1 Introduction and overview

This protocol specification specifies the format, message sequences, and semantics of the Protocol SOME/IP Service Discovery (SOME/IP-SD).

The main tasks of the Service Discovery Protocol are communicating the availability of functional entities called service instances in the in-vehicle communication as well as controlling the send behavior of event messages. This allows sending only event messages to receivers requiring them (Publish/Subscribe). The solution described here is also known as SOME/IP-SD (Scalable service-Oriented MiddlewarE over IP - Service Discovery).

1.1 Protocol purpose and objectives

SOME/IP-SD is used to

- Locate service instances.
- Detect when service instances are available.
- Implement the Publish/Subscribe handling.

1.2 Applicability of the protocol

SOME/IP-SD can be used for service discovery in vehicle networks.

1.2.1 Constraints and assumptions

The SOME/IP-SD has the following constraints:

- SOME/IP-SD supports only IP-based communication.
- The network communication design has to consider the following limitations, if a subscription is handled via multicast communication:
 - Initial events should be transported via unicast.

1.3 Dependencies

1.3.1 Dependencies to other protocol layers

SOME/IP-SD depends on SOME/IP. SOME/IP itself supports both TCP and UDP communications but SOME/IP-SD uses only UDP (See [PRS_SOMEIPSD_00220]).

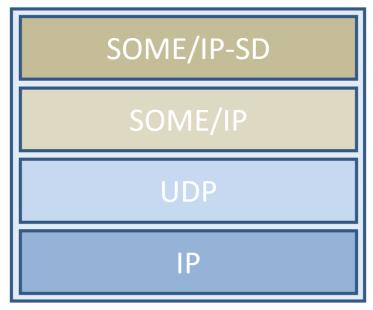

Figure 1.1: SOME/IP-SD Dependencies to other protocol layers

2 Use Cases

ID	Name	Description	
UC_001	Service Offering	A server is offering a service instance to the network without the need to statically configure the endpoint of the service instance on the client side. This also includes the availability of the service instance.	
UC_002	Service Subscription	A Client finds a desired service instance and subscribes to its eventgroups without knowing the server's endpoint(s).	
UC_003	Flexible com- munication paths	Clients can be dynamically connected to Service Instances at runtime; thus, avoiding static configuration.	

Protocol Requirements

3.1 Requirements Traceability

Requirement	Description	Satisfied by
[RS_SOMEIPSD 00001]	SOME/IP Service Discovery Protocol shall be used on top of SOME/IP Protocol	[PRS_SOMEIPSD_00151] [PRS_SOMEIPSD_00152] [PRS_SOMEIPSD_00153] [PRS_SOMEIPSD_00154] [PRS_SOMEIPSD_00157] [PRS_SOMEIPSD_00158] [PRS_SOMEIPSD_00159] [PRS_SOMEIPSD_00160] [PRS_SOMEIPSD_00161] [PRS_SOMEIPSD_00162] [PRS_SOMEIPSD_00163] [PRS_SOMEIPSD_00164] [PRS_SOMEIPSD_00250] [PRS_SOMEIPSD_00251] [PRS_SOMEIPSD_00252] [PRS_SOMEIPSD_00600] [PRS_SOMEIPSD_00600] [PRS_SOMEIPSD_00853]
[RS_SOMEIPSD 00002]	SOME/IP Service Discovery Protocol shall support unicast messages	[PRS_SOMEIPSD_00256] [PRS_SOMEIPSD_00259] [PRS_SOMEIPSD_00540] [PRS_SOMEIPSD_00601] [PRS_SOMEIPSD_00602] [PRS_SOMEIPSD_00631] [PRS_SOMEIPSD_00702]
[RS_SOMEIPSD 00003]	SOME/IP Service Discovery Protocol shall support multicast messages	[PRS_SOMEIPSD_00238] [PRS_SOMEIPSD_00239] [PRS_SOMEIPSD_00256] [PRS_SOMEIPSD_00323] [PRS_SOMEIPSD_00324] [PRS_SOMEIPSD_00325] [PRS_SOMEIPSD_00326] [PRS_SOMEIPSD_00331] [PRS_SOMEIPSD_00332] [PRS_SOMEIPSD_00333] [PRS_SOMEIPSD_00545] [PRS_SOMEIPSD_00601] [PRS_SOMEIPSD_00601] [PRS_SOMEIPSD_00603] [PRS_SOMEIPSD_00631] [PRS_SOMEIPSD_00847] [PRS_SOMEIPSD_00848] [PRS_SOMEIPSD_00848] [PRS_SOMEIPSD_00849] [PRS_SOMEIPSD_00850]
[RS_SOMEIPSD 00004]	SOME/IP Service Discovery Protocol shall support SOME/IP and non-SOME/IP services	[PRS_SOMEIPSD_00437] [PRS_SOMEIPSD_00438] [PRS_SOMEIPSD_00439] [PRS_SOMEIPSD_00440]
[RS_SOMEIPSD 00005]	SOME/IP Service Discovery Protocol shall support different versions of the same service	[PRS_SOMEIPSD_00512] [PRS_SOMEIPSD_00806]

4 Acronyms and Abbreviations

The glossary below includes acronyms and abbreviations relevant to the SOME/IP specification that are not included in the [1, AUTOSAR glossary].

Abbreviation / Acronym:	Description:
Method	a method, procedure, function, or subroutine that is called/in-
Metriod	voked.
Parameters	input, output, or input/output arguments of a method or an event
Remote Procedure Call (RPC)	a method call from one ECU to another that is transmitted using
hemote Procedure Gair (NPG)	messages
Request	a message of the client to the server invoking a method
Response	a message of the server to the client transporting results of a
•	method invocation
Request/Response communica-	a RPC that consists of request and response
tion	·
Fire&Forget communication	a RPC call that consists only of a request message
	A uni-directional data transmission that is only invoked on
	changes or cyclically and is sent from the producer of data to
Event	the consumers. One event could even be both sent cyclically and
	spontaneously on change. This is completely in the responsibility
	of the sending application because the receiver has no means at
	all to distinguish between those two. a field does represent a status and thus has a valid value at all
Field	times on which getter, setter and notfier act upon.
	an event message the notifier of a field sends. The message of
	such a notifier cannot be distinguished from the event message;
Notification Event	therefore, when referring to the message of an event, this shall
	also be true for the messages of notifiers of fields.
Getter	a Request/Response call that allows read access to a field.
Setter	a Request/Response call that allows write access to a field.
	sends out event message with a new value on change of the
Notifier	value of the field.
	a logical combination of zero or more methods, zero or more
Service	events, and zero or more fields (empty service is allowed, e.g.
	for announcing non-SOME/IP services in SOME/IP-SD)
Frankanana	a logical grouping of events and notification events of fields inside
Eventgroup	a service in order to allow subscription
Service Interface	the formal specification of the service including its methods,
Service interface	events, and fields
Service Instance	software implementation of the service interface, which can exist
Service instance	more than once in the vehicle and more than once on an ECU
Server	The ECU offering a service instance shall be called server in the
OCI VCI	context of this service instance.
Client	The ECU using the service instance of a server shall be called
	client in the context of this service instance.
Union or Variant	a data structure that dynamically assumes different data types.
Offering a service instance	that one ECU implements an instance of a service and tells other
9 2 - 2	ECUs using SOME/IP-SD that they may use it.
Finding a service instance	to send a SOME/IP-SD message in order to find a needed ser-
	vice instance.
Dublishing on overtere	eventgroups are implicitly published by offering a service (in-
Publishing an eventgroup	stance) they are part of. Based on this, a client can subscribe
	to an eventgroup.

Abbreviation / Acronym:	Description:
Subscribing to an eventgroup	a client requests a server to send the content of an eventgroup of a service instance using a SOME/IP-SD message.
unicast event	Events and Field notifiers, which are transmitted via unicast. The IP and Port Numbers of the sender are defined by the endpoint options of the offered service instance. The IP and Port Numbers are defined by the endpoint options of the subscribe eventgroup by the client.
multicast event	Events and field notifiers which are transmitted via multicast. The IP and Port Number of the sender are defined by the endpoint option of the offered service instance. The IP and Port Numbers are defined by the multicast endpoint option.
server multicast endpoint	Multicast endpoint (including IP multicast address, port, and protocol) provided by the server to announce where the server service transmits multicast events to. This is SOME/IP feature since the beginning and is supported by all SOME/IP implementations.
client unicast endpoint	Unicast endpoint (including IP multicast address, port, and protocol) provided by the client service to announce where the client service expects to receive unicast events from the corresponding server service.
client multicast endpoint	Multicast endpoint (including IP multicast address, port, and protocol) provided by the client service to announce where the client service expects to receive events from the corresponding server service. This could be used alternatively to a client unicast endpoint. Note: This is currently an AUTOSAR proprietary extension to SOME/IP. Other SOME/IP standards may only allow Servers to sent Multicast Endpoints.
Security Association	The protected connection or association based on a security protocol, like IPsec or MACsec. This also includes the state of the security protocol. Note: While this only somewhat also applies to TLS and DTLS, in the following TLS and DTLS are included, when the term is used.
Secured Port	A TCP or UDP Port that is protected by a security protocol based on a Security Association.

Table 4.1: Acronyms and Abbreviations

5 Protocol specification

5.1 SOME/IP Service Discovery (SOME/IP-SD)

5.1.1 General

SOME/IP-SD is used to

- Locate service instances.
- Detect if service instances are running.
- Implement the Publish/Subscribe handling.

Inside the vehicular network service instance locations are commonly known; therefore, the state of the service instance is of primary concern. The location of the service (i.e. IP-Address, transport protocol, and port number) are of secondary concern.

5.1.1.1 Terms and Definitions

[PRS_SOMEIPSD_00238]

Upstream requirements: RS SOMEIPSD 00003

[A separate server service instance shall be used per network interface if a service needs to be offered on multiple network interfaces.]

[PRS_SOMEIPSD_00239]

Upstream requirements: RS SOMEIPSD 00003

[A separate client service instance shall be used per network interface if a service needs to be configured to be accessed using multiple different network interfaces.]

5.1.2 SOME/IP-SD Message Format

5.1.2.1 General Requirements

[PRS SOMEIPSD 00220]

Upstream requirements: RS SOMEIPSD 00010

[SOME/IP-SD messages shall be sent over UDP.]

[PRS_SOMEIPSD_00251]

Upstream requirements: RS_SOMEIPSD_00001

The SOME/IP-SD Message shall be as follows:

- Message ID (Service ID/Method ID) [32 bit]: 0xFFFF 8100
- Length [32 bit]
- Request ID (Client ID/Session ID) [32 bit]
- Protocol Version [8 bit]: 0x01
- Interface Version [8 bit]: 0x01
- Message Type [8 bit]: 0x02
- Return Code [8 bit]: 0x00
- Flags [8 bit]
- Reserved [24 bit]
- Length of Entries Array [32 bit]
- Entries Array [variable size]
- Length of Options Array [32 bit]
- Options Array [variable size]

1

The SOME/IP-SD Header Format is shown in Figure 5.1.

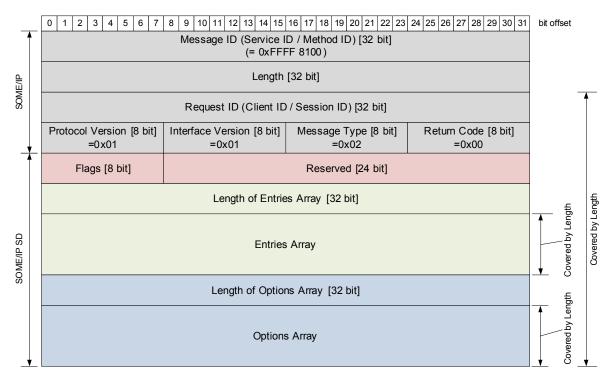

Figure 5.1: SOME/IP-SD Header Format

[PRS_SOMEIPSD_00250]

Upstream requirements: RS_SOMEIPSD_00001

[Service Discovery Messages shall start with a SOME/IP header.]

[PRS SOMEIPSD 00250] can be seen in Figure 5.1.

[PRS SOMEIPSD 00151]

Upstream requirements: RS SOMEIPSD 00001

[Service Discovery messages shall use the Service-ID (16 Bits) of 0xFFFF.

[PRS SOMEIPSD 00152]

Upstream requirements: RS_SOMEIPSD_00001

[Service Discovery messages shall use the Method-ID (16 Bits) of 0x8100.]

[PRS SOMEIPSD 00153]

Upstream requirements: RS_SOMEIPSD_00001

[Service Discovery messages shall use a uint32 length field as specified by SOME/IP. That means that the length is measured in bytes and starts with the first byte after the length field and ends with the last byte of the SOME/IP-SD message.]

[PRS SOMEIPSD 00154]

Upstream requirements: RS_SOMEIPSD_00001

[Service Discovery messages shall have a Client-ID (16 Bits) set to 0x0000, since there exists only a single SOME/IP-SD instance.

[PRS_SOMEIPSD_00157]

Upstream requirements: RS_SOMEIPSD_00001

[The Session-ID (SOME/IP header) shall be incremented for every SOME/IP-SD message sent. |

[PRS_SOMEIPSD_00158]

Upstream requirements: RS SOMEIPSD 00001

[The Session-ID (SOME/IP header) shall start with 1 and be 1 even after wrapping.]

[PRS SOMEIPSD 00159]

Upstream requirements: RS_SOMEIPSD_00001

[The Session-ID (SOME/IP header) shall not be set to 0.]

[PRS_SOMEIPSD_00160]

Upstream requirements: RS SOMEIPSD 00001

[SOME/IP-SD Session ID handling is done per "communication relation", i.e. multicast as well as unicast per peer (see [PRS_SOMEIPSD_00255]).]

[PRS_SOMEIPSD_00161]

Upstream requirements: RS SOMEIPSD 00001

[Service Discovery messages shall have a Protocol-Version (8 Bits) of 0x01.]

[PRS SOMEIPSD 00162]

Upstream requirements: RS_SOMEIPSD_00001

[Service Discovery messages shall have a Interface-Version (8 Bits) of 0x01.]

[PRS SOMEIPSD 00163]

Upstream requirements: RS SOMEIPSD 00001

[Service Discovery messages shall have a Message Type (8 bits) of 0x02 (Notification).]

[PRS SOMEIPSD 00164]

Upstream requirements: RS_SOMEIPSD_00001

[Service Discovery messages shall have a Return Code (8 bits) of 0x00 (E_OK).

[PRS SOMEIPSD 00853]

Upstream requirements: RS_SOMEIPSD_00001

[All fields in the Service Discovery messages shall be in Network Byte Order (i.e. Big Endian Byte Order).]

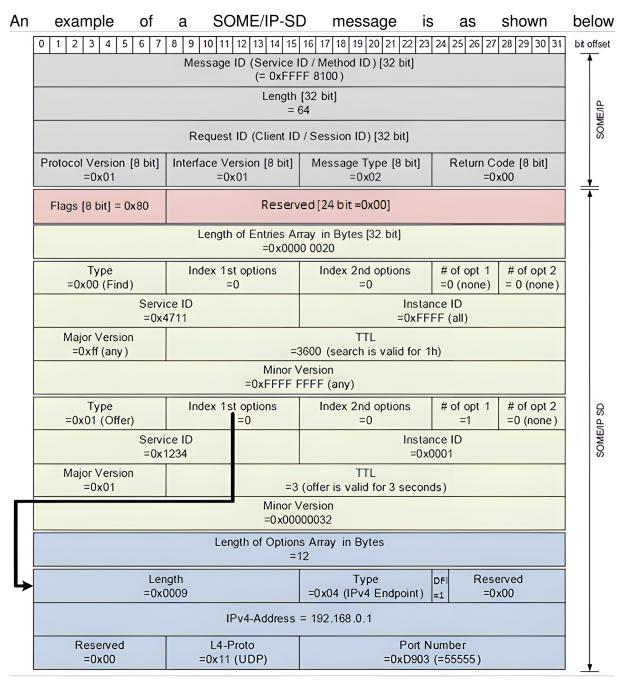

Figure 5.2: SOME/IP-SD Example Message

5.1.2.2 SOME/IP-SD Header

[PRS SOMEIPSD 00252]

Upstream requirements: RS_SOMEIPSD_00001

[SOME/IP-SD shall be transported using SOME/IP.]

[PRS SOMEIPSD 00252] can be seen in Figure 5.2.

[PRS SOMEIPSD 00253]

Upstream requirements: RS SOMEIPSD 00006

[The SOME/IP-SD Header shall start with an 8 Bit field called flags.]

See a representation of Flags in Figure 5.3.

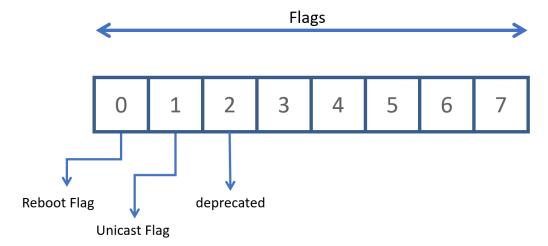

Figure 5.3: Flags in SOME/IP-SD

[PRS SOMEIPSD 00254]

Upstream requirements: RS_SOMEIPSD_00006

[The first flag of the SOME/IP-SD Flags field (highest order bit) shall be called Reboot Flag.|

For flags see Figure 5.3.

[PRS SOMEIPSD 00255]

Upstream requirements: RS_SOMEIPSD_00006

[The Reboot Flag of the SOME/IP-SD Header shall be set to one for all messages after reboot until the Session-ID in the SOME/IP-Header wraps around and thus starts with 1 again. After this wrap around the Reboot Flag is set to 0.|

[PRS SOMEIPSD 00256]

Upstream requirements: RS_SOMEIPSD_00002, RS_SOMEIPSD_00003

The information for the reboot flag and the Session ID shall be kept for multicast and unicast separately.

[PRS SOMEIPSD 00631]

Upstream requirements: RS_SOMEIPSD_00002, RS_SOMEIPSD_00003

The information for the reboot flag and the Session ID shall be kept for every senderreceiver relation (i.e. source address and destination address) separately.

Note:

This means there shall be separate counters for sending and receiving.

Sending

- There shall be a counter for multicast.
- There shall be a separate counter for each peer for unicast.

Receiving

- There shall be a counter for each peer for multicast.
- There shall be a counter for each peer for unicast.

[PRS SOMEIPSD 00258]

Upstream requirements: RS SOMEIPSD 00006

The detection of a reboot shall be done as follows (with the new values of the current packet from the communication partner and old the last value received before):

```
if old.reboot==0 and new.reboot==1 then Reboot detected
OR
if old.reboot==1 and new.reboot==1 and old.session id>=new.session id then Reboot
detected
```

[PRS SOMEIPSD 00259]

Upstream requirements: RS_SOMEIPSD_00002

The second flag of the SOME/IP-SD Flags (second highest order bit) shall be called Unicast Flag.

For flags see Figure 5.3.

[PRS SOMEIPSD 00540]

Upstream requirements: RS_SOMEIPSD_00002

[The Unicast Flag of the SOME/IP-SD Header shall be set to Unicast (that means 1) for all SD Messages since this means that receiving using unicast is supported.]

Note:

The Unicast Flag is left over from historical SOME/IP versions and is only kept for compatibility reasons. Its use besides this is very limited.

For flags see Figure 5.3.

[PRS_SOMEIPSD_00702]

Upstream requirements: RS SOMEIPSD 00002

[Undefined bits within the Flag field shall be set to '0' when sending and ignored on receiving.]

[PRS SOMEIPSD 00261]

Upstream requirements: RS SOMEIPSD 00006

[After the Flags the SOME/IP-SD Header shall have a field of 24 bits called Reserved.]

[PRS SOMEIPSD 00262]

Upstream requirements: RS_SOMEIPSD_00006

[After the SOME/IP-SD Header the Entries Array shall follow.]

[PRS_SOMEIPSD_00263]

Upstream requirements: RS SOMEIPSD 00006

The entries shall be processed exactly in the order they arrive.

[PRS_SOMEIPSD_00264]

Upstream requirements: RS_SOMEIPSD_00006

[After the Entries Array in the SOME/IP-SD Header an Option Array shall follow.]

[PRS_SOMEIPSD_00265]

Upstream requirements: RS_SOMEIPSD_00006

[The Entries Array and the Options Array of the SOME/IP-SD message shall start with a length field as uint32 that counts the number of bytes of the following data; i.e. the entries or the options.]

5.1.2.3 Entry Format

[PRS SOMEIPSD 00266]

Upstream requirements: RS_SOMEIPSD_00006

The service discovery shall support multiple entries that are combined in one service discovery message.

Note:

The entries are used to synchronize the state of services instances and the Publish/Subscribe handling.

[PRS SOMEIPSD 00267]

Upstream requirements: RS SOMEIPSD 00006

[Two types of entries exist: A Service Entry Type for Services and an Eventgroup Entry Type for Eventgroups.]

[PRS SOMEIPSD 00268]

Upstream requirements: RS_SOMEIPSD_00006

[A Service Entry Type shall be 16 Bytes of size and include the following fields in this order:

- Type Field [uint8]: encodes FindService (0x00), OfferService (0x01) and StopOfferService (0x01)
- Index First Option Run [uint8]: Index of this runs first option in the option array.
- Index Second Option Run [uint8]: Index of this runs second option in the option array.
- Number of Options 1 [uint4]: Describes the number of options the first option run uses.
- Number of Options 2 [uint4]: Describes the number of options the second option run uses.
- Service ID [uint16]: Describes the Service ID of the Service or Service Instance this entry is concerned with.
- Instance ID [uint16]: Describes the Service Instance ID of the Service Instance this entry is concerned with or is set to 0xFFFF if all service instances of a service are meant.
- Major Version [uint8]: Encodes the major version of the service (instance).
- TTL [uint24]: Describes the lifetime of the entry in seconds.
- Minor Version [uint32]: Encodes the minor version of the service.

[PRS_SOMEIPSD_00268] is shown in Figure 5.4.

0 1 2 3 4 5 6 7	8 9 10 11 12 13 14 15	16 17 18 19 20 21 22 23	24 25 26 27	28 29 30 31	bit offset
Туре	Index 1st options	Index 2nd options	# of opt 1	# of opt 2	
Service ID Instance ID					
Major Version	ΠL				
Minor Version					

Figure 5.4: SOME/IP-SD Service Entry Type

[PRS SOMEIPSD 00270]

Upstream requirements: RS_SOMEIPSD_00006

[An Eventgroup Entry (Type 2) shall be 16 Bytes of size and include the following fields in this order:

- Type Field [uint8]: encodes Subscribe (0x06), StopSubscribeEventgroup (0x06), SubscribeAck (0x07) and SubscribeEventgroupNack (0x07).
- Index of first option run [uint8]: Index of this runs first option in the option array.
- Index of second option run [uint8]: Index of this runs second option in the option array.
- Number of Options 1 [uint4]: Describes the number of options the first option run uses.
- Number of Options 2 [uint4]: Describes the number of options the second option run uses.
- Service-ID [uint16]: Describes the Service ID of the Service or Service Instance this entry is concerned with.
- Instance ID [uint16]: Describes the Service Instance ID of the Service Instance this entry is concerned with. The Service Instance ID shall not be set to 0xFFFF for any Instance.
- Major Version [uint8]: Encodes the major version of the service instance this eventgroup is part of.
- TTL [uint24]: Descibes the lifetime of the entry in seconds.
- Reserved [uint12]: Shall be set to 0x000.
- Counter [uint4]: Is used to differentiate identical Subscribe Eventgroups of the same subscriber. Set to 0x0 if not used.
- Eventgroup ID [uint16]: Transports the ID of an Eventgroup.

1

SOME/IP-SD Eventgroup Entry Type is shown in Figure 5.5.

0 1 2 3 4 5 6 7	8 9 10 11 12 13 14 15	16 17 18 19 20 21 22 23 24 25 26 27	28 29 30 31 bit o	offset
Туре	Index 1st options	Index 2nd options # of opt 1	# of opt 2	
Servic	vice ID Instance			
Major Version	TTL			
Reserved (0x000	000) Counter Eventgroup ID			

Figure 5.5: SOME/IP-SD Eventgroup Entry Type

[PRS SOMEIPSD 00845]

Upstream requirements: RS_SOMEIPSD_00006

[The Major Version of an entry (according to [PRS_SOMEIPSD_00268] and [PRS_SOMEIPSD_00270]) shall match the version of the corresponding Service Interface

Note: While SOME/IP-SD defines the Major and Minor version of a service interface, SOME/IP messages themselves only use the major version in the interface version field of the SOME/IP header.

5.1.2.3.1 Referencing Options from Entries

[PRS SOMEIPSD 00833]

Upstream requirements: RS_SOMEIPSD_00025

[Using the following fields of the entries, options are referenced by the entries:

- Index First Option Run: Index into array of options for first option run. Index 0 means first option of this SOME/IP-SD message.
- Index Second Option Run: Index into array of options for second option run. Index 0 means first option of this SOME/IP-SD message.
- Number of Options 1: Length of first option run. Length 0 means no option in option run.
- Number of Options 2: Length of second option run. Length 0 means no option in option run.

١

Two different option runs exist: First Option Run and Second Option Run.

Rationale for the support of two option runs: Two different types of options are expected: options common between multiple SOME/IP-SD entries and options different for each SOME/IP-SD entry. Supporting two different options runs is the most efficient way to support these two types of options, while keeping the wire format highly efficient.

[PRS SOMEIPSD 00341]

Upstream requirements: RS_SOMEIPSD_00025

[Each option run shall reference the first option and the number of options for this run.]

[PRS SOMEIPSD 00342]

Upstream requirements: RS SOMEIPSD 00025

If the number of options is set to zero, the option run is considered empty.

[PRS SOMEIPSD 00343]

Upstream requirements: RS SOMEIPSD 00025

[For empty runs the Index (i.e. Index First Option Run and/or Index Second Option Run) shall be set to zero.

[PRS SOMEIPSD 00834]

Upstream requirements: RS_SOMEIPSD_00025

[Implementations shall accept and process incoming SD messages with option run length set to zero and option index not set to zero by ignoring this option run.

5.1.2.4 Options Format

Options are used to transport additional information to the entries. This includes for instance the information how a service instance is reachable (IP-Address, Transport Protocol, Port Number).

[PRS SOMEIPSD 00273]

Upstream requirements: RS_SOMEIPSD_00006

In order to identify the option type every option shall start with:

- Length [uint16]: Specifies the length of the option in Bytes.
- Type [uint8]: Specifying the type of the option.
- Discardable Flag [1 bit]: Specifies, if this option can be discarded.
- Bit 1 to bit 7 are reserved and shall be 0.

[PRS SOMEIPSD 00275]

Upstream requirements: RS_SOMEIPSD_00006

The discardable flag shall be set to 1 if the option can be discarded by a receiving ECU that does not support this option.

5.1.2.4.1 Configuration Option

The configuration option is used to transport arbitrary configuration strings. This allows to encode additional information like the name of a service or its configuration. In additional, the configuration option allows to offer non-SOME/IP services with SOME/IP-SD.

[PRS SOMEIPSD 00276]

Upstream requirements: RS SOMEIPSD 00006

The format of the Configuration Option shall be as follows:

- Length [uint16]: Shall be set to the total number of bytes occupied by the configuration option, excluding the 16 bit length field and the 8 bit type flag.
- Type [uint8]: Shall be set to 0x01.
- Discardable Flag [1 bit]: Shall be set to 1 if the Option can be discarded by the receiver.
- Bit 1 to bit 7 are reserved and shall be 0.
- ConfigurationString [dynamic length]: Shall carry the configuration string.

[PRS SOMEIPSD 00277]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00009

The Configuration Option shall specify a set of name-value-pairs based on the DNS TXT and DNS-SD format. [2] [3]

[PRS SOMEIPSD 00278]

Upstream requirements: RS_SOMEIPSD_00006

The format of the configuration string shall start with a single byte length field that describes the number of bytes following this length field. After the length field a character sequence with the specified length shall follow.

[PRS SOMEIPSD 00279]

Upstream requirements: RS_SOMEIPSD_00006

[After each character sequence another length field and a following character sequence are expected until a length field shall be set to 0x00.]

[PRS_SOMEIPSD_00280]

Upstream requirements: RS_SOMEIPSD_00006

[After a length field is set to 0x00 no characters shall follow.]

[PRS SOMEIPSD 00281]

Upstream requirements: RS_SOMEIPSD_00006

A character sequence shall encode a key and optionally a value.

[PRS_SOMEIPSD_00282]

Upstream requirements: RS_SOMEIPSD_00006

The character sequences shall contain an equal character ("=", 0x3D) to divide key and value.

[PRS_SOMEIPSD_00283]

Upstream requirements: RS SOMEIPSD 00006

[The key shall not include an equal character and shall be at least one non-whitespace character. The characters of "Key" shall be printable US-ASCII values (0x20-0x7E), excluding '=' (0x3D).]

[PRS SOMEIPSD 00284]

Upstream requirements: RS_SOMEIPSD_00006

The "=" shall not be the first character of the sequence.

[PRS SOMEIPSD 00285]

Upstream requirements: RS_SOMEIPSD_00006

[For a character sequence without an '=' that key shall be interpreted as present.]

[PRS SOMEIPSD 00286]

Upstream requirements: RS_SOMEIPSD_00006

[For a character sequence ending on an '=' that key shall be interpreted as present with empty value.]

[PRS SOMEIPSD 00287]

Upstream requirements: RS_SOMEIPSD_00006

[Multiple entries with the same key in a single Configuration Option shall be supported.]

The format of the Configuration Option is shown in Figure 5.6.

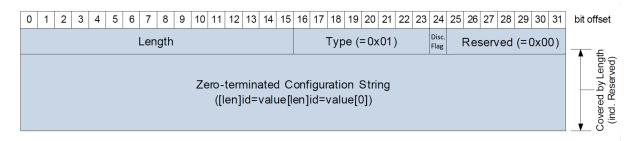

Figure 5.6: SOME/IP-SD Configuration Option

Example for SOME/IP-SD Configuration Option

0 1 2 3 4 5 6 7	8 9 10 11 12 13 14 15	16 17 18 19 20 21 22 23	24 25 26 27 28 29 30 31	bit offset

2	3	[0]		

Figure 5.7: SOME/IP-SD Configuration Option Example

5.1.2.4.2 Load Balancing Option

The Load Balancing option is used to prioritize different instances of the same service, so that a client can choose the service instance dynamically. This option will be referenced by Offer Service entries.

[PRS SOMEIPSD 00542]

Upstream requirements: RS_SOMEIPSD_00011

[The Load Balancing Option shall carry a Priority and Weight like the DNS-SRV records, which shall be used for load balancing different service instances. [4]]

[PRS SOMEIPSD 00711]

Upstream requirements: RS_SOMEIPSD_00011

[When looking for all service instances of a service (Service Instance set to 0xFFFF), the client shall choose the service instance with highest priority that also matches client specific criteria.

Note: Client specific criteria may be applied by the client application when choosing one of the offered service instances. They are not defined in this specification, and could e.g. restrict the range of appropriate instance IDs.

[PRS SOMEIPSD 00712]

Upstream requirements: RS SOMEIPSD 00011

[When having more than one service instance with highest priority (lowest value in Priority field) the service instance shall be chosen randomly based on the weights of the service instances. The probability of choosing a service instance shall be the weight of a service instance divided by the sum of the weights of all considered service instances.

[PRS_SOMEIPSD_00713]

Upstream requirements: RS_SOMEIPSD_00011

[If an Offer Service entry references no Load Balancing option and several service instances are offered, the client shall handle the service instances without Load Balancing option as though they had the lowest priority.]

[PRS SOMEIPSD 00714]

Upstream requirements: RS SOMEIPSD 00011

[When looking for a specific service instances of a service (Service Instance set to any value other than 0xFFFF), the evaluation of the Load Balancing Option does not apply.

[PRS SOMEIPSD 00544]

Upstream requirements: RS_SOMEIPSD_00011

The Format of the Load Balancing Option shall be as follows:

- Length [uint16]: Shall be set to 0x0005.
- Type [uint8]: Shall be set to 0x02.
- Discardable Flag [1 bit]: Shall be set to 1 if the Option can be discarded by the receiver.
- Bit 1 to bit 7 are reserved and shall be 0.

- Priority [uint16]: Carries the Priority of this instance. Lower value means higher priority.
- Weight [uint16]: Carries the Weight of this instance. Large value means higher probability to be chosen.

The format of the Load Balancing Option is shown in Figure 5.8.

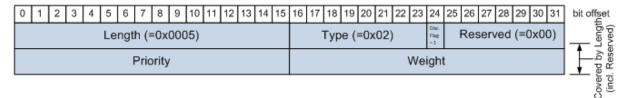

Figure 5.8: SOME/IP-SD Load Balancing Option

5.1.2.4.3 IPv4 Endpoint Option

The IPv4 Endpoint Option is used by a SOME/IP-SD instance to signal the relevant endpoint(s). Endpoints include the local IP address, the transport layer protocol (e.g. UDP or TCP), and the port number of the sender. These ports are used for the events and notification events as well.

[PRS_SOMEIPSD_00305]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

The IPv4 Endpoint Option shall use the Type 0x04.

[PRS SOMEIPSD 00306]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The IPv4 Endpoint Option shall specify the IPv4-Address, the transport layer protocol (ISO/OSI layer 4) used, and its Port Number.]

[PRS_SOMEIPSD_00307]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

The Format of the IPv4 Endpoint Option shall be as follows:

- Length [uint16]: Shall be set to 0x0009.
- Type [uint8]: Shall be set to 0x04.
- Discardable Flag [1 bit]: Shall be set to 0.
- Bit 1 to bit 7 are reserved and shall be 0.

- IPv4-Address [uint32]: Shall transport the unicast IP-Address as four Bytes.
- Reserved [uint8]: Shall be set to 0x00.
- Transport Protocol (L4-Proto) [uint8]: Shall be set to the transport layer protocol (ISO/OSI layer 4) based on the IANA/IETF types (0x06: TCP, 0x11: UDP).
- Transport Protocol Port Number (L4-Port) [uint16]: Shall be set to the port of the layer 4 protocol.

SOME/IP-SD IPv4 Endpoint Option is shown in Figure 5.9.

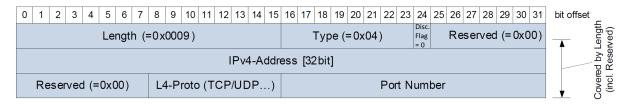

Figure 5.9: SOME/IP-SD IPv4 Endpoint Option

[PRS_SOMEIPSD_00310]

Upstream requirements: RS SOMEIPSD 00006, RS SOMEIPSD 00010

[The server shall use the IPv4 Endpoint Option with Offer Service entries to signal the endpoints it serves the service instance on. That is up to one UDP endpoint and up to one TCP endpoint.]

[PRS SOMEIPSD 00380]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

The endpoints the server referenced with an Offer Service entry shall also be used as source of events. That is source IP address and source port numbers for the transport protocols in the endpoint option.

[PRS SOMEIPSD 00807]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The client shall use the IPv4 Endpoint Option with Subscribe Eventgroup entries to signal the IP address and the UDP and/or TCP port numbers, on which it is ready to receive the events.]

Note: The client is ready to receive the events, if sockets are already opened, and any security associations required by the network security protocols (IPsec, MACsec, or other security protocols) are already established and fully operational.

[PRS SOMEIPSD 00835]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[Different provided service instances of the same service on the same ECU shall use different endpoints, so that they can be differentiated by the endpoints. Different services may share the same endpoints.]

5.1.2.4.4 IPv6 Endpoint Option

The IPv6 Endpoint Option is used by a SOME/IP-SD instance to signal the relevant endpoint(s). Endpoints include the local IP address, the transport layer protocol (e.g. UDP or TCP), and the port number of the sender. These ports are used for the events and notification events as well.

[PRS SOMEIPSD 00314]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

The IPv6 Endpoint Option shall use the Type 0x06.

[PRS SOMEIPSD 00315]

Upstream requirements: RS SOMEIPSD 00006, RS SOMEIPSD 00010

The Format of the IPv6 Endpoint Option shall be as follows:

- Length [uint16]: Shall be set to 0x0015.
- Type [uint8]: Shall be set to 0x06.
- Discardable Flag [1 bit]: Shall be set to 0.
- Bit 1 to bit 7 are reserved and shall be 0.
- IPv6-Address [uint128]: Shall transport the unicast IP-Address as 16 Bytes.
- Reserved [uint8]: Shall be set to 0x00.
- Transport Protocol (L4-Proto) [uint8]: Shall be set to the transport layer protocol (ISO/OSI layer 4) based on the IANA/IETF types (0x06: TCP, 0x11: UDP).
- Transport Protocol Port Number (L4-Port) [uint16]: Shall be set to the transport layer port(e.g. 30490).

1

SOME/IP-SD IPv6 Endpoint Option shall be as shown in Figure 5.10

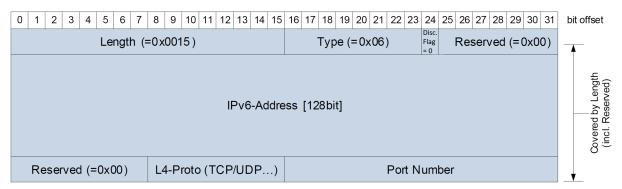

Figure 5.10: SOME/IP-SD IPv6 Endpoint Option

[PRS SOMEIPSD 00319]

Upstream requirements: RS SOMEIPSD 00006, RS SOMEIPSD 00010

The server shall use the IPv6 Endpoint Option with Offer Service entries to signal the endpoints the services is available on. That is upto one UDP endpoint and upto one TCP endpoint.

[PRS SOMEIPSD 00320]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The endpoints the server referenced with an Offer Service entry shall also be used as source of events. That is source IP address and source port numbers for the transport protocols in the endpoint option.]

[PRS SOMEIPSD 00321]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The client shall use the IPv6 Endpoint Option with Subscribe Eventgroup entries to signal the IP address and the UDP and/or TCP port numbers, on which it is ready to receive the events.]

Note:

- The client is ready to receive the events, if sockets are already opened, and any security associations required by the network security protocols (IPsec, MACsec or other security protocols) are already established and fully operational
- Security association status monitoring and its implications towards Service discovery shall apply for all Service Instances using secured ports.

[PRS SOMEIPSD 00836]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[Different service instances of the same service on the same ECU shall use different endpoints, so that they can be distinguished by the endpoints. Different services may share the same endpoints.]

5.1.2.4.5 IPv4 Multicast Option

The IPv4 Multicast Option is either transmitted by the server (server multicast endpoint) or by the client (client multicast endpoint):

- If it is transmitted by the server, then a server announces the IPv4 multicast address, the transport layer protocol, and the port number, to where the multicast events are transmitted to.
- If it is transmitted by the client, then a client indicates the IPv4 multicast address, the transport layer protocol, and the port number, where a client expects to receive multicast events.

[PRS_SOMEIPSD_00323]

Upstream requirements: RS_SOMEIPSD_00003

Γ

IPv4 Multicast Options shall be referenced by SubscribeEventgroup or by StopSubscribeEventgroup or by SubscribeEventgroupAck entries:

- If it is referenced by a SubscribeEventgroup entry, it describes the client service multicast endpoint (i.e. destination IP address and destination port), where the multicast events shall be received by the client.
- If it is referenced by a StopSubscribeEventgroup entry, it reflects the intent to stop the subscription of a client which has subscribed before via a client service multicast endpoint (i.e. destination IP address and destination port) to the given event group.
- If it is referenced by a SubscribeEventgroupAck entry, it describes the server multicast endpoint (i.e. destination IP address and destination port), where a server shall transmit the multicast events to.

١

[PRS SOMEIPSD 00324]

Upstream requirements: RS_SOMEIPSD_00003

The IPv4 Multicast Option shall use the Type 0x14.

[PRS SOMEIPSD 00325]

Upstream requirements: RS_SOMEIPSD_00003

[The IPv4 Multicast Option shall specify the IPv4-Address, the transport layer protocol (ISO/OSI layer 4) used, and its Port Number.

[PRS_SOMEIPSD_00326]

Upstream requirements: RS_SOMEIPSD_00003

The Format of the IPv4 Endpoint Option shall be as follows:

- Length [uint16]: Shall be set to 0x0009.
- Type [uint8]: Shall be set to 0x14.
- Discardable Flag [1 bit]: Shall be set to 0.
- Bit 1 to bit 7 are reserved and shall be 0.
- IPv4-Address [uint32]: Shall transport the multicast IP-Address as four Bytes.
- Reserved [uint8]: Shall be set to 0x00.
- Transport Protocol (L4-Proto) [uint8]: Shall be set to the transport layer protocol (ISO/OSI layer 4) based on the IANA/IETF types (0x11: UDP).
- Transport Protocol Port Number (L4-Port) [uint16]: Shall be set to the port of the layer 4 protocol.

SOME/IP-SD IPv4 Multicast Option shall be as shown in Figure 5.11

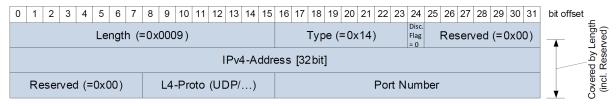

Figure 5.11: SOME/IP-SD IPv4 Multicast Option

[PRS SOMEIPSD 00847]

Upstream requirements: RS_SOMEIPSD_00003

The IPv4-Address field [32 bits] of the IPv4 Multicast Option shall be set according the following rules:

 If a server service transmits a SubscribeEventgroupAck then the field shall be set to the configured multicast IP address of the corresponding provided Eventgroup (server multicast endpoint).

• If a client service transmit a SubscribeEventgroup or StopSubscribeEventgroup, then the field shall be set to the configured multicast IP address of the corresponding consumed Eventgroup (client service multicast endpoint).

[PRS SOMEIPSD 00848]

Upstream requirements: RS_SOMEIPSD 00003

Γ

The Port Number field [16 bits] of the IPv4 Multicast Option shall be set according the following rules:

- If a server service transmits a SubscribeEventgroupAck then the field shall be set to the configured port of the corresponding provided Eventgroup (server multicast endpoint).
- If a client service transmits a SubscribeEventgroup or StopSubscribeEventgroup, then the field shall be set to the configured port of the corresponding consumed Eventgroup (client service multicast endpoint).

1

5.1.2.4.6 IPv6 Multicast Option

The IPv6 Multicast Option is either transmitted by the server service (server multicast endpoint) or by the client service (client service multicast endpoint):

- If it is transmitted by the server service, then a server announces the IPv6 multicast address, the transport layer protocol (ISO/OSI layer 4), and the port number, to where the multicast events and multicast-notification-events are transmitted to.
- If it is transmitted by the client service, then a client indicates the IPv6 multicast address, the transport layer protocol (ISO/OSI layer 4), and the port number, where a client expects to receive multicast events and multicast-notificationevents.

[PRS SOMEIPSD 00331]

Upstream requirements: RS_SOMEIPSD_00003

The IPv6 Multicast Option shall use the Type 0x16.

[PRS SOMEIPSD 00332]

Upstream requirements: RS_SOMEIPSD_00003

[The IPv6 Multicast Option shall specify the IPv6-Address, the transport layer protocol (ISO/OSI layer 4) used, and its Port Number.]

[PRS SOMEIPSD 00333]

Upstream requirements: RS_SOMEIPSD_00003

The Format of the IPv6 Multicast Option shall be as follows:

- Length [uint16]: Shall be set to 0x0015.
- Type [uint8]: Shall be set to 0x16.
- Discardable Flag [1 bit]: Shall be set to 0.
- Bit 1 to bit 7 are reserved and shall be 0.
- IPv6-Address [uint128]: Shall transport the multicast IP-Address as 16 Bytes.
- Reserved [uint8]: Shall be set to 0x00.
- Transport Protocol (L4-Proto) [uint8]: Shall be set to the transport layer protocol (ISO/OSI layer 4) based on the IANA/IETF types (0x11: UDP).
- Transport Protocol Port Number (L4-Port) [uint16]: Shall be set to the port of the layer 4 protocol.

١

SOME/IP-SD IPv6 Multicast Option shall be as shown in Figure 5.12.

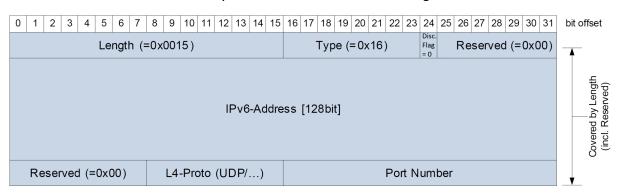

Figure 5.12: SOME/IP-SD IPv6 Multicast Option

[PRS_SOMEIPSD_00849]

Upstream requirements: RS_SOMEIPSD_00003

[The IPv6-Address field [128 bits] of the IPv6 Multicast option shall be set according the following rules:

- If a server service transmits a SubscribeEventgroupAck then the field shall be set to the configured multicast IP address of the corresponding provided Eventgroup (server multicast endpoint).
- If a client service transmits a SubscribeEventgroup or StopSubscribeEventgroup, then the field shall be set to the configured IP multicast address of the corresponding consumed Eventgroup (client service multicast endpoint).

[PRS_SOMEIPSD_00850]

Upstream requirements: RS_SOMEIPSD_00003

[The Port Number field [16 bits] of the IPv6 Multicast Option shall be set according the following rules:

- If a server service transmits a SubscribeEventgroupAck then the field shall be set to the configured port of the corresponding provided Eventgroup (server multicast endpoint).
- If a client service transmits a SubscribeEventGroup or StopSubscribeEvent-Group, then the field shall be set to the configured port of the corresponding consumed Eventgroup (client service multicast endpoint).

[PRS_SOMEIPSD_00545]

Upstream requirements: RS SOMEIPSD 00003

[IPv6 Multicast Options shall be referenced by SubscribeEventgroup or by StopSubscribeEventgroup or by SubscribeEventgroupAck entries:

- If it is referenced by a SubscribeEventgroup entry, it describes the client service multicast endpoint (i.e. destination IP address and destination port), where the multicast events shall be received by the client.
- If it is referenced by a StopSubscribeEventgroup entry, it reflects the intent to stop the subscription of a client which has subscribed before via a client service multicast multicast endpoint (i.e. destination IP address and destination port) to the given event group.
- If it is referenced by a SubscribeEventgroupAck entry, it describes the server multicast endpoint (i.e. destination IP address and destination port), where a server shall transmit the multicast events to.

5.1.2.4.7 IPv4 SD Endpoint Option

The IPv4 SD Endpoint Option is used to transport the endpoint (i.e. IP-Address and Port) of the senders SD implementation. This is used to identify the SOME/IP-SD Instance even in cases in which the IP-Address and/or Port Number cannot be used.

Note:

This is used to identify the SOME/IP-SD Instance even in cases in which the IP-

Address and/or Port Number cannot be used. A use case would be a proxy service discovery on one ECU which handles the multicast traffic for another ECU.

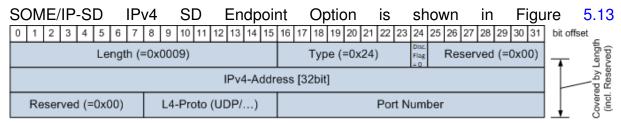

Figure 5.13: SOME/IP-SD IPv4 SD Endpoint Option

[PRS SOMEIPSD 00547]

Upstream requirements: RS SOMEIPSD 00006, RS SOMEIPSD 00010

[The IPv4 SD Endpoint Option may be included in any SD message up to 1 time.]

[PRS SOMEIPSD 00650]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The IPv4 SD Endpoint Option shall only be included if the SOME/IP-SD message is transported over IPv4.]

[PRS SOMEIPSD 00856]

Upstream requirements: RS SOMEIPSD 00006, RS SOMEIPSD 00010

o A receiver shall ignore all IPv4 SD Endpoint Options received over IPv6.

[PRS SOMEIPSD 00651]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

The IPv4 SD Endpoint Option shall be the first option in the options array, if existing.

IPRS SOMEIPSD 008541

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[A receiver shall ignore all IPv4 SD Endpoint Options that are located after the first position of the options array.]

[PRS SOMEIPSD 00548]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The IPv4 SD Endpoint Option shall not be referenced by any SD Entry.]

[PRS SOMEIPSD 00857]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[A receiver shall ignore all references to the IPv4 SD Endpoint Option by Entries.]

[PRS SOMEIPSD 00549]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[If the IPv4 SD Endpoint Option is included in the SD message, the receiving SD Service Instance shall use the content of this option instead of the Source IP Address and Source Port for answering this SD message and for identifying the sender-receiver relation for reboot detection according to [PRS_SOMEIPSD_00631].

Note:

This is important for answering the received SD message (e.g. Offer after Find or Subscribe after Offer or Subscribe Ack after Subscribe) as well as the reboot detection (channel based on SD Endpoint Option and not out addresses).

[PRS SOMEIPSD 00550]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The IPv4 SD Endpoint Option shall use the Type 0x24.]

[PRS SOMEIPSD 00551]

Upstream requirements: RS SOMEIPSD 00006, RS SOMEIPSD 00010

The IPv4 SD Endpoint Option shall specify the IPv4-Address, the transport layer protocol (ISO/OSI layer 4) and Port Number of the sender used for Service Discovery.

[PRS_SOMEIPSD_00552]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

The Format of the IPv4 SD Endpoint Option shall be as follows:

- Length [uint16]: Shall be set to 0x0009.
- Type [uint8]: Shall be set to 0x24.
- Discardable Flag [1 bit]: Shall be set to 0.
- Bit 1 to bit 7 are reserved and shall be 0.
- IPv4-Address [uint32]: Shall transport the unicast IP-Address of SOME/IP-SD as four Bytes.
- Reserved [uint8]: Shall be set to 0x00.
- Transport Protocol (L4-Proto) [uint8]: Shall be set to the transport layer protocol of SOME/IP-SD (currently: 0x11 UDP).

• Transport Protocol Port Number (L4-Port) [uint16]: Shall be set to the transport layer port of SOME/IP-SD (currently: 30490).

5.1.2.4.8 IPv6 SD Endpoint Option

The Ipv6 SD Endpoint Option is used to transport the endpoint (i.e. IP-Address and Port) of the senders SD implementation. This is used to identify the SOME/IP-SD Instance even in cases in which the IP-Address and/or Port Number cannot be used. SOME/IP-SD IPv6 SD Endpoint Option is shown in Figure 5.14

Note:

A use case would be a proxy service discovery on one ECU which handles the multicast traffic for another ECU.

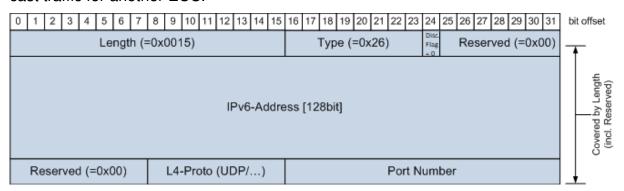

Figure 5.14: SOME/IP-SD IPv6 SD Endpoint Option

[PRS SOMEIPSD 00554]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The IPv6 SD Endpoint Option may be included in any SD message up to 1 time.]

[PRS SOMEIPSD 00654]

Upstream requirements: RS SOMEIPSD 00006, RS SOMEIPSD 00010

The IPv6 SD Endpoint Option shall be the first option in the options array, if existing.

[PRS SOMEIPSD 00855]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[A receiver shall ignore all IPv6 SD Endpoint Options that are located after the first position of the options array.]

[PRS SOMEIPSD 00555]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The IPv6 SD Endpoint Option shall not be referenced by any SD Entry. |

[PRS SOMEIPSD 00859]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[A receiver shall ignore all references to the IPv6 SD Endpoint Option by Entries.]

[PRS SOMEIPSD 00556]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[If the IPv6 SD Endpoint Option is included in the SD message, the receiving SD Service Instance shall use the content of this option instead of the Source IP Address and Source Port for answering this SD messages and for identifying the sender-receiver relation for reboot detection according to [PRS_SOMEIPSD_00631].

[PRS SOMEIPSD 00557]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

The IPv6 SD Endpoint Option shall use the Type 0x26.

[PRS SOMEIPSD 00558]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

[The IPv6 SD Endpoint Option shall specify the IPv6-Address, the transport layer protocol (ISO/OSI layer 4) and Port Number of the sender used for Service Discovery.]

[PRS SOMEIPSD 00559]

Upstream requirements: RS_SOMEIPSD_00006, RS_SOMEIPSD_00010

The Format of the IPv6 SD Endpoint Option shall be as follows:

- Length [uint16]: Shall be set to 0x0015.
- Type [uint8]: Shall be set to 0x26.
- Discardable Flag [1 bit]: Shall be set to 0.
- Bit 1 to bit 7 are reserved and shall be 0.
- IPv6-Address [uint128]: Shall transport the unicast IP-Address of SOME/IP-SD as 16 Bytes.
- Reserved [uint8]: Shall be set to 0x00.
- Transport Protocol (L4-Proto) [uint8]: Shall be set to the transport layer protocol of SOME/IP-SD (currently: 0x11 UDP).

• Transport Protocol Port Number (L4-Port) [uint16]: Shall be set to the transport layer port of SOME/IP-SD (currently: 30490).

[PRS_SOMEIPSD_00837]

Upstream requirements: RS SOMEIPSD 00006, RS SOMEIPSD 00010

[The IPv6 SD Endpoint Option shall only be included if the SOME/IP-SD message is transported over IPv6.

[PRS SOMEIPSD 00860]

Upstream requirements: RS SOMEIPSD 00006, RS SOMEIPSD 00010

A receiver shall ignore all IPv6 SD Endpoint Options received over IPv4.

5.1.2.5 Service Entries

5.1.2.5.1 Find Service Entry

[PRS SOMEIPSD 00350]

Upstream requirements: RS_SOMEIPSD_00008, RS_SOMEIPSD_00021

The Find Service entry type shall be used for finding service instances and shall only be sent if the current state of a service is unknown (no current Service Offer was received and is still valid).

[PRS SOMEIPSD 00351]

Upstream requirements: RS SOMEIPSD 00008, RS SOMEIPSD 00021

[Find Service entries shall set the entry fields in the following way:

- Type shall be set to 0x00 (FindService).
- Service ID shall be set to the Service ID of the service that shall be found.
- Instance ID shall be set to 0xFFFF, if all service instances shall be returned. It shall be set to the Instance ID of a specific service instance, if just a single service instance shall be returned.
- Major Version shall be set to 0xFF, that means that services with any version shall be returned. If set to value different than 0xFF, services with this specific major version shall be returned only.
- Minor Version shall be set to 0xFFFF FFFF, that means that services with any version shall be returned. If set to a value different to 0xFFFF FFFF, services with this specific minor version shall be returned only.

• TTL is not used for FindService entries and can be set to an arbitrary value. The field is only defined for backward compatibility, and the value shall be ignored by the receiver of the message.

Note: It is expected that the Major Version on client side is configured to a specific value in normal operation since the client should look for an specific interface version. Different Major Versions are not compatible to each other.

[PRS SOMEIPSD 00528]

Upstream requirements: RS SOMEIPSD 00008, RS SOMEIPSD 00025

[A sender shall not reference Endpoint Options nor Multicast Options in a Find Service Entry.

[PRS SOMEIPSD 00529]

Upstream requirements: RS SOMEIPSD 00013, RS SOMEIPSD 00025

[A receiver shall ignore Endpoint Options and Multicast Options in a Find Service Entry. |

[PRS SOMEIPSD 00530]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

Other Options (neither Endpoint nor Multicast Options), shall still be allowed to be used in a Find Service Entry.

[PRS SOMEIPSD 00825]

Upstream requirements: RS_SOMEIPSD_00008, RS_SOMEIPSD_00013

[When receiving a FindService Entry the Service ID, Instance ID, Major Version, and Minor Version shall match exactly to the configured values to identify a Service Instance, except if "any values" are in the Entry (i.e. 0xFFFF for Service ID, 0xFFFF for Instance ID, 0xFF for Major Version, and 0xFFFFFFF for Minor Version.)

[PRS SOMEIPSD 00839]

Upstream requirements: RS SOMEIPSD 00008, RS SOMEIPSD 00013

[If a FindService Entry is received within the Initial Wait Phase for this Server Service Instance, it shall be ignored.

5.1.2.5.2 Offer Service Entry

[PRS SOMEIPSD 00355]

Upstream requirements: RS_SOMEIPSD_00013

The Offer Service entry type shall be used to offer a service to other communication partners.

[PRS SOMEIPSD 00356]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

Offer Service entries shall set the entry fields in the following way:

- Type shall be set to 0x01 (OfferService).
- Service ID shall be set to the Service ID of the service instance offered.
- Instance ID shall be set to the Instance ID of the service instance that is offered.
- Major Version shall be set to the Major Version of the service instance that is offered.
- Minor Version shall be set to the Minor Version of the service instance that is offered.
- TTL shall be set to the lifetime of the service instance. After this lifetime the service instance shall considered not been offered.
- If TTL is set to 0xFFFFFF, the Offer Service entry shall be considered valid until the next reboot.
- If CYCLIC_OFFER_DELAY is defined, TTL shall be greater or equal to the value for CYCLIC_OFFER_DELAY.
- TTL shall not be set to 0x000000 since this is considered to be the Stop Offer Service Entry.

[PRS SOMEIPSD 00357]

Upstream requirements: RS SOMEIPSD 00013, RS SOMEIPSD 00025

[Offer Service entries shall always reference either an IPv4 or IPv6 Endpoint Option to signal how the service is reachable.]

[PRS SOMEIPSD 00358]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

[For each Transport Layer Protocol needed for the service (i.e. UDP and/or TCP) an IPv4 Endpoint option shall be added if IPv4 is supported.

[PRS_SOMEIPSD_00359]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

[For each Transport Layer Protocol needed for the service (i.e. UDP and/or TCP) an IPv6 Endpoint option shall be added if IPv6 is supported.

[PRS SOMEIPSD 00826]

Upstream requirements: RS_SOMEIPSD_00012, RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

[When receiving the initial OfferService Entry the Service ID, Instance ID, Major Version and Minor Version shall match exactly to the configured values to identify a Service Instance, except if "any values" are in the service configuration (i.e. 0xFFFF for Instance ID and 0xFFFFFFFF for Minor Version.)

[PRS_SOMEIPSD_00827]

Upstream requirements: RS_SOMEIPSD_00012, RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

[When receiving a subsequent OfferService Entry or a StopOfferService Entry the Service ID, Instance ID, Major Version shall match exactly to the values in the initial OfferService entry to identify a Service Instance.]

5.1.2.5.3 Stop Offer Service Entry

[PRS SOMEIPSD 00363]

Upstream requirements: RS SOMEIPSD 00014

The Stop Offer Service entry type shall be used to stop offering service instances.

[PRS SOMEIPSD 00364]

Upstream requirements: RS SOMEIPSD 00014

Stop Offer Service entries shall set the entry fields exactly like the Offer Service entry they are stopping, except:

TTL shall be set to 0x000000.

-

[PRS SOMEIPSD 00840]

Upstream requirements: RS SOMEIPSD 00014

[A StopOfferService (type 0x01), shall carry, i.e. reference, the same options as the entries trying to stop.]

5.1.2.5.4 Usage of Options in Entries

[PRS_SOMEIPSD_00583] Allowed Option Types for Entry Types

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00008, RS_SOMEIPSD_00013, RS_SOMEIPSD_00014, RS_SOMEIPSD_00015, RS_SOMEIPSD_00016

Γ

	Endpoint	Multicast	Configuration	Load Balanc- ing
FindService	0	0	0-1	0
OfferService	1-2	0	0-1	0-1
StopOffer Service	1-2	0	0-1	0-1
Subscribe Event-	0-2	0-1	0-1	0
group				
StopSubscribe	0-2	0-1	0-1	0
Eventgroup				
Subscribe Event-	0	0-1	0-1	0
groupAck				
Subscribe Event-	0	0	0-1	0
groupNack				

5.1.2.6 Endpoint Handling for Services and Events

[PRS_SOMEIPSD_00476]

Upstream requirements: RS_SOMEIPSD_00025

[The Service Discovery shall overwrite IP Addresses and Port Numbers with those transported in Endpoint and Multicast Options if the statically configured values are different from those in these options.]

Note: In other words if a mix of a static and dynamic configuration exists (static configuration that defines the communication endpoints exists and at the same time endpoint options are exchanged via SD messages at runtime) and the endpoint options in the static configuration are different from the endpoint options received via SD then the endpoints options received over SD take precedence over the preconfigured endpoint options.

[PRS_SOMEIPSD_00360]

Upstream requirements: RS SOMEIPSD 00013, RS SOMEIPSD 00025

The IP addresses and port numbers of the Endpoint Options shall also be used for transporting events and notification events.

[PRS SOMEIPSD 00361]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

[In case of UDP the endpoint option shall be used for the source address and the source port of the events and notification events, it is also the address the client can send method requests to.]

[PRS SOMEIPSD 00362]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

[In case of TCP the endpoint option shall be used for the IP address and port the client needs to open a TCP connection in order to receive events using TCP.]

[PRS_SOMEIPSD_00801]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

[SOME/IP shall allow services to use UDP and TCP at the same time.]

[PRS SOMEIPSD 00802]

Upstream requirements: RS SOMEIPSD 00013, RS SOMEIPSD 00025

[Which message is sent by which underlying transport protocol shall be determined by configuration: A Service can use UDP and TCP endpoints at the same time. But per element of the service it shall to be configured whether TCP or UDP is used.]

Note: It needs to be restricted in the configuration which methods and which events are provided over TCP/UDP. This also means that the same event can not be provided over TCP and UDP.

5.1.2.6.1 Service Endpoints

The referenced Endpoint Options of the Offer Service entries denotes the

- IP Address and Port Numbers the service instance is reachable at the server.
- IP Address and Port Numbers the service instance sends the events from.

[PRS SOMEIPSD 00480]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

[Events of this service instance shall not be sent from any other Endpoints than those given in the Endpoint Options of the Offer Service entries.]

[PRS SOMEIPSD 00481]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00025

[If an ECU offers multiple service instances, SOME/IP messages of these service instances shall be differentiated by the information transported in the Endpoint Options referenced by the Offer Service entries.]

5.1.2.6.2 Eventgroup Endpoints

[PRS_SOMEIPSD_00484]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00025

The Endpoint Options referenced in the Subscribe Eventgroup entries shall also be used to send unicast UDP or TCP SOME/IP events for this Service Instance.

Thus the Endpoint Options referenced in the Subscribe Eventgroup entries are the IP Address and the Port Numbers on the client side.

[PRS SOMEIPSD 00486]

Upstream requirements: RS SOMEIPSD 00015, RS SOMEIPSD 00025

TCP events are transported using the TCP connection the client has opened to the server before sending the Subscribe Eventgroup entry.

[PRS SOMEIPSD 00487]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00025

The initial value of field notifiers (i.e., fields and not pure events) shall be transported using unicast from Server to Client.

[PRS SOMEIPSD 00488]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00025

[Subscribe Eventgroup Ack entries shall reference up to 1 Multicast Option for the Internet Protocol used (IPv4 or IPv6).]

[PRS SOMEIPSD 00489]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00025

The Multicast Option shall be set to UDP as transport protocol.

[PRS SOMEIPSD 00490]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00025

The client shall open the Endpoint specified in the Multicast Option referenced by the Subscribe Eventgroup Ack entry as fast as possible to not miss multicast events.

Example: Figure 5.15 shows an example with the different Endpoint and a Multicast Option:

- The Server offers the Service Instance on Server UDP-Endpoint SU and Server TCP-Endpoint ST
- The Client opens a TCP connection
- The Client sends a Subscribe Eventgroup entry with Client UDP-Endpoint CU (unicast) and a Client TCP-Endpoint CT.
- The Server answers with a Subscribe Eventgroup Ack entry with Multicast MU

Then the following operations happen:

- The Client calls a method on the Server
- Request is sent from CU to SU and Response from SU to CU
- For TCP this would be: Request dyn to ST and RESPONSE from ST to CT
- The Server sends a Unicast UDP Event: SU to CU
- The Server sends a Unicast TCP Event: ST to CT
- The Server sends a Multicast UDP Event: SU to MU

Keep in mind that Multicast Endpoints use a Multicast IP Address on the receiver side, i.e. the client, and TCP cannot be used for Multicast communication.

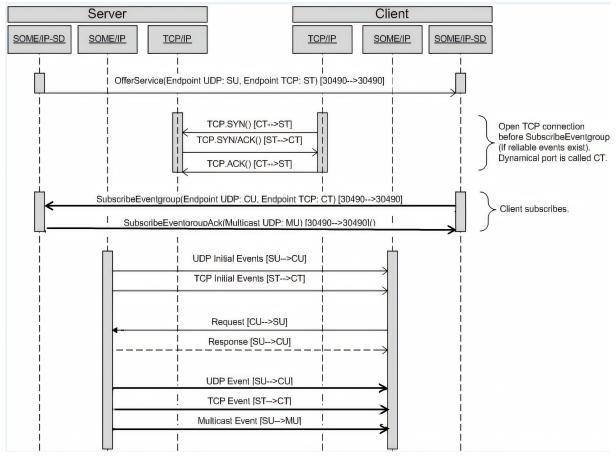

Figure 5.15: Publish/Subscribe Example for Endpoint Options and the usage of ports

5.1.3 Service Discovery Messages

[PRS_SOMEIPSD_00600]

Upstream requirements: RS_SOMEIPSD_00001

[All SD Messages shall be sent to SD PORT.]

[PRS_SOMEIPSD_00601]

Upstream requirements: RS SOMEIPSD 00002, RS SOMEIPSD 00003

[SD PORT shall be used as the source port for SD Unicast/Multicast Messages.]

[PRS SOMEIPSD 00602]

Upstream requirements: RS_SOMEIPSD_00002

[All unicast SD messages should have SD_PORT as destination port unless the SD Endpoint Option defines a different port.]

[PRS SOMEIPSD 00603]

Upstream requirements: RS_SOMEIPSD_00003, RS_SOMEIPSD_00022

[All SD multicast messages shall be sent using the SD_MULTICAST_IP.]

[PRS SOMEIPSD 00841]

Upstream requirements: RS SOMEIPSD 00013, RS SOMEIPSD 00025

[When receiving Service Discovery messages, the receiver shall ignore Entries of unknown type.]

Using the previously specified header format, different entries and messages consisting of one or more entries can be built. The specific entries and their header layouts are explained in the following sections.

5.1.3.1 Eventgroup Entry

5.1.3.1.1 Subscribe Eventgroup Entry

[PRS SOMEIPSD 00385]

Upstream requirements: RS SOMEIPSD 00015

The Subscribe Eventgroup entry type shall be used to subscribe to an eventgroup.

[PRS SOMEIPSD 00386]

Upstream requirements: RS_SOMEIPSD_00015

[Subscribe Eventgroup entries shall set the entry fields in the following way:

- Type shall be set to 0x06 (SubscribeEventgroup).
- Service ID shall be set to the Service ID of the service instance that includes the eventgroup subscribed to.
- Instance ID shall be set to the Instance ID of the service instance that includes the eventgroup subscribed to.
- Major Version shall be set to the Major Version of the service instance of the eventgroup subscribed to.
- Eventgroup ID shall be set to the Eventgroup ID of the eventgroup subscribed to.
- TTL shall be set to the lifetime of the subscription.
 - If set to 0xFFFFFF, the Subscribe Eventgroup entry shall be considered valid until the next reboot.

- TTL shall not be set to 0x000000 since this is considered to be the Stop Offer Service Entry.
- Reserved shall be set to 0x000 until further notice.
- Counter shall be used to differentiate between parallel subscribes to the same eventgroup of the same service (only difference in endpoint). If not used, set to 0x0.

[PRS SOMEIPSD 00846]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00025

[A SubscribeEventgroup entry reference the endpoints (IP address, port, and protocol) where the client wishes to receive the events. A client service could subscribe to the same Eventgroup either with a client unicast endpoint or with a client multicast endpoint:

- If a client subscribes with a client unicast endpoint via an Endpoint Option, the client announces its desire to receive the events as unicast events transmitted to the given unicast endpoint.
- If a client subscribes with a client multicast endpoint via an Endpoint Option, the client announces its desire to receive the events as multicast events transmitted to the given multicast endpoint.

[PRS SOMEIPSD 00387]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00025

[SubscribeEventgroup entries shall reference options according to the following rules:

- either up to two IPv4 or up to two IPv6 Endpoint Options (one for UDP, one for TCP)
- either up to one IPv4 Multicast Option or up to one IPv6 Multicast Option (only UDP supported)

Note:

This explicitly rules out that a single service instance is offered via IPv4 and IPv6 at the same time.

[PRS SOMEIPSD 00828]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00025

[When receiving a SubscribeEventgroup or StopSubscribeEventgroup the Service ID, Instance ID, Eventgroup ID, and Major Version shall match exactly to the configured values to identify an Eventgroup of a Service Instance.]

[PRS SOMEIPSD 00810]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00025

[If the server receives a Subscribe Eventgroup entry without a UDP Endpoint Option (see [PRS_SOMEIPSD_00387]) and the MULTICAST_THRESHOLD for the Eventgroup is not configured with value 1 then SubscribeEventGroupNack shall be sent back to the client.

5.1.3.1.2 Stop Subscribe Eventgroup Entry

[PRS SOMEIPSD 00388]

Upstream requirements: RS_SOMEIPSD_00017

[The Stop Subscribe Eventgroup entry type shall be used to stop subscribing to event-groups.]

[PRS SOMEIPSD 00389]

Upstream requirements: RS_SOMEIPSD_00017

[Stop Subscribe Eventgroup entries shall set the entry fields exactly like the Subscribe Eventgroup entry they are stopping, except:

• TTL shall be set to 0x000000.

[PRS SOMEIPSD 00574]

Upstream requirements: RS_SOMEIPSD_00017

[A Stop Subscribe Eventgroup Entry shall reference the same options the Subscribe Eventgroup Entry referenced. This includes but is not limited to Endpoint and Configuration options.]

5.1.3.1.3 Subscribe Eventgroup Acknowledgement (Subscribe Eventgroup Ack) Entry

[PRS SOMEIPSD 00390]

Upstream requirements: RS_SOMEIPSD_00015

[The Subscribe Eventgroup Acknowledgment entry type shall be used to indicate that Subscribe Eventgroup entry was accepted.]

[PRS SOMEIPSD 00391]

Upstream requirements: RS_SOMEIPSD_00015

Subscribe Eventgroup Acknowledgment entries shall set the entry fields in the following way:

- Type shall be set to 0x07 (SubscribeEventgroupAck).
- Service ID, Instance ID, Major Version, Eventgroup ID, TTL, Reserved and Counter shall be the same value as in the Subscribe Eventgroup that is being answered.

[PRS SOMEIPSD 00392]

Upstream requirements: RS_SOMEIPSD_00015

[Subscribe Eventgroup Ack entries referencing events and notification events that are transported via multicast shall reference an IPv4 Multicast Option and/or and IPv6 Multicast Option. The Multicast Options state to which Multicast address and port the events and notification events will be sent to.]

[PRS SOMEIPSD 00829]

Upstream requirements: RS_SOMEIPSD_00015

[When receiving a SubscribeEventgroupAck or SubscribeEventgroupNack the Service ID, Instance ID, Eventgroup ID, and Major Version shall match exactly to the corresponding SubscribeEventgroup Entry to identify an Eventgroup of a Service Instance.]

5.1.3.1.4 Subscribe Eventgroup Negative Acknowledgement (Subscribe Eventgroup Nack) Entry

[PRS SOMEIPSD 00393]

Upstream requirements: RS SOMEIPSD 00015

The Subscribe Eventgroup Negative Acknowledgment entry type shall be used to indicate that Subscribe Eventgroup entry was NOT accepted.

[PRS SOMEIPSD 00394]

Upstream requirements: RS_SOMEIPSD_00015

[Subscribe Eventgroup Negative Acknowledgment entries shall set the entry fields in the following way:

- Type shall be set to 0x07 (SubscribeEventgroupAck).
- Service ID, Instance ID, Major Version, Eventgroup ID, Counter, and Reserved shall be the same value as in the Subscribe that is being answered.
- The TTL shall be set to 0x000000.

[PRS SOMEIPSD 00566]

Upstream requirements: RS_SOMEIPSD_00015

[Reasons to not accept a Subscribe Eventgroup include (but are not limited to):

- Combination of Service ID, Instance ID, Eventgroup ID, and Major Version is unknown
- Required TCP-connection was not opened by client
- Problems with the references options occurred
- Resource problems at the Server
- Security association not yet established

[PRS SOMEIPSD 00527]

Upstream requirements: RS SOMEIPSD 00015

[When the client receives a SubscribeEventgroupNack as answer on a SubscribeEventgroup for which a TCP connection is required, the client shall check the TCP connection and shall restart the TCP connection if needed.

Note: [PRS SOMEIPSD 00527] involves checking the state of the network security protocol

Rational:

The server might have lost the TCP connection and the client has not.

Checking the TCP connection might include the following:

- Checking whether data is received for e.g. other Eventgroups.
- Sending out a Magic Cookie message and waiting for the TCP ACK.
- Reestablishing the TCP connection.

[PRS SOMEIPSD 00842] Overview of currently supported Entry Types

Upstream requirements: RS SOMEIPSD 00015

	TTL > 0		TTL = 0		
Type	0x00	0x04	0x00	0x04	
0x00	FindService				
0x01	OfferService		StopOfferService		
0x02		SubscribeEventgroup		StopSubscribeEventgroup	
0x03		SubscribeEventgroupAck		SubscribeEventgroupNack	

5.1.4 Service Discovery Communication Behavior

[PRS SOMEIPSD 00800]

Upstream requirements: RS SOMEIPSD 00025

SOME/IP Service Discovery shall reduce the number of Service Discovery messages by packing entries together, if they can be sent at the same time:

- Multiple entries of different service instances (e.g., all Offer Service entries)
- Multiple entries of different types. E.g.:
 - Offer Service entries and Find Service entries
 - Subscribe Eventgroup Ack Entries and Subscribe Eventgroup Nack entries

1

5.1.4.1 Startup Behavior

[PRS SOMEIPSD 00395]

Upstream requirements: RS_SOMEIPSD_00025

For each Service Instance the Service Discovery shall have at least these three phases in regard to sending entries:

- Initial Wait Phase
- Repetition Phase
- Main Phase

Note:

An actual implemented state machine will need more than just states for these three phases. E.g. local services can be still down and remote services can be already known (no finds needed anymore).

[PRS SOMEIPSD 00397]

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00012

The service discovery shall enter the Initial Wait Phase for a client service instance when the link on the interface needed for this service instance is up and the client service is requested by the application.

[PRS SOMEIPSD 00133]

Upstream requirements: RS SOMEIPSD 00025, RS SOMEIPSD 00012

The service discovery shall enter the Initial Wait Phase for a server service instance when the link on the interface needed for this service instance is up and the server service is available.

Note:

It is possible that the link is up but the service instance is not yet available on server side.

Service instances require the availability of the needed applications and possible external sensors and actuators as well. Basically the functionality needed by this service instance has to be ready to offer a service and finding a service is applicable after some application requires it.

[PRS SOMEIPSD 00399]

Upstream requirements: RS_SOMEIPSD_00025

The Service Discovery shall wait based on the INITIAL_DELAY after entering the Initial Wait Phase and before sending the first messages for the Service Instance.

[PRS_SOMEIPSD_00400]

Upstream requirements: RS_SOMEIPSD_00025

[INITIAL_DELAY shall be defined as a minimum and a maximum delay.]

[PRS SOMEIPSD 00401]

Upstream requirements: RS_SOMEIPSD_00025

The wait time shall be determined by choosing a random value between the minimum and maximum of INITIAL DELAY.

[PRS SOMEIPSD 00804]

Upstream requirements: RS_SOMEIPSD_00025

The Service Discovery shall use the same random value, if ClientService and ServerService reference the same ClientServiceTimer and ServerServiceTimer, respectively, and if it its ensured that the referencing ClientService and ServerService, respectively, are requested and released in the same point in time.

[PRS SOMEIPSD 00805]

Upstream requirements: RS SOMEIPSD 00025

The Service Discovery shall use different random values per ClientService and ServerService, if the ClientServices and ServerService referencing their own ClientServiceTimer and ServerServiceTimer, respectively. Thus, if a ClientService or ServerService enters the Initial Wait Phase, they shall use an individual calculated random value within the Initial Wait Phase.

[PRS SOMEIPSD 00404]

Upstream requirements: RS_SOMEIPSD 00025

[After sending the first message the Repetition Phase of this Service Instance/these Service Instances is entered.]

[PRS SOMEIPSD 00405]

Upstream requirements: RS SOMEIPSD 00025

The Service Discovery shall wait in the Repetitions Phase based on REPETITIONS_BASE_DELAY.

[PRS SOMEIPSD 00406]

Upstream requirements: RS_SOMEIPSD_00025

[After each message sent in the Repetition Phase the delay is doubled.]

[PRS SOMEIPSD 00407]

Upstream requirements: RS_SOMEIPSD_00025

[The Service Discovery shall send out only up to REPETITIONS_MAX entries during the Repetition Phase.]

[PRS SOMEIPSD 00408]

Upstream requirements: RS SOMEIPSD 00025

[Sending Find entries shall be stopped after receiving the corresponding Offer entries by jumping to the Main Phase in which no Find entries are sent.]

[PRS SOMEIPSD 00409]

Upstream requirements: RS_SOMEIPSD_00025

[If REPETITIONS_MAX is set to 0, the Repetition Phase shall be skipped and the Main Phase is entered for the Service Instance after the Initial Wait Phase.]

[PRS SOMEIPSD 00410]

Upstream requirements: RS_SOMEIPSD_00025

[After the Repetition Phase the Main Phase is being entered for a Service Instance.]

[PRS_SOMEIPSD_00411]

Upstream requirements: RS SOMEIPSD 00025

[After entering the Main Phase, the provider shall wait 1*CYCLIC_OFFER_DELAY before sending the first offer entry message.]

[PRS_SOMEIPSD_00412]

Upstream requirements: RS SOMEIPSD 00025

[In the Main Phase Offer Messages shall be sent cyclically if a CYCLIC_OFFER_DELAY is configured.]

[PRS SOMEIPSD 00413]

Upstream requirements: RS_SOMEIPSD_00025

[After a message for a specific Service Instance the Service Discovery waits for 1*CYCLIC_OFFER_DELAY before sending the next message for this Service Instance.]

[PRS SOMEIPSD 00415]

Upstream requirements: RS_SOMEIPSD_00025

[For Find entries (Find Service and Find Eventgroup) no cyclic messages are allowed in Main Phase.

[PRS SOMEIPSD 00582]

Upstream requirements: RS_SOMEIPSD_00025

[Subscribe EventGroup Entries shall be triggered by Offer entries, which are sent cyclically.]

[PRS_SOMEIPSD_00416]

Upstream requirements: RS SOMEIPSD 00025

[Example:

Initial Wait Phase:

- Wait for random_delay in Range(INITIAL_DELAY_MIN, _MAX)
- Send message (Find Service and Offer Service entries)

Repetition Phase (REPETITIONS BASE DELAY=100ms, REPETITIONS MAX=2):

- Wait $2^0 * 100ms$
- Send message (Find Service and Offer Service entries)
- Wait $2^1 * 100ms$
- Send message (Find Service and Offer Service entries)

Main Phase:

- Server:
 - as long message is active and CYCLIC_OFFER_DELAY is defined
 - * Wait CYCLIC_OFFER_DELAY
 - * Send message (Offer Service entries)
- Client:
 - as long as offer service messages are received, Subscribe Eventgroup message is sent

1

5.1.4.2 Server Answer Behavior

[PRS SOMEIPSD 00417]

Upstream requirements: RS_SOMEIPSD_00025

[The Service Discovery shall delay answers to entries that were received in multicast SOME/IP-SD messages using the configuration item REQUEST_RESPONSE_DELAY. This is valid for the following two cases:

- Offer entry (unicast or multicast) after received find entry (multicast)
- Subscribe entry (unicast) after received offer entry (multicast)

[PRS SOMEIPSD 00419]

Upstream requirements: RS_SOMEIPSD_00025

The REQUEST_RESPONSE_DELAY shall not apply if unicast messages are answered with unicast messages.

[PRS SOMEIPSD 00420]

Upstream requirements: RS_SOMEIPSD_00025

[REQUEST RESPONSE DELAY shall be specified by a minimum and a maximum.]

[PRS SOMEIPSD 00421]

Upstream requirements: RS SOMEIPSD 00025

[The actual delay shall be randomly chosen between minimum and maximum of RE-QUEST_RESPONSE_DELAY.]

[PRS SOMEIPSD 00422]

Upstream requirements: RS_SOMEIPSD_00025

For basic implementations all Find Service entries shall be answered with Offer Service entries transported using unicast.

[PRS SOMEIPSD 00423]

Upstream requirements: RS_SOMEIPSD_00025

[For optimization purpose the following behaviors shall be supported as option:

• Find messages received with the Unicast Flag set to 1 in main phase, shall be answered with a unicast response if the latest offer was sent less than 1/2 CYCLIC_OFFER_DELAY ago.

• Find messages received with the Unicast Flag set to 1 in main phase, shall be answered with a multicast RESPONSE if the latest offer was sent 1/2 CYCLIC_OFFER_DELAY or longer ago.

[PRS SOMEIPSD_00843]

Upstream requirements: RS_SOMEIPSD_00025

[Entries received with the unicast flag set to 0, shall not be answered with unicast but ignored.

5.1.4.3 Shutdown Behavior

[PRS SOMEIPSD 00427]

Upstream requirements: RS_SOMEIPSD_00017, RS_SOMEIPSD_00012

When a server service instance of an ECU is in the Repetition and Main Phase and is being stopped, a Stop Offer Service entry shall be sent out.

[PRS SOMEIPSD 00751]

Upstream requirements: RS SOMEIPSD 00017

When the link goes down for a server service instance in the Initial Wait Phase, Repetition Phase or Main Phase, the service discovery shall enter the Down Phase and reenter into Initial Wait Phase when the link is up again and the service is still available.

[PRS SOMEIPSD 00752]

Upstream requirements: RS SOMEIPSD 00017

[When the link goes down for a client service instance in the Initial Wait Phase, Repetition Phase or Main Phase, the service discovery shall enter the Down Phase and reenter into Initial Wait Phase when the link is up again and the service is still available..

[PRS SOMEIPSD 00428]

Upstream requirements: RS SOMEIPSD 00017

[When a server sends out a Stop Offer Service entry all subscriptions for this service instance shall be deleted on the server side.

[PRS SOMEIPSD 00429]

Upstream requirements: RS_SOMEIPSD_00017

[When a client receives a Stop Offer Service entry all subscriptions for this service instance shall be deleted on the client side.]

[PRS_SOMEIPSD_00430]

Upstream requirements: RS_SOMEIPSD_00017

[When a client receives a Stop Offer Service entry, the client shall not send out Find Service entries but wait for Offer Service entry or change of status (application, network management, Ethernet link, or similar).

[PRS_SOMEIPSD_00431]

Upstream requirements: RS_SOMEIPSD_00017

[When a client service instance of an ECU is in the Main Phase and is being stopped (i.e. the service instance is released), the SD shall send out Stop Subscribe Event-group entries for all subscribed Eventgroups.

[PRS SOMEIPSD 00432]

Upstream requirements: RS_SOMEIPSD_00017

[When the whole ECUs is being shut down Stop Offer Service entries shall be sent out for all service entries and Stop Subscribe Eventgroup entries for Eventgroups.]

5.1.4.4 State Machines

[PRS SOMEIPSD 00433]

Upstream requirements: RS_SOMEIPSD_00025

[In this section the state machines of the client and server are shown.]

[PRS SOMEIPSD 00434]

Upstream requirements: RS_SOMEIPSD_00025

[SOME/IP Service State Machine Server is described as follows:

States inside SD Server State Machine (Service) are defined as follows:

- SD Server State Machine (Service)
 - Not Ready
 - Ready
 - * Initial Wait Phase

- · Timer Set
- * Repetition Phase
 - · Timer Set
- * Main Phase
 - · Timer Set

Initial entry points of SD Server State Machine (Service) are inside the following states:

- SD Server State Machine (Service)
 - Ready
 - * Initial Wait Phase
 - * Repetition Phase
 - * Main Phase

Transitions inside SD Server State Machine (Service) are defined as follows:

FROM entry point SD Server State Machine (Service)

TO Not Ready

WITH [ifstatus!=up and configured or service-status==down]

FROM entry point SD Server State Machine (Service)

TO Not Ready

WITH [ifstatus==up_and_configured or service-status==up]

FROM Not Ready

TO Ready

Timer()
```

Note: Graphical information of the SOME/IP Service State Machine Server is shown in Figure 5.16

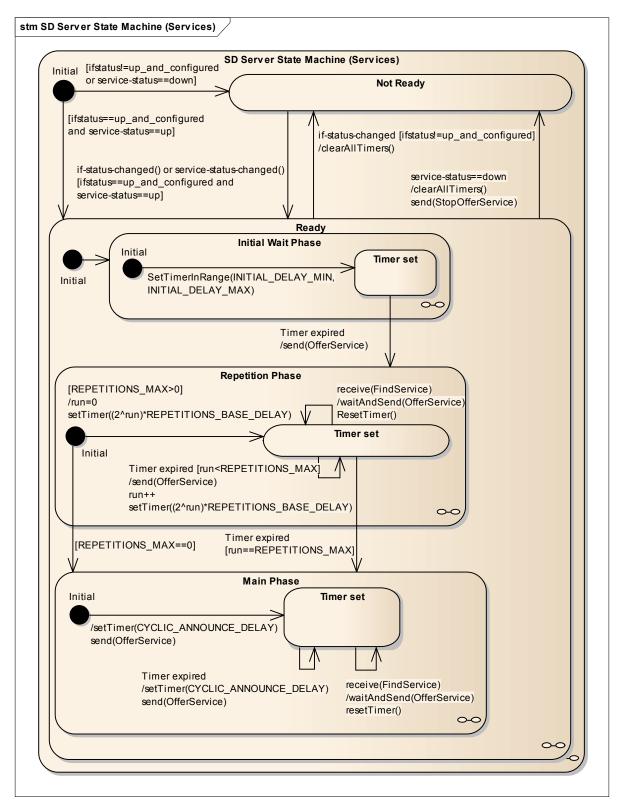

Figure 5.16: SOME/IP Service State Machine Server

[PRS SOMEIPSD 00435]

Upstream requirements: RS_SOMEIPSD_00025

[SOME/IP Service State Machine Client is described as follows:

States inside SD Client State Machine (Service) are defined as follows:

- SD Client State Machine (Service)
 - Not Requested
 - * Service Not Seen
 - * Service Seen
 - Requested_but_not_ready
 - Main
 - * Service Ready
 - * Stopped
 - Searching for Service
 - * Initial Wait Phase
 - · Timer Set
 - * Repetition Phase
 - · Timer Set

Initial entry points of SD Client State Machine (Service) are inside the following states:

- SD Client State Machine (Service)
 - Not Requested
- Searching for Service
 - Initial Wait Phase
 - Repetition Phase

Transitions inside SD Client State Machine (Service) are defined as follows:

FROM entry point SD Client State Machine (Service) TO Not Requested WITH [Service Not Requested]

FROM entry point SD Client State Machine (Service) TO Requested_but_not_ready

WITH Service Not Requested and ifstatus!=up_and_configured

FROM entry point SD Client State Machine (Service) TO Searching for Service WITH Service Requested and ifstatus==up_and_configured

Note: Graphical information of the SOME/IP Service State Machine Client is shown in Figure 5.17

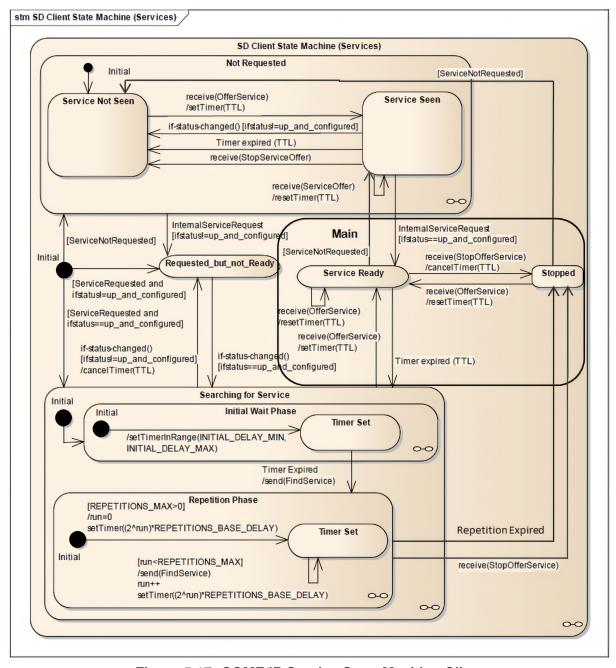

Figure 5.17: SOME/IP Service State Machine Client

Note: The most likely assumed cause for a TTL expiry while the client's state machine resides in state "Service Ready" is the temporary (duration in the order of the CYCLIC_OFFER_DELAY or smaller) failure of an intermediate link (i.e., a link along the path from client to server which, however, is not directly connected to the client ECU and thus this link failure is not perceivable via a change in the ifstatus). Thus, the specified reaction - namely transition into "Searching for Service" state (and thus into the initial wait phase) - in case of a TTL expiry is deliberately different from the specified reactions in case of received StopOfferService entries and detected server reboots, where a transition into the "Stopped" state takes place. Transiting back into the "Searching for Service" state in case of TTL expiries caused by temporary inter-

mediate link failures speeds up recovery by approx. a factor of 10 (depending on the configuration of the INITIAL_DELAY, the REQUEST_RESPONSE_DELAY, and the CYCLIC_OFFER_DELAY) through the explicit sending of FindService entries by the client which are answered by OfferService entries of the server (even if the server itself resides in the main phase).

5.1.4.5 SOME/IP-SD Mechanisms and Errors

In this section SOME/IP-SD in cases of errors (e.g. lost or corrupted packets) is discussed. This is also be understood as rationale for the mechanisms used and the configuration possible.

Soft State Protocol: SOME/IP-SD was designed as soft state protocol, that means that entries come with a lifetime and need to be refreshed to stay valid (setting the TTL to the maximum value shall turn this off).

Initial Wait Phase:

The Initial Wait Phase was introduced for two reasons: deskewing events of starting ECUs to avoid traffic bursts and allowing ECUs to collect multiple entries in SD messages.

Repetition Phase:

The Repetition Phase was introduced to allow for fast synchronization of clients and servers. If the clients startup later, it will find the server very fast. And if the server starts up later, the client can be found very fast. The Repetition Phase increases the time between two messages exponentially to avoid that overload situations keep the system from synchronization.

Main Phase:

In the Main Phase the SD tries to stabilize the state and thus decreases the rate of packets by sending no Find Services anymore and only offers in the cyclic interval (e.g. every 1s).

Request-Response-Delay:

SOME/IP-SD shall be configured to delay the answer to entries in multicast messages by the Request-Response-Delay. This is useful in large systems with many ECUs. When sending a SD message with many entries in it, a lot of answers from different ECUs arrive at the same time and put large stress on the ECU receiving all these answers.

5.1.4.6 Error Handling

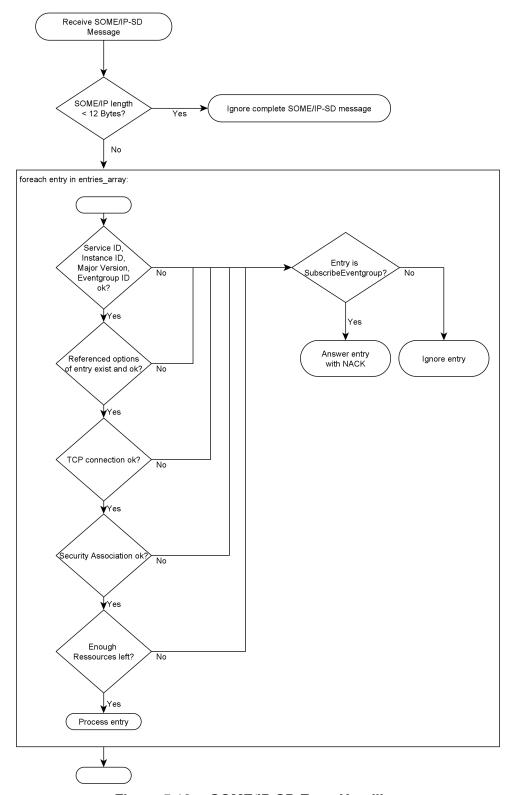

Figure 5.18: - SOME/IP-SD Error Handling

Figure 5.18 shows a simplified process for the error handling of incoming SOME/IP-SD messages.

[PRS SOMEIPSD 00125]

Upstream requirements: RS SOMEIPSD 00019

[Check that at least enough bytes for an empty SOME/IP-SD message are present, i.e the message is at least 12 Bytes long. If the check fails, the message shall be discarded without further actions.]

[PRS_SOMEIPSD_00126]

Upstream requirements: RS_SOMEIPSD_00019

[If the Service ID of a received entry is not known and not a Subscribe Eventgroup entry, the entry shall be ignored. Otherwise a Negative Acknowledgement shall be returned according to [PRS_SOMEIPSD_00393].|

[PRS SOMEIPSD 00127]

Upstream requirements: RS_SOMEIPSD_00019

[If the Instance ID of a received entry is not known and not a Subscribe Eventgroup entry, the entry shall be ignored. Otherwise a Negative Acknowledgement shall be returned according to [PRS_SOMEIPSD_00393].]

[PRS SOMEIPSD 00128]

Upstream requirements: RS_SOMEIPSD_00019

[If the Major Version of a received entry is not known and not a Subscribe Eventgroup entry, the entry shall be ignored. Otherwise a Negative Acknowledgement shall be returned according to [PRS SOMEIPSD 00393].]

[PRS SOMEIPSD 00129]

Upstream requirements: RS_SOMEIPSD_00019

[If the Eventgroup ID of a received entry is not known and not a Subscribe Eventgroup entry, the entry shall be ignored. Otherwise a Negative Acknowledgement shall be returned according to [PRS_SOMEIPSD_00393]. This is only applicable to eventgroup entries.

[PRS_SOMEIPSD_00803]

Upstream requirements: RS_SOMEIPSD_00019

[If the length of the Entries Array has an invalid size (i.e. the entries array would exceed the message size), the message shall be discarded without further actions.]

[PRS SOMEIPSD 00130]

Upstream requirements: RS_SOMEIPSD_00019

Check the referenced Options of each received entry:

- The referenced options exist.
- The entry references all required options (e.g. a provided eventgroup that uses unicast requires a unicast endpoint option in a received Subscribe Eventgroup entry).
- The entry only references supported options (e.g. a required eventgroup that does not support multicast data reception does not support multicast endpoint options in a Subscribe Eventgroup ACK entry).
- There are no conflicts between the options referenced by an entry (i.e. two options of same type with contradicting content).
- The Type of the referenced Option is known or the discardable flag is set to 1.
- The Type of the referenced Option is allowed for the entry [PRS SOMEIPSD 00583] or discardable flag is set to 1.
- The Length of the referenced Option is consistent to the Type of the Option.
- An Endpoint Option has a valid L4-Protocol field.
- The Option is valid (e.g. a multicast endpoint option shall use a multicast IP address).

Note:

If an entry references an option that is known by the Service Discovery implementation but not required by the service (e.g. an Offer references a TCP and UDP option and the client uses only UDP, or a Subscribe Eventgroup entry references a UDP endpoint option but the server uses only multicast event transmission), the entry shall be processed.

[PRS SOMEIPSD 00131]

Upstream requirements: RS_SOMEIPSD_00019

[Check if the TCP connection is already present (only applicable, if TCP is configured for Eventgroup and Subscribe Eventgroup entry was received) |

[PRS SOMEIPSD_00852]

Upstream requirements: RS_SOMEIPSD_00019

[Check if a security association is already established.]

[PRS_SOMEIPSD_00132]

Upstream requirements: RS_SOMEIPSD_00019

[Check if enough resources are left (e.g. Socket Connections)]

[PRS SOMEIPSD 00232]

Upstream requirements: RS_SOMEIPSD_00019

Γ

If the checks in [PRS_SOMEIPSD_00130] fail for a received Find entry, the entry shall be ignored, except when Endpoint or Multicast Options are referenced, in which case only the Options shall be ignored according to [PRS_SOMEIPSD_00529].

[PRS SOMEIPSD 00233]

Upstream requirements: RS_SOMEIPSD_00019

[If the checks in [PRS_SOMEIPSD_00130] fail for a received Offer entry, the entry shall be ignored.

[PRS SOMEIPSD 00234]

Upstream requirements: RS SOMEIPSD 00019

[PRS_SOMEIPSD_00130], [PRS_SOMEIPSD_00131], [PRS_SOMEIPSD_00832], [PRS_SOMEIPSD_00852] or [PRS_SOMEIPSD_00132] fail for a received Subscribe Eventgroup entry, a Subscribe Eventgroup NACK entry shall be sent.

[PRS SOMEIPSD 00235]

Upstream requirements: RS_SOMEIPSD_00019

[If the checks in [PRS_SOMEIPSD_00130] or [PRS_SOMEIPSD_00132] fail for a received Subscribe Eventgroup ACK entry, the entry shall be processed, but the subscription shall not be considered as successful.]

[PRS SOMEIPSD 00231]

Upstream requirements: RS_SOMEIPSD_00019

Options that are referenced by an entry shall be ignored if:

- The Option Type is not known (i.e. not yet specified, or not supported by the receiver) and the discardable flag is set to 1.
- The option is redundant (i.e. another option of the same type and same content is referenced by this entry).

• The option is not required (e.g. a provided eventgroup that uses only multicast does not require a unicast endpoint option in a received Subscribe Eventgroup entry, though it is still allowed).

[PRS SOMEIPSD 00844]

Upstream requirements: RS_SOMEIPSD_00019

[If the two Configuration Options have conflicting items (same name), all items shall be handled. There shall be no attempt been made to merge duplicate items.

[PRS_SOMEIPSD_00832]

Upstream requirements: RS SOMEIPSD 00019

[Check for a provided service instance which requires a secure connection if on reception of a subscribe the security association for the corresponding connection is already established.]

5.1.5 Non-SOME/IP protocols with SOME/IP-SD

Besides SOME/IP other communication protocols are used within the vehicle; e.g., for Network Management, Diagnostics, or Flash Updates. Such communication protocols might need to communicate a service instance or have eventgroups as well.

[PRS SOMEIPSD 00437]

Upstream requirements: RS SOMEIPSD 00004

[For Non-SOME/IP protocols (the application protocol itself doesn't use SOME/IP but it is published over SOME/IP SD) a special Service-ID shall be used and further information shall be added using the configuration option:

- Service-ID shall be set to 0xFFFE (reserved)
- Instance-ID shall be used as described for SOME/IP services and eventgroups.
- The Configuration Option shall be added and shall contain exactly one entry with key "otherserv" and a configurable non-empty value that is determined by the system department.

1

[PRS SOMEIPSD 00438]

Upstream requirements: RS_SOMEIPSD_00004

[SOME/IP services shall not use the otherserv-string in the Configuration Option.]

[PRS_SOMEIPSD_00439]

Upstream requirements: RS_SOMEIPSD_00004

[For Find Service/Offer Service/Request Service entries the otherserv-String shall be used when announcing non-SOME/IP service instances.]

[PRS SOMEIPSD 00440]

Upstream requirements: RS_SOMEIPSD_00004

Γ

Example for valid otherserv-string: "otherserv=internaldiag".

Example for an invalid otherserv-string: "otherserv". Example for an invalid otherserv-string: "otherserv=".|

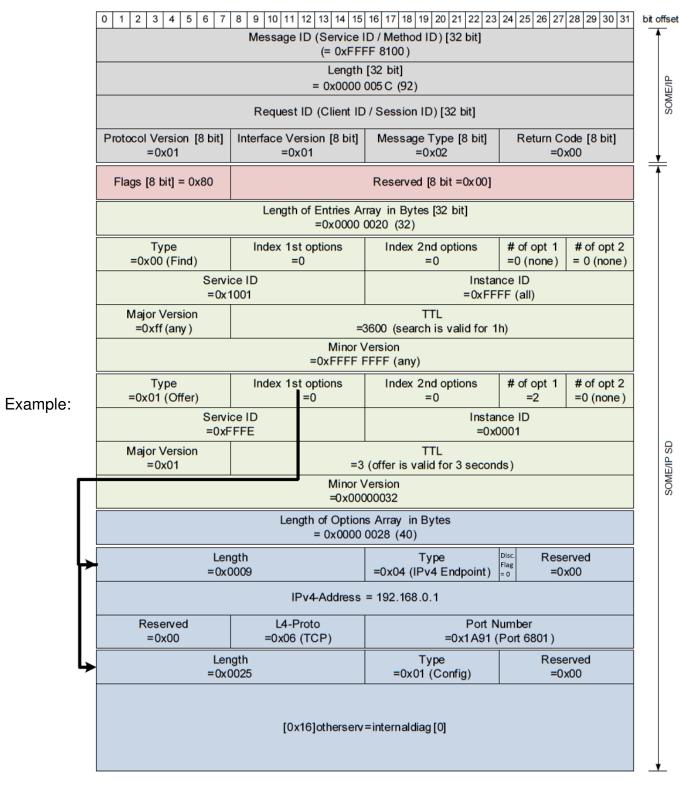

Figure 5.19: SOME/IP-SD Example PDU for Non-SOME/IP-SD

5.1.6 Publish/Subscribe with SOME/IP and SOME/IP-SD

Note: In contrast to the SOME/IP request/response mechanism there may be cases in which a client requires a set of parameters from a server, but does not want to request that information each time it is required. These are called notifications and concern events and fields.

[PRS SOMEIPSD 00443]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00014, RS_SOMEIPSD_00015, RS_SOMEIPSD_00016

[All clients needing events and/or notification events shall register using the SOME/IP-SD at run-time with a server.]

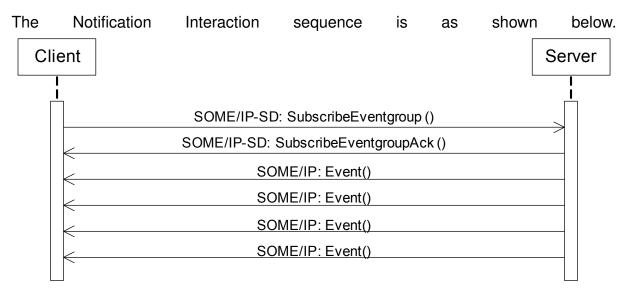

Figure 5.20: Notification interaction

This feature is comparable but NOT identical to the MOST notification mechanism.

[PRS SOMEIPSD 00446]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00014, RS_SOMEIPSD_00015, RS_SOMEIPSD_00016

[With the SOME/IP-SD entry Offer Service the server offers to push notifications to clients; thus, it shall be used as trigger for Subscriptions.]

[PRS SOMEIPSD 00449]

Upstream requirements: RS SOMEIPSD 00015

[Each client shall respond to a SOME/IP-SD Offer Service entry from the server with a SOME/IP-SD Subscribe Eventgroup entry as long as the client is still interested in receiving the notifications/events of this eventgroup. If the client is able to reliably detect the reboot of the server using the SOME/IP-SD messages reboot flag, the client shall

handle the reboot as if a StopOffer entry was received and proceed with the received entries after all actions upon a StopOffer have been finalized.

[PRS SOMEIPSD 00862] Client based distinction between field notifiers and pure events

Upstream requirements: RS_SOMEIPSD_00015

The distinction between field notifiers and pure events shall be taken based on the configuration of the client.

Reasons for the client to explicitly request initial values for field notifiers (see [PRS SOMEIPSD 00463]) include but are not limited to:

- The client is currently not subscribed to the Eventgroup.
- The client has seen a link-down/link-up after the last Subscribe Eventgroup entry.
- The client has not received a Subscribe Eventgroup Ack after the last regular Subscribe Eventgroup
- The client has detected a Reboot of the Server of this Services

[PRS SOMEIPSD 00570]

Upstream requirements: RS SOMEIPSD 00015

[If the client subscribes to two or more eventgroups including one or more identical events or field notifiers, the server shall not send duplicated events or field notifiers. This applies to the sending of regular events and regular field notifiers. This does not apply to the sending of initial values for field notifiers (see [PRS SOMEIPSD 00571]).

[PRS SOMEIPSD 00450]

Upstream requirements: RS SOMEIPSD 00015

[Publish/Subscribe with link loss at client side is described as follows:

1. No prior registrations + Client subscribes

(a) Server: OfferService()

(b) Client: SubscribeEventgroup[Session ID=x, Reboot=0]

(c) Server: updateRegistration()

(d) Server: SubscribeEventgroupAck + Events()

2. Link loss at client side

(a) Client: linkDown()

(b) Client: deleteEntries()

(c) Client: linkUp()

3. Client subscribes again, Client Reboot detected

(a) Server: OfferService()

(b) Client: SubscribeEventgroup[Session ID=1, Reboot=1]

(c) Server: updateRegistration()

(d) Server SubscribeEventgroupAck + Events()

Note: Description is also shown in Figure 5.21.

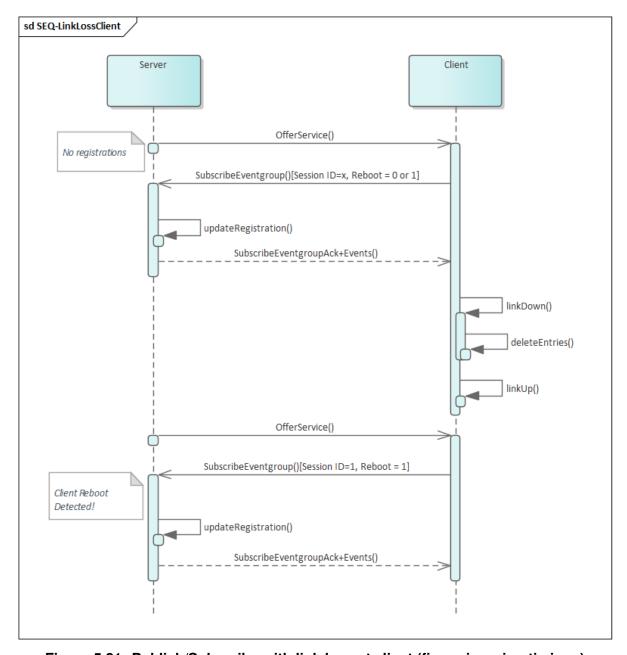

Figure 5.21: Publish/Subscribe with link loss at client (figure ignoring timings)

Note: The server sending Offer Service entries as implicit Publishes has to keep state of Subscribe Eventgroup messages for this eventgroup instance in order to know if notifications/events have to be sent.

[PRS SOMEIPSD 00452]

Upstream requirements: RS_SOMEIPSD_00017, RS_SOMEIPSD_00020

[A client shall deregister from a server by sending a SOME/IP-SD Subscribe Eventgroup message with TTL=0 (Stop Subscribe Eventgroup see [PRS SOMEIPSD 00389]).|

[PRS SOMEIPSD 00453]

Γ

Upstream requirements: RS SOMEIPSD 00015, RS SOMEIPSD 00017

Publish/Subscribe Registration/Deregistration behavior is described as follows:

1. Client 1 subscribes

- (a) Server: OfferService() to Client 1 and Client 2
- (b) Client 1: SubscribeEventgroup()
- (c) Server: updateRegistration()
- (d) Server: SubscribeEventgroupAck + Events() to Client 1

2. Client 2 subscribes

- (a) Client 2: SubscribeEventgroup()
- (b) Server: updateRegistration()
- (c) Server: SubscribeEventgroupAck + Events() to Client 2

3. Client 2 stops subscription

- (a) Client 2: StopSubscribeEventgroup()
- (b) Server: updateRegistration()

4. Client 1 remains registered

Note: Description is also shown in Figure 5.22.

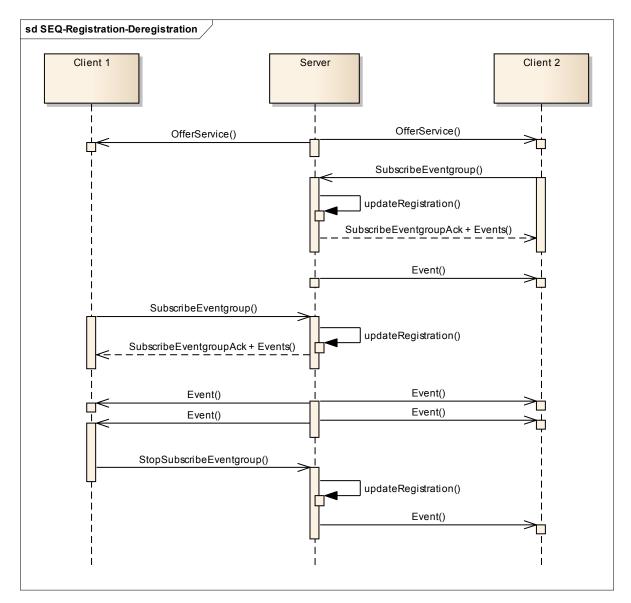

Figure 5.22: Publish/Subscribe Registration/Deregistration behavior (figure ignoring timings)

[PRS SOMEIPSD 00454]

Upstream requirements: RS_SOMEIPSD_00017, RS_SOMEIPSD_00019

[The SOME/IP-SD on the server shall delete the subscription, if a relevant SOME/IP error occurs after sending an event or notification event.]

The error includes but is not limited to not being able to reach the communication partner and errors of the TCP connection.

[PRS_SOMEIPSD_00457]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00015

Γ

Publish/Subscribe with link loss at server is described as follows:

1. No prior registrations + Client subscribes

- (a) Server: OfferService()
- (b) Client: SubscribeEventgroup()
- (c) Server: updateRegistration()
- (d) Server: SubscribeEventgroupAck + Events()

2. Link loss at server side

- (a) Server: linkDown()
- (b) Server: deleteRegistrations()
- (c) Server: linkUp()

3. Server offers again, Server Reboot detected by client

- (a) Server: OfferService()[Session ID=1, Reboot=1]
- (b) Client: SubscribeEventgroup()
- (c) Server: updateRegistration()
- (d) Server SubscribeEventgroupAck + Events()

١

Note: Description is also shown in Figure 5.23

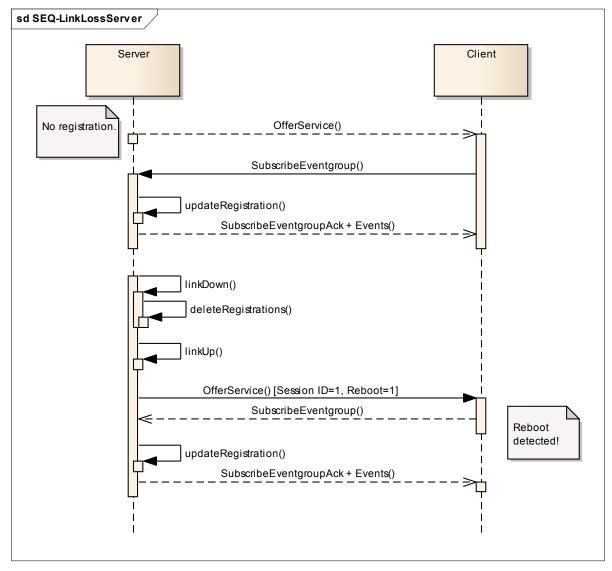

Figure 5.23: Publish/Subscribe with link loss at server (figure ignoring timings)

[PRS SOMEIPSD 00461]

Upstream requirements: RS_SOMEIPSD_00015

[The client shall open a TCP connection to the server before sending the Subscribe Eventgroup entry if the Service is offered over TCP and the client requests an Eventgroup over TCP according to the configuration.]

[PRS SOMEIPSD 00830]

Upstream requirements: RS_SOMEIPSD_00015

[A client which wants to subscribe to an eventgroup of a service which demands a security association shall start (if not already started) to establish the security and wait until the security association is established. The client shall send a SubscribeEventgroup entry for an eventgroup of this service after the security association is established.]

Note: For security associations which demand that only one participant is allowed to start establishing the security association (like TLS/DTLS), each ECU shall use different endpoints for server services and client service to ensure that the ECU is acting for each secured connection either as a client (which shall start establishing the security association) or as a server.

[PRS_SOMEIPSD_00462]

Upstream requirements: RS SOMEIPSD 00015

[After a client has sent a Subscribe Eventgroup entry the server shall send a Subscribe Eventgroup Ack entry.]

[PRS SOMEIPSD 00463]

Upstream requirements: RS_SOMEIPSD_00015

The client shall wait for the Subscribe Eventgroup Ack entry acknowledging a Subscribe Eventgroup entry. If this Subscribe Eventgroup Ack entry does not arrive before the next Subscribe Eventgroup entry is sent, the client shall do the following:

 Send a Stop Subscribe Eventgroup entry and a Subscribe Eventgroup entry in the same SOME/IP-SD message the Subscribe Eventgroup entry would have been sent with

Note:

This behavior exists to cope with short durations of communication loss, so new Initial Events are triggered to lower the effects of the loss of messages.

[PRS SOMEIPSD 00577]

Upstream requirements: RS_SOMEIPSD_00015

[The requirement [PRS_SOMEIPSD_00463] shall not be applied to Offer Service entries that are a reaction to Find Service entries. This means that the Subscribe Eventgroup Ack entry of a Subscribe Eventgroup entry that was triggered by a unicast Offer Service entry is not monitored as well as upon a unicast Offer Service entry the Stop Subscribe Eventgroup entry/Subscribe Eventgroup entry is not sent.]

Rationale:

If a client sends a Subscribe Eventgroup entry as a reaction to a unicast offer, and a multicast offer arrives immediately after that but before the the Subscribe Eventgroup Ack entry could be sent by the server and received, the client shall not complain (i.e. Stop Subscribe/Subscribe) about a not yet received acknowledgement.

Note:

This behavior exists to cope with short durations of communication loss. The receiver of a Stop Subscribe Eventgroup and Subscribe Eventgroup combination would send

out initial values for field notifiers to lower the effects of the loss of messages (see [PRS_SOMEIPSD_00122]).

[PRS SOMEIPSD 00464]

Upstream requirements: RS SOMEIPSD 00015

[The server shall send the first notifications/events (i.e. initial values) according to [PRS SOMEIPSD 00120] immediately after sending the Subscribe Eventgroup Ack.

[PRS SOMEIPSD 00465]

Upstream requirements: RS_SOMEIPSD_00015

The server shall not send initial values of events (i.e., pure events and not fields) upon subscriptions.

[PRS SOMEIPSD 00120]

Upstream requirements: RS SOMEIPSD 00015

The server shall send initial values of field notifiers (i.e., fields and not pure events) upon subscriptions.

[PRS_SOMEIPSD_00861] Server based distinction between field notifiers and pure events

Upstream requirements: RS_SOMEIPSD_00015

The distinction between field notifiers and pure events shall be taken based on the configuration of the server.

[PRS SOMEIPSD 00121]

Upstream requirements: RS_SOMEIPSD_00015

[If a subscription was already valid and is updated by a Subscribe Eventgroup entry, no initial values shall be sent.]

Note: [PRS_SOMEIPSD_00465], [PRS_SOMEIPSD_00120], and [PRS_SOMEIPSD_00861] imply that even if a client explicitly requests the sending of initial values and thus the trigger on the server side according to [PRS_SOMEIPSD_00122] is fullfilled, no initial values shall be sent by the server for members of the Eventgroup which (according to the server's own configuration) are pure events (and not fields).

[PRS_SOMEIPSD_00122]

Upstream requirements: RS_SOMEIPSD_00015

[The reception of a Stop Subscribe Eventgroup entry and a Subscribe Eventgroup entry in the same SOME/IP-SD message shall trigger the server to send initial values of field notifiers.]

[PRS SOMEIPSD 00466]

Upstream requirements: RS_SOMEIPSD_00015, RS_SOMEIPSD_00016

[Publish/Subscribe States (server behavior for unicast eventgroups) are defined as follows:

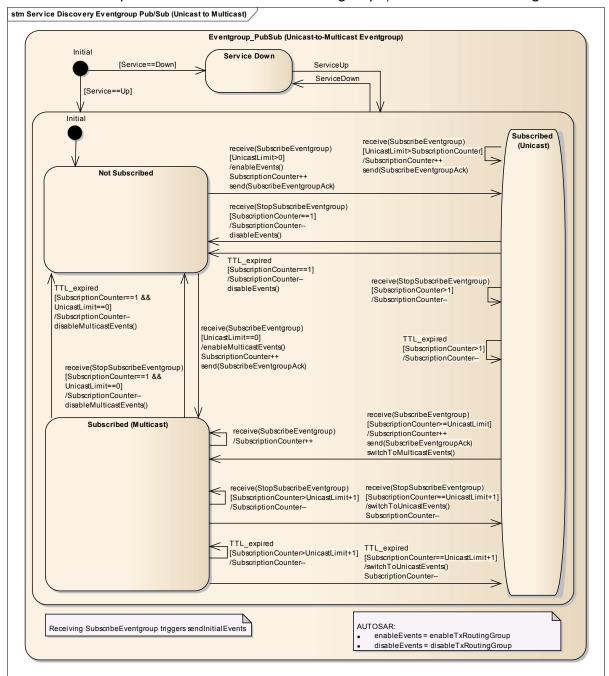

Figure 5.26: Publish/Subscribe State Diagram (server behavior for adaptive unicast/multicast eventgroups)

[PRS_SOMEIPSD_00134] Unicast/Multicast switching for event and notification event transmission via UDP

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00016

[For events and notification events which are configured to be transmitted via UDP (see [PRS_SOMEIPSD_00802]) SOME/IP-SD shall support automated switching from unicast to multicast communication if a configured threshold of the numbers of subscribers was reached.]

Note:

Limiting the switching between unicast and multicast to UDP is motivated by the following rationale:

- the use of TCP is limited to unicast communication
- dynamically switching between TCP and UDP does not make sense from a semantic perspective since the choice for either TCP or UDP is motivated by requirements for
 - reliability (no message loss, no out-of-order delivery)
 - transmission of data which is larger than the MTU (when neither SOME/IP-TP or IP fragmentation is used)

[PRS SOMEIPSD 00470]

Upstream requirements: RS SOMEIPSD 00025, RS SOMEIPSD 00015

[SOME/IP SD Protocol shall support implicit configuration of communication endpoints and registrations of subscribers. These shall be based on static configurations and not use any SD messages on the network.]

Note:

Depending on the project the use case can exist to use services based on a static configuration where no Service Discovery takes place on the network at all. In such cases of implicit registrations, there are no find or subscribe messages exchanged but the services can be used out of the box. Such preconfigurations are not part of SOME/IP or SOME/IP SD. Hence, their configuration and implementation is project specific.

[PRS SOMEIPSD 00472]

Upstream requirements: RS_SOMEIPSD_00015

The following entries shall be transported by unicast only:

- Subscribe Eventgroup
- Stop Subscribe Eventgroup
- Subscribe Eventgroup Ack

Subscribe Eventgroup Nack

If an entry of any of these types is received in a multicast SD message, this entry shall be ignored.

[PRS SOMEIPSD 00808]

Upstream requirements: RS_SOMEIPSD_00015

[The client shall retry to subscribe to a Eventgroup of a ServerService, if the SUB-SCRIBE_RETRY_MAX is configured greater than 0. The subscription to the Eventgroup shall be sent, if a SubscribeEventgroupAck/Nack entry of the requested Eventgroup was not received within a configurable timeout (SUBSCRIBE_RETRY_DELAY). The retry shall be done as long as the Eventgroup is requested and the configured retry count (SUBSCRIBE_RETRY_MAX) was not exceeded.

[PRS_SOMEIPSD_00809]

Upstream requirements: RS SOMEIPSD 00015

[ServerService where the TTL of the received OfferService is set to 0xFFFFFF, could set <code>SUBSCRIBE_RETRY_MAX</code> to INF. In this case, the retry shall be done as long as the Eventgroup is requested and no <code>SubscribeEventgroupAck/NAck</code> entry of the requested Eventgroup was received.]

[PRS SOMEIPSD 00851]

Upstream requirements: RS_SOMEIPSD_00015

The automated switching from client service unicast/multicast endpoint to server multicast endpoint has to consider configuration of MULTICAST_THRESHOLD:

- if MULTICAST_THRESHOLD is configured to a value n with n=0, then automated switching between client service unicast/multicast endpoints and the server multicast endpoint is disabled. Only unicast/multicast communication to client service unicast/multicast endpoints is supported.
- if MULTICAST_THRESHOLD is configured to a value n with n=1, then automated switching between client service unicast/multicast endpoints and the server multicast endpoint is disabled. Only multicast communication to the server multicast endpoint is supported.
- if MULTICAST_THRESHOLD is configured to a value n with n > 1 and the number of subscribed clients with different endpoint information is larger than the threshold or equal to the threshold, then server service shall use the server multicast endpoint to transmit the events.
- if MULTICAST_THRESHOLD is configured to a value n with n > 1 and the number of subscribed clients with different endpoint information is smaller than the threshold, then the server service shall transmit the events to the endpoints which

were provided by the client services either as client unicast endpoint or as client service multicast endpoint.

1

5.1.7 Reserved and special identifiers for SOME/IP and SOME/IP-SD.

In this chapter an overview of reserved and special identifiers are shown.

[PRS_SOMEIPSD_00515] Reserved and Special Service-IDs

Upstream requirements: RS SOMEIPSD 00025

Γ

Service-ID	Description	
0x0000	Reserved	
0xFF00 - 0xFF1F	Reserved for Testing at OEM	
0xFF20 - 0xFF3F	Reserved for Testing at Tier-1	
0xFF40 - 0xFF5F	Reserved for ECU Internal Communication (Tier-1 proprietary)	
0xFFFE	Reserved for non-SOME/IP service instances.	
0xFFFF	SOME/IP and SOME/IP-SD special service (Magic Cookie, SOME/IP-	
	SD,).	

[PRS SOMEIPSD 00516] Reserved and Special Instance-IDs

Upstream requirements: RS_SOMEIPSD_00025

Γ

Instance-ID	Description
0x0000	Reserved
0xFFFF	All Instances

[PRS_SOMEIPSD_00517] Reserved and Special Method-IDs

Upstream requirements: RS_SOMEIPSD_00025

Γ

Method-ID	Description
0x0000	Reserved
0x7FFF	Reserved
0x8000	Reserved
0xFFFF	Reserved

1

[PRS_SOMEIPSD_00531] Reserved Eventgroup-IDs

Upstream requirements: RS_SOMEIPSD_00025

Γ

Eventgroup-ID	Description
0x0000	Reserved
0xFFFF	All Eventgroups

[PRS_SOMEIPSD_00519] Method-IDs of Service 0xFFFF

Upstream requirements: RS_SOMEIPSD_00025

Γ

Method-ID/Event-	Description
ID	
0x0000	SOME/IP Magic Cookie Messages
0x8000	SOME/IP Magic Cookie Messages
0x8100	SOME/IP-SD messages (events)

١

[PRS_SOMEIPSD_00520] Reserved Names

Upstream requirements: RS_SOMEIPSD_00025

Γ

Name	Description
hostname	Used to name a host or ECU.
instancename	Used to name an instance of a service.
servicename	Used to name a service.
otherserv	Used for non-SOME/IP Services.

Configuration Parameters

The Following chapter summarizes all the configuration parameters that are used.

Name	Description	
INITIAL_DELAY_MIN	Minimum duration to delay randomly the transmission of	
	a message.	
INITIAL_DELAY_MAX	Maximum duration to delay randomly the transmission of	
	a message.	
REPETITIONS_BASE_DELAY	Duration of delay for repetitions.	
REPETITIONS_MAX	Configuration for the maximum number of repetitions.	
REQUEST_RESPONSE_DELAY	The Service Discovery shall delay answers using this	
	configuration item.	
CYCLIC_OFFER_DELAY	Interval between cyclic offers in the main phase.	
SD_PORT	is a UDP Port for SD Messages (30490 as default).	
SD_MULTICAST_IP	address which shall be used by the SD multicast mes-	
	sages.	
SUBSCRIBE_RETRY_MAX	Max count of retries for subscribe, as long as the Event-	
	group is requested (0=no retry, INF= retry forever (as	
	long as the Eventgroup is requested and no no Sub-	
	scribeEventgroupAck/Nack entry was received)).	
SUBSCRIBE_RETRY_DELAY	Duration of delay to send a consecutive subscribe	
	entries, if a Eventgroup is requested and no Sub-	
	scribeEventgroupAck/Nack entry was received.	
MULTICAST_THRESHOLD	Specifies the number of subscribed clients with different endpoint information per Eventgroup that triggers the server to change the transmission of events to the server multicast endpoint. This multicast endpoint is configured by the server service and provided with the SubscribeEventgroupAck:	
	 If configured to 0 only the client service unicast/- multicast endpoint will be used. 	
	 If configured to 1 the first client and all further sub- scribed clients will be served via the server multi- cast endpoint. 	
	 If configured to n up to n-1 clients with different endpoint information will be served via a client service unicast/multicast endpoint provided by the client within the SubscribeEventgroup. As soon as the number of subscribed clients with differ- ent endpoint information reaches n, then all sub- scribed clients are served via the server multicast endpoint. 	

Table 6.1: Configuration Parameters

7 Protocol Usage

7.1 Mandatory Feature Set and Basic Behavior

In this section the mandatory feature set of the Service Discovery and the relevant configuration constraints are discussed. This allow for bare minimum implementations without optional or informational features that might not be required for current use cases.

The following information is defined as compliance check list(s). If a feature is not implemented, the implementation is considered not to comply to SOME/IP-SDs basic feature set.

[PRS SOMEIPSD 00496]

Upstream requirements: RS_SOMEIPSD_00008, RS_SOMEIPSD_00013, RS_SOMEIPSD_00014, RS_SOMEIPSD_00015, RS_SOMEIPSD_00017, RS_SOMEIPSD_00007

The following entry types shall be implemented:

- Find Service
- Offer Service
- Stop Offer Service
- Subscribe Eventgroup
- Stop Subscribe Eventgroup
- Subscribe Eventgroup Ack
- Subscribe Eventgroup Nack

[PRS SOMEIPSD 00497]

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00007

The following option types shall be implemented, when IPv4 is required:

- IPv4 Endpoint Option
- IPv4 Multicast Option
- Configuration Option
- IPv4 SD Endpoint Option (receiving at least)

١

[PRS SOMEIPSD 00498]

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00007

The following option types shall be implemented, if IPv6 is required:

- IPv6 Endpoint Option
- IPv6 Multicast Option
- Configuration Option
- IPv6 SD Endpoint Option (receiving at least)

[PRS SOMEIPSD 00500]

Upstream requirements: RS_SOMEIPSD_00013, RS_SOMEIPSD_00008, RS_SOMEIPSD_00014, RS_SOMEIPSD_00015, RS_SOMEIPSD_00017, RS_SOMEIPSD_00025, RS_SOMEIPSD_00007

The following behaviors/reactions shall be implemented on the Server side:

- The Server shall offer services including the Initial Wait Phase, the Repetition Phase, and the Main Phase depending on the configuration.
- The Server shall offer services using Multicast (Repetition Phase and Main Phase) on the multicast address defined by SD MULTICAST IP.
- The Server shall answer a Find Service in the Main Phase with an Offer Service using Unicast.
- The Server shall send a Stop Offer Service when shutting down.
- The Server shall receive a Subscribe Eventgroup as well as a Stop Subscribe Eventgroup and react according to this specification.
- The Server shall send a Subscribe Eventgroup Ack and Subscribe Eventgroup Nack using unicast.
- The Server shall support controlling the sending (i.e. fan out) of SOME/IP event messages based on the subscriptions of SOME/IP-SD. This might include sending events based on Multicast.
- The Server shall support the triggering of SOME/IP Initial Events.

[PRS SOMEIPSD 00501]

Upstream requirements: RS_SOMEIPSD_00008, RS_SOMEIPSD_00015, RS_SOMEIPSD_00025, RS_SOMEIPSD_00007

The following behaviors/reactions shall be implemented on the Client side:

- The Client shall find services using a Find Service entry and Multicast (on the multicast address defined by SD_MULTICAST_IP) only in the repetition phase.
- The Client shall stop finding a service if the regular Offer Service arrives.
- The Client shall react to the Servers Offer Service with a unicast SD message that includes all Subscribe Eventgroups of the offered Service Instances that the clients currently requires.
- The Client shall interpret and react to the Subscribe Eventgroup Ack and Subscribe Eventgroup Nack as specified in this document.

[PRS SOMEIPSD 00502]

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00020, RS_SOMEIPSD_00027 RS_SOMEIPSD_00007

The following behavior and configuration constraints shall be supported by the Client:

- The Client shall be able handle Eventgroups if only the TTL of the SD Timings is specified. This means that of all the timings for the Initial Wait Phase, the Repetition Phase, and the Main Phase only TTL is configured. This means the client shall only react on the Offer Service by the Server.
- The Client shall answer to an Offer Service with a Subscribe Eventgroup even without configuration of the Request-Response-Delay, meaning it should not wait but answer instantaneously.

[PRS_SOMEIPSD_00503]

Upstream requirements: RS_SOMEIPSD_00018, RS_SOMEIPSD_00007

The Client and Server shall implement the Reboot Detection as specified in this document and react accordingly. This includes but is not limited to:

- Setting Session ID and Reboot Flag according to this specification.
- Keeping a Session ID counter only used for sending Multicast SD messages.
- Keeping Session ID counters for every Unicast relation for sending Unicast SD messages.
- Understanding Session ID and Reboot Flag according to this specification.
- Keeping a Multicast Session ID counter per ECU that exchanges Multicast SD messages with this ECU.
- Keeping a Unicast Session ID counter per ECU that exchanges Unicast SD messages with this ECU.
- Detecting reboot based on this specification and reaction accordingly.

• Correctly interpreting the IPv4 and IPv6 SD Endpoint Options in regard to Reboot Detection.

[PRS SOMEIPSD 00504]

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00013, RS_SOMEIPSD_00015, RS_SOMEIPSD_00007

The Client and Server shall implement the "Endpoint Handling for Service and Events". This includes but is not limited to:

- Adding 1 Endpoint Option UDP to an Offer Service if UDP is needed.
- Adding 1 Endpoint Option TCP to an Offer Service if TCP is needed.
- Adding 1 Endpoint Option UDP to Subscribe Eventgroup if events over UDP are required.
- Adding 1 Endpoint Option TCP to Subscribe Eventgroup if events over TCP are required.
- Adding 1 Multicast Option UDP to Subscribe Eventgroup Ack if multicast events are required.
- Understanding and acting according to the Endpoint and Multicast Options transported as described above.
- Overwriting preconfigured values (e.g. IP Addresses and Ports) with the information of these Endpoint and Multicast Options.
- Interpreting incoming IPv4 and IPv6 Endpoint Options as SD endpoints instead of the Address and Port number in the outer layers.

[PRS SOMEIPSD 00821]

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00013, RS_SOMEIPSD_00015, RS_SOMEIPSD_00007

[The Client and Server shall implement the explicit requesting of initial values for field notifiers.]

7.2 Migration and Compatibility

7.2.1 Supporting multiple versions of the same service.

In order to support migrations scenarios ECUs shall support serving as well as using different incompatible versions of the same service.

[PRS SOMEIPSD 00512]

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00008, RS_SOMEIPSD_00013, RS_SOMEIPSD_00015, RS_SOMEIPSD_00005

[In order to support a Service with more than one version the following is required:

- The server shall offer the service instance of this service once per major version.
- The client shall find the service instances once per supported major version or shall use the Major Version as 0xFF (all versions).
- The client shall subscribe to events of the service version it needs.
- All SOME/IP-SD entries shall use the same Service-IDs and Instance-IDs but different Major Versions.
- The server has to demultiplex messages based on the socket they arrive, Message-ID, Major Versions and relay it based on these conditions internally to the correct receiver.

1

[PRS_SOMEIPSD_00806]

Upstream requirements: RS_SOMEIPSD_00025, RS_SOMEIPSD_00008, RS_SOMEIPSD_00013, RS_SOMEIPSD_00015, RS_SOMEIPSD_00005

[In one VLAN there shall be at most one service instance with the same Service ID, Major Version, and Instance ID. This applies to the servers and to the clients.]

Note: Offering more than one Service Instance with the same Major Version but different Minor Versions is not supported.
