1 Document Information and Content

This auxiliary document provides a collection of constraints for AUTOSAR models. All constraints are copied from template specification from the AUTOSAR Adaptive Platform, so this document does not introduce any new constraints.

A list of the documents that the constraints originate from can be found in the table of contents. Chapter 2 contains the collected constraints, grouped by source documents. All constraints from the same source document are contained within a single section.

2 Autosar Model Constraints

2.1 AP_TPS_MachineConfiguration

[constr_9322] `ApmcFunctionalClusterDef` category restriction
 Status: DRAFT
 Imposition time: `IT_CfgFc`

⌈The following values for the attribute `category` of `ApmcFunctionalClusterDef` are reserved by the AUTOSAR Standard:

- STANDARDIZED_CLUSTER_DEFINITION

- VENDOR_SPECIFIC_CLUSTER_DEFINITION

⌋

[constr_10579] Existence of `definition`
 Status: DRAFT
 Imposition time: `IT_CfgFc`

⌈In the context of an `ApmcAbstractValue`, the reference in the role `definition` shall exist.

⌋

[constr_10580] Restriction regarding the value of `ApmcDefinitionElement.lowerMultiplicity` vs. `ApmcDefinitionElement.lowerMultiplicity`
 Status: DRAFT
 Imposition time: `IT_CfgFc`

⌈In the context of any given `ApmcDefinitionElement`, if attribute `upperMultiplicity` exists, then its value shall be greater or equal to the value of the attribute `lowerMultiplicity` in the same context.

⌋

[constr_10581] Existence of reference in the role `ApmcFunctionalClusterValue.definition`
 Status: DRAFT
 Imposition time: `IT_CfgFc`

⌈For each `ApmcFunctionalClusterValue`, the reference in the role `definition` shall exist.

⌋

[constr_10582] Existence of reference in the role `ApmcContainerValue.definition`

    Status: DRAFT

    Imposition time: `IT_CfgFc`

⌈For each `ApmcContainerValue`, the reference in the role `definition` shall exist.

⌋

[constr_10583] Existence of reference in the role `ApmcContainerElementValue.definition`

    Status: DRAFT

    Imposition time: `IT_CfgFc`

⌈For each `ApmcContainerElementValue`, the reference in the role `definition` shall exist.

⌋

[constr_10584] Allowed `value` for a `ApmcNumericalParamValue` that implements an boolean-style parameter

    Status: DRAFT

    Imposition time: `IT_CfgFc`

⌈For any `ApmcNumericalParamValue` that refers to an `ApmcBooleanParamDef` in the role `definition`, the content of the `ApmcNumericalParamValue.value` shall only be either 0 or 1.

⌋

[constr_10585] Allowed `value` for a `ApmcTextualParamValue` that implements an enumeration-style parameter

    Status: DRAFT

    Imposition time: `IT_CfgFc`

⌈For any `ApmcTextualParamValue` that refers to an `ApmcEnumerationParamDef` in the role `definition`, the content of the `ApmcTextualParamValue.value` shall only be identical to the `shortName` of one one the `ApmcEnumerationLiteralDef`s that are aggregated by the applicable `ApmcEnumerationParamDef` in the role `literal`.

[constr_1482] Mapping of service interfaces vs. mapping of service interface elements

Imposition time: `IT_BefAraApiGen`

⌈In order to establish a mapping between a given pair of `ServiceInterface`s, at most **one of** the following alternatives can exist:

- the given pair of `ServiceInterface`s is referenced by a `ServiceInterfaceMapping`, where one `ServiceInterface` is referenced in the role `sourceServiceInterface` and the other `ServiceInterface` is referenced in the role `compositeServiceInterface`.

- an arbitrary mixture of the following options exists:

  - an `event` aggregated by one of the given `ServiceInterface`s is referenced by a `ServiceInterfaceEventMapping` in the role `sourceEvent` and one `event`s aggregated by the other given `ServiceInterface` is referenced by the same `ServiceInterfaceEventMapping` in the role `targetEvent`.

  - a `trigger` aggregated by one of the given `ServiceInterface`s is referenced by a `ServiceInterfaceTriggerMapping` in the role `sourceTrigger` and one `trigger` aggregated by the other given `ServiceInterface` is referenced by the same `ServiceInterfaceTriggerMapping` in the role `targetTrigger`.

  - a `field` aggregated by one of the given `ServiceInterface`s is referenced by a `ServiceInterfaceFieldMapping` in the role `sourceField` and one `field`s aggregated by the other given `ServiceInterface` is referenced by the same `ServiceInterfaceFieldMapping` in the role `targetField`.

  - a `method` aggregated by one of the given `ServiceInterface`s is referenced by a `ServiceInterfaceMethodMapping` in the role `sourceMethod` and one `method`s aggregated by the other given `ServiceInterface` is referenced by the same `ServiceInterfaceMethodMapping` in the role `targetMethod`.

⌋

[constr_1483] Applicability of a `ServiceInterface`

Imposition time: `IT_BefAraApiGen`

⌈The applicability of a `ServiceInterface` shall be limited to the *AUTOSAR adaptive platform*, i.e. a `ServiceInterface` shall only be taken to type a `PortPrototype` if the latter is aggregated by an `AdaptiveApplicationSwComponentType` or by a `CompositionSwComponentType` defined in the context of an `Executable`.

⌋

[constr_1488] Initialization of a `DataPrototype` typed by an `ApplicationAssocMapDataType`

Imposition time: `IT_BefAraApiGen`

⌈A `DataPrototype` typed by an `ApplicationAssocMapDataType` shall only be initialized by an `ApplicationAssocMapValueSpecification`.

⌋

[constr_1489] Uniqueness of `ApplicationAssocMapValueSpecification.mapElementTuple.key`

Imposition time: `IT_BefAraApiGen`

⌈The value of all `mapElementTuple.key` elements in the context of a given `ApplicationAssocMapValueSpecification` shall be unique.

⌋

[constr_1490] Allowed value for `Executable.category` if `ProcessToMachineMapping` references a `NonOsModuleInstantiation`

Imposition time: `IT_Mani`

⌈If a `ProcessToMachineMapping` references a `NonOsModuleInstantiation`, then the `Process` referenced in the role `ProcessToMachineMapping.process` shall only refer (in the role `Process.executable`) to an `Executable` where attribute `Executable.category` is set to `PLATFORM_LEVEL` (see [constr_1605]).

⌋

[constr_1492] `SwComponentType` referenced in the role `Executable.rootSwComponentPrototype.applicationType`

Imposition time: `IT_BefAraApiGen`

⌈Any `SwComponentType` referenced in the role `Executable.rootSwComponentPrototype.applicationType`, or used to type a `SwComponentPrototype` nested inside the `SwComponentType` referenced in the role `Executable.rootSwCompo-`

nentPrototype.applicationType shall **only** be either a CompositionSwComponentType or an AdaptiveApplicationSwComponentType.

⌋

[constr_1494] Initial value for `event`

Imposition time: IT_BefAraApiGen

⌈A ServiceInterface.event shall **not** have an initValue.

⌋

[constr_1507] `PortInterfaceToDataTypeMapping` is only applicable to `ServiceInterface` or `PersistencyKeyValueStorageInterface`

Imposition time: IT_BefAraApiGen

⌈PortInterfaceToDataTypeMapping.portInterface shall only refer to **either** a ServiceInterface **or** a PersistencyKeyValueStorageInterface.

⌋

[constr_1536] Definition of `SoftwareCluster` applies for a single `Machine`

Imposition time: IT_Mani

⌈Within the scope of a SoftwareCluster, each Process referenced in the role containedProcess shall be mapped (e.g. by means of the existence of a ProcessToMachineMapping) to the same Machine.

⌋

[constr_1549] Value of `ProcessorCore.coreId`

Imposition time: IT_Mani

⌈The value of ProcessorCore.coreId shall be unique in the context of the enclosing Processor.

⌋

[constr_1550] Reference from `Process` to `ProcessDesign`

Imposition time: IT_Mani

⌈Each ProcessDesign shall only be referenced from a single Process.

⌋

[constr_1551] Existence of `DataPrototypeInServiceInterfaceRef.dataPrototype` vs. `DataPrototypeInServiceInterfaceRef.elementInImplDatatype`

Imposition time: `IT_BefAraApiGen`

⌈For every given `DataPrototypeInServiceInterfaceRef`, either the aggregation `DataPrototypeInServiceInterfaceRef.dataPrototype` or `DataPrototypeInServiceInterfaceRef.elementInImplDatatype` shall exist.

⌋

[constr_1553] Restriction for `ProcessToMachineMapping`

Imposition time: `IT_Mani`

⌈The following restrictions apply for the usage of `ProcessToMachineMapping`:

1. Each combination of `Process` and `Machine` shall only be referenced by one `ProcessToMachineMapping` in the role `process` or `machine`.

2. Each `Process` shall only be referenced by a single `ProcessToMachineMapping` in the role `process`.

⌋

[constr_1554] Restriction regarding attribute `PersistencyKeyValuePair.initValue`

Imposition time: `IT_Mani`

⌈The concrete sub-class of `ValueSpecification` aggregated in the role `PersistencyKeyValuePair.initValue` shall not (after resolving a possible redirection by means of `ConstantReference`) be a `ReferenceValueSpecification`.

⌋

[constr_1555] Restriction applicable for `PersistencyPortPrototypeToKeyValueStorageMapping.portPrototype`

Imposition time: `IT_Mani`

⌈The reference `PersistencyPortPrototypeToKeyValueStorageMapping.portPrototype` shall only be used for a `PortPrototype` typed by a `PersistencyKeyValueStorageInterface`.

⌋

[constr_1556] **Restriction applicable for `PersistencyPortPrototype-ToFileStorageMapping.portPrototype`**

Imposition time: `IT_Mani`

⌈The reference `PersistencyPortPrototypeToFileStorageMapping.port-Prototype` shall only be used for a `PortPrototype` typed by a `Persistency-FileStorageInterface`.

⌋

[constr_1560] Usage of `SoftwareClusterDesign.requiredARElement`

Imposition time: `IT_SubSysDes`

⌈The reference `SoftwareClusterDesign.requiredARElement` shall not be used to refer to another `SoftwareClusterDesign` or even `SoftwareCluster`.

⌋

[constr_1566] Usage of `SoftwareCluster.containedARElement`

Imposition time: `IT_Mani`

⌈The reference `SoftwareCluster.containedARElement` shall not be used to refer to a `SoftwareCluster` or a `SoftwareClusterDesign`.

⌋

[constr_1570] Restriction for `UserDefinedServiceInterfaceDeployment` of `category` SERVICE_INTERFACE_DEPLOYMENT_IPC

Imposition time: `IT_Mani`

⌈An `AdaptivePlatformServiceInstance` that references a `UserDefined-ServiceInterfaceDeployment` of `category` SERVICE_INTERFACE_DEPLOY-MENT_IPC shall **only** be referenced by a `UserDefinedServiceInstanceToMa-chineMapping` in the role `serviceInstance` that in turn references a `UserDe-finedCommunicationConnector`.

⌋

[constr_1571] `CppImplementationDataType` is limited

Imposition time: `IT_BefAraApiGen`

⌈The usage of a `CppImplementationDataType` is limited to the context of `AdaptiveApplicationSwComponentType`s and `CompositionSwComponent-Type`s defined in the context of an `Executable`.

⌋

[constr_1576] Existence of `CppTemplateArgument.templateType` vs. `CppTemplateArgument.allocator`

Imposition time: `IT_BefAraApiGen`

⌈For any given `CppTemplateArgument`, **at most one of** the references

- `CppTemplateArgument.templateType` or

- `CppTemplateArgument.allocator`

⌋

[constr_1578] Applicable data categories

Imposition time: `IT_BefAraApiGen`

⌈

Category	Applicable to ...								Description
	ApplicationArrayDataType	ApplicationRecordDataType	ApplicationPrimitiveDataType	ApplicationRecordElement	ApplicationArrayElement	ApplicationValueSpecification	StdCppImplementationDataType	CustomCppImplementationDataType	
VALUE			x	x	x	x	x		Contains a single value. See also [TPS_MANI_03192].
TYPE_REFERENCE							x		The element is defined via reference to another data type (via `CppImplementationDataType.typeReference`).
STRUCTURE		x		x	x		x		Holds one or several further elements which can have different `AutosarDataType`s. See also [TPS_MANI_03180].
VARIANT							x	x	Can hold values of different data types. It is similar to `STRUCTURE` except that all of its members start at the same location in memory. A `VARIANT` data prototype can contain only one of its elements at a time and represents a type-safe union. The size of the `VARIANT` is at least the size of the largest member. See also [TPS_MANI_03189].
ARRAY	x			x	x		x	x	A fixed-sized array of sub-elements of the same data type. See also [TPS_MANI_03169].
VECTOR							x	x	An array of elements of the same data type that is able to grow at run-time. See also [TPS_MANI_03174].
ASSOCIATIVE_MAP							x	x	An associative array of key-value pairs. See also [TPS_MANI_03183].
STRING			x	x	x	x	x		Contains a text string. See also [TPS_MANI_03178].
BOOLEAN			x	x	x	x			Contains one boolean state. Depending on the CPU direct addressing of single bits may not be available. So a byte or a word can be used to store only one logical state.

[constr_1581] Value of `fileElement.fileName`

Imposition time: `IT_BefAraApiGen`

⌈Within the scope of any given `PersistencyFileStorageInterface`, the value of all `fileElement`.`fileName` shall be unique.

⌋

[constr_1582] `PersistencyKeyValuePair.valueDataType` shall match to `AbstractImplementationDataType` for the corresponding `Persistency-DataElement`

Imposition time: `IT_Mani`

⌈Each `PersistencyKeyValuePair`.`valueDataType` shall match the `AbstractImplementationDataType` that either directly or indirectly (via the applicable `DataTypeMap`) types the corresponding (based on identical values of the respective `shortName`) `PersistencyDataElement`.

⌋

[constr_1589] Value of `file.fileName`

Imposition time: `IT_Mani`

⌈Within the scope of any given `PersistencyFileStorage`, the value of all `file`.`fileName` shall be unique.

A `fileName` is considered unique if there are no other `fileName`s with **exactly** the same sequence of characters[1].

⌋

[constr_1593] Completeness of the existence of a set of `TlvDataIdDefinition.tlvArgument`s

Imposition time: `IT_BefAraApiGen`

⌈If the reference `TlvDataIdDefinition`.`tlvArgument` exists for one `argument` of a given `ClientServerOperation` then further `TlvDataIdDefinition`.`tlvArgument` shall exist **for all** `argument`s of the given `ClientServerOperation` and all affected `TlvDataIdDefinition` shall be aggregated by the same `TransformationPropsToServiceInterfaceElementMapping`.

⌋

---

[1]The characters "x" and "X" are not considered as identical characters for this purpose.

[constr_1594] Consistent assignment of TLV data ids to `ApplicationRecordDataType`

Imposition time: `IT_BefAraApiGen`

⌈For every `ApplicationRecordDataType` where direct members set the attribute `ApplicationRecordElement.isOptional` to the value `true` references to **all direct members** of this `ApplicationRecordDataType` shall be created on the basis of the definition of `TlvDataIdDefinition`.

⌋

[constr_1595] Consistent assignment of TLV data ids to `CppImplementationDataType` or `CppImplementationDataTypeElement`

Imposition time: `IT_BefAraApiGen`

⌈For every `CppImplementationDataType` of `category STRUCTURE` where direct members set the attribute `CppImplementationDataTypeElement.isOptional` to the value `true` references to **all direct members** of this `CppImplementationDataType` shall be created on the basis of the definition of `TlvDataIdDefinition`.

⌋

[constr_1596] Scope of the uniqueness of the value of `TlvDataIdDefinition.id` for references to `ArgumentDataPrototype`

Imposition time: `IT_BefAraApiGen`

⌈For all `TlvDataIdDefinition` that are referencing `ArgumentDataPrototype`s of a given `ClientServerOperation` in the role `tlvArgument`, the attribute `TlvDataIdDefinition.id` **shall exist and have a unique value per communication direction**, i.e. in the context of the collection of all

- `argument`s where attribute `direction` is set to either `in` or `inout`

- `argument`s where attribute `direction` is set to either `out` or `inout`

- `argument`s where attribute `direction` is set to `inout` (if the `method` **only** has `argument`s where attribute `direction` is set to `inout`)

of the respective enclosing `ClientServerOperation`.

⌋

[constr_1597] Scope of the uniqueness of the value of `TlvDataIdDefinition.id` for references to `ApplicationRecordElement`

Imposition time: `IT_BefAraApiGen`

⌈For all `TlvDataIdDefinition` that are referencing `ApplicationRecordElement`s of a given `ApplicationDataType` in the role `tlvRecordElement` the at-

tribute `TlvDataIdDefinition`.id **shall exist and have a unique value** in the context of respective enclosing `ApplicationRecordDataType`.

⌋

[constr_1598] Scope of the uniqueness of the value of `TlvDataIdDefinition.id` for references to `CppImplementationDataTypeElement`

Imposition time: `IT_BefAraApiGen`

⌈For all `TlvDataIdDefinition` that are referencing `CppImplementationDataTypeElement`s of a given `CppImplementationDataType`/`CppImplementationDataTypeElement` in the role `tlvImplementationDataTypeElement` the attribute `TlvDataIdDefinition`.id **shall exist and have a unique value** in the context of respective enclosing `CppImplementationDataType` or `CppImplementationDataTypeElement`.

⌋

[constr_1599] `TlvDataIdDefinition` referencing `ArgumentDataPrototype`

Imposition time: `IT_BefAraApiGen`

⌈Each `ArgumentDataPrototype` shall be referenced **at most once** in the role `tlvArgument` in the context of the same `TransformationPropsToServiceInterfaceElementMapping`.

⌋

[constr_1600] `TlvDataIdDefinition` referencing `ApplicationRecordElement`

Imposition time: `IT_BefAraApiGen`

⌈Each `ApplicationRecordElement` shall be referenced **at most once** in the role `tlvRecordElement` in the context of the same `TransformationPropsToServiceInterfaceElementMapping`.

⌋

[constr_1601] `TlvDataIdDefinition` referencing `CppImplementationDataTypeElement`

Imposition time: `IT_BefAraApiGen`

⌈Each `CppImplementationDataTypeElement` shall be referenced **at most once** in the role `tlvImplementationDataTypeElement` in the context of the same `TransformationPropsToServiceInterfaceElementMapping`.

⌋

**[constr_1603] Completeness of the existence of a set of `TlvDataIdDefinition.`
`tlvRecordElement`s**

Imposition time: `IT_BefAraApiGen`

⌈If the reference `TlvDataIdDefinition.tlvRecordElement` exists for one `element` of a given `ApplicationRecordDataType` then further `TlvDataIdDefinition.tlvRecordElement` shall exist **for all** `element`s of the given `ApplicationRecordDataType` and all affected `TlvDataIdDefinition` shall be aggregated by the same `TransformationPropsToServiceInterfaceElementMapping`.

⌋

**[constr_1604] Completeness of the existence of a set of `TlvDataIdDefinition.`
`tlvImplementationDataTypeElement`s**

Imposition time: `IT_BefAraApiGen`

⌈If the reference `TlvDataIdDefinition.tlvImplementationDataTypeElement` exists for one `subElement` of a given `CppImplementationDataType` or `CppImplementationDataTypeElement` then further `TlvDataIdDefinition.tlvImplementationDataTypeElement` shall exist **for all** `subElement`s of the given `CppImplementationDataType` or `CppImplementationDataTypeElement` and all affected `TlvDataIdDefinition` shall be aggregated by the same `TlvDataIdDefinitionSet`.

⌋

[constr_1605] Standardized values of attribute `Executable.category`

Imposition time: `IT_BefAraApiGen`

⌈The following values for attribute `Executable.category` are standardized by AUTOSAR:

- `PLATFORM_LEVEL`: the `Executable` represents software on the platform level (i.e. conceptually located *on the level of* the middleware).

- `APPLICATION_LEVEL`: the `Executable` represents software on the application level (i.e. conceptually located *above* the middleware).

⌋

[constr_1606] `Process`es with mutual `ExecutionDependency`s

Imposition time: `IT_Mani`

⌈A `Process.stateDependentStartupConfig.executionDependency` shall not refer to any `ModeDeclaration` owned by a second `Process` that in turn refers via `stateDependentStartupConfig.executionDependency` to any `ModeDeclaration` owned by the first `Process`.

⌋

[constr_1613] File name of matching pairs of `PersistencyFileElement` and `PersistencyFile`

Imposition time: `IT_Mani`

⌈The value of attributes `PersistencyFileElement.fileName` and `PersistencyFile.fileName` shall be identical for matching pairs (as identified by the application of [TPS_MANI_01187]) of `PersistencyFileStorage` and `PersistencyFile`.

⌋

[constr_1618] Ability to shut down

Imposition time: `IT_Mani`

⌈In the context of one `Machine`, at least one `Process` shall have a `stateDependentStartupConfig.functionGroupState` that has the `shortName` Shutdown.

⌋

[constr_1619] Ability to restart

Imposition time: `IT_Mani`

⌈In the context of one `Machine`, at least one `Process` shall have a `stateDependentStartupConfig.functionGroupState` that has the `shortName` Restart.

⌋

[constr_1625] Existence of reference `ApApplicationError.errorDomain`

Imposition time: `IT_BefAraApiGen`

⌈For each `ApApplicationError`, the reference `errorDomain` shall exist.

In other words, the association of an `ApApplicationError` with a corresponding `ApApplicationErrorDomain` is mandatory.

⌋

[constr_1628] Definition of static length field sizes in case of TLV usage

Imposition time: `IT_BefAraApiGen`

⌈If the aggregation `tlvDataIdDefinition` exists for a given `TransformationPropsToServiceInterfaceElementMapping` then attributes

- `sizeOfArrayLengthField`,
- `sizeOfStringLengthField`,
- `sizeOfStructLengthField`, and
- `sizeOfUnionLengthField`

⌋

[constr_1629] Identical sizes of length fields in case of TLV usage

Imposition time: `IT_BefAraApiGen`

⌈If the aggregation `tlvDataIdDefinition` exists for a given `Transformation-PropsToServiceInterfaceElementMapping` then attributes

- `sizeOfArrayLengthField`,
- `sizeOfStringLengthField`,
- `sizeOfStructLengthField`, and
- `sizeOfUnionLengthField`

⌋

[constr_1630] No definition of length field sizes on `DataPrototype` level in case of TLV usage

Imposition time: `IT_BefAraApiGen`

⌈If the reference in the role `tlvDataIdDefinition` exists for a given `Transformation-tionPropsToServiceInterfaceElementMapping` then attributes

- `sizeOfArrayLengthField`,
- `sizeOfStringLengthField`,
- `sizeOfStructLengthField`, and
- `sizeOfUnionLengthField`

shall not be individually defined on the level of a `DataPrototype` (i.e. by means of the reference `SomeipDataPrototypeTransformationProps.someipTransformationProps`) but only on the level of a `ServiceInterface` (i.e. by means of the reference `TransformationPropsToServiceInterfaceElementMapping.transformationProps`).

⌋

[constr_1658] Number of `DiagnosticTroubleCodeUdsToClearConditionGroupMapping` elements per `DiagnosticTroubleCodeUds`

Imposition time: `IT_DiagDes`

⌈The mapping element `DiagnosticTroubleCodeUdsToClearConditionGroupMapping` shall be created no more than once per `DiagnosticTroubleCodeUds`.

If several `DiagnosticTroubleCodeUdsToClearConditionGroupMapping` elements referring to the same `DiagnosticTroubleCodeUds` are defined, then the `Clear Condition Group` mapping shall be regarded as defective.

⌋

[constr_1659] Restriction for the usage of `CppImplementationDataTypeElementQualifier.inplace`

Imposition time: `IT_BefAraApiGen`

⌈The attribute `CppImplementationDataTypeElementQualifier.inplace` shall only exist if the target referenced in the role `CppImplementationDataTypeElementQualifier.typeReference` is an `StdCppImplementationDataType` that has the attribute `category` set to either of the values

- `ARRAY`
- `VECTOR`
- `ASSOCIATIVE_MAP`
- `VARIANT`
- `STRUCTURE`
- `STRING`
- `TYPE_REFERENCE`, if the `CppImplementationDataType` refers to a `CompuMethod` of `category` `TEXTTABLE`

⌋

[constr_1660] Restriction for the usage of `CppTemplateArgument.inplace`

Imposition time: `IT_BefAraApiGen`

⌈The attribute `CppTemplateArgument.inplace` shall only exist if the target referenced in the role `CppTemplateArgument.templateType` is an `StdCppImplementationDataType` that has the attribute `category` set to either of the values

- `ARRAY`

▽

△

Class	ApSomeipTransformationProps			
byteOrder	ByteOrderEnum	0..1	attr	Specifies the byte order of data in the serialized data stream.
implements LegacyString Serialization	Boolean	0..1	attr	This attribute indicates that Strings in the SOME/IP message shall NOT be serialized according to the SOME/IP specification for Strings. If this attribute is set to true, BOM and null-termination shall NOT be added in the serialization for Strings in the payload. If this attribute is set to false (or not set) BOM and null-termination shall be added in the serialization for Strings in the payload according to the SOME/IP specification for Strings. NOTE! This attribute is not future safe, and will be removed in an upcoming AUTOSAR release! **Tags:** atp.Status=obsolete
isDynamic LengthFieldSize	Boolean	0..1	attr	This attribute represents the ability to control the setting of the wire type for TLV encoding. If the attribute is set to true then wire type 5-7 shall be used. If the attribute does not exist or is set to false then wire type 4 shall be used.
sizeOfArray LengthField	PositiveInteger	0..1	attr	Configures the SOME/IP serialization for the referenced dataPrototype in case of a variable size Array (Vector), fixed-size Array or an Associative_Map. It describes the size of the length field (in Bytes) that will be put in front of the Array or Associative_Map in the SOME/IP message.
sizeOfString LengthField	PositiveInteger	0..1	attr	Configures the SOME/IP serialization for the referenced dataPrototype in case of a String. It describes the size of the length field (in Bytes) that will be put in front of the String in the SOME/IP message.
sizeOfStruct LengthField	PositiveInteger	0..1	attr	Configures the SOME/IP serialization for the referenced dataPrototype in case of an Struct. It describes the size of the length field (in Bytes) that will be put in front of the Struct in the SOME/IP message.
sizeOfUnion LengthField	PositiveInteger	0..1	attr	Configures the SOME/IP serialization for the referenced dataPrototype in case of a Union. It describes the size of the length field (in Bytes) that will be put in front of the Union in the SOME/IP message.
sizeOfUnion TypeSelector Field	PositiveInteger	0..1	attr	Configures the SOME/IP serialization for the referenced dataPrototype in case of a Union. It describes the size of the type selector field (in Bytes) that will be put in front of the Union in the SOME/IP message.
stringEncoding	BaseTypeEncoding String	0..1	attr	Configures the encoding for SOME/IP serialization for the referenced dataPrototype in case of an String.

Class	ApplicationDataType (abstract)
Package	M2::AUTOSARTemplates::SWComponentTemplate::Datatype::Datatypes
Note	ApplicationDataType defines a data type from the application point of view. Especially it should be used whenever something "physical" is at stake. An ApplicationDataType represents a set of values as seen in the application model, such as measurement units. It does not consider implementation details such as bit-size, endianess, etc. It should be possible to model the application level aspects of a VFB system by using ApplicationDataTypes only.

Attribute	Type	Mult.	Kind	Note
direction	ArgumentDirectionEnum	0..1	attr	This attribute specifies the direction of the argument prototype.
serverArgumentImplPolicy	ServerArgumentImplPolicyEnum	0..1	attr	This defines how the argument type of the servers RunnableEntity is implemented. If the attribute is not defined this has the same semantics as if the attribute is set to the value useArgumentType for primitive arguments and structures.

Table A.43: ArgumentDataPrototype

Enumeration	ArgumentDirectionEnum
Package	M2::AUTOSARTemplates::GenericStructure::GeneralTemplateClasses::PrimitiveTypes
Note	Use cases: • Arguments in ClientServerOperation can have different directions that need to be formally indicated because they have an impact on how the function signature looks like eventually. • Arguments in BswModuleEntry already determine a function signature, but the direction is used to specify the semantics, especially of pointer arguments.

baseTypeSize	PositiveInteger	0..1	attr	Describes the length of the data type specified in the container in bits. **Tags:** xml.sequenceOffset=70
byteOrder	ByteOrderEnum	0..1	attr	This attribute specifies the byte order of the base type. **Tags:** xml.sequenceOffset=110
memAlignment	PositiveInteger	0..1	attr	This attribute describes the alignment of the memory object in bits. E.g. "8" specifies, that the object in question is aligned to a byte while "32" specifies that it is aligned four byte. If the value is set to "0" the meaning shall be interpreted as "unspecified". **Tags:** xml.sequenceOffset=100
native Declaration	NativeDeclarationString	0..1	attr	This attribute describes the declaration of such a base type in the native programming language, primarily in the Programming language C. This can then be used by a code generator to include the necessary declarations into a header file. For example BaseType with shortName: "MyUnsignedInt" native Declaration: "unsigned short" Results in typedef unsigned short MyUnsignedInt; If the attribute is not defined the referring Implementation DataTypes will not be generated as a typedef by RTE. If a nativeDeclaration type is given it shall fulfill the characteristic given by basetypeEncoding and baseType Size.

Class	CommunicationConnector (abstract)			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore::CoreTopology			
Note	The connection between the referencing ECU and the referenced channel via the referenced controller.			
	Connectors are used to describe the bus interfaces of the ECUs and to specify the sending/receiving behavior. Each CommunicationConnector has a reference to exactly one communicationController.			
	Note: Several CommunicationConnectors can be assigned to one PhysicalChannel in the scope of one ECU Instance.			
Base	ARObject, Identifiable, MultilanguageReferrable, Referrable

commController	Communication Controller	0..1	ref	Reference to the communication controller. The CommunicationConnector and referenced CommunicationController shall be aggregated by the same ECUInstance.
				The communicationController can be referenced by several CommunicationConnector elements. This is important for the FlexRay Bus. FlexRay communicates via two physical channels. But only one controller in an ECU is responsible for both channels. Thus, two connectors (for channel A and for channel B) shall reference to the same controller.
createEcu WakeupSource	Boolean	0..1	attr	If this parameter is available and set to true then a channel wakeup source shall be created for the Physical Channel referencing this CommunicationConnector.

Attribute	**Type**	**Mult.**	**Kind**	**Note**
associated Event Identification	PositiveInteger	0..1	attr	This attribute represents the identification number that is associated with the enclosing DiagnosticEvent and allows to identify it when placed into a snapshot record or extended data record storage. This value can be reported as internal data element in snapshot records or extended data records.
clearEvent Allowed Behavior	DiagnosticClearEvent AllowedBehaviorEnum	0..1	attr	This attribute defines the resulting UDS status byte for the related event, which shall not be cleared according to the ClearEventAllowed callback
confirmation Threshold	PositiveInteger	0..1	attr	This attribute defines the number of operation cycles with a failed result before a confirmed DTC is set to 1. The semantic of this attribute is a by "1" increased value compared to the confirmation threshold of the "trip counter" mentioned in ISO 14229-1 in figure D.4. A value of "1" defines the immediate confirmation of the DTC along with the first reported failed. This is also sometimes called "zero trip DTC". A value of "2" defines a DTC confirmation in the operation cycle after the first occurred failed. A value of "2" is typically used in the US for OBD DTC confirmation. **Stereotypes:** atpVariation **Tags:** vh.latestBindingTime=preCompileTime
connected Indicator	DiagnosticConnected Indicator	*	aggr	Event specific description of Indicators. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=connectedIndicator.shortName, connected Indicator.variationPoint.shortLabel vh.latestBindingTime=postBuild
prestorage FreezeFrame	Boolean	0..1	attr	This attribute describes whether the Prestorage of Freeze Frames is supported by the assigned event or not. true: Prestorage of FreezeFrames is supported fFalse: Prestorage of FreezeFrames is not supported
prestored Freezeframe StoredInNvm	Boolean	0..1	attr	If the Event uses a prestored freeze-frame (using the operations PrestoreFreezeFrame and ClearPrestored FreezeFrame of the service interface DiagnosticMonitor) this attribute indicates if the Event requires the data to be stored in non-volatile memory. TRUE = Dem shall store the prestored data in non-volatile memory, FALSE = Data can be lost at shutdown (not stored in Nvm)
recoverableIn SameOperation Cycle	Boolean	0..1	attr	If the attribute is set to true then reporting PASSED will reset the indication of a failed test in the current operation cycle. If the attribute is set to false then reporting PASSED will be ignored and not lead to a reset of the indication of a failed test.

Aggregated by	IPSecConfig.ipSecRule			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
direction	Communication DirectionType	0..1	attr	This attribute defines the direction in which the traffic is monitored. If this attribute is not set a bidirectional traffic monitoring is assumed.
headerType	IPsecHeaderTypeEnum	0..1	attr	Header type specifying the IPsec security mechanism.
ipProtocol	IPsecIpProtocolEnum	0..1	attr	This attribute defines the relevant IP protocol used in the Security Policy Database (SPD) entry.
localCertificate	CryptoService Certificate	*	ref	This reference identifies the applicable certificate used for a local authentication.
localId	String	0..1	attr	This attribute defines how the local participant should be identified for authentication.
localPortRange End	PositiveInteger	0..1	attr	This attribute restricts the traffic monitoring and defines an end value for the local port range. If this attribute is not set then this rule shall be effective for all local ports. Please note that port ranges are currently not supported in the AUTOSAR AP's operating system backend. If AP systems are involved, each IPsec rule may only contain a single port.
localPortRange Start	PositiveInteger	0..1	attr	This attribute restricts the traffic monitoring and defines a start value for the local port range. If this attribute is not set then this rule shall be effective for all local ports. Please note that port ranges are currently not supported in the AUTOSAR AP's operating system backend. If AP systems are involved, each IPsec rule may only contain a single port.

Class	ISignal			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore::CoreCommunication			
Note	Signal of the Interaction Layer. The RTE supports a "signal fan-out" where the same System Signal is sent in different SignalIPdus to multiple receivers. To support the RTE "signal fan-out" each SignalIPdu contains ISignals. If the same System Signal is to be mapped into several SignalIPdus there is one ISignal needed for each ISignalToIPduMapping. ISignals describe the Interface between the Precompile configured RTE and the potentially Postbuild configured Com Stack (see ECUC Parameter Mapping). In case of the SystemSignalGroup an ISignal shall be created for each SystemSignal contained in the SystemSignalGroup. **Tags:** atp.recommendedPackage=ISignals

Class	ISignal			
data Transformation	DataTransformation	0..1	ref	Optional reference to a DataTransformation which represents the transformer chain that is used to transform the data that shall be placed inside this ISignal. **Stereotypes:** atpSplitable; atpVariation **Tags:** atp.Splitkey=dataTransformation.dataTransformation, dataTransformation.variationPoint.shortLabel vh.latestBindingTime=codeGenerationTime
dataTypePolicy	DataTypePolicyEnum	0..1	attr	With the aggregation of SwDataDefProps an ISignal specifies how it is represented on the network. This representation follows a particular policy. Note that this causes some redundancy which is intended and can be used to support flexible development methodology as well as subsequent integrity checks. If the policy "networkRepresentationFromComSpec" is chosen the network representation from the ComSpec that is aggregated by the PortPrototype shall be used. If the "override" policy is chosen the requirements specified in the PortInterface and in the ComSpec are not fulfilled by the networkRepresentationProps. In case the System Description doesn't use a complete Software Component Description (VFB View) the "legacy" policy can be chosen.
initValue	ValueSpecification	0..1	aggr	Optional definition of a ISignal's initValue in case the System Description doesn't use a complete Software Component Description (VFB View). This supports the inclusion of legacy system signals. This value can be used to configure the Signal's "Init Value". If a full DataMapping exist for the SystemSignal this information may be available from a configured Sender ComSpec and ReceiverComSpec. In this case the initvalues in SenderComSpec and/or ReceiverComSpec override this optional value specification. Further restrictions apply from the RTE specification.
iSignalProps	ISignalProps	0..1	aggr	Additional optional ISignal properties that may be stored in different files. **Stereotypes:** atpSplitable **Tags:** atp.Splitkey=iSignalProps
iSignalType	ISignalTypeEnum	0..1	attr	This attribute defines whether this iSignal is an array that results in a UINT8_N / UINT8_DYN ComSignalType in the COM configuration or a primitive type.
length	UnlimitedInteger	0..1	attr	Size of the signal in bits. The size needs to be derived from the mapped VariableDataPrototype according to the mapping of primitive DataTypes to BaseTypes as used in the RTE. Indicates maximum size for dynamic length signals. The ISignal length of zero bits is allowed.

Class	ISignal				
network Representation Props	SwDataDefProps	0..1	aggr		Specification of the actual network representation. The usage of SwDataDefProps for this purpose is restricted to the attributes compuMethod and baseType. The optional baseType attributes "memAllignment" and "byteOrder" shall not be used.
					The attribute "dataTypePolicy" in the SystemTemplate element defines whether this network representation shall be ignored and the information shall be taken over from the network representation of the ComSpec.
					If "override" is chosen by the system integrator the network representation can violate against the requirements defined in the PortInterface and in the network representation of the ComSpec.
					In case that the System Description doesn't use a complete Software Component Description (VFB View) this element is used to configure "ComSignalDataInvalid Value" and the Data Semantics.

reception DefaultValue (ordered)	ValueSpecification	*	aggr		Value used to fill data on the receiver side, if less then expected data is received.
					The value is expected to cover the entire expected ISignal network payload.
systemSignal	SystemSignal	0..1	ref		Reference to the System Signal that is supposed to be transmitted in the ISignal.
timeout Substitution Value	ValueSpecification	0..1	aggr		Defines and enables the ComTimeoutSubstituition for this ISignal.
transformation ISignalProps	TransformationISignal Props	*	aggr		A transformer chain consists of an ordered list of transformers. The ISignal specific configuration properties for each transformer are defined in the TransformationISignalProps class. The transformer configuration properties that are common for all ISignals are described in the TransformationTechnology class.

Class	ISignalGroup			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore::CoreCommunication			
Note	SignalGroup of the Interaction Layer. The RTE supports a "signal fan-out" where the same System Signal Group is sent in different SignalIPdus to multiple receivers.			
	An ISignalGroup refers to a set of ISignals that shall always be kept together. A ISignalGroup represents a COM Signal Group.

timeout	TimeValue	0..1	attr	• ISignalPort with communicationDirection = in:
				Optional timeout value in seconds for the reception of the ISignal. The attribute value is used to configure the Com Timeout in the COM module. The RTE ignores this attribute. The timeout can also be specified with the NonqueuedReceiverComSpec.aliveTimeout attribute. If a full DataMapping exists for the SystemSignal and the value is available in the configured ReceiverComSpec, then the timeout value in the ReceiverComSpec overrides this optional timeout specification during the creation of the Base Ecu Configuration of the COM module.
				• ISignalPort with communicationDirection = out:
				Optional timeout value in seconds for the transmission of the ISignal. The attribute value is used to configure the ComTimeout in the COM module. The RTE ignores this attribute. The timeout can also be specified with the ender ComSpec.transmissionAcknowledge.timeout attribute. If a full DataMapping exists for the SystemSignal and the value is available in the configured SenderComSpec, then the timeout value in the SenderComSpec overrides this optional timeout specification during the creation of the Base Ecu Configuration of the COM module.
				This attribute can be used in the following cases:
				• legacy signal where the System Description doesn't use a complete Software Component Description (VFB View) and where the DataMapping is missing.
				• bus monitoring use cases in which the DataMapping is ignored.

Class	ISignalToIPduMapping			
packingByte Order	ByteOrderEnum	0..1	attr	This parameter defines the order of the bytes of the signal and the packing into the SignalIPdu. The byte ordering "Little Endian" (MostSignificantByteLast), "Big Endian" (MostSignificantByteFirst) and "Opaque" can be selected. For opaque data endianness conversion shall be configured to Opaque. The value of this attribute impacts the absolute position of the signal into the SignalIPdu (see the startPosition attribute description).
				For an ISignalGroup the packingByteOrder is irrelevant and shall be ignored.
startPosition	UnlimitedInteger	0..1	attr	This parameter is necessary to describe the bitposition of a signal within an SignalIPdu. It denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packingByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7.
				Please note that the way the bytes will be actually sent on the bus does not impact this representation: they will always be seen by the software as a byte array.
				If a mapping for the ISignalGroup is defined, this attribute is irrelevant and shall be ignored.
transferProperty	TransferPropertyEnum	0..1	attr	Defines how the referenced ISignal contributes to the send triggering of the ISignalIPdu.
update IndicationBit Position	UnlimitedInteger	0..1	attr	The UpdateIndicationBit indicates to the receivers that the signal (or the signal group) was updated by the sender. Length is always one bit. The UpdateIndicationBitPosition attribute describes the position of the update bit within the SignalIPdu. For Signals of a ISignalGroup this attribute is irrelevant and shall be ignored.
				Note that the exact bit position of the updateIndicationBit Position is linked to the value of the attribute packingByte Order because the method of finding the bit position is different for the values mostSignificantByteFirst and most SignificantByteLast. This means that if the value of packingByteOrder is changed while the value of update IndicationBitPosition remains unchanged the exact bit position of updateIndicationBitPosition within the enclosing ISignalIPdu still undergoes a change.
				This attribute denotes the least significant bit for "Little Endian" and the most significant bit for "Big Endian" packed signals within the IPdu (see the description of the packingByteOrder attribute). In AUTOSAR the bit counting is always set to "sawtooth" and the bit order is set to "Decreasing". The bit counting in byte 0 starts with bit 0 (least significant bit). The most significant bit in byte 0 is bit 7.

Class	Identifiable (abstract)			
uuid	String	0..1	attr	The purpose of this attribute is to provide a globally unique identifier for an instance of a meta-class. The values of this attribute should be globally unique strings prefixed by the type of identifier. For example, to include a DCE UUID as defined by The Open Group, the UUID would be preceded by "DCE:". The values of this attribute may be used to support merging of different AUTOSAR models. The form of the UUID (Universally Unique Identifier) is taken from a standard defined by the Open Group (was Open Software Foundation). This standard is widely used, including by Microsoft for COM (GUIDs) and by many companies for DCE, which is based on CORBA. The method for generating these 128-bit IDs is published in the standard and the effectiveness and uniqueness of the IDs is not in practice disputed. If the id namespace is omitted, DCE is assumed. An example is "DCE:2fac1234-31f8-11b4-a222-08002b34c003". The uuid attribute has no semantic meaning for an AUTOSAR model and there is no requirement for AUTOSAR tools to manage the timestamp. **Tags:** xml.attribute=true

Class	PduTriggering			
Package	M2::AUTOSARTemplates::SystemTemplate::Fibex::FibexCore::CoreCommunication			
Note	The PduTriggering describes on which channel the IPdu is transmitted. The Pdu routing by the PduR is only allowed for subclasses of IPdu. Depending on its relation to entities such channels and clusters it can be unambiguously deduced whether a fan-out is handled by the Pdu router or the Bus Interface. If the fan-out is specified between different clusters it shall be handled by the Pdu Router. If the fan-out is specified between different channels of the same cluster it shall be handled by the Bus Interface.

Class	PeriodicEventTriggering			
Package	M2::AUTOSARTemplates::CommonStructure::Timing::TimingConstraint::EventTriggeringConstraint			
Note	Describes the behavior of an event with a strict periodic occurrence pattern, given by `period`. Additionally, it is possible to soften the strictness of the periodic occurrence behavior by specifying a `jitter`, so that there can be a deviation from the `period` up to the size of the `jitter`.			
Base	*ARObject*, *EventTriggeringConstraint*, *Identifiable*, *MultilanguageReferrable*, *Referrable*, *Timing Constraint*, *Traceable*

dynamic RuntimeLength Handling	Boolean	0..1	attr		Defines whether the length information for handling this SecuredIPdu with SecuredIPdu.useSecuredPdu Header=noHeader is taken from the configuration or from the actually provided length information during runtime. true: SecuredIPdu length information is taken from the actually provided length information during runtime. false: SecuredIPdu length information is taken from the configuration.
freshnessProps	SecureCommunication FreshnessProps	0..1	ref		Reference to freshness properties that are valid for this SecuredIPdu.
payload	PduTriggering	0..1	ref		Reference to a Pdu that will be protected against unauthorized manipulation and replay attacks.
secure Communication Props	SecureCommunication Props	0..1	aggr		Specific configuration properties for this SecuredIPdu.
useAs Cryptographic IPdu	Boolean	0..1	attr		If this attribute is set to true the SecuredIPdu contains the Authentication Information for an AuthenticIPdu that is transmitted in a separate message. The AuthenticIPdu contains the original payload, i.e. the secured data. If this attribute is set to false this SecuredIPdu contains the payload of an Authentic IPdu supplemented by additional Authentication Information.
useSecuredPdu Header	SecuredPduHeader Enum	0..1	attr		This attribute defines the size of the header which is inserted into the SecuredIPdu. If this attribute is set to anything but noHeader, the SecuredIPdu contains the Secured I-PDU Header to indicate the length of the AuthenticIPdu. The AuthenticIPdu contains the original payload, i.e. the secured data.

eventMulticast UdpPort	PositiveInteger	0..1	attr	UdpPort configuration that is used for Event communication in the IP-Multicast case. During SOME/IP Service Discovery: Send in the SD-SubscribeEventGroupAck Message to client (answer to SD-SubscribeEventGroup). Event: This is the destination-port where the server sends the multicast event messages if the multicastThreshold is exceeded.
ipv4MulticastIp Address	Ip4AddressString	0..1	attr	Multicast IPv4 Address that is transmitted in the Event GroupSubscribeAck message.
ipv6MulticastIp Address	Ip6AddressString	0..1	attr	Multicast IPv6 Address that is transmitted in the Event GroupSubscribeAck message.
multicast Threshold	PositiveInteger	0..1	attr	Specifies the number of subscribed clients that trigger the server to change the transmission of events to multicast. Example: If configured to 0 only unicast will be used. If configured to 1 the first client will be already served by multicast. If configured to 2 the first client will be served with unicast and as soon as the 2nd client arrives both will be served by multicast. This does not influence the handling of initial events, which are served using unicast only.

remoteMulticast Config	SomeipRemote MulticastConfig	*	ref	This reference defines a remote multicast Address (IP Address, Port) that is used in a static configuration to setup the communication path between a service provider and service consumer. This reference shall ONLY be used if the remote address is determined from the configuration and not at runtime from the Service Discovery. **Tags:** atp.Status=candidate
remoteUnicast Config	SomeipRemoteUnicast Config	*	ref	In case that a static service connection is used and a single peer exists this element is used to statically configure the remote peer's address. **Tags:** atp.Status=candidate
tcpPort	ApApplicationEndpoint	0..1	ref	local TcpPort that will be used by the ServiceInstance for the communication.
udpCollection BufferSize Threshold	PositiveInteger	0..1	attr	Specifies the amount of data in bytes that shall be buffered for data transmission over the udp connection specified by this SomeipServiceInstanceToMachine Mapping. If this attribute is set to a value, then the data collection feature is enabled.
udpPort	ApApplicationEndpoint	0..1	ref	local UdpPort that will be used by the ServiceInstance for the communication.

Class	«atpVariation» **SwDataDefProps**
Package	M2::MSR::DataDictionary::DataDefProperties
Note	This class is a collection of properties relevant for data objects under various aspects. One could consider this class as a "pattern of inheritance by aggregation". The properties can be applied to all objects of all classes in which SwDataDefProps is aggregated. Note that not all of the attributes or associated elements are useful all of the time. Hence, the process definition (e.g. expressed with an OCL or a Document Control Instance MSR-DCI) has the task of implementing limitations. SwDataDefProps covers various aspects: • Structure of the data element for calibration use cases: is it a single value, a curve, or a map, but also the recordLayouts which specify how such elements are mapped/converted to the DataTypes in the programming language (or in AUTOSAR). This is mainly expressed by properties like swRecordLayout and swCalprmAxisSet • Implementation aspects, mainly expressed by swImplPolicy, swVariableAccessImplPolicy, swAddr Method, swPointerTagetProps, baseType, implementationDataType and additionalNativeTypeQualifier • Access policy for the MCD system, mainly expressed by swCalibrationAccess • Semantics of the data element, mainly expressed by compuMethod and/or unit, dataConstr, invalid Value • Code generation policy provided by swRecordLayout **Tags:** vh.latestBindingTime=codeGenerationTime

implementation DataType	AbstractImplementation DataType	0..1	ref	This association denotes the ImplementationDataType of a data declaration via its aggregated SwDataDefProps. It is used whenever a data declaration is not directly referring to a base type. Especially • redefinition of an ImplementationDataType via a "typedef" to another ImplementationDatatype • the target type of a pointer (see SwPointerTarget Props), if it does not refer to a base type directly • the data type of an array or record element within an ImplementationDataType, if it does not refer to a base type directly • the data type of an SwServiceArg, if it does not refer to a base type directly **Tags:** xml.sequenceOffset=215

Class	SynchronizationTimingConstraint
Package	M2::AUTOSARTemplates::CommonStructure::Timing::TimingConstraint::SynchronizationTiming Constraint

Note	This constraint is used to restrict the timing behavior of different, but correlated events or event chains, with regard to synchronization. Two scenarios are supported:
	
	• If (`synchronizationConstraintType`==`responseSynchronization`)
	
	  – `TimingDescriptionEvent`s: An arbitrary number of correlated events which play the role of responses shall occur synchronously with respect to a predefined tolerance.
	
	  – `TimingDescriptionEventChain`s: An arbitrary number of correlated event chains with a common stimulus, but different responses, where the responses shall occur synchronously with respect to a predefined tolerance.
	
	• If (`synchronizationConstraintType`==`stimulusSynchronization`)
	
	  – `TimingDescriptionEvent`s:An arbitrary number of correlated events which play the role of stimuli shall occur synchronously with respect to a predefined tolerance.
	
	  – `TimingDescriptionEventChain`s: An arbitrary number of correlated event chains with a common response, but different stimuli, where the stimuli shall occur synchronously with respect to a predefined tolerance.
	
	In case the constraint is imposed on events the following two scenarios are supported:
	
	• If (`eventOccurrenceKind`==`singleOccurrence`): any of the events shall occur only once in the given time interval.
	
	• If (`eventOccurrenceKind`==`multipleOccurrences`): any of the events may occur more than once in the given time interval. In other words multiple occurrences of an event within the given time interval are permitted.

Class	TlsCryptoCipherSuite			
Package	M2::AUTOSARTemplates::SystemTemplate::SecureCommunication			
Note	This meta-class represents a cipher suite for describing cryptographic operations in the context of establishing a connection of ApplicationEndpoints that is protected by TLS.			
Base	*ARObject*, *Identifiable*, *MultilanguageReferrable*, *Referrable*			
Aggregated by	TlsCryptoServiceMapping.tlsCipherSuite, TlsSecureComProps.tlsCipherSuite			
Attribute	**Type**	**Mult.**	**Kind**	**Note**
authentication	CryptoServicePrimitive	0..1	ref	This reference identifies the crypto service primitive for the generation and verification of MACs.
certificate	CryptoService Certificate	0..1	ref	This reference identifies the applicable local certificate.
cipherSuiteId	PositiveInteger	0..1	attr	Identification of the CipherSuite according to the IANA assignments list.
cipherSuite ShortLabel	String	0..1	attr	Name of the CipherSuite according to the IANA assignments list.
ellipticCurve	CryptoEllipticCurve Props	*	ref	This references point to the properties of elliptic curves.
encryption	CryptoServicePrimitive	0..1	ref	This reference identifies the crypto service primitive for the execution of encryption.
keyExchange	CryptoServicePrimitive	*	ref	This reference identifies the individual (i.e. per cipher suite) crypto service primitive for the execution of key exchange during the handshake phase.
keyExchange Authentication	CryptoServicePrimitive	*	ref	This reference identifies the crypto service primitives for the generation and verification of signatures during the key exchange algorithm.

Class	UdpNmCluster			
nmCbvPosition	Integer	0..1	attr	Defines the position of the control bit vector within the Nm Pdu (Byte position). If this attribute is not configured, the Control Bit Vector is not used.
nmImmediate NmCycleTime	TimeValue	0..1	attr	Defines the immediate NmPdu cycle time in seconds which is used for nmImmediateNmTransmissions NmPdu transmissions. This attribute is only valid if nmImmediate NmTransmissions is greater one.
nmImmediate Nm Transmissions	PositiveInteger	0..1	attr	Defines the number of immediate NmPdus which shall be transmitted. If the value is zero no immediate NmPdus are transmitted. The cycle time of immediate NmPdus is defined by nmImmediateNmCycleTime.
nmMsgCycle Time	TimeValue	0..1	attr	Period of a NmPdu in seconds. It determines the periodic rate in the periodic transmission mode with bus load reduction and is the basis for transmit scheduling in the periodic transmission mode without bus load reduction.
nmNetwork Timeout	TimeValue	0..1	attr	Network Timeout for NmPdus in seconds. It denotes the time how long the UdpNm shall stay in the Network Mode before transition into Prepare Bus-Sleep Mode shall take place.
nmNidPosition	Integer	0..1	attr	Defines the byte position of the source node identifier within the NmPdu. If this attribute is not configured, the Node Identification is not used.
nmRepeat MessageTime	TimeValue	0..1	attr	Timeout for Repeat Message State in seconds. Defines the time how long the NM shall stay in the Repeat Message State.
nmUserData Length	Integer	0..1	attr	Defines the length in bytes of the user data contained in the Nm message. User data excludes the PNC bit vector.
nmUserData Offset	PositiveInteger	0..1	attr	Specifies the offset (in bytes) of the user data information in the NM message. User data excludes the PNC bit vector.
nmWaitBus SleepTime	TimeValue	0..1	attr	Timeout for bus calm down phase in seconds. It denotes the time how long the CanNm shall stay in the Prepare Bus-Sleep Mode before transition into Bus-Sleep Mode shall take place.
vlan	EthernetPhysical Channel	0..1	ref	Reference to the vlan (represented by the Ethernet PhysicalChannel) this UdpNmCluster shall apply to.
