## 1 Introduction and functional overview

The Function Inhibition Manager is responsible for providing a control mechanism for software components and the functionality therein. In this context, a functionality can be built up of the contents of one, several or parts of runnable entities with the same set of permission / inhibit conditions. By means of the FiM, inhibiting ( deactivation of application function) these functionalities can be configured and even modified during runtime (post-built configuration).

Functionality and runnable entity are different and independent types of classifications. Runnable entities are mainly characterized by their scheduling requirements. In contrast to that, functionalities are classified by their inhibit conditions. The services of the FiM focus on functionalities in SW-Cs, however, they are not limited to them. Functionalities of the BSW can also use the FiM services.

The functionalities are assigned to an identifier (FID - function identifier) along with the inhibit conditions for that particular identifier. The functionalities poll for the permission state of their respective FIDs before execution. If an inhibit condition comes true for a particular identifier, the corresponding functionality shall not be executed anymore.

The FiM is closely related to the Dem since diagnostic events and their status information are supported as inhibit conditions. Hence, functionality which needs to be stopped in case of a failure, e.g. of a certain sensor, can be represented by a particular identifier. If the failure is detected and the event is reported to the Dem, the FiM then inhibits the FID and therefore the corresponding functionality.

In order to handle the relation of functionality and linked events, the identifier and inhibit conditions of the functionality have been introduced into the SW-C template (equivalence for BSW) and during configuration, data structures are built up to deal with the sensitiveness of the identifiers against certain events.

Software components can be integrated into a new environment as a collection of events which can be configured without big effort. Furthermore, system analysis is supported when questions as, for example, "Which functionality is inhibited if a particular event is detected?" arise. The data basis of the FiM serves as documentation of the configured relations between events and the SW-C to be inhibited.

In AUTOSAR, the RTE deals with SW-C in terms of their interfaces and scheduling requirements. In contrast to that, the FiM deals with inhibit conditions and provides supporting mechanisms for controlling functionalities via respective identifiers (FID). Therefore, the FiM concept and RTE concept do not interfere with each other.

The basic targets of the FiM specification document are:

- Standardization of APIs
- Introduction of possible implementation approaches
- Provide the ability for a common approach of OEM and supplier

## 2 Acronyms and abbreviations

Abbreviation / Acronym:	Description:
Activity state	The activity state is the status of a software component being executed. The activity state results from the permission state as a precondition and physical enable condition, too. It is not calculated by the FiM and not available as a status variable. It can only be derived from local information within a software component. For further details, see chapter <a href="#">7.2.1.6</a> .
API	Application Programming Interface
BSW	Basic Software
Dem	Diagnostic Event Manager
ECU	Electronic Control Unit
FID	Function Identifier
FiM	Function Inhibition Manager
Functionality	<p>Functionality comprises User-visible and User-non-visible functional aspects of a system (see <a href="#">[2]</a>).</p> <p>In addition to that - in the FiM context - a functionality can be built up of the contents of one, several or parts of runnable entities with the same set of permission / inhibit conditions. By means of the FiM, the inhibition of these functionalities can be configured and even modified by calibration. Each functionality is represented by a unique FunctionId. A functionality is characterized by a specific set of inhibit condition in contrast to runnable entities having specific scheduling conditions.</p>
HW	Hardware
ID	Identification/Identifier
Inhibition Condition	The relation between one FID, an inhibition mask and the status of a Dem event/component. (see <a href="#">FiMInhibitionConfiguration</a> )
ISO	International Standardization Organization
MIL	Malfunction Indication Light
Monitoring function	<ul style="list-style-type: none"> <li>Part of the Software Component.</li> <li>Mechanism to monitor and finally to detect a fault of a certain sensor, actuator or could be a plausibility check</li> <li>Reports states about events from internal processing of a SW-C or from further processing of return values of other basic software modules.</li> <li>See also <a href="#">AUTOSAR_SWS_DiagnosticEventManager</a> <a href="#">[3]</a></li> </ul>
NVRAM	Non volatile Memory
OBD	On-board Diagnostics
OBDII	Emission-related On-board Diagnostics
OEM	Original Equipment Manufacturer
OS	Operating System
Permission state	The permission state contains the information whether a functionality, represented by its FID, can be executed or whether it shall not run. The state is controlled by the FiM based on reported events. For further details, see chapter <a href="#">7.2.1.6</a> .
RAM	Random Access Memory
ROM	Read-only Memory
RTE	Runtime Environment
Runnable entity	A Runnable Entity is a part of an Atomic Software-Component, which can be executed and scheduled independently from the other Runnable Entities of this Atomic Software-Component. It is described by a sequence of instructions that can be started by the RTE. Each runnable entity is associated with exactly one EntryPoint.
SW-C	Software Component
UDS	Unified Diagnostic Services

△

Abbreviation / Acronym:	Description:
WP	Autosar Work Package
Xxx_	Placeholder for an API provider

### 3.2 Related standards and norms

- [13] IEC 7498-1 The Basic Model, IEC Norm, 1994
- [14] D1.5-General Architecture; ITEA/EAST-EEA, Version 1.0; chapter 3, page 72 et seq.
- [15] D2.1-Embedded Basic Software Structure Requirements; ITEA/EAST-EEA, Version 1.0 or higher
- [16] D2.2-Description of existing solutions; ITEA/EAST-EEA, Version 1.0 or higher.

### 3.3 Related specification

AUTOSAR provides a General Specification on Basic Software modules [1, SWS BSW General], which is also valid for Function Inhibition Manager.

Thus, the specification SWS BSW General shall be considered as additional and required specification for Function Inhibition Manager.

## 4 Constraints and assumptions

### [SWS\_Fim\_00007]

*Upstream requirements: SRS\_Fim\_04701*

[FID numbers shall be unique per FiM.]

Since communication between software components and basic software is limited to one ECU, the FiM can only control FIDs being located on the same ECU. Note that the RTE does currently not support communication between basic software and software components located on different ECUs.

### 4.1 Limitations

Timing constraints have to be considered for the whole system. Note that the process and response times strongly depend on the implementation of the FiM module. Hence, if there are explicit needs for faster responses of the FiM than the cycle (time slice of the task) these needs have to be considered by the FiM implementation specifically by the affected application. Special measures have to be implemented by the FiM which are not explicitly specified in this AUTOSAR document, since here, the implementation is - on purpose - not prescribed.

### [SWS\_Fim\_00043]

*Upstream requirements: SRS\_Fim\_04706*

[The FiM shall compute the permission of a FID independently of the state of other FIDs.]

Interdependencies between FIDs are not supported by the FiM. That means an FID does not influence another FID.

### 4.2 Applicability to car domains

The FiM is designed to fulfill the design demands for ECUs with respect to a central handling of reactions of the system upon detected malfunctions, e.g. open circuit or shortcut. Therefore, the immediate domain of applicability of the FiM is currently body, chassis and powertrain ECUs. However, there is no reason that the FiM cannot be used in implementations of ECUs for other car domains as, for example, infotainment.

One major constraint is that the FiM alone will NOT be able to handle SW-Components that are:

1. time critical - They might be too slow for local reconfigurations (fast backup reaction in case of e.g. invalid signals).
2. physically interactive - They might not be sufficiently flexible.

3. safety critical - They might not have sufficient software integrity.

## 5 Dependencies on other modules

### [SWS\_Fim\_00044]

*Upstream requirements:* [SRS\\_BSW\\_00384](#)

[The AUTOSAR **Function Inhibition Manager (FiM)** has interfaces and dependencies on the Diagnostic Event Manager (Dem), the Software Components (SW-C) with FID interface, the ECU State Manager, the RTE and the BSW modules supposed to be inhibited by the FiM.]

- The **Diagnostic Event Manager (Dem)** is in charge of handling detected malfunctions denoted as events and reported by monitoring functions. The Dem informs and updates the Function Inhibition Manager (FiM) upon changes of the monitor status in order to stop or release functionalities according to assigned dependencies.
- **SW-Components (SW-C) with FID interface** query for permission to execute functionality identified by an FID at the FiM. The FIDs have to be provided by the SW components.
- **ECU State manager** is responsible for the basic initialization and de-initialization of BSW-components.
- **BSW module(s)** that are supposed to be inhibited by the FiM shall use the FiM interface to ask for permission. Therefore, the affected BSW modules have to provide the corresponding configuration data (EventID - FID - Inhibition mask relation) at configuration time realized by using a template similar to the SW-component template. The interface handling for BSW modules corresponds to the interface handling for SW-components.
- **The RTE** implements scheduling mechanisms for BSW, e.g. assigns priority and memory protection to each BSW module used in an ECU.

### 5.1 Requirements

There are three sources of requirements for this specification:

- The requirements for the functionality of the FiM service are specified in [\[4\]](#). In order to model the VFB view of the Service, the chapter on AUTOSAR Services of the VFB specification [\[5\]](#) has to be considered as an additional requirement.
- For the formal description of the SW-C attributes [\[6\]](#) gives the requirements.

### 5.1.1 Use Cases

On each ECU, typically one instance of the FiM Service and several Atomic Software Component instances using this Service are employed. The Atomic Software Components are named "clients" further on in this document.

Additionally, there are parts of the basic software, which either control the FiM Manager (e.g. the ECUState Manager for initialization and shutdown) or need to query the FiM for execution permission themselves.

## 6 Requirements traceability

Requirement	Description	Satisfied by
[SRS_BSW_00172]	The scheduling strategy that is built inside the Basic Software Modules shall be compatible with the strategy used in the system	[SWS_Fim_00070]
[SRS_BSW_00304]	All AUTOSAR Basic Software Modules shall use only AUTOSAR data types instead of native C data types	[SWS_Fim_00027]
[SRS_BSW_00305]	Data types naming convention	[SWS_Fim_00027]
[SRS_BSW_00310]	API naming convention	[SWS_Fim_00006] [SWS_Fim_00011] [SWS_Fim_00021]
[SRS_BSW_00312]	Shared code shall be reentrant	[SWS_Fim_00011] [SWS_Fim_00021]
[SRS_BSW_00331]	All Basic Software Modules shall strictly separate error and status information	[SWS_Fim_00015]
[SRS_BSW_00344]	BSW Modules shall support link-time configuration	[SWS_Fim_00013]
[SRS_BSW_00345]	BSW Modules shall support pre-compile configuration	[SWS_Fim_00013]
[SRS_BSW_00357]	For success/failure of an API call a standard return type shall be defined	[SWS_Fim_00097]
[SRS_BSW_00358]	The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void	[SWS_Fim_00006] [SWS_Fim_00045] [SWS_Fim_00059]
[SRS_BSW_00373]	The main processing function of each AUTOSAR Basic Software Module shall be named according the defined convention	[SWS_Fim_00060]
[SRS_BSW_00377]	A Basic Software Module can return a module specific types	[SWS_Fim_00027]
[SRS_BSW_00384]	The Basic Software Module specifications shall specify at least in the description which other modules they require	[SWS_Fim_00044]
[SRS_BSW_00404]	BSW Modules shall support post-build configuration	[SWS_Fim_00092]
[SRS_BSW_00405]	BSW Modules shall support multiple configuration sets	[SWS_Fim_00092]

**Table 6.1: Requirements Tracing**

## 7 Functional specification

### 7.1 Background & Rationale

The Function Inhibition Manager allows querying the permission / inhibition status of software components and the functionality therein. In the FiM context an FID (FID - function identifier) identifies an application functionality along with the inhibit conditions for that particular identifier. The functionalities poll for the permission state of their FID before execution. If an inhibit condition applies for a particular identifier, the corresponding functionality is not allowed to be executed anymore. By means of the FiM, the inhibition of these functionalities can be configured and even modified by calibration. Dem events and their status information are supported as inhibit conditions.

In order to handle the relation of functionality and associated affecting events, the identifier (FID) and inhibit conditions (events) of the functionality are included in the SW component template (equivalence for BSW). During configuration of the FiM, data structures (i.e. an inhibit matrix) are built up to deal with the sensitiveness of the identifiers against certain events.

### 7.2 Requirements

#### 7.2.1 FiM core variables

##### 7.2.1.1 Definition of 'Diagnostic Event'

A 'Diagnostic Event' is an identifier provided by the Dem to a specific diagnostic monitor function to report an error.

See AUTOSAR\_SWS\_DiagnosticEventManager document for further details [3].

##### 7.2.1.2 Definition of 'Monitor Status'

A 'monitor status' is the status calculated by the Dem according to the reported values of monitor functions. Possible values are defined by Dem\_MonitorStatusType.

See AUTOSAR\_SWS\_DiagnosticEventManager document for further details [3].

##### 7.2.1.3 Definition of 'Monitored Component'

A 'Monitored Component' is an identifier provided by the Dem to a specific monitored component (hardware component or signal). The FAILED status of a 'monitored component' represents the result of all assigned monitoring functions and inherited failure information from other DemComponents.

See AUTOSAR\_SWS\_DiagnosticEventManager document for further details [3].

#### 7.2.1.4 Definition of 'Summarized Event'

##### [SWS\_Fim\_00061]

*Upstream requirements: [SRS\\_Fim\\_04719](#)*

[The FiM configuration shall support summarizing events. A summarized event consists of multiple single diagnostic events.]

During the configuration process, these single events can be combined to a summarized event (ECUC\_FiM\_00037). A summarized event simplifies dealing with the multiple events that are associated with or represented by the particular summarized event. For simplicity, this particular summarized event can be used as an inhibit condition in the SW-C templates.

##### [SWS\_Fim\_00064]

*Upstream requirements: [SRS\\_Fim\\_04719](#)*

[The FiM shall also be able to process the inhibit conditions of all FIDs associated to one summarized event if one of the Dem Events associated to this summarized event is reported to the FiM.]

Hence, the particular summarized event is just a representative of multiple diagnostic events (ref.[10.2.3](#)). A use case for summarized events is for example the combination of all error conditions that indicate a failed sensor:

A sensor X has multiple diagnostics, e.g. short cut ground, battery and open circuit: X\_SCG, X\_SCB and X\_OC. The functions FID\_0, FID\_1, ..., FID\_N are to be inhibited in case of this fault. A direct configuration requires  $3 * N$  containers [FiMInhibitionConfiguration](#) with FIM\_INH\_EVENT\_ID = X\_SCG/SCB/OC and FIM\_INH\_FUNCTION\_ID = FID\_0/.../N.

With summarized events ([FiMSummaryEvent](#)), a group of events can be reused for several inhibition configurations, by selecting it as [FiMInhSumRef](#). This may simplify configuration.

#### 7.2.1.5 Definition of 'Function Identifier'

The Fim implements the calculation of function permissions. Object to those calculations are SW-Components or logical units, which receive the information "Permission granted" / "permission denied".

To address those components, these have to be configured in FIM and a Function Identifier is assigned to address them via interfaces.

## [SWS\_Fim\_00002]

*Upstream requirements: SRS\_Fim\_04701*

「The configuration process shall guarantee that FunctionIds are unique per FiM. Two distinct functionalities with different dependencies on events shall never have the same FunctionId (see also [SWS\_Fim\_00007]).」

## [SWS\_Fim\_00003]

*Upstream requirements: SRS\_Fim\_04701*

「The FiM module's environment shall use the FunctionId to directly point to the associated functionality information (permission status etc.)」

The flow of information starts with the API call of the Dem providing changes of the event information. This information is processed and dependencies to FIDs are evaluated. Finally, the permission state of the FIDs is accessed via API through the RTE (Figure 7.1).

**Figure 7.1: Logical information flow to determine FID permission states for an implementation with permission state stored in RAM**

The permission state of each FID is calculated based on the EventIds assigned to a specific FID. Afterwards, the calculated permission states of each FID (e.g. FID\_K) are "and-ed" to determine the resulting permission state. This implies an implementation where the FiM stores the permission state of the FIDs in RAM.

Alternatively, the FiM can poll the monitor status to re-calculate the permission state. The polling is triggered either by a functionality requesting its permission state (SW-C or BSW) or in a cyclic task. In this case, there is no increased process effort within the FiM at changes of any event.

### 7.2.1.6 Definition of 'Function Identifier permission state'

#### [SWS\_Fim\_00015]

*Upstream requirements:* [SRS\\_BSW\\_00331](#), [SRS\\_Fim\\_04713](#)

[The FID permission state contains the information whether a functionality represented by its FID can be executed. If the permission state == TRUE, the functionality associated with the FID is permitted to be executed. If the permission state == FALSE, the functionality associated with the FID is not allowed to be executed.]

The permission state is based on events reported by the Dem. Therefore, the permission state does not directly consider physical conditions (e.g. temperature, engine speed...) but those conditions reported to the Dem (e.g. sensor defect).

Additionally to the permission state as prerequisite, the activity state (is the function active or not) includes physical enable conditions representing whether the functionality is indeed executed or not, i.e. is active or not.

As stated above, one possible implementation is to provide the permission state in status variables. An alternative is to compute the permission on the query based on the underlying dependencies.

Hint: If the permission states are stored in status variables, they are unique values per FID. SW-components access the status via [FiM\\_GetFunctionPermission](#).

#### [SWS\_Fim\_00009]

*Upstream requirements:* [SRS\\_Fim\\_04713](#)

[If the implementation uses status variables for the permission of the FIDs, the status variables shall be readable for tracking purposes by the calibration system (to be defined by AUTOSAR) during the development phase of the ECU.]

## 7.2.2 FiM core functionalities

### 7.2.2.1 Initialization

#### [SWS\_Fim\_00069]

*Upstream requirements:* [SRS\\_Fim\\_04712](#)

〔The function [FiM\\_DemInit](#) shall compute the permission state for all FIDs.〕

#### [SWS\_Fim\_00082]

*Upstream requirements:* [SRS\\_Fim\\_04712](#)

〔The function [FiM\\_DemInit](#) shall access the EventId states via the function [Dem\\_GetMonitorStatus](#) and the component information via [Dem\\_GetComponentFailed](#).〕

#### [SWS\_Fim\_00109] Initial FID state information callback

*Upstream requirements:* [SRS\\_Fim\\_04700](#)

〔If the FiM initializes an initial FID state as defined in [SWS\_Fim\_00069] and the container [FiMCallbackFIDStatusChanged](#) is configured for this [FiMFID](#), the FiM shall call the [CBFidStatusChanged](#) callback with [FiM\\_FidStatusChangeType](#) set to INIT and Permission set to the new initialized FID state. [\[SRS\\_Fim\\_04700\]](#)〕

The FiM will trigger the [CBFidStatusChanged](#) when the FID is initialized or the FiD states. The callback may be called at a time the destination component is yet not finalized by its init function. It is up to the component to handle calls of [CBFidStatusChanged](#) at any time.〕

#### [SWS\_Fim\_00018]

*Upstream requirements:* [SRS\\_BSW\\_00416](#), [SRS\\_Fim\\_04712](#)

〔If Dem events status information is used, the FiM module shall compute the permission states for all FIDs at its initialization based on all restored monitor status information (not only events stored in the fault memory) of the Dem.〕

The FiM is designed that it requires Dem monitor states during initialization. Therefore the Dem needs to ensure that at the point in time the FiM is initialized, the Dem is ready to provide monitor states via [Dem\\_GetMonitorStatus](#). The FiM is not able to detect a not initialized Dem due to possible disabled events and will always behave as described in [SWS\_Fim\_00097].

#### [SWS\_Fim\_00102]

*Upstream requirements:* [SRS\\_Fim\\_04712](#)

〔The initialization of Dem and Fim shall always follow the below order :

step 0) [Dem\\_PreInit](#)

step 1) Non-volatile memory data has to be available.

step 2) `FiM_Init` (setting up internal variables); after `FiM_Init`, the Fim is not yet ready to be used.

step 3) `Dem_Init`: do the internal DEM initialization and use `FiM_DemInit` to finally initialize the FIM]

Note: From step 3 onwards, the Dem and Fim are finally initialized and ready to be used.

#### **[SWS\_Fim\_00104]**

*Upstream requirements:* [SRS\\_BSW\\_00406](#)

〔If `FiM_GetFunctionPermission` is called before the Fim is initialized, the Fim shall return `E_NOT_OK`.(`FiM_DemInit`).〕

#### **7.2.2.2 Fim Data Structure**

##### **[SWS\_Fim\_00013]**

*Upstream requirements:* [SRS\\_BSW\\_00344](#), [SRS\\_BSW\\_00345](#), [SRS\\_Fim\\_04706](#)

〔The configuration process of the Fim shall create data structures within the Fim module to store the inhibit relations (EventID - FID - applicable mask).〕

A configurable number of EventIds and inhibition masks are assigned to one FID. The number of EventIds and inhibit masks per FID have to match so that for each configured event, a corresponding inhibit mask exists.

The inhibition mask contains the inhibition conditions for a FID provided that the associated EventIds have a certain status (`Dem_UdsStatusByteType`). These masks define which states of an event the FID is sensitive to. However, the mask does not only address certain bits according to the `Dem_UdsStatusByteType`, it rather selects an algorithm to calculate the boolean inhibition condition from the `Dem_UdsStatusByteType`.

The implementation of the Fim data structure cannot be prescribed. A possible implementation of the inhibit matrix could be a block of calibration values for each inhibit source (=EventId). That means for each EventId a list of FIDs and masks is available that shall be inhibited by this EventId. A possible Fim structure consisting of such a configuration and a FID status array is exemplarily shown in Figure 2.

There is an inhibition mask assigned to every FID and both are assigned to a particular EventId. If this event has a certain state, the inhibition of the FID becomes active if the event state matches the configured mask.

Figure 7.2: Inhibit Mask

### [SWS\_Fim\_00008]

*Upstream requirements: [SRS\\_Fim\\_04706](#)*

[The FiM module shall provide the possibility to modify the inhibit conditions by post-built configuration.]

Depending on the implementation, it might not be possible to:

- Add new events.
- Extend the number of inhibited FID's per event.
- Extend the specified configuration parameters concerning number of events, number of FIDs and number of links.

#### 7.2.2.3 Interaction between Dem and Function Inhibition Manager (FiM)

### [SWS\_Fim\_00022]

*Upstream requirements: [SRS\\_Fim\\_04717](#)*

[The purpose of the FiM module is to provide services to control (permit / inhibit) functionality within SW-Cs based on Dem events being supported as inhibit conditions.]

**[SWS\_Fim\_00065]**

*Upstream requirements:* [SRS\\_Fim\\_04706](#)

〔The Function Inhibition Manager shall use the FID - EventIDs - inhibition masks relations provided by the software components to determine the permission state for all configured FIDs.〕

Upon changes in the monitor status of a reported event, the Dem informs the FiM about the monitor status change via the API function [FiM\\_DemTriggerOnMonitorStatus](#), if DemTriggerFiMReports is enabled.

On being informed about a monitor status change, the Fim uses the API [Dem\\_GetMonitorStatus](#) to recalculate the function inhibitions.

1. Note: From the function point of view, synchronous update of inhibit / release conditions can be made either within or outside of [FiM\\_MainFunction](#) API.

As mentioned in chapter [4.1](#), the implementation of the FiM highly depends on requirements (e.g. timing requirements) derived from applications. If an application requires fast reaction times the FiM has to provide FID information sufficiently fast to allow triggering limp-home functionality.

The API [FiM\\_DemTriggerOnMonitorStatus](#) is only relevant if a status variable per FID is stored. In an alternative implementation when no status is stored and the permission status is calculated every time when queried, the API [FiM\\_DemTriggerOnMonitorStatus](#) is without effect.

As an example of implementation, Figure 3 shows the calculation of a single Event Id-FID link. On the left hand side, the monitor status is reported by the Dem as [Dem\\_EventStatusExtendedType](#). This status is compared to the mask configured for the EventId associated with the FID.

An inhibition counter is assigned to each FID. The inhibition counter contains the number of currently inhibiting EventIds.

If the calculation is performed cyclically (monitor status is read through [Dem\\_GetMonitorStatus](#)), the inhibition counter shall be incremented if the status and the mask match; otherwise, the inhibition counter is not updated. This is applicable for [FiM\\_GetFunctionPermission](#) (if the permission state has to be computed upon the query) and [FiM\\_MainFunction](#) APIs.

In the trigger on monitor status change, the stored currently inhibiting EventIds (inhibition counter) shall be used for the computation for the permission state. If there is a monitor status change reported by [FiM\\_DemTriggerOnMonitorStatus](#), then the following shall be performed:

- a. If the change in status for the EventId results in a released state (mask does not match with the monitor status), then the inhibition counter has to be decremented.
- b. If the change in status for the EventId results in an inhibited state (mask matches with the monitor status), then the inhibition counter has to be incremented.

If the inhibition counter is > 0, then the FID permission state shall be set to FALSE, otherwise the FID permission state shall be set to TRUE.

Figure 7.3: Calculation of permission state based on monitor status information

### [SWS\_Fim\_00012]

*Upstream requirements: [SRS\\_Fim\\_04702](#)*

[The FiM module shall calculate the inhibit status based on the actual status of the inhibit source and the calibrated mask which exists for each inhibit source (ref. 10.2.7). The FiM module shall inhibit the FID if the Monitor status is equal to the calibrated mask (=Defect, Tested, NotTested). The inhibition is deactivated if the mask of the event does not match anymore the calibrated value.]

Optionally, the tested status can be used for inhibiting. Depending on the inhibition condition, the inhibition can be active if the event has status "Tested" or "NotTested". If no tested value is selected, the tested status is not relevant.

The available combinations of status flags are assigned to a predefined value which has verbal representation like "Tested", "Not\_Tested" or Last\_Failed".

**[SWS\_Fim\_00098]** [The Function Inhibition Manager shall use the FID - DemComponentId - inhibition configuration to determine the permission state for the configured FID.]

Upon changes of the FAILED status of a DemComponent, the function status shall be recalculated. Whenever the component status is FAILED (ComponentFailedStatus = TRUE), the FID is inhibited.]

**[SWS\_Fim\_00099]** [The FIM shall use the API Dem\_GetComponentFailed to get the current FAILED status of a component.]

**[SWS\_Fim\_00100]**

*Upstream requirements:* [SRS\\_Fim\\_04717](#)

〔If the FIM is configured for being triggered on eventStatus (FiMCyclicEventEvaluation), the FIM shall accept the status changed information of a DemComponent by providing the function [FiM\\_DemTriggerOnComponentStatus](#).〕

**7.2.2.4 Interaction between SW-Components and Function Inhibition Manager (FiM)****[SWS\_Fim\_00016]**

*Upstream requirements:* [SRS\\_Fim\\_04706](#)

〔The configuration engineer shall provide at compile time the inhibit conditions for each FID required for handling the dependencies of functionalities and events in the FiM module.〕

Note, that modifications by calibration shall be possible. The configuration mechanism of the FiM using SW-component template contents shall consider these requirements.

First, the FID needs to be introduced and allocated. Furthermore, for each FID a list of events plus associated mask causing the inhibition of the FID shall be provided by the SW-component. Chapter 10 introduces how the SW-component template considers these configuration requirements.

During the configuration process, the data structures are built up. Depending on the implementation this could, e.g. be a mapping of an event onto all affected FIDs or alternatively vice versa, a mapping of a FID onto all events affecting it.

Controlling implies that within the implemented functionality, the permission of a FID is queried via AUTOSAR service.

**[SWS\_Fim\_00020]**

*Upstream requirements:* [SRS\\_Fim\\_04713](#)

〔The FiM module shall ensure an immediate control of functionality by synchronously responding to an incoming permission query. The FiM module shall realize this behavior either by storing the permission state as a status variable or by evaluation of the event states upon permission query.〕

**[SWS\_Fim\_00105]**

*Upstream requirements:* [SRS\\_Fim\\_04723](#)

〔If a function (FID) is set to not available using the interface [FiM\\_SetFunctionAvailable](#), its permission state [FiM\\_GetFunctionPermission](#) shall always return FALSE.〕

Polling the FID state from an application or SW-Component via the [FiM\\_GetFunctionPermission](#) can result in considerable CPU load, especially if a very large number of FIDs (e.g. 2000 or more) are used in the system and the FIDs are cyclically polled within a short time. In a typical vehicle operation, errors occur seldomly and the FID state mostly indicates a permission to run. So instead of polling the inhibition state frequently with always the same result (permission to run) it can be more efficient for an application to get triggered by a function state change. Therefore the FiM provides an optional callback mechanism that is triggered each time a FID state changes its value.

### [SWS\_Fim\_00110] FID state change callback

*Upstream requirements:* [SRS\\_Fim\\_04700](#)

[If the state of an FID changes and the container [FiMCallbackFIDStatusChanged](#) is configured for this [FiMFID](#), the FiM shall call the [CBFidStatusChanged](#) callback with [FiM\\_FidStatusChangeType](#) set to CHANGED and Permission set to the new FID state.]

The FID state change callback is provided via both: via C-Function or RTE call on a C/S interface. If [FiMCallbackFIDStatusChangedFnc](#) is not empty, the FiM uses this function name as C function callback with signature based on [CBFidStatusChanged](#). If [FiMCallbackFIDStatusChangedFnc](#) is empty, the FiM uses the operation [CBFidStatusChanged](#) on the C/S Interface [FunctionInhibitionCallback](#) for the callback.

#### 7.2.2.5 Application example for FiM usage

Figure 7.4: FiM usage

- The configuration of the FiM actually establishes the relationship between the EventId and the assigned FunctionId(s)
- The required information is:
  - For each FunctionId: How does the status of the FunctionId depend on the status of one/several EventIds?

- \* The mask determines the relationship between the EventId status and the inhibit status of the FunctionId.
- \* The row result is 'OR'ed to come up with the overall result for one FunctionId if it depends on several EventIds.

### 7.2.3 OBD-Functionality

#### 7.2.3.1 In-Use-Monitor Performance Ratio (IUMPR) Support

In order to track the behavior of diagnostic functions in every day usage, in particular the capability to find malfunctions, the regulations require the tracking of this performance in relation to a standardized driving profile. This is called "In-Use Monitor Performance Ratio" (IUMPR) defined as the number of times a fault could have been found (=numerator) divided by the number of times the standardized driving profile has been fulfilled (=denominator). The relevant data recording is allocated in the Dem based on FIDs and EventIDs.

Thus, based on the FiM configuration of the referenced FIDs it can be evaluated whether a Ratio Id specific data record needs to be stopped. In particular, IUMPR tracking shall be stopped as long as the entry remains visible in service \$07.

The Dem may use the FiM configuration for its IUMPR calculation or by call of [FiM\\_GetFunctionPermission](#) of a dedicated FID.

Note: The FiM does not provide special OBDII functionality but uses already existing mechanisms for OBDII.

## 7.3 Error classification

Chapter [1, General Specification of Basic Software Modules] 7.2 “Error Handling” describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

### 7.3.1 Development Errors

#### [SWS\_Fim\_00076] Definition of development errors in module FiM

Type of error	Related error code	Error value
API function called before the FiM module has been full initialized or after the FiM module has been shut down	FIM_E_UNINIT	0x01

Type of error	Related error code	Error value
FIM_GetFunctionPermission called with wrong FID	FIM_E_FID_OUT_OF_RANGE	0x02
Dem calls FiM with invalid EventId	FIM_E_EVENTID_OUT_OF_RANGE	0x03
API is invoked with NULL Pointer.	FIM_E_PARAM_POINTER	0x04
Invalid configuration set selection	FIM_E_INIT_FAILED	0x05

]

### 7.3.2 Runtime Errors

There are no runtime errors.

### 7.3.3 Production Errors

There are no production errors.

### 7.3.4 Extended Production Errors

There are no Extended Production Errors.

## 7.4 Configuration Constraints

**[SWS\_Fim\_CONSTR\_00001]** [For each configured [FiMInhibitionConfiguration](#), at least one of [FiMInhSumRef](#) or [FiMInhEventRef](#) or [FiMInhComponen-tRef](#) shall be configured.]

## 8 API specification

### 8.1 Imported types

In this chapter, all types included from the following files are listed:

#### [SWS\_Fim\_00081] Definition of imported datatypes of module FiM

Module	Header File	Imported Type
Dem	Dem.h	Dem_ComponentIdType
	Rte_Dem_Type.h	Dem_EventIdType
	Rte_Dem_Type.h	Dem_MonitorStatusType
Std	Std_Types.h	Std_ReturnType
	Std_Types.h	Std_VersionInfoType

]

### 8.2 Type definitions

#### 8.2.1 FiM\_ConfigType

#### [SWS\_Fim\_00092] Definition of datatype FiM\_ConfigType

*Upstream requirements:* [SRS\\_BSW\\_00404](#), [SRS\\_BSW\\_00405](#)

]

<b>Name</b>	FiM_ConfigType	
<b>Kind</b>	Structure	
<b>Elements</b>	--	
	<b>Type</b>	—
	<b>Comment</b>	implementation specific
<b>Description</b>	This type defines a data structure for the post build parameters of the FIM. At initialization the FIM gets a pointer to a structure of this type to get access to its configuration data, which is necessary for initializsation.	
<b>Available via</b>	FiM.h	

]

## 8.2.2 FiM\_FidStatusChangeType

### [SWS\_Fim\_91001] Definition of datatype FiM\_FidStatusChangeType

*Upstream requirements:* [SRS\\_Fim\\_04700](#)

〔

<b>Name</b>	FiM_FidStatusChangeType		
<b>Kind</b>	Type		
<b>Derived from</b>	uint8		
<b>Range</b>	INIT	0x00	The callback is called triggered by the Fim initialisation.
	CHANGED	0x01	The callback is called triggered by a FID state change.
<b>Description</b>	This type is used to distinguish an initial FID state from a FID state change callback call.		
<b>Available via</b>	FiM.h		

〕

## 8.3 Function definitions

This is a list of functions provided for upper layer modules.

### 8.3.1 Interface ECUState Manager <-> FiM

#### 8.3.1.1 FiM\_Init

### [SWS\_Fim\_00077] Definition of API function FiM\_Init 〔

<b>Service Name</b>	FiM_Init	
<b>Syntax</b>	<pre>void FiM_Init (     const FiM_ConfigType* FimConfigPtr )</pre>	
<b>Service ID [hex]</b>	0x00	
<b>Sync/Async</b>	Synchronous	
<b>Reentrancy</b>	Non Reentrant	
<b>Parameters (in)</b>	FiMConfigPtr	-
<b>Parameters (inout)</b>	None	
<b>Parameters (out)</b>	None	
<b>Return value</b>	None	
<b>Description</b>	This service initializes the FIM.	
<b>Available via</b>	FiM.h	

〕

Note: see Chapter [9.1](#)

## [SWS\_Fim\_00045]

*Upstream requirements:* [SRS\\_BSW\\_00358](#), [SRS\\_BSW\\_00406](#)

〔If development error detection is turned on the FiM module shall report an error to the DET if it has not successfully completed the initialization and has detected not permitted access.〕

## [SWS\_Fim\_00059]

*Upstream requirements:* [SRS\\_BSW\\_00358](#), [SRS\\_BSW\\_00406](#)

〔A static status variable denoting if the FiM is initialized shall be initialized with value 0 before any APIs of the FiM is called.

[FiM\\_Init](#) shall set the static status variable to a value not equal to 0.〕

In order to restore the permission states quickly, it is recommended that the Dem provides direct access to monitor status information if Dem and FiM are implemented as a cluster. In this case, the FiM needs to have knowledge about the data structure of the Dem so that it can directly access EventId states.

Note: There is no explicit action during shutdown. The permission states remain valid until the ECU is shut down since they directly depend on the monitor status information.

### 8.3.2 Interface SW-Components <-> FiM

#### 8.3.2.1 FiM\_GetFunctionPermission

##### [SWS\_Fim\_00011] Definition of API function FiM\_GetFunctionPermission

*Upstream requirements:* [SRS\\_BSW\\_00310](#), [SRS\\_BSW\\_00312](#), [SRS\\_Fim\\_04700](#), [SRS\\_Fim\\_04709](#)

〔

<b>Service Name</b>	FiM_GetFunctionPermission	
<b>Syntax</b>	<pre>Std_ReturnType FiM_GetFunctionPermission (   FiM_FunctionIdType FID,   boolean* Permission )</pre>	
<b>Service ID [hex]</b>	0x01	
<b>Sync/Async</b>	Synchronous	
<b>Reentrancy</b>	Reentrant	
<b>Parameters (in)</b>	FID	Identification of a functionality by assigned FID. The FunctionId is configured in the FIM. Min.: 1 (0: Indication of no functionality) Max.: Result of configuration of FIDs in FIM (Max is either 255 or 65535)
<b>Parameters (inout)</b>	None	
<b>Parameters (out)</b>	Permission	TRUE: FID has permission to run FALSE: FID has no permission to run, i.e. shall not be executed

▽

<b>Return value</b>	Std_ReturnType	E_OK: The request is accepted E_NOT_OK: The request is not accepted, ie. initialization of FIM not completed
<b>Description</b>	This service reports the permission state to the functionality.	
<b>Available via</b>	FiM.h	

]

**[SWS\_Fim\_00066]***Upstream requirements: SRS\_Fim\_04700*

〔The SW Components and the BSW shall use the function [FiM\\_GetFunctionPermission](#) to query for the permission to execute a certain functionality represented by the respective FID.〕

**[SWS\_Fim\_00025]***Upstream requirements: SRS\_Fim\_04700*

〔The function [FiM\\_GetFunctionPermission](#) shall deliver the return value synchronously to enable direct use of this information for controlling and executing the underlying code in the software component.〕

**[SWS\_Fim\_00055]***Upstream requirements: SRS\_BSW\_00406*

〔If development error detection for the module FiM is enabled: the function [FiM\\_GetFunctionPermission](#) shall perform a plausibility check on the FID range. If a FID is out of range, the function shall raise a development error and return no permission (FALSE).〕

**[SWS\_Fim\_00056]***Upstream requirements: SRS\_BSW\_00406*

〔If development error detection for the module FiM is enabled: the function [FiM\\_GetFunctionPermission](#) shall check that the initialization of the module FiM has been completed. If the function detects that the initialization is not complete, it shall raise a development error and return no permission (FALSE).〕

### 8.3.2.2 FiM\_SetFunctionAvailable

#### [SWS\_Fim\_00106] Definition of API function FiM\_SetFunctionAvailable

*Upstream requirements:* [SRS\\_Fim\\_04723](#)

]

<b>Service Name</b>	FiM_SetFunctionAvailable	
<b>Syntax</b>	<pre>Std_ReturnType FiM_SetFunctionAvailable (   FiM_FunctionIdType FID,   boolean Availability )</pre>	
<b>Service ID [hex]</b>	0x07	
<b>Sync/Async</b>	Synchronous	
<b>Reentrancy</b>	Reentrant	
<b>Parameters (in)</b>	FID	Identification of a functionality by assigned FID.
	Availability	The permission of the requested FID: TRUE: Function is available. FALSE: Function is not available.
<b>Parameters (inout)</b>	None	
<b>Parameters (out)</b>	None	
<b>Return value</b>	Std_ReturnType	E_OK: The request is accepted E_NOT_OK: Request is not accepted (e.g. invalid FID is given)
<b>Description</b>	This service sets the availability of a function. The function is only available if FiMAvailability Support is configured as True.	
<b>Available via</b>	FiM.h	

]

### 8.3.3 Interface Dem <-> FiM

#### 8.3.3.1 FiM\_DemTriggerOnMonitorStatus

#### [SWS\_Fim\_00021] Definition of API function FiM\_DemTriggerOnMonitorStatus

*Upstream requirements:* [SRS\\_BSW\\_00310](#), [SRS\\_BSW\\_00312](#), [SRS\\_Fim\\_04717](#)

]

<b>Service Name</b>	FiM_DemTriggerOnMonitorStatus	
<b>Syntax</b>	<pre>void FiM_DemTriggerOnMonitorStatus (   Dem_EventIdType EventId )</pre>	
<b>Service ID [hex]</b>	0x02	
<b>Sync/Async</b>	Synchronous	
<b>Reentrancy</b>	Reentrant	
<b>Parameters (in)</b>	EventId	Identification of an Event by assigned event number. The Event Number is configured in the DEM. Min.: 1 (0: Indication of no Event or Failure) Max.: Result of configuration of Event Numbers in DEM (Max is either 255 or 65535)
<b>Parameters (inout)</b>	None	
<b>Parameters (out)</b>	None	

▽

△

<b>Return value</b>	None
<b>Description</b>	This service is provided to be called by the Dem in order to inform the Fim about monitor status changes.
<b>Available via</b>	FIM_Dem.h

]

### [SWS\_Fim\_00057]

*Upstream requirements:* [SRS\\_BSW\\_00406](#)

〔If development error detection for the module FIM is enabled: the function [FIM\\_DemTriggerOnMonitorStatus](#) shall perform a plausibility check on the EventId. If the requested EventId is not existing in the Dem configuration, the function shall raise the development error [FIM\\_E\\_EVENTID\\_OUT\\_OF\\_RANGE](#).〕

### [SWS\_Fim\_00058]

*Upstream requirements:* [SRS\\_BSW\\_00406](#)

〔If development error detection for the module FIM is enabled: The function [FIM\\_DemTriggerOnMonitorStatus](#) shall check for complete initialization of the FIM. If the function detects that the initialization is not complete, it shall raise a development error.〕

### 8.3.3.2 FIM\_DemTriggerOnComponentStatus

#### [SWS\_Fim\_00101] Definition of API function FIM\_DemTriggerOnComponentStatus

<b>Service Name</b>	FIM_DemTriggerOnComponentStatus	
<b>Syntax</b>	<pre>void FIM_DemTriggerOnComponentStatus (   Dem_ComponentIdType ComponentId )</pre>	
<b>Service ID [hex]</b>	0x06	
<b>Sync/Async</b>	Synchronous	
<b>Reentrancy</b>	Non Reentrant	
<b>Parameters (in)</b>	ComponentId	Identification of a DemComponent.
<b>Parameters (inout)</b>	None	
<b>Parameters (out)</b>	None	
<b>Return value</b>	None	
<b>Description</b>	Triggers on changes of the component failed status.	
<b>Available via</b>	FIM_Dem.h	

]

### 8.3.3.3 FiM\_DemInit

#### [SWS\_Fim\_00006] Definition of API function FiM\_DemInit

*Upstream requirements:* [SRS\\_BSW\\_00310](#), [SRS\\_BSW\\_00358](#)

]

<b>Service Name</b>	FiM_DemInit
<b>Syntax</b>	void FiM_DemInit ( void )
<b>Service ID [hex]</b>	0x03
<b>Sync/Async</b>	Synchronous
<b>Reentrancy</b>	Non Reentrant
<b>Parameters (in)</b>	None
<b>Parameters (inout)</b>	None
<b>Parameters (out)</b>	None
<b>Return value</b>	None
<b>Description</b>	This service re-initializes the FIM.
<b>Available via</b>	FiM_Dem.h

]

### 8.3.3.4 FiM\_GetVersionInfo

#### [SWS\_Fim\_00078] Definition of API function FiM\_GetVersionInfo

<b>Service Name</b>	FiM_GetVersionInfo	
<b>Syntax</b>	void FiM_GetVersionInfo ( Std_VersionInfoType* versioninfo )	
<b>Service ID [hex]</b>	0x04	
<b>Sync/Async</b>	Synchronous	
<b>Reentrancy</b>	Reentrant	
<b>Parameters (in)</b>	None	
<b>Parameters (inout)</b>	None	
<b>Parameters (out)</b>	versioninfo	Pointer to where to store the version information of this module.
<b>Return value</b>	None	
<b>Description</b>	This service returns the version information of this module.	
<b>Available via</b>	FiM.h	

]

### 8.3.4 Call-back notifications

This chapter lists all functions provided by the FiM module and used by lower layer modules.

### 8.3.4.1 CBFidStatusChanged

#### [SWS\_Fim\_91002] Definition of configurable interface CBFidStatusChanged

*Upstream requirements:* [SRS\\_Fim\\_04700](#)

]

<b>Service Name</b>	CBFidStatusChanged	
<b>Syntax</b>	<pre>Std_ReturnType CBFidStatusChanged (   Fim_FidStatusChangeType Status,   boolean Permission )</pre>	
<b>Sync/Async</b>	Synchronous	
<b>Reentrancy</b>	Reentrant	
<b>Parameters (in)</b>	Status	Set to INIT if the Fim is calling this callback due to the initialisation of the module. If set to CHANGED, this callback indicates a FID state change
	Permission	Indicates the initial/new FID permission state. TRUE: FID has permission to run FALSE: FID has no permission to run.
<b>Parameters (inout)</b>	None	
<b>Parameters (out)</b>	None	
<b>Return value</b>	Std_ReturnType	E_OK: this function always returns E_OK for compatibility reasons with RTE
<b>Description</b>	–	
<b>Available via</b>	Fim.h	

]

### 8.3.5 Scheduled functions

This chapter lists all functions provided by the Fim module and called directly by the Basic Software Module Scheduler.

#### 8.3.5.1 Fim\_MainFunction

#### [SWS\_Fim\_00060] Definition of scheduled function Fim\_MainFunction

*Upstream requirements:* [SRS\\_BSW\\_00373](#)

]

<b>Service Name</b>	Fim_MainFunction
<b>Syntax</b>	<pre>void Fim_MainFunction (   void )</pre>
<b>Service ID [hex]</b>	0x05
<b>Description</b>	–
<b>Available via</b>	SchM_Fim.h

]

The evaluation of permission states can be performed either on event change or cyclically.

**[SWS\_Fim\_00070]**

*Upstream requirements: [SRS\\_BSW\\_00172](#)*

〔If FiM module polls monitor status (as defined in configuration parameter `FiMEven-tUpdateTriggeredByDem` = FALSE) and decides to do it in a cyclic manner, `FiM_MainFunction` shall be used to calculate the permission states of all EventIds using their inhibition masks. The API `Dem_GetMonitorStatus` shall be used to get status information of EventIds.〕

**[SWS\_Fim\_00097]**

*Upstream requirements: [SRS\\_BSW\\_00357](#)*

〔If `Dem_GetMonitorStatus` returns `E_NOT_OK`, the FiM shall not consider this event in its inhibition mask calculation〕

**[SWS\_Fim\_00067]**

*Upstream requirements: [SRS\\_Fim\\_04717](#)*

〔The FiM shall perform the evaluation of actual EventIds status information cyclically for all the EventIds using the inhibition mask and then calculate the corresponding FID permission states. FiM shall access the monitor status information using the API `Dem_GetMonitorStatus` if Dem and FiM are implemented as separate modules. FiM shall access the monitor status structure of Dem if Dem and FiM are implemented as a bundle.〕

### 8.3.6 Expected Interfaces

This chapter lists all functions the module FiM requires from other modules.

#### 8.3.6.1 Mandatory Interfaces

This chapter defines all interfaces, which are required to fulfill the core functionality of the module.

**[SWS\_Fim\_00079] Definition of mandatory interfaces required by module FiM 〔**

<i>API Function</i>	<i>Header File</i>	<i>Description</i>
<code>Dem_GetMonitorStatus</code>	<code>Dem.h</code>	Gets the current monitor status for an event.
<code>SchM_ActMainFunction_FiM</code>	<code>&lt;none&gt;</code>	Invokes the <code>SchM_ActMainFunction</code> function to trigger the activation of a corresponding main processing function.

〕

### 8.3.6.2 Optional Interfaces

This chapter defines all interfaces, which are required to fulfill an optional functionality of the module.

#### [SWS\_Fim\_00080] Definition of optional interfaces requested by module FiM

API Function	Header File	Description
Det_ReportError	Det.h	Service to report development errors.

]

## 8.4 Service interfaces

This chapter specifies the ports and port interfaces to operate the FiM functionality over the VFB.

### 8.4.1 Client-Server-Interfaces

#### 8.4.1.1 FunctionInhibition

Using the concepts of the SW-C template, the interface is defined as follows:

#### [SWS\_Fim\_00090] Definition of ClientServerInterface FunctionInhibition

*Upstream requirements:* [SRS\\_Fim\\_04700](#)

]

<b>Name</b>	FunctionInhibition		
<b>Comment</b>	The SW Components can use this service to query for the permission to execute a certain functionality represented by a FID.		
<b>IsService</b>	true		
<b>Variation</b>	–		
<b>Possible Errors</b>	0	E_OK	Operation successful
	1	E_NOT_OK	Operation failed

<b>Operation</b>	GetFunctionPermission		
<b>Comment</b>	Get the permission state of the respective FID.		
<b>Relates to</b>	<a href="#">FIM_GetFunctionPermission</a>		
<b>Variation</b>	–		
<b>Parameters</b>	Permission		
	<b>Type</b>	boolean	
	<b>Direction</b>	OUT	
	<b>Comment</b>	The permission of the requested FID. TRUE: FID has permission to run FALSE: FID has no permission to run, i.e. shall not be executed	
	<b>Variation</b>	–	

<b>Possible Errors</b>	E_OK E_NOT_OK
------------------------	------------------

#### 8.4.1.2 ControlFunctionAvailable

Using the concepts of the SW-C template, the interface is defined as follows:

##### [SWS\_Fim\_00107] Definition of ClientServerInterface ControlFunctionAvailable

*Upstream requirements: SRS\_Fim\_04723*

<b>Name</b>	ControlFunctionAvailable		
<b>Comment</b>	SW Components can use this service to set the availability of a function.		
<b>IsService</b>	true		
<b>Variation</b>	({ecuc(FiM/FiMGeneral/FiMAvailabilitySupport)} == True)		
<b>Possible Errors</b>	0	E_OK	Operation successful
	1	E_NOT_OK	Operation failed

<b>Operation</b>	SetFunctionAvailable		
<b>Comment</b>	Sets the availability of a function.		
<b>Relates to</b>	<a href="#">FIM_SetFunctionAvailable</a>		
<b>Variation</b>	–		
<b>Parameters</b>	Availability		
	<b>Type</b>	boolean	
	<b>Direction</b>	IN	
	<b>Comment</b>	The permission of the requested FID: TRUE: Function is available. FALSE: Function is not available.	
	<b>Variation</b>	–	
<b>Possible Errors</b>	E_OK E_NOT_OK		

#### 8.4.1.3 FunctionInhibitionCallback

Using the concepts of the SW-C template, the interface is defined as follows:

##### [SWS\_Fim\_91004] Definition of ClientServerInterface FunctionInhibitionCallback

*Upstream requirements: SRS\_Fim\_04700*

<b>Name</b>	FunctionInhibitionCallback		
<b>Comment</b>	The SW Components can use this service to get informed on permission state changes of a FID.		
<b>IsService</b>	true		
<b>Variation</b>	–		
<b>Possible Errors</b>	0	E_OK	Operation successful

<b>Operation</b>	CBFidStatusChanged																		
<b>Comment</b>	–																		
<b>Relates to</b>	<a href="#">CBFidStatusChanged</a>																		
<b>Variation</b>	–																		
<b>Parameters</b>	Status <table border="1"> <tr> <td><b>Type</b></td> <td><a href="#">FiM_FunctionIdType</a></td> </tr> <tr> <td><b>Direction</b></td> <td>IN</td> </tr> <tr> <td><b>Comment</b></td> <td>Set to INIT if the FiM is calling this callback due to the initialisation of the module. If set to CHANGED, this callback indicates a FID state change</td> </tr> <tr> <td><b>Variation</b></td> <td>–</td> </tr> </table> Permission <table border="1"> <tr> <td><b>Type</b></td> <td>boolean</td> </tr> <tr> <td><b>Direction</b></td> <td>IN</td> </tr> <tr> <td><b>Comment</b></td> <td>Indicates the initial/new FID permission state. TRUE: FID has permission to run FALSE: FID has no permission to run.</td> </tr> <tr> <td><b>Variation</b></td> <td>–</td> </tr> </table>			<b>Type</b>	<a href="#">FiM_FunctionIdType</a>	<b>Direction</b>	IN	<b>Comment</b>	Set to INIT if the FiM is calling this callback due to the initialisation of the module. If set to CHANGED, this callback indicates a FID state change	<b>Variation</b>	–	<b>Type</b>	boolean	<b>Direction</b>	IN	<b>Comment</b>	Indicates the initial/new FID permission state. TRUE: FID has permission to run FALSE: FID has no permission to run.	<b>Variation</b>	–
<b>Type</b>	<a href="#">FiM_FunctionIdType</a>																		
<b>Direction</b>	IN																		
<b>Comment</b>	Set to INIT if the FiM is calling this callback due to the initialisation of the module. If set to CHANGED, this callback indicates a FID state change																		
<b>Variation</b>	–																		
<b>Type</b>	boolean																		
<b>Direction</b>	IN																		
<b>Comment</b>	Indicates the initial/new FID permission state. TRUE: FID has permission to run FALSE: FID has no permission to run.																		
<b>Variation</b>	–																		
<b>Possible Errors</b>	<a href="#">E_OK</a>																		

]

## 8.4.2 Implementation Data Types

### 8.4.2.1 FiM\_FunctionIdType

#### [SWS\_Fim\_00027] Definition of ImplementationDataType FiM\_FunctionIdType

*Upstream requirements: [SRS\\_BSW\\_00304](#), [SRS\\_BSW\\_00305](#), [SRS\\_BSW\\_00377](#)*

<b>Name</b>	FiM_FunctionIdType		
<b>Kind</b>	Type		
<b>Derived from</b>	<b>Basetype</b>	<b>Variation</b>	
	uint16	platform depended	
	uint8	platform depended	
<b>Range</b>	0..255, 0..65535	–	Identifier of functionality Configurable, size depends on System complexity. Remark: Not all numbers are valid. The FIM data generation tool shall only assign valid values.
<b>Description</b>	Type for the FunctionID		

▽

<b>Variation</b>	-
<b>Available via</b>	Rte_FiM_Type.h

### 8.4.3 Ports

#### [SWS\_Fim\_00094] Definition of Port Func\_{Name} provided by module FiM

*Upstream requirements:* [SRS\\_Fim\\_04700](#)

<b>Name</b>	Func_{Name}		
<b>Kind</b>	ProvidedPort	<b>Interface</b>	FunctionInhibition
<b>Description</b>	A client can query the FiM for execution permission for a specific function. The FIDs which represent the functions are not directly used by the client SW-C. Instead, the mechanism of "port-defined argument values" is used and every FID is mapped to a separate port that is responsible for the data exchange via RTE.		
<b>Port Defined Argument Value(s)</b>	<b>Type</b>	FiM_FunctionIdType	
	<b>Value</b>	{ecuc(FiM/FiMConfigSet/FiMFID/FiMFunctionId.value)}	
<b>Variation</b>	Name = {ecuc(FiM/FiMConfigSet/FiMFID.SHORT-NAME)}		

#### [SWS\_Fim\_00108] Definition of Port Control\_{Name} provided by module FiM

*Upstream requirements:* [SRS\\_Fim\\_04723](#)

<b>Name</b>	Control_{Name}		
<b>Kind</b>	ProvidedPort	<b>Interface</b>	ControlFunctionAvailable
<b>Description</b>	A client can set the availability for a specific function.		
<b>Port Defined Argument Value(s)</b>	<b>Type</b>	FiM_FunctionIdType	
	<b>Value</b>	{ecuc(FiM/FiMConfigSet/FiMFID/FiMFunctionId.value)}	
<b>Variation</b>	({ecuc(FiM/FiMGeneral/FiMAvailabilitySupport}) == True) Name = {ecuc(FiM/FiMConfigSet/FiMFID.SHORT-NAME)}		

#### [SWS\_Fim\_91003] Definition of Port CBFIDStatusChanged\_{Name} required by module FiM

*Upstream requirements:* [SRS\\_Fim\\_04700](#)

<b>Name</b>	CBFIDStatusChanged_{Name}		
<b>Kind</b>	RequiredPort	<b>Interface</b>	FunctionInhibitionCallback
<b>Description</b>	-		

<b>Variation</b>	Name=(({ecuc(FiM/FiMConfigSet/FiMFID/FiMCallbackFIDStatusChanged )} != NULL) && ({ecuc(FiM/FiMConfigSet/FiMFID/FiMCallbackFIDStatusChanged/FiMCallbackFIDStatusChangedFnc)} == NULL)) Name = {ecuc(FiM/FiMConfigSet/FiMFID.SHORT-NAME)}
------------------	---

]

#### 8.4.4 Internal Behavior

The InternalBehavior of the FiM Service is only seen by the local RTE. Additionally to the definition of the function identifiers as port defined arguments, the InternalBehavior has to specify the operation invoked runnables:

```
Internal Behavior FiM {  
    // definition of associated operation-invoked RTE-events not shown  
    // (it is done in the same way as for any SWC type)  
    // section "runnable entities":  
  
    RunnableEntity GetFunctionPermission  
  
    symbol "FiMGetFunctionPermission"  
    canbeInvokedConcurrently = TRUE  
}
```

## 9 Sequence diagrams

### 9.1 Initialization sequence of FiM

Figure 9.1: Initialization sequence of FiM

### 9.2 FiM\_DemTriggerOnMonitorStatus

The sequence diagram below illustrates how the Dem informs the FiM about the change of a certain monitor status by calling [FiM\\_DemTriggerOnMonitorStatus](#). Furthermore, it indicates how the FID is affected by requesting permission status using [FiM\\_GetFunctionPermission](#).

**Figure 9.2: FiM\_DemTriggerOnMonitorStatus**

## 10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification, Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module FiM.

Chapter 10.3 specifies published information of the module FiM.

### 10.1 How to read this chapter

For details refer to [1] Chapter 10.1 “*Introduction to configuration specification*”.

### 10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters. The detailed meanings of the parameters are described in Chapter 7 and Chapter 8.

#### 10.2.1 FiM

##### [ECUC\_FiM\_00612] Definition of EcucModuleDef FiM [

Module Name	FiM	
Description	Configuration of the FiM (Function Inhibition Manager) module.	
Post-Build Variant Support	true	
Supported Config Variants	VARIANT-POST-BUILD, VARIANT-PRE-COMPIL	

Included Containers		
Container Name	Multiplicity	Dependency
FiMConfigSet	1	This container contains the configuration parameters and sub containers of the FiM module supporting multiple configuration sets.
FiMGeneral	1	–

]

Figure 10.1: Configuration overview for FiM

## 10.2.2 FiMGeneral

### [ECUC\_FiM\_00040] Definition of EcucParamConfContainerDef FiMGeneral [

Container Name	FiMGeneral
Parent Container	FiM
Description	-
Multiplicity	1
Configuration Parameters	

Included Parameters		
Parameter Name	Multiplicity	ECUC ID
FiMAvailabilitySupport	1	[ECUC_FiM_00610]
FiMDevErrorDetect	1	[ECUC_FiM_00087]
FiMEventUpdateTriggeredByDem	1	[ECUC_FiM_00086]
FIMMainFunctionPeriod	1	[ECUC_FiM_00611]
FiMMaxEventsPerFidInhibitionConfiguration	0..1	[ECUC_FiM_00608]
FiMMaxFiMInhibitionConfigurations	0..1	[ECUC_FiM_00606]
FiMMaxInputEventsPerSummaryEvents	0..1	[ECUC_FiM_00609]
FiMMaxSumEventsPerFidInhibitionConfiguration	0..1	[ECUC_FiM_00607]
FiMMaxSummaryEvents	1	[ECUC_FiM_00091]
FiMVersionInfoApi	1	[ECUC_FiM_00094]

## No Included Containers

## [ECUC\_FiM\_00610] Definition of EcucBooleanParamDef FiMAvailabilitySupport

Parameter Name	FiMAvailabilitySupport		
Parent Container	FiMGeneral		
Description	This configuration parameter specifies, if the Fim shall support the service to set the Availability of a Functionality. true: Service is supported. false: Service is not supported		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Dependency			

## [ECUC\_FiM\_00087] Definition of EcucBooleanParamDef FiMDevErrorDetect

Parameter Name	FiMDevErrorDetect		
Parent Container	FiMGeneral		
Description	Switches the development error detection and notification on or off. <ul style="list-style-type: none"> <li>• true: detection and notification is enabled.</li> <li>• false: detection and notification is disabled.</li> </ul>		
Multiplicity	1		
Type	EcucBooleanParamDef

### 10.2.3 FiMConfigSet

[ECUC\_FiM\_00601] Definition of EcucParamConfContainerDef FiMConfigSet

<b>Container Name</b>	FiMConfigSet	
<b>Parent Container</b>	FiM	
<b>Description</b>	This container contains the configuration parameters and sub containers of the FiM module supporting multiple configuration sets.	
<b>Multiplicity</b>	1	
<b>Configuration Parameters</b>		

<b>No Included Parameters</b>
-------------------------------

<b>Included Containers</b>		
<b>Container Name</b>	<b>Multiplicity</b>	<b>Dependency</b>
<a href="#">FiMFID</a>	1..*	This container includes symbolic names of all FIDs.
<a href="#">FiMInhibitionConfiguration</a>	1..*	This container includes all configuration parameters concerning the relationship between event and FID.
<a href="#">FIMSummaryEvent</a>	0..*	The summarized EventId definition record consists of a summarized event ID and specific Dem Events. This record means that a particular FID that has to be disabled in case of summarized event (defined above) is to be disabled in any of the specific events. A possible solution could be assigning events as summarized events along with a list of specific events. During the configuration process the summarized event substitutes the referenced single events. However, it is not outlined how this requirement is solved - whether by configuration process or by implementation within the FiM. The FiM configuration tool could also build up a suitable data structure for summarized events and deal with it in the FiM implementation.

]

#### 10.2.4 FiMFID

##### [ECUC\_FiM\_00039] Definition of EcucParamConfContainerDef FiMFID [

<b>Container Name</b>	FiMFID	
<b>Parent Container</b>	FiMConfigSet	
<b>Description</b>	This container includes symbolic names of all FIDs.	
<b>Multiplicity</b>	1..*	
<b>Configuration Parameters</b>		

<b>Included Parameters</b>		
<b>Parameter Name</b>	<b>Multiplicity</b>	<b>ECUC ID</b>
<a href="#">FIMFunctionId</a>	1	[ECUC_FiM_00085]

<b>Included Containers</b>		
<b>Container Name</b>	<b>Multiplicity</b>	<b>Dependency</b>
<a href="#">FIMCallbackFIDStatusChanged</a>	0..1	The presence of this container sets up the callout function FIDStatusChanged for this FID.

]

### [ECUC\_FiM\_00085] Definition of EcucIntegerParamDef FiMFunctionId

Parameter Name	FiMFunctionId		
Parent Container	FiMFID		
Description	Unique identifier of a FimFunctionId. This parameter should not be changeable by user, because the Id should be generated by Fim itself to prevent gaps and multiple use of an Id. Note: The implementer can add the attribute 'withAuto' to the parameter definition which indicates that the value can be calculated by the generator automatically. When 'withAuto' is set to 'true' for this parameter definition the 'isAutoValue' can be set to 'true'. If 'isAutoValue' is set to 'true' the actual value will not be considered during ECU Configuration but will be (re-)calculated by the code generator and stored in the value attribute afterwards.		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 65535		
Default value	-		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	-	
	Post-build time	-	
Dependency			

### 10.2.5 FiMInhibitionConfiguration

### [ECUC\_FiM\_00038] Definition of EcucParamConfContainerDef FiMInhibitionConfiguration

Container Name	FiMInhibitionConfiguration		
Parent Container	FiMConfigSet		
Description	This container includes all configuration parameters concerning the relationship between event and FID.		
Multiplicity	1..*		
Post-Build Variant Multiplicity	true		
Multiplicity Configuration Class	Pre-compile time	X	VARIANT-PRE-COMPIL
	Link time	-	
	Post-build time	X	VARIANT-POST-BUILD
Configuration Parameters			

Included Parameters			
Parameter Name	Multiplicity	ECUC ID	
FiMInhInhibitionMask	1	[ECUC_FiM_00096]	
FiMInhComponentRef	0..*	[ECUC_FiM_00605]	
FiMInhEventRef	0..*	[ECUC_FiM_00100]
