumedDds Operation.variationPoint.shortLabel
DdsCpConsumedServiceInstance.consumedDdsServiceEvent	consumedDdsServiceEvent, consumedDdsService Event.variationPoint.shortLabel

Table G.1: Usage of splitable elements

H Variation Points in the Scope of this Document

This chapter contains a table of all model elements stereotyped ≪atpVariation≫ in the scope of this document.

Each entry in following Table consists of the identification of the model element itself and the applicable value of the tagged value vh.latestBindingTime.

For more information about the concept of variation points and how model elements that contain variation points shall be treated please refer to [1].
