

Document Title	Specification of Time Synchronization over FlexRay
Document Owner	AUTOSAR
Document Responsibility	AUTOSAR
Document Identification No	675

Document Status	published
Part of AUTOSAR Standard	Classic Platform
Part of Standard Release	R25-11

Document Change History			
Date	Release	Changed by	Description
2025-11-27	R25-11	AUTOSAR Release Management	Reporting of security events updated
2024-11-27	R24-11	AUTOSAR Release Management	- Offset Time Domains removed - Changed lower layer from FrIf to LSduR
2023-11-23	R23-11	AUTOSAR Release Management	- Clarification of / refinement of sequence counter validation - Clarification of / refinement of Timesync message transmission and debouncing behavior - Incorporation of validation findings for "Secured Time Synchronization"
2022-11-24	R22-11	AUTOSAR Release Management	- Support for "Secured Time Synchronization" added - Minor content changes, clarifications
2021-11-25	R21-11	AUTOSAR Release Management	- Hysteresis added for sequence counter validation - Small enhancement to improve precision of Global Time - Bugfix for Time Validation

2020-11-30	R20-11	AUTOSAR Release Management	• Time Validation updated for Time Gateways • Post build variant value corrected for FrTSynGlobalTimeMasterHandleId and FrTSynGlobalTimeSlaveHandleId
2019-11-28	R19-11	AUTOSAR Release Management	• Time Validation (draft) • Clarification regarding messages with stuck sequence counter • Clarification regarding cyclic operation entry after timebase startup • Clarification regarding transmission and reception of User Bytes • Changed Document Status from Final to published
2018-10-31	4.4.0	AUTOSAR Release Management	• Modifications to enhance the precision of Global Time Synchronization • Additional minor corrections / clarifications / editorial changes; For details please refer to the Change Documentation
2016-11-30	4.3.0	AUTOSAR Release Management	• Offset message formats changed • Immediate Time Synchronization message transmission • Various enhancements and corrections
2015-07-31	4.2.2	AUTOSAR Release Management	• Error code FRTSYN_E_INVALID_PDU_SDU_ID replaced by FRTSYN_E_INVALID_PDUID • FlexRay communication state handling simplified (FrIf_GetPOCStatus replaced by FrIf_GetState)
2014-10-31	4.2.1	AUTOSAR Release Management	• Initial Release

1 Introduction and functional overview

The `FrTSyn` module handles the distribution of time information over FlexRay buses.

The FlexRay mechanism is much simpler than the mechanism for CAN since it is based on the fact, that FlexRay nodes are synchronized to each other, otherwise no messages can be transmitted on FlexRay.

Both, Time Master and Time Slaves have the same view on the FlexRay global time. It is therefore just necessary to define the same point in (FlexRay) time and to transmit the time information, which will be valid at that point in (FlexRay) time.

Although this same point in (FlexRay) time could be in theory any FlexRay macrotick within a FlexRay cycle, the start of a FlexRay cycle simplifies this mechanism. In addition, the mechanism does not just use any cycle start but uses the cycle start of the subsequent cycle with cycle counter value 0, i.e. the Time Master transmits time information located in the future.

On FlexRay only one Time Synchronization message is needed.

The Time Master uses its current FlexRay time, i.e. macrotick counter and cycle counter, and the current time, which shall be distributed and calculates the resulting time at the start of the next cycle 0. Once this resulting time has been calculated, it is neither very time critical, when exactly the FlexRay frame is transmitted, nor when it is received and processed.

Every Time Slave receiving the transmitted time information will use it in combination with the current FlexRay macrotick counter and cycle counter to determine the actual master time and set its slave time.

Figure 1.1 illustrates the Time Synchronization mechanism on FlexRay.

Figure 1.1: FlexRay Time Synchronization Mechanism

The `FrTSyn` also supports securing the global time messages on the FlexRay communication bus. The figure below shows the time provider modules interface with the security modules in the AUTOSAR Layered Architecture.

Figure 1.2: Timesync modules interface with security modules in the AUTOSAR Layered Architecture

2 Acronyms, Abbreviations, and Definitions

This section lists module local abbreviations and definitions. For additional Time Synchronization related abbreviations and definitions refer to chapter 3 in the RS Time Synchronization [1]. For general terms and abbreviations refer to the AUTOSAR Glossary [2].

Abbreviation	Description
GTM	Global Time Master
BswM	BSW Mode Manager module
<Bus>TSyn	Bus specific Time Synchronization module
CRC	Cyclic Redundancy Checksum
CSM	Crypto Service Manager
Debounce Time	Minimum gap between two Tx messages with the same PDU
Det	Default Error Tracer module
FCNT	FlexRay Cycle Counter
FR	FlexRay
FrIf	FlexRay interface module
FrTSyn	Time Synchronization over FlexRay module
FV	Freshness Value
FVL	Freshness Value Length
FVM	Freshness Value Manager
ICV	Integrity Check Value
ICVL	Integrity Check Value Length
IdsM	Intrusion Detection System Manager module
LSduR	L-SDU Router module
MAC	Message Authentication Code
SC	Sequence Counter in Time Synchronization messages
SGW	"Synchronized to Gateway" state of Time Synchronization
StbM	Synchronized Time-Base Manager
SYNC message	Time Synchronization message
Timesync	Time Synchronization

3.2 Related specification

AUTOSAR provides a General Specification on Basic Software modules [3, SWS BSW General], which is also valid for [FrTSyn](#).

Thus, the specification SWS BSW General shall be considered as additional and required specification for [FrTSyn](#).

4 Constraints and assumptions

4.1 Limitations

Time Masters, Time Gateways and Time Slaves shall work with a Time Base reference clock with a tick duration of $2\mu\text{s}$.

4.2 Applicability to car domains

Automotive systems requiring a common Time Base for ECUs regardless of which bus system the ECUs are connected to.

5 Dependencies to other modules

The Time Synchronization over FlexRay (**FrTSyn**) has interfaces towards the Synchronized Time-Base Manager (**StbM**), the FlexRay Interface (**FrIf**), the L-SDU Router (**LSduR**), the BSW Mode Manager (**BswM**), the Default Error Tracer (**Det**), the Crypto Service Manager (**Csm**), and the Intrusion Detection System Manager (**IdsM**).

Table 6.1: Requirements Tracing

7 Functional specification

This chapter defines the behavior of the Time Synchronization over FlexRay. The API of the module is defined in chapter 8, while the configuration is defined in chapter 10.

7.1 Overview

The Time Synchronization over FlexRay is responsible to ensure the collection and distribution of Synchronized Time information across the FlexRay network. It interacts with the [StbM](#) and provides all FlexRay specific functions to the [StbM](#).

Time Synchronization principles and common wording is described in [5] and [1].

7.2 Module Handling

This section contains description of auxiliary functionality of the Time Synchronization over FlexRay.

7.2.1 Initialization

The Time Synchronization over FlexRay is initialized via [FrTSyn_Init](#). Except for [FrTSyn_GetVersionInfo](#) and [FrTSyn_Init](#), the API functions of the Time Synchronization over FlexRay may only be called when the module has been properly initialized.

[SWS_FrTSyn_00003]

Upstream requirements: [RS_TS_00003](#), [RS_TS_00004](#)

[A call to [FrTSyn_Init](#) initializes all internal variables and sets the Time Synchronization over FlexRay to the initialized state.
]

[SWS_FrTSyn_00006]

Upstream requirements: [RS_TS_20041](#)

[The Sequence Counter ([SC](#)) shall be initialized with 0.
]

7.2.2 FlexRay Interface

[SWS_FrTSyn_00078]

Upstream requirements: [RS_TS_20040](#), [RS_TS_20041](#)

[The [FrTSyn](#) module shall call `FrIf_GetGlobalTime` only if `FrIf_GetState` returns `FRIF_STATE_ONLINE`. This is to ensure that `FrIf_GetGlobalTime` returns valid time information, i.e. that the FlexRay communication controller is synchronous to the FlexRay global time.]

7.2.3 Error Handling

[SWS_FrTSyn_00058]

Upstream requirements: [RS_TS_20042](#), [SRS_BSW_00323](#)

[On errors and exceptions, the [FrTSyn](#) module shall not modify its current module state but shall simply report the error event.]

7.3 Message Format

SYNC messages may share the same [FR](#) PDU by using a multiplexed signal group. The multiplexer is located in byte 0, named `Type`.

For different Time Domains the same [FR](#) PDU may be used if Time Synchronization messages are sent by the same Time Master or Time Gateway.

For different Time Domains different [FR](#) PDUs shall be used if Time Synchronization messages are sent by different Time Masters or Time Gateways.

The usage of [CRC](#) is optional. To ensure a great variability between several time observing units, the configuration decides of how to handle [CRC](#) protected time synchronization messages if the receiver does not support the [CRC](#) calculation. Hence it might be possible, that a receiver is just using the given Time Base value, without evaluating the [CRC](#).

SYNC messages can be [ICV](#) secured. This provides the integrity and authenticity protection of these messages.

The usage of a [ICV](#) is optional. To ensure a great variability between several time observing units, the configuration decides on how to handle [ICV](#) secured Time Synchronization messages if the receiver does not support the [ICV](#) calculation. Hence it might be possible, that a receiver is just using the given Time Base value without evaluating the [ICV](#).

[SWS_FrTSyn_00007]

Upstream requirements: [RS_TS_20043](#)

[The byte order for time values inside Time Synchronization messages is "Big Endian".]

[SWS_FrTSyn_00009]

Upstream requirements: [RS_TS_20043](#), [RS_TS_20074](#)

[If the message type is 0x10 or 0x20 (not [ICV](#) secured [SYNC](#) messages), the Payload Length shall be 16.]

The length of [ICV](#) secured messages depends on the length of the variable [FV](#) and [ICV](#) fields.

[SWS_FrTSyn_00136]

Upstream requirements: [RS_TS_20043](#), [RS_TS_20074](#)

[If the message type is 0x50 or 0x60 ([ICV](#) secured [SYNC](#) messages), the Payload Length shall be 18 .. 254, depending on the configured [FV](#) length ([StbMFreshnessValueLength](#)) and the [ICV](#) length ([FrTSynIcvTxLength](#)).]

[SWS_FrTSyn_00110]

Upstream requirements: [RS_TS_20074](#)

[For [SYNC](#) messages, if the [FVL](#) field is 0, there shall be no [FV](#) field, i.e., the [ICV](#) field shall follow immediately, starting with byte 18.]

[SWS_FrTSyn_00111]

Upstream requirements: [RS_TS_20074](#)

[For [SYNC](#) messages, if the [ICVL](#) field is 0, there shall be no [ICV](#) field, i.e., the [SYNC](#) message shall end with byte 17.]

[SWS_FrTSyn_00010]

Upstream requirements: [RS_TS_20043](#), [RS_TS_20045](#)

[Time Synchronization messages contain User Data according to the given message format.]

[SWS_FrTSyn_00011]

Upstream requirements: [RS_TS_20045](#)

[User Data shall be read consistently from the incoming Time Synchronization messages.]

[SWS_FrTSyn_00012]

Upstream requirements: [RS_TS_20045](#)

[User Data shall be written consistently to outgoing Time Synchronization messages.]

If the number of User Data Fields in a Time Synchronization message is greater than the number of User Data Bytes provided by the StbM, the remaining User Data Fields shall be set to 0 (default value).]

[SWS_FrTSyn_00013]

Upstream requirements: [RS_TS_20045](#)

[User Data shall be mapped to the StbM_UserDataType, where the byte number given in the message and by the StbM_UserDataType shall match (User Byte 0 mapped to StbM_UserDataType.userByte0 etc.). StbM_UserDataType.userDataLength shall be set to the Time Synchronization message type specific number of User Bytes.]

7.3.1 SYNC message

The message layout of the SYNC messages is defined by the following requirements:

- [\[SWS_FrTSyn_00014\]](#)
- [\[SWS_FrTSyn_00015\]](#)
- [\[SWS_FrTSyn_00106\]](#)
- [\[SWS_FrTSyn_00107\]](#)

depending on whether the payload is [CRC](#) protected and/or [ICV](#) secured or not.

[SWS_FrTSyn_00014] SYNC message format - not CRC protected, not ICV secured

Upstream requirements: [RS_TS_20041](#), [RS_TS_20043](#)

[

Byte	Bit Position	Field Name	Field Value Range	Description
0		Type	0x10	Message Type
1		User Byte 2	default: 0

」

7.4 Acting as Time Master

A Time Master is an entity which is the master for a certain Time Base and which propagates this Time Base to a set of Time Slaves within a certain segment of a communication network, being a source for this Time Base.

If a Time Master is also the owner of the Global Time Base, the Time Base from which all further Time Bases are derived from, then it is the Global Time Master. A Time Gateway typically consists of one Time Master port which is connected to one or more Time Slaves. When mapping time entities to real ECUs it has to be noted, that an ECU could be Time Master (or even Global Time Master) for one Time Base and Time Slave for another Time Base.

Figure 7.1: Terminology Example

If the FrTSyn is configured as a Time Master for Time Domain, the FrTSyn module checks on each `FrTSyn_MainFunction` call the necessity for a Timesync message transmission for that Time Domain.

Figure 7.2 illustrates how FrTSyn determines if (immediate and cyclic) message transmission of a Timesync message is required.

Figure 7.2: Timesync Message Transmission

[SWS_FrTSyn_00173] SYNC message transmission by LSduR_FrTSynTransmit

Upstream requirements: [RS_TS_20039](#)

[A Time Master shall transmit SYNC messages by calling `LSduR_FrTSynTransmit` with the `PduId` derived via `FrTSynGlobalTimePduRef` of the corresponding Time Domain.]

7.4.1 SYNC message processing

[SWS_FrTSyn_00018]

Upstream requirements: [RS_TS_20043](#)

[A Time Synchronization message sequence consists of a SYNC message per Time Domain.]

Note: Refer to figure [9.1](#) for the sequence diagram of a Time Master.

[SWS_FrTSyn_00019]

Upstream requirements: [RS_TS_20039](#), [RS_TS_20043](#)

[For each configured Time Master (refer to `FrTSynGlobalTimeMaster`) if

- the `GLOBAL_TIME_BASE` bit within the `timeBaseStatus` is set
- and `FrTSynGlobalTimeTxPeriod` is unequal to 0
- and the associated `cyclicMsgResumeCounter` is equal or less than 0,

then the `FrTSyn` module shall periodically transmit SYNC messages with the cycle `FrTSynGlobalTimeTxPeriod` including the time value, which will be valid at the start of the next FlexRay cycle 0 and User Data.

The cyclic transmission shall be started in the earliest possible `FrTSyn_MainFunction` call once the requirements above are fulfilled.]

Note: "earliest possible" means:

- In the next `FrTSyn_MainFunction`, because `GLOBAL_TIME_BASE` is set outside the `FrTSyn_MainFunction`.
- In the current `FrTSyn_MainFunction`, when switching from immediate to cyclic transmission (because this decision is made inside the `FrTSyn_MainFunction`). For details on immediate transmission refer to chapter [7.4.4](#).

[SWS_FrTSyn_00021]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20043](#)

[If

- `FrTSynGlobalTimeTxIcvSecured` is set to `ICV_NOT_SUPPORTED`

- `FrTSynGlobalTimeTxCrcSecured` is set to `CRC_NOT_SUPPORTED`

then the message type of the `SYNC` message shall be `0x10` (i.e., `SYNC` message not CRC protected and not ICV authenticated).

If

- `FrTSynGlobalTimeTxIcvSecured` is set to `ICV_NOT_SUPPORTED`
- `FrTSynGlobalTimeTxCrcSecured` is set to `CRC_SUPPORTED`

then the message type of the `SYNC` message shall be `0x20` (i.e., `SYNC` message CRC protected and not ICV authenticated).]

[SWS_FrTSyn_00112]

Upstream requirements: `RS_TS_20041`, `RS_TS_20043`, `RS_TS_20074`

[If

- `FrTSynGlobalTimeTxIcvSecured` is set to `ICV_SUPPORTED`
- `FrTSynGlobalTimeTxCrcSecured` is set to `CRC_NOT_SUPPORTED`

then the message type of the `SYNC` message shall be `0x50` (i.e., `SYNC` message not CRC protected, but ICV authenticated).

If

- `FrTSynGlobalTimeTxIcvSecured` is set to `ICV_SUPPORTED`
- `FrTSynGlobalTimeTxCrcSecured` is set to `CRC_SUPPORTED`

then the message type of the `SYNC` message shall be `0x60` (i.e., `SYNC` message CRC protected and ICV authenticated).]

7.4.2 Transmission mode

[SWS_FrTSyn_00026]

Upstream requirements: `RS_TS_20039`, `RS_TS_20043`

[If `FrTSyn_SetTransmissionMode(Controller, Mode)` is called and parameter `Mode` equals `FRTSYN_TX_OFF`, all transmit requests from `FrTSyn` shall be omitted on this FlexRay channel.]

[SWS_FrTSyn_00027]

Upstream requirements: `RS_TS_20039`, `RS_TS_20043`

[If `FrTSyn_SetTransmissionMode(Controller, Mode)` is called and parameter `Mode` equals `FRTSYN_TX_ON`, all transmit requests from `FrTSyn` on this FlexRay channel shall be able to be transmitted.]

7.4.3 Debounce Time

The FrTSyn debounces FlexRay Tx PDUs of a Time Master to avoid bursts of Timesync messages on the bus (e.g. if immediate transmission is enabled).

For each Tx PDU the FrTSyn maintains a debounce counter `debounceCounter`. On each transmission of a Timesync message the `debounceCounter` is (re-)loaded by the configured debounce time `FrTSynGlobalTimeDebounceTime`. The `debounceCounter` is decremented in each FrTSyn main cycle. Transmission of the same PDU can only be triggered, if the `debounceCounter` has reached the value 0. Refer also to the overall sequence for the Timesync message transmission in [Figure 7.2](#).

The FrTSyn does not support sharing of PDUs across domains and busses, i.e. same PDU ID shall not be used for different time domains.

[SWS_FrTSyn_00085]

Upstream requirements: [RS_TS_20039](#)

[If for a Time Domain

- [FrTSynGlobalTimeDebounceTime](#) is greater than 0
- and the corresponding Timesync PDU has been successfully sent,

then the FrTSyn shall set the PDU specific `debounceCounter` to [FrTSynGlobalTimeDebounceTime](#).]

Note: A Timesync PDU is considered to be successfully sent, if

- for a Tx Pdu, which is configured for immediate transmission, `LSduR_FrTSynTransmit` returns `E_OK`,
- and for a Tx Pdu, which is configured for decoupled transmission, [FrTSyn_TriggerTransmit](#) returns `E_OK`.

[SWS_FrTSyn_00169]

Upstream requirements: [RS_TS_20039](#)

[If for a Time Domain

- [FrTSynGlobalTimeDebounceTime](#) is greater than 0
- and the `debounceCounter` for the corresponding Timesync PDU is greater than 0,

then the FrTSyn shall decrement the `debounceCounter` value by [FrTSynMainFunctionPeriod](#) on each invocation of [FrTSyn_MainFunction](#).]

[SWS_FrTSyn_00086]

Upstream requirements: [RS_TS_20039](#)

[If for a Time Domain

- `FrTSynGlobalTimeDebounceTime` is greater than 0
- and the `debounceCounter` for the corresponding Timesync PDU is greater than 0
- and a transmission of a TimeSync message is requested,

then FrTSyn shall defer the actual transmission of the Timesync message until `debounceCounter` is equal or less than 0]

Rationale: While debouncing a new transmission request should not get lost.

[SWS_FrTSyn_00170]

Upstream requirements: [RS_TS_20039](#)

[If for a Time Domain

- `FrTSynGlobalTimeDebounceTime` is greater than 0
- and a deferred SYNC message transmission request is pending
- and a new immediate or cyclic transmission of a SYNC message is requested,

then the FrTSyn shall discard the pending request for that Time Domain.]

Rationale: While debouncing there is no queuing of multiple transmission requests. The latest request is the best one.

7.4.4 Immediate Time Synchronization

In addition to the cyclic Timesync message transmission an immediate message transmission might be required. Refer also to the overall sequence for the Timesync message transmission in [Figure 7.2](#).

[SWS_FrTSyn_00087]

Upstream requirements: [RS_TS_20039](#)

[If `FrTSynImmediateTimeSync` is set to TRUE for a Time Base, FrTSyn shall check on each `FrTSyn_MainFunction` call by calling `StbM_GetTimeBaseUpdateCounter`, if the `timeBaseUpdateCounter` of the corresponding Time Base has changed.]

[SWS_FrTSyn_00088]

Upstream requirements: [RS_TS_20039](#)

[If

- `FrTSynImmediateTimeSync` is set to TRUE
- and the `timeBaseUpdateCounter` of a Time Base has changed
- and the `GLOBAL_TIME_BASE` bit of the `timeBaseStatus` is set,

then FrTSyn shall trigger an immediate transmission of Time Synchronization messages for the corresponding Time Base.]

Note: `timeBaseStatus` can be obtained by `StbM_GetTimeBaseStatus` or `StbM_GetCurrentTime`.

Note: The `debounceCounter` as described in 7.4.3 shall always be considered.

In addition to the actual trigger condition for an immediate transmission (refer to [SWS_FrTSyn_00088] above) the parameter `FrTSynCyclicMsgResumeTime` needs to be considered for immediate transmission. Refer also to the trigger condition for cyclic Timesync message transmissions (refer to [SWS_FrTSyn_00019]) .

Two main scenarios are relevant for configuration of `FrTSynCyclicMsgResumeTime`

- With `FrTSynCyclicMsgResumeTime` and `FrTSynGlobalTimeTxPeriod` both being configured as zero, a single shot mode is achieved that is solely triggered by the change of the `timeBaseUpdateCounter`.
- With `FrTSynCyclicMsgResumeTime` greater than `FrTSynGlobalTimeTxPeriod` a hold-over scenario in a Time Gateway can be configured:
 - While Timesync messages are received from the Time Master side, the Timesync messages on the sub-busses are only triggered by immediate transmission (cyclic transmission is suspended while `cyclicMsgResumeCounter` is running).
 - If no Timesync messages from the Time Master side are received anymore and a timeout is detected, cyclic transmission takes over (cyclic transmission no longer suspended because `cyclicMsgResumeCounter` has elapsed).
 - If reception of Timesync messages from the Time Master side resumes, the Timesync messages on the sub-busses are again triggered by immediate transmission (cyclic transmission is again suspended by running `cyclicMsgResumeCounter`).

[SWS_FrTSyn_00090]

Upstream requirements: RS_TS_20039

[If for a Time Domain

- `FrTSynImmediateTimeSync` is set to TRUE
- and `FrTSynCyclicMsgResumeTime` is greater than 0
- and an immediate SYNC message (refer to [SWS_FrTSyn_00088]) is sent,

then the FrTSyn shall set the counter `cyclicMsgResumeCounter` to `FrTSynCyclicMsgResumeTime` for the corresponding Time Domain.]

[SWS_FrTSyn_00093]

Upstream requirements: [RS_TS_20039](#)

[If for a Time Domain the `cyclicMsgResumeCounter` is greater than 0, then the FrTSyn shall discard cyclic Timesync message transmission requests for that Time Domain.]

[SWS_FrTSyn_00161]

Upstream requirements: [RS_TS_20039](#)

[If for a Time Domain the `cyclicMsgResumeCounter` is greater than 0, then the FrTSyn shall decrement the `cyclicMsgResumeCounter` of the corresponding Time Domain by `FrTSynMainFunctionPeriod` on each invocation of `FrTSyn_MainFunction`.]

[SWS_FrTSyn_00091]

Upstream requirements: [RS_TS_20039](#)

[If the `cyclicMsgResumeCounter` is decremented to 0 or below, then the FrTSyn shall resume cyclic Timesync message transmission within the `FrTSyn_MainFunction` call by requesting a SYNC message transmission.]

Note: [[SWS_FrTSyn_00091](#)] is to ensure, that the first cyclic transmission is requested in the same main function call in which also `cyclicMsgResumeCounter` reaches 0 (refer to term "earliest possible" main function in [[SWS_FrTSyn_00019](#)]). If the message is actually transmitted also depends on the `debounceCounter`.

7.4.5 Calculation and Assembling of Time Synchronization Messages

This chapter describes the workflow, how the items of a Time Synchronization message will be calculated (1st step) and how the message will be assembled (2nd step).

7.4.5.1 Global Time Calculation

[SWS_FrTSyn_00028]

Upstream requirements: [RS_TS_20043](#)

[The transmitter of a Synchronized Time Base (Time Master) shall perform the following steps to distribute the Synchronized Time Base:

1. Retrieve current Synchronized Time Base's Time Tuple as `[T_SYNC; T0_VLT]` via `StbM_GetCurrentTime`
2. Protect the following two steps against interruptions:
 - (a) Get `currentCycle` and `currentMacroTicks` via `FrIf_GetGlobalTime`

- (b) Retrieve current Virtual Local Time value as $T1_{VLT}$ via `StbM_GetCurrentVirtualLocalTime`
 3. Calculate the (future) time value of the Time Base at the start of the next FlexRay cycle by $T0 = T_{SYNC} + (T1_{VLT} - T0_{VLT}) + (64 - \text{currentCycle}) * \text{CycleLength} - (\text{CycleLength} / \text{MacroTicksPerCycle}) * \text{currentMacroTicks}$
 4. Calculate `SyncTimeSec` (second portion of $T0$) and `SyncTimeNSec` (nanosecond portion of $T0$)
-]

Note: Refer to figure 9.1 for the Time Master sequence of actions.

Note: It is inevitable to retrieve `currentCycle` and `currentMacroTicks` of the FlexRay time and $T1_{VLT}$ of the Virtual Local Time in an atomic way, otherwise any delay between them will worsen the precision by the amount of the delay.

Note: If the calculation is done on an integer basis the rounding error of the term $(\text{CycleLength} / \text{MacroTicksPerCycle})$ needs to be minimized. This can be done in multiple ways, e.g., by calculating

- $((\text{CycleLength} * \text{currentMacroTicks}) / \text{MacroTicksPerCycle})$ on 64 bit architectures or
- $(((((\text{CycleLength} * 256) / \text{MacroTicksPerCycle}) * \text{currentMacroTicks}) / 256))$ on 32 bit architectures (multiplication by 256 is acceptable for any possible FlexRay parameter configuration)

`CycleLength` and `MacroTicksPerCycle` are retrieved via `FrIf_GetCycleLength` and `FrIf_GetMacroTicksPerCycle`.

7.4.5.2 SGW Calculation

[SWS_FrTSyn_00020]

Upstream requirements: [RS_TS_20043](#)

[The [SGW](#) value (Time Gateway synchronization status) shall be retrieved from the Time Base synchronization status. If the `SYNC_TO_GATEWAY` bit within `timeBaseStatus` is not set the [SGW](#) value shall be `SyncToGTM`. Otherwise the [SGW](#) value shall be set to `SyncToSubDomain`.]

7.4.5.3 Sequence Counter Calculation

[SWS_FrTSyn_00030]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20043](#)

[A Sequence Counter ([SC](#)) of 4 bit is representing numbers from 0 to 15 per Time Domain. The Sequence Counter shall be independent between SYNC messages and shall be incremented by 1 on every transmission request of a SYNC message. It shall wrap around at 15 to 0 again.]

7.4.5.4 CRC Calculation

[SWS_FrTSyn_00031]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20043](#)

[The function `Crc_CalculateCRC8H2F` as defined in [\[6\]](#) shall be used to calculate the [CRC](#), if configured.]

[SWS_FrTSyn_00035]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20043](#)

[The `DataID` shall be calculated as `DataID = DataIDList[SC]`, where `DataIDList` is given by configuration for each message type (refer to [FrTSynGlobal-TimeSyncDataIDList](#)).]

Note: A specific `DataID` out of a predefined `DataIDList` ensures the identification of data elements of Time Synchronization messages.

[SWS_FrTSyn_00036]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20043](#)

[The [CRC](#) shall be calculated over Time Synchronization message byte 2 to byte 15 and `DataID`, where byte 2 is applied first, followed by the other bytes in ascending order, and `DataID` last.]

7.4.5.5 ICV Calculation

Refer to [\[5\]](#) Chapter 7.17 “Freshness Value” for the configuration details of [FV](#) referenced in each Time Domain.

[SWS_FrTSyn_00114]

Upstream requirements: [RS_TS_20074](#)

[When:

- the **FV** is referenced (refer [FrTSynIcvGenerationFvIdRef](#)),
- and the configured truncated **FV** length (`StbMFreshnessValueTruncLength`) is equal to the **FV** length (`StbMFreshnessValueLength`),

the Time Master shall call `StbM_GetTxFreshness` to obtain the **FV** by using the `StbMFreshnessValueId` (referenced via the [FrTSynIcvGenerationFvIdRef](#) parameter).]

[SWS_FrTSyn_00115]

Upstream requirements: [RS_TS_20074](#)

[When:

- the **FV** is referenced (refer [FrTSynIcvGenerationFvIdRef](#)),
- and the configured truncated **FV** length (`StbMFreshnessValueTruncLength`) < **FV** length (`StbMFreshnessValueLength`),

the Time Master shall call `StbM_GetTxFreshnessTruncData` to obtain the **FV** and the truncated **FV** by using the `StbMFreshnessValueId` (referenced via the [FrTSynIcvGenerationFvIdRef](#) parameter).]

Note: Having the configured truncated **FV** length (`StbMFreshnessValueTruncLength`) > **FV** length (`StbMFreshnessValueLength`) in **StbM** is not a valid configuration.

[SWS_FrTSyn_00116]

Upstream requirements: [RS_TS_20074](#)

[When the **FV** is not referenced (refer [FrTSynIcvGenerationFvIdRef](#)), the Time Master shall not include the **FV** in the **ICV** generation and neither in the **SYNC** message.]

[SWS_FrTSyn_00117]

Upstream requirements: [RS_TS_20074](#)

[If `StbM_GetTxFreshness` returns `E_OK`, the Time Master shall construct the **SYNC** message with **FV** and use the full **FV** in the **ICV** generation.]

[SWS_FrTSyn_00118]

Upstream requirements: [RS_TS_20074](#)

[If `StbM_GetTxFreshnessTruncData` returns `E_OK`, the Time Master shall construct the **SYNC** message with truncated **FV** and use the full **FV** in the **ICV** generation.]

[SWS_FrTSyn_00119]

Upstream requirements: [RS_TS_20074](#)

[When `StbM_GetTxFreshness` or `StbM_GetTxFreshnessTruncData` return a non-recoverable error code (i.e, `E_NOT_OK`), then the Time Master shall:

- stop the `ICV` generation and set the `FVL` and the `ICVL` to 0 in the `SYNC` message,
- call `Det_ReportRuntimeError` with parameter `ErrorId` set to `FRTSYN_E_FRESHNESSFAILURE` (refer [\[SWS_FrTSyn_91000\]](#)),
- and report the security event `SEV_TSYN_FR_FRESHNESS_NOT_AVAILABLE` to the `IdsM`.

]

Refer to [\[7\]](#) Chapter 10.2.5 “*CsmJob*” for the configuration details of `CSM` job used for `ICV` generation.

[SWS_FrTSyn_00120]

Upstream requirements: [RS_TS_20074](#)

[If `FrTSynIcvGenerationBase` for the Time Domain is configured to `ICV_MAC`, the Time Master shall call `Csm_MacGenerate` to generate the `ICV` value.]

[SWS_FrTSyn_00121]

Upstream requirements: [RS_TS_20074](#)

[If `FrTSynIcvGenerationBase` for the Time Domain is configured to `ICV_SIGNATURE`, the Time Master shall call `Csm_SignatureGenerate` to generate the `ICV` value.]

Note: The `mode` parameter is intentionally left open for the implementer to choose (i.e. `CRYPTO_OPERATIONMODE_SINGLECALL` would possibly be the best option since it does not require further calls to `CSM`).

The `CSM` job used to generate the `ICV` can be configured to synchronous or asynchronous behavior. The `ICV` generation timeout observation should be disabled, when the `CSM` job used to generate the `ICV`, is configured in synchronous behavior.

[SWS_FrTSyn_00122]

Upstream requirements: [RS_TS_20074](#)

[If `FrTSynIcvGenerationTimeout` is set to 0, the Time Master shall not do `ICV` generation timeout monitoring.]

[SWS_FrTSyn_00123]

Upstream requirements: [RS_TS_20074](#)

[If:

- `FrTSynIcvGenerationTimeout` is set to any value greater than 0,
- and `Csm_MacGenerate` or `Csm_SignatureGenerate` returns `E_OK`,

the Time Master shall start the `FrTSynIcvGenerationTimeout`.]

[SWS_FrTSyn_00124]

Upstream requirements: [RS_TS_20074](#)

[If:

- [FrTSynIcvGenerationTimeout](#) is set to any value greater than 0,
- the callback [FrTSyn_IcvGenerationIndication](#) is called,

the Time Master shall stop the [FrTSynIcvGenerationTimeout](#).]

[SWS_FrTSyn_00125]

Upstream requirements: [RS_TS_20074](#)

[If one of the following conditions is true:

- the authentication build counter has reached the configuration value [FrTSynTx-AuthenticationBuildAttempts](#),
- the verification of the ICV has returned a non-recoverable error such as returning `E_NOT_OK` or `KEY_FAILURE`,
- [FrTSynIcvGenerationTimeout](#) expires before the notification of the [FrTSyn_IcvGenerationIndication](#) callback

then the Time Master shall

- stop the [ICV](#) generation and set the [FVL](#) and the [ICVL](#) to 0 in the [SYNC](#) message,
- and report the security event [SEV_TSYN_FR_ICV_GENERATION_FAILED](#) to the `IdsM`.

]

[SWS_FrTSyn_00126]

Upstream requirements: [RS_TS_20074](#)

[With the notification of the [FrTSyn_IcvGenerationIndication](#) callback, the Time Master shall add the generated [ICV](#) to the [SYNC](#) message and transmit it.]

[SWS_FrTSyn_00127]

Upstream requirements: [RS_TS_20074](#)

[When the FV is referenced (refer [FrTSynIcvGenerationFvIdRef](#)), then the Time Master shall notify the successful transmission of the [SYNC](#) message to [FVM](#) by calling `StbM_SPduTxConfirmation`.]

[SWS_FrTSyn_00153]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[For every transmission of messages of type `0x50` and `0x60`, the Time Master shall maintain an authentication build counter (refer to [FrTSynTxAuthentication-BuildAttempts](#)).]

[SWS_FrTSyn_00154]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[Upon the initial processing of messages of type 0x50 and 0x60 (i.e., upon the first attempt of a freshness value and ICV generation for each received message) the Time Master shall set the authentication build counter to 0.]

[SWS_FrTSyn_00155]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[If `StbM_GetTxFreshness` or `StbM_GetTxFreshnessTruncData` return a recoverable error code (e.g., `STBM_E_BUSY`), then the Time Master shall increment the authentication build counter.]

[SWS_FrTSyn_00156]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[If `Csm_MacGenerate` or `Csm_SignatureGenerate` return a recoverable error code (e.g., `E_BUSY`, `QUEUE_FULL`), then the Time Master shall increment the authentication build counter.]

[SWS_FrTSyn_00171]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[If

- the generation of the authenticated message has failed
- and the authentication build counter has not yet reached the configuration value [FrTSynTxAuthenticationBuildAttempts](#),

then the Time Master shall retry the freshness attempt and the ICV calculation in the next call of [FrTSyn_MainFunction](#).]

7.4.5.6 Message Assembling

[SWS_FrTSyn_00037]

Upstream requirements: [RS_TS_20043](#), [RS_TS_20074](#)

[For each transmission of a Time Synchronization message the FrTSyn module shall assemble the message as follows:

- Calculate [SC](#)
- Copy `currentCycle` (refer to [\[SWS_FrTSyn_00028\]](#)) to [FCNT](#) (for SYNC message)

- Calculate [SGW](#)
- Copy all data to the appropriate position within the related message
- Calculate [CRC](#) (configuration dependent)
- Fetch the [FV](#) (configuration dependent) and append the [FVL](#), [ICVL](#) and [FV](#) in the appropriate position within the related message
- Calculate the [ICV](#) (configuration dependent) and append it in the appropriate position within the related message

]

7.5 Acting as Time Slave

A Time Slave is an entity, which is the recipient for a certain Time Base within a certain segment of a communication network, being a consumer for this Time Base.

7.5.1 SYNC message processing

[SWS_FrTSyn_00038]

Upstream requirements: [RS_TS_20042](#), [RS_TS_20043](#)

[The [FrTSyn](#) shall only accept a SYNC message with `Type` equal to `0x20 / 0x60` and a correct CRC value if [FrTSynRxCrcValidated](#) is configured to [CRC_VALIDATED](#).]

[SWS_FrTSyn_00039]

Upstream requirements: [RS_TS_20043](#)

[The [FrTSyn](#) shall only accept a SYNC message with `Type` equal to `0x10 / 0x50` if [FrTSynRxCrcValidated](#) is configured to [CRC_NOT_VALIDATED](#).]

[SWS_FrTSyn_00040]

Upstream requirements: [RS_TS_20043](#)

[The [FrTSyn](#) shall only accept a SYNC message with `Type` equal to `0x10 / 0x50` or `0x20 / 0x60` if [FrTSynRxCrcValidated](#) is configured to [CRC_IGNORED](#).]

[SWS_FrTSyn_00081]

Upstream requirements: [RS_TS_20042](#), [RS_TS_20043](#)

[The [FrTSyn](#) shall only accept a SYNC message with `Type` equal to `0x10 / 0x50` or a SYNC message with `Type` equal to `0x20 / 0x60` and a correct CRC value if [FrTSynRxCrcValidated](#) is configured to [CRC_OPTIONAL](#).]

[SWS_FrTSyn_00128]

Upstream requirements: [RS_TS_20074](#)

[If [FrTSynRxIcvVerificationType](#) is configured to [ICV_VERIFIED](#), [FrTSyn](#) shall perform ICV verification for [SYNC](#) messages with [ICV](#) value (Message type: 0x50, 0x60).

The [FrTSyn](#) shall consider ICV verification as failed for [SYNC](#) messages without [ICV](#) (Message type: 0x10, 0x20).]

[SWS_FrTSyn_00129]

Upstream requirements: [RS_TS_20074](#)

[If [FrTSynRxIcvVerificationType](#) is configured to [ICV_NOT_VERIFIED](#), the [FrTSyn](#) shall not perform the ICV verification and the [SYNC](#) messages shall not contain an [ICV](#) value (Message type: 0x10, 0x20).

The [FrTSyn](#) shall consider ICV verification as failed for [SYNC](#) messages with [ICV](#) (Message type: 0x50, 0x60).]

[SWS_FrTSyn_00130]

Upstream requirements: [RS_TS_20074](#)

[If [FrTSynRxIcvVerificationType](#) is configured to [ICV_IGNORED](#), [FrTSyn](#) shall not perform the ICV verification.

The [FrTSyn](#) shall ignore the [ICV](#) in [SYNC](#) messages with [ICV](#) (Message type: 0x50, 0x60).]

[SWS_FrTSyn_00131]

Upstream requirements: [RS_TS_20074](#)

[If [FrTSynRxIcvVerificationType](#) is configured to [ICV_OPTIONAL](#), the [FrTSyn](#) shall perform ICV verification for [SYNC](#) messages with [ICV](#) (Message type: 0x50, 0x60).

The [FrTSyn](#) shall not perform ICV verification for [SYNC](#) messages without [ICV](#) (Message type: 0x10, 0x20).]

[SWS_FrTSyn_00041]

Upstream requirements: [RS_TS_20040](#), [RS_TS_20042](#), [RS_TS_20043](#)

[For valid [SYNC](#) messages a new Time Tuple, consisting of the Global Time value and the associated value of the Virtual Local Time, shall be calculated and forwarded to the [StbM](#) module via [StbM_BusSetGlobalTime](#).]

7.5.2 Validation and Disassembling of Time Synchronization Messages

This chapter describes the workflow how the items of a Time Synchronization message will be validated (1st step) and how the message will be disassembled (2nd step).

7.5.2.1 Global Time Calculation

[SWS_FrTSyn_00046]

Upstream requirements: [RS_TS_20043](#)

[The receiver of a Synchronized Time Base shall perform the following steps to assemble the Synchronized Time Base:

1. On SYNC message RX indication (or in the subsequent MainFunction call) store received time value T0 (SyncTimeSec, SyncTimeNSec)
2. Protect the following two steps against interruptions:
 - (a) Get `currentCycle` and `currentMacroticks` via `FrIf_GetGlobalTime`
 - (b) Retrieve current Virtual Local Time value as $T1_{VLT}$ via `StbM_GetCurrentVirtualLocalTime`
3. Calculate Time Tuple [T1; $T1_{VLT}$] to update the Time Slave's local instance of the Time Base:
 - (a)
$$T1 = T0 + (\text{CycleLength} * \text{currentCycle}) + ((\text{CycleLength} / \text{MacrotickPerCycle}) * \text{currentMacroticks})$$
 - (b) If `currentCycle` is greater or equal than the retrieved `FCNT` value from the transmitter (Time Master), then the calculated value T1 shall be subtracted by 64 times the FlexRay cycle duration: $T1 = T1 - (\text{CycleLength} * 64)$

]

Note: Refer to figure [9.2](#) for the Time Slave sequence of actions.

Note: It is inevitable to retrieve `currentCycle` and `currentMacroticks` of the FlexRay time and $T1_{VLT}$ of the Virtual Local Time atomic, otherwise any delay between them will worsen the precision by the amount of the delay.

Note: In order to minimize rounding errors for the term $(\text{CycleLength} / \text{MacrotickPerCycle})$ in case of integer calculation refer to note below [\[SWS_FrTSyn_00028\]](#).

7.5.2.2 SGW Calculation

[SWS_FrTSyn_00094]

Upstream requirements: [RS_TS_20040](#), [RS_TS_20042](#)

[If the [SGW](#) value of a [SYNC](#) message is set to `SyncToSubDomain`, the `SYNC_TO_GATEWAY` bit within `timeBaseStatus` shall be set to `TRUE`. Otherwise, it shall be set to `FALSE`.]

7.5.2.3 Sequence Counter Validation

[Figure 7.3](#) illustrates the Sequence Counter validation of a Time Slave for SYNC messages.

Figure 7.3: Sequence Counter Validation

[SWS_FrTSyn_00162]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20042](#)

[Upon reception of a SYNC message, if the message is the first SYNC message after startup, then a Time Slave shall consider the `Sequence Counter` value as valid.]

Rationale: After startup it makes sense to skip the Sequence Counter check and to allow the Sequence Counter of the Time Slave to synchronize to the one of the Time Master.

[SWS_FrTSyn_00163]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20042](#)

[Upon reception of a SYNC message, if the Sequence Counter check is disabled for SYNC messages (i.e., `FrTSynGlobalTimeSequenceCounterJumpWidth == 0`), then a Time Slave shall consider the `Sequence Counter` value of the SYNC message as valid.]

[SWS_FrTSyn_00164]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20042](#)

[Upon reception of a SYNC message, if

- the message is not the first SYNC message after startup
- and Sequence Counter check is enabled (i.e., `FrTSynGlobalTimeSequenceCounterJumpWidth > 0`)
- and the Time Domain is not in timeout (i.e., `TIMEOUT` bit not set in Time Base synchronization status `timeBaseStatus`)

then a Time Slave shall check the difference value between the Sequence Counter of the current message and the Sequence Counter of the previous SYNC message.

If the difference value is greater than 0 and less or equal than `FrTSynGlobalTimeSequenceCounterJumpWidth`, a Time Slave shall consider the Sequence Counter value as valid, else as invalid.]

7.5.2.3.1 Sequence Counter Hysteresis

This chapter specifies how to apply an optional hysteresis (`FrTSynGlobalTimeSequenceCounterHysteresis`, refer to [SWS_FrTSyn_00168]) to check if the `Sequence Counter value` is valid, i.e., if the Sequence Counter check is actually successful.

This requires that a number of consecutive `Sequence Counter jumps` are valid. Requirements [SWS_FrTSyn_00165], [SWS_FrTSyn_00166] and [SWS_FrTSyn_00167] specify when an individual `Sequence Counter jump` is considered to be valid.

The hysteresis improves robustness against a scenario with a buggy master implementation or injection of invalid master messages, i.e., when the Sequence Counter increments by more than `FrTSynGlobalTimeSequenceCounterJumpWidth`. In such a scenario (without any hysteresis) a message with any (also invalid) Sequence Counter value would cause the Time Slave to leave the Timeout state although the Sequence Counter is not incremented correctly. A hysteresis avoids this.

[SWS_FrTSyn_00165]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20042](#)

[Upon reception of a SYNC message, if

- Sequence Counter check is enabled (i.e., `FrTSynGlobalTimeSequenceCounterJumpWidth > 0`)
- and the Time Domain is in timeout (i.e., TIMEOUT bit set in Time Base synchronization status `timeBaseStatus`)
- and the Sequence Counter is stuck, i.e., the value of the difference between the Sequence Counter of the current message and the Sequence Counter of the previous SYNC message is 0,

then a Time Slave shall consider the Sequence Counter jump as invalid.]

[SWS_FrTSyn_00166]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20042](#)

[Upon reception of a SYNC message, if

- Sequence Counter check is enabled (i.e., `FrTSynGlobalTimeSequenceCounterJumpWidth > 0`)
- and the Time Domain is in timeout (i.e., TIMEOUT bit set in Time Base synchronization status `timeBaseStatus`)
- and the message is the first SYNC message in Timeout for which the Sequence Counter is not stuck,

then a Time Slave shall consider the Sequence Counter jump as valid.]

Rationale: After a Timeout (e.g., due to a reset or disconnect of the Time Master) it is very likely that the Sequence Counter of the first received Timesync message is out of sync, i.e., the Sequence Counter difference exceeds `FrTSynGlobalTimeSequenceCounterJumpWidth`. To allow for faster re-synchronization of the Sequence Counter to the Time Master, the Sequence Counter of the first Timesync message is not checked for `FrTSynGlobalTimeSequenceCounterJumpWidth`.

However, a stuck Sequence Counter will always, i.e., also in this situation, be considered as invalid (refer to [\[SWS_FrTSyn_00165\]](#)).

[SWS_FrTSyn_00167]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20042](#)

[Upon reception of a SYNC message, if

- Sequence Counter check is enabled (i.e., `FrTSynGlobalTimeSequenceCounterJumpWidth` > 0)
- and the Time Domain is in timeout (i.e., `TIMEOUT` bit set in Time Base synchronization status `timeBaseStatus`)
- and the Sequence Counter is not stuck, i.e., the value of the difference between the Sequence Counter of the current message and the Sequence Counter of the previous message is not 0
- and the message is not the first SYNC message in Timeout for which the Sequence Counter is not stuck,

then a Time Slave shall check if the value of the difference between the Sequence Counter of the current message and the Sequence Counter of the previous SYNC message exceeds the threshold `FrTSynGlobalTimeSequenceCounterJumpWidth`.

If the difference value exceeds the threshold `FrTSynGlobalTimeSequenceCounterJumpWidth`, a Time Slave shall consider the Sequence Counter jump as invalid, else as valid.]

[SWS_FrTSyn_00168]

Upstream requirements: [RS_TS_20041](#), [RS_TS_20042](#)

[Upon reception of a SYNC message, if

- Sequence counter check is enabled (i.e., `FrTSynGlobalTimeSequenceCounterJumpWidth` > 0)
- and the Time Domain is in timeout (i.e., `TIMEOUT` bit set in Time Base synchronization status `timeBaseStatus`),

then a Time Slave shall check the number of consecutive valid Sequence Counter jumps (refer to requirements [\[SWS_FrTSyn_00165\]](#), [\[SWS_FrTSyn_00166\]](#) and [\[SWS_FrTSyn_00167\]](#)).

If the number of consecutive valid Sequence Counter jumps exceeds the value `FrTSynGlobalTimeSequenceCounterHysteresis`, a Time Slave shall consider the Sequence Counter value as valid, else as invalid.]

7.5.2.4 CRC Validation

[SWS_FrTSyn_00050]

Upstream requirements: [RS_TS_20042](#), [RS_TS_20043](#)

[The function `Crc_CalculateCRC8H2F` as defined in [\[6\]](#) shall be used to validate the `CRC`, if configured.]

[SWS_FrTSyn_00054]

Upstream requirements: [RS_TS_20042](#), [RS_TS_20043](#)

[The `DataID` shall be calculated as `DataID = DataIDList[SC]`, where `DataIDList` is given by configuration for each message `Type`.]

Note: A specific `DataID` out of a predefined `DataIDList` ensures the identification of data elements of Time Synchronization messages.

[SWS_FrTSyn_00055]

Upstream requirements: [RS_TS_20042](#), [RS_TS_20043](#)

[The `CRC` shall be calculated over Time Synchronization message byte 2 to byte 15 and `DataID`, where byte 2 is applied first, followed by the other bytes in ascending order, and `DataID` last.]

7.5.2.5 ICV Verification

Refer to [\[5\]](#) Chapter 7.17 “Freshness Value” for the configuration details of `FV` referenced in each Time Domain.

[SWS_FrTSyn_00137]

Upstream requirements: [RS_TS_20074](#)

[When the `FV` is referenced (refer [FrTSynIcvVerificationFvIdRef](#)) and the `FVL` of the received `SYNC` message is greater than 0, the Time Slave shall call the `StbM_GetRxFreshness` Api to obtain the `FV` by using:

- the `StbMFreshnessValueId` from the reference [FrTSynIcvVerificationFvIdRef](#),
- the `StbMTruncatedFreshnessValue` as received in the `FV` field of the `SYNC` message,
- the `StbMTruncatedFreshnessValueLength` as received in the `FVL` field of the `SYNC` message,
- the `StbMFreshnessValueLength` from the reference [FrTSynIcvVerificationFvIdRef](#),
- the `StbMAuthVerifyAttempts` as the number of failed verification attempts for the current message (ICV verification attempt counter).

]

[SWS_FrTSyn_00138]*Upstream requirements:* [RS_TS_20074](#)

[When the [FVL](#) of the received [SYNC](#) message is equal to 0, the Time Slave shall not include the [FV](#) in the ICV verification.]

[SWS_FrTSyn_00139]*Upstream requirements:* [RS_TS_20074](#)

[When the [FV](#) is not referenced (refer [FrTSynIcvVerificationFvIdRef](#)) and the [FVL](#) of the received [SYNC](#) message is greater than 0, the Time Slave shall stop the ICV verification and consider the ICV verification as failed.]

[SWS_FrTSyn_00140]*Upstream requirements:* [RS_TS_20074](#)

[If `StbM_GetRxFreshness` returns `E_OK`, the Time Slave shall use the [FV](#) in ICV verification.]

[SWS_FrTSyn_00142]*Upstream requirements:* [RS_TS_20074](#)

[If `StbM_GetRxFreshness` returns a non-recoverable error code (i.e, `E_NOT_OK`), the Time Slave shall

- consider the ICV verification of the received SYNC message as failed,
- stop the ICV verification,
- call `Det_ReportRuntimeError` with parameter `ErrorId` set to [FRTSYN_E_FRESHNESSFAILURE](#) (refer to [\[SWS_FrTSyn_91000\]](#))
- and report the security event [SEV_TSYN_FR_FRESHNESS_NOT_AVAILABLE](#) to the IdSM.

]

Refer to [\[7\]](#) Chapter 10.2.5 “*CsmJob*” for the configuration details of [CSM](#) job used for [ICV](#) generation.

[SWS_FrTSyn_00143]*Upstream requirements:* [RS_TS_20074](#)

[If [FrTSynIcvVerificationBase](#) for the Time Domain is configured to [ICV_MAC](#), the Time Slave shall call `Csm_MacVerify` to verify the ICV value, using as many bytes as specified in the [ICVL](#).]

[SWS_FrTSyn_00144]

Upstream requirements: [RS_TS_20074](#)

[If [FrTSynIcvVerificationBase](#) for the Time Domain is configured to [ICV_SIGNATURE](#), the Time Slave shall call [Csm_SignatureVerify](#) to verify the ICV value, using as many bytes as specified in the [ICVL](#).]

Note: The `mode` parameter is intentionally left open for the implementer to choose (i.e. `CRYPTO_OPERATIONMODE_SINGLECALL` would possibly be the best option since it does not require further calls to [CSM](#)).

The [CSM](#) job used to generate the [ICV](#) can be configured to synchronous or asynchronous behavior.

[SWS_FrTSyn_00145]

Upstream requirements: [RS_TS_20074](#)

[If [FrTSynIcvVerificationTimeout](#) is set to 0, then the Time Slave shall not do ICV verification timeout monitoring.]

[SWS_FrTSyn_00146]

Upstream requirements: [RS_TS_20074](#)

[If [Csm_MacVerify](#) or [Csm_SignatureVerify](#) return a recoverable error code (e.g., `CRYPTO_E_BUSY` or `CRYPTO_QUEUE_FULL`), then the Time Slave shall

- consider the verification of the received SYNC message as failed
- and increment the ICV authentication build counter for this SYNC message.

]

[SWS_FrTSyn_00147]

Upstream requirements: [RS_TS_20074](#)

[If:

- [FrTSynIcvVerificationTimeout](#) is set to any value greater than 0,
- and [Csm_MacVerify](#) or [Csm_SignatureVerify](#) returns `E_OK`,

the Time Slave shall start the [FrTSynIcvVerificationTimeout](#).]

[SWS_FrTSyn_00148]

Upstream requirements: [RS_TS_20074](#)

[If:

- [FrTSynIcvVerificationTimeout](#) is set to any value greater than 0,
- and the [FrTSyn_IcvVerificationIndication](#) callback is called,

the Time Slave shall stop the [FrTSynIcvVerificationTimeout](#).]

[SWS_FrTSyn_00149]

Upstream requirements: [RS_TS_20074](#)

[If one of the following conditions is true:

- the authentication build counter has reached the configuration value [FrTSynRxAuthenticationBuildAttempts](#),
- the ICV verification attempt counter has reached the configuration value [FrTSynIcvVerificationAttempts](#),
- the verification of the [ICV](#) has returned a non-recoverable error such as returning `E_NOT_OK`, or `KEY_FAILURE`,
- the [ICVL](#) is 0 in the received [SYNC](#) message,
- [FrTSynIcvVerificationTimeout](#) expires before the notification of the [FrTSynIcvVerificationIndication](#) callback

then the Time Slave shall

- stop the ICV verification and consider the ICV verification as failed
- and report the security event [SEV_TSYN_FR_ICV_VERIFICATION_FAILED](#) to the IdsM.

]

[SWS_FrTSyn_00157]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[For every reception of messages that require ICV verification the Time Slave shall maintain an authentication build counter (refer [FrTSynRxAuthenticationBuildAttempts](#)).]

[SWS_FrTSyn_00158]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[Upon the initial processing of messages that require ICV verification (i.e., upon the first attempt of a freshness value and ICV verification for each received message) the Time Slave shall set the authentication build counter to 0.]

[SWS_FrTSyn_00159]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[If `StbM_GetRxFreshness` returns a recoverable error code (e.g., `STBM_E_BUSY`), then the Time Slave shall

- increment the authentication build counter
- and not do ICV verification.

]

[SWS_FrTSyn_00160]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[If

- verification of the authenticated message has failed
- and the authentication build counter has not yet reached the configuration value [FrTSynRxAuthenticationBuildAttempts](#),

then the Time Slave shall retry the freshness attempt and ICV verification in the next call of [FrTSyn_MainFunction](#).]

[SWS_FrTSyn_00172]

Status: DRAFT

Upstream requirements: [RS_TS_20074](#)

[If the verification of the ICV could be successfully executed but the verification failed (e.g. the MAC verification has failed or the key was invalid), then the Time Slave shall

- increment the ICV verification attempt counter
- and set the authentication build counter to 0.

]

Note: Resetting the authentication build counter will prevent dropping the authentication process too early even though ICV verification attempts are still possible.

7.5.2.6 Message Disassembling

[SWS_FrTSyn_00056]

Upstream requirements: [RS_TS_20043](#)

[For each received Time Synchronization message the [FrTSyn](#) shall validate the message as follows (all conditions must match):

1. `Type` matches depending on the [FrTSynRxCrcValidated](#) parameter
2. `sc` value is valid (refer to requirements [\[SWS_FrTSyn_00162\]](#) to [\[SWS_FrTSyn_00168\]](#))
3. `D` matches to the defined Time Domain range for each `Type`
4. `D` matches to one of the configured Time Domains
5. `SyncTimeNSec` matches the defined range of `StbM_TimeStampType`. nanoseconds.

6. CRC (including DataID) matches depending on the `FrTSynRxCrcValidated` parameter.
7. ICV verification is successful, depending on the `FrTSynRxIcvVerification-Type` parameter.

]

[SWS_FrTSyn_00057]

Upstream requirements: [RS_TS_20042](#), [RS_TS_20043](#)

[If the validation of received Time Synchronization message is successful (refer to [\[SWS_FrTSyn_00056\]](#)), the `FrTSyn` shall disassemble the message and forward the global time via `StbM_BusSetGlobalTime` to `StbM`.]

[SWS_FrTSyn_00150]

Upstream requirements: [RS_TS_20042](#), [RS_TS_20043](#)

[If the validation of the received Time Synchronization message has failed (refer to [\[SWS_FrTSyn_00056\]](#)), the `FrTSyn` shall discard the message.]

7.6 Time Recording

7.6.1 Global Time Measurement Support

[SWS_FrTSyn_00092]

Upstream requirements: [RS_TS_00034](#)

[On an invocation of `StbM_BusSetGlobalTime` the member `pathDelay` of the `measureDataPtr` structure shall be set to 0.]

7.6.2 Time Validation

[SWS_FrTSyn_00096]

Upstream requirements: [RS_TS_00034](#)

[The `FrTSyn` shall support Time Validation, if `FrTSynTimeValidationSupport` set to TRUE.]

[SWS_FrTSyn_00097]

Upstream requirements: [RS_TS_00034](#)

[
If

- `FrTSynTimeValidationSupport` is enabled and
- `FrTSynEnableTimeValidation` for the Time Domain is enabled

`FrTSyn` shall do time recording for Time Validation for that Time Domain.

]

[SWS_FrTSyn_00098]

Upstream requirements: [RS_TS_00034](#)

[

If

- time recording for Time Validation is enabled for a Time Domain (refer to [\[SWS_FrTSyn_00096\]](#) and [\[SWS_FrTSyn_00097\]](#)) and
- `FrTSyn` is configured as Time Slave for that Time Domain,

`FrTSyn` shall call `StbM_FrSetSlaveTimingData` upon successful reception of a SYNC message.

`StbM_FrSetSlaveTimingData` shall be called after `StbM_BusSetGlobalTime`.]

Note: `StbM_BusSetGlobalTime` shall be called first, because it updates the Sync-local Time Tuple (refer to [\[5\]](#)), which is required by `StbM_FrSetSlaveTimingData`. Refer to figure [9.2](#) for the overall sequence of API calls for a Time Slave.

[SWS_FrTSyn_00099]

Upstream requirements: [RS_TS_00034](#)

[Upon invocation of `StbM_FrSetSlaveTimingData` `FrTSyn` shall pass following values

- the Sequence Counter as received in the SYNC message,
- the segment id of the physical channel on which the SYNC message has been received (refer to parameter `FrTSynGlobalTimeNetworkSegmentId`)
- `currentCycle` and `currentMacroticks` and `FCNT` as read upon reception of the SYNC message (refer to step 2 in [\[SWS_FrTSyn_00046\]](#)),
- `CycleLength` and `MacrotickDuration`
- the Sync ingress timestamp $T1_{VLT}$ as retrieved in step 1 in [\[SWS_FrTSyn_00046\]](#))
- $T0$ as received in the SYNC message (refer to step 1 in [\[SWS_FrTSyn_00046\]](#)),

by the parameter `measureDataPtr`.

Struct members

- `measureDataPtr→referenceLocalTimestamp` and
- `measureDataPtr→referenceGlobalTimestampSec`

shall be passed as 0.]

Note: `MacroTickDuration` is calculated as `CycleLength / MacroTicksPerCycle`

Note: The `FrTSyn` passes 0 to avoid undefined values. The structure members `referenceLocalTimestamp` and `referenceGlobalTimestampSec` will be set by the `StbM` `StbM_FrSetSlaveTimingData` internally (refer to [SWS_StbM_00471] in [5]).

[SWS_FrTSyn_00100]

Upstream requirements: [RS_TS_00034](#)

[
If

- time recording for Time Validation is enabled for a Time Domain (refer to [SWS_FrTSyn_00096] and [SWS_FrTSyn_00097]) and
- `FrTSyn` is configured as Time Master for that Time Domain,

`FrTSyn` shall call `StbM_FrSetMasterTimingData` upon successful transmission of a SYNC message.]

Note: Refer to figure 9.1 for the overall sequence of API calls for a Time Master.

[SWS_FrTSyn_00101]

Upstream requirements: [RS_TS_00034](#)

[Upon invocation of `StbM_FrSetMasterTimingData` `FrTSyn` shall pass the following data

- the Sequence Counter as sent in the SYNC message
- the segment id of the physical channel on which the SYNC message has been sent (refer to parameter `FrTSynGlobalTimeNetworkSegmentId`)
- `currentCycle` and `currentMacroTicks` read upon construction of the Sync message (refer to step 2 in [SWS_FrTSyn_00028]),
- `cycleLength` and `macroTickDuration`
- the reference timestamp $T1_{VLT}$ (refer to step 2 in [SWS_FrTSyn_00028]),
- $T0$ as sent in the SYNC message (refer to step 3 in [SWS_FrTSyn_00028]),

by the parameter `measureDataPtr`.]

7.7 Security Events

[SWS_FrTSyn_00105]

Upstream requirements: [SRS_BSW_00489](#)

[If security event reporting has been enabled for the FrTSyn module ([FrTSynEnableSecurityEventReporting](#) = true) the respective security events shall be reported to the IdsM [8] via the interfaces defined in BSWGeneral [3].]

The following table lists the security events which are standardized for the FrTSyn together with their trigger conditions.

[SWS_FrTSyn_00103] Security events for FrTSyn

Status: DRAFT

Upstream requirements: [SRS_BSW_00488](#), [SRS_BSW_00489](#)

[

Name	Description	ID
SEV_TSYN_FR_ICV_GENERATION_FAILED	ICV generation for a Sync message has failed.	70
SEV_TSYN_FR_ICV_VERIFICATION_FAILED	ICV verification of a received Sync message has failed.	71
SEV_TSYN_FR_FRESHNESS_NOT_AVAILABLE	Failed to get freshness value from FvM.	72

]

The following tables specify the context data which shall be reported for the respective security events.

[SWS_FrTSyn_92000] Security event context data definition: SEV_TSYN_FR_ICV_GENERATION_FAILED

Status: DRAFT

Upstream requirements: [SRS_BSW_00488](#), [SRS_BSW_00489](#)

[

SEV Name	SEV_TSYN_FR_ICV_GENERATION_FAILED	
ID	70	
Description	ICV generation for a Sync message has failed.	
Context Data Version	1	
Context Data	Data Type	Allowed Values
GlobalTimeDomainId	uint8	

]

[SWS_FrTSyn_92001] Security event context data definition: SEV_TSYN_FR_ICV_VERIFICATION_FAILED

GlobalTimeDomainId	uint8	

]

7.8 Error Classification

Chapter [3, General Specification of Basic Software Modules] 7.2 “Error Handling” describes the error handling of the Basic Software in detail. Above all, it constitutes a classification scheme consisting of five error types which may occur in BSW modules.

Based on this foundation, the following section specifies particular errors arranged in the respective subsections below.

7.8.1 Development Errors

[SWS_FrTSyn_00059] Definition of development errors in module FrTSyn

Upstream requirements: [SRS_BSW_00385](#)

[

Type of error	Related error code	Error value
API service called with wrong PDU or SDU.	FRTSYN_E_INVALID_PDUID	0x01
API service used in un-initialized state	FRTSYN_E_UNINIT	0x20
A pointer is invalid	FRTSYN_E_NULL_POINTER	0x21
FrTSyn initialization failed	FRTSYN_E_INIT_FAILED	0x22
API called with invalid parameter	FRTSYN_E_PARAM	0x23
Invalid Controller index	FRTSYN_E_INV_CTRL_IDX	0x24

]

7.8.2 Runtime Errors

[SWS_FrTSyn_91000] Definition of runtime errors in module FrTSyn

Upstream requirements: [SRS_BSW_00385](#)

[

Type of error	Related error code	Error value
No FV available from the FVM	FRTSYN_E_FRESHNESSFAILURE	0x01

]

7.8.3 Production Errors

There are no production errors.

7.8.4 Extended Production Errors

There are no extended production errors.

8 API specification

8.1 API

8.1.1 Imported types

In this section all types included from the following modules are listed:

[SWS_FrTSyn_00060] Definition of imported datatypes of module FrTSyn

Upstream requirements: [RS_TS_20043](#)

Module	Header File	Imported Type
Comtype	ComStack_Types.h	PduIdType
	ComStack_Types.h	PduInfoType
	ComStack_Types.h	PduLengthType
	ComStack_Types.h	RateDeviationStatusType (draft)
	ComStack_Types.h	RateDeviationWithStatusType (draft)
Csm	Rte_Csm_Type.h	Crypto_OperationModeType
	Rte_Csm_Type.h	Crypto_ResultType
	Rte_Csm_Type.h	Crypto_VerifyResultType
FrIf	FrIf.h	FrIf_StateType
IdsM	IdsM.h	IdsM_SecurityEventIdType
	Rte_IdsM_Type.h	IdsM_TimestampDataType
StbM	Rte_StbM_Type.h	StbM_FrTimeMasterMeasurementType
	Rte_StbM_Type.h	StbM_FrTimeSlaveMeasurementType
	Rte_StbM_Type.h	StbM_SynchronizedTimeBaseType
	Rte_StbM_Type.h	StbM_TimeBaseStatusType
	Rte_StbM_Type.h	StbM_TimeStampShortType
	Rte_StbM_Type.h	StbM_TimeStampType
	Rte_StbM_Type.h	StbM_TimeTupleType
	Rte_StbM_Type.h	StbM_UserDataType
	StbM.h	StbM_MeasurementType
	StbM.h	StbM_VirtualLocalTimeType
Std	Std_Types.h	Std_ReturnType
	Std_Types.h	Std_VersionInfoType

8.1.2 Type definitions

8.1.2.1 FrTSyn_ConfigType

[SWS_FrTSyn_00061] Definition of datatype FrTSyn_ConfigType

Upstream requirements: [RS_TS_20043](#)

[

Name	FrTSyn_ConfigType	
Kind	Structure	
Elements	implementation specific	
	Type	–
	Comment	–
Description	This is the base type for the configuration of the Time Synchronization over FlexRay. A pointer to an instance of this structure will be used in the initialization of the Time Synchronization over FlexRay. The content of this structure is defined in chapter 10 Configuration specification.	
Available via	FrTSyn.h	

]

8.1.2.2 FrTSyn_TransmissionModeType

[SWS_FrTSyn_00062] Definition of datatype FrTSyn_TransmissionModeType

Upstream requirements: [RS_TS_20043](#)

[

Name	FrTSyn_TransmissionModeType		
Kind	Enumeration		
Range	FRTSYN_TX_OFF	–	Transmission Disabled
	FRTSYN_TX_ON	–	Transmission Enabled
Description	Handles the enabling and disabling of the transmission mode		
Available via	FrTSyn.h		

]

8.1.3 Function definitions

8.1.3.1 FrTSyn_Init

[SWS_FrTSyn_00063] Definition of API function FrTSyn_Init

Upstream requirements: [RS_TS_20043](#)

[

Service Name	FrTSyn_Init	
Syntax	<pre>void FrTSyn_Init (const FrTSyn_ConfigType* configPtr)</pre>	
Service ID [hex]	0x01	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	configPtr	Pointer to selected configuration structure
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This function initializes the Time Synchronization over FlexRay.	
Available via	FrTSyn.h	

]

See section [7.2.1](#) for details.

8.1.3.2 FrTSyn_GetVersionInfo

[SWS_FrTSyn_00064] Definition of API function FrTSyn_GetVersionInfo

Upstream requirements: [RS_TS_20043](#)

[

Service Name	FrTSyn_GetVersionInfo	
Syntax	<pre>void FrTSyn_GetVersionInfo (Std_VersionInfoType* versioninfo)</pre>	
Service ID [hex]	0x02	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	None	
Parameters (inout)	None	
Parameters (out)	versioninfo	Pointer to where to store the version information of this module.
Return value	None	
Description	Returns the version information of this module.	
Available via	FrTSyn.h	

]

8.1.3.3 FrTSyn_SetTransmissionMode

[SWS_FrTSyn_00065] Definition of API function FrTSyn_SetTransmissionMode

Upstream requirements: [RS_TS_20043](#)

[

Service Name	FrTSyn_SetTransmissionMode	
Syntax	<pre>void FrTSyn_SetTransmissionMode (uint8 CtrlIdx, FrTSyn_TransmissionModeType Mode)</pre>	
Service ID [hex]	0x03	
Sync/Async	Synchronous	
Reentrancy	Non Reentrant	
Parameters (in)	CtrlIdx	Index of the FlexRay channel
	Mode	FRTSYN_TX_OFF FRTSYN_TX_ON
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	This API is used to turn on and off the TX capabilities of the FrTSyn.	
Available via	FrTSyn.h	

]

[SWS_FrTSyn_00095]

Upstream requirements: [SRS_BSW_00323](#), [SRS_BSW_00337](#), [SRS_BSW_00386](#)

[The function [FrTSyn_SetTransmissionMode](#) shall inform the [Det](#), if development error detection is enabled ([FrTSynDevErrorDetect](#) is set to `TRUE`) and if function call has failed because of the following reasons:

- Invalid CtrlIdx ([FRTSYN_E_INV_CTRL_IDX](#))
- Invalid Mode ([FRTSYN_E_PARAM](#))

]

8.1.4 Call-back notifications

This is a list of functions provided for other modules.

8.1.4.1 FrTSyn_RxIndication

[SWS_FrTSyn_00066] Definition of callback function FrTSyn_RxIndication

Upstream requirements: [RS_TS_20043](#)

[

Service Name	FrTSyn_RxIndication	
Syntax	<pre>void FrTSyn_RxIndication (PduIdType RxPduId, const PduInfoType* PduInfoPtr)</pre>	
Service ID [hex]	0x42	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId.	
Parameters (in)	RxPduId	ID of the received PDU.
	PduInfoPtr	Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	Indication of a received PDU from a lower layer communication interface module.	
Available via	FrTSyn.h	

]

Note: The callback function [FrTSyn_RxIndication](#) called by the [FrIf](#) module and implemented by the [FrTSyn](#) module. It is called in case of a receive indication event of the [FR](#) Driver.

[SWS_FrTSyn_00067]

Upstream requirements: [SRS_BSW_00323](#), [SRS_BSW_00337](#), [SRS_BSW_00386](#)

[The callback function [FrTSyn_RxIndication](#) shall inform the [Det](#), if development error detection is enabled ([FrTSynDevErrorDetect](#) is set to `TRUE`) and if function call has failed because of the following reasons:

- Invalid [RxPduId](#) ([FRTSYN_E_INVALID_PDUID](#))
- [PduInfoPtr](#) or [SduDataPtr](#) equals `NULL_PTR` ([FRTSYN_E_NULL_POINTER](#))

]

Caveats of [FrTSyn_RxIndication](#)

- The [FrTSyn](#) module is initialized correctly.

8.1.4.2 FrTSyn_TriggerTransmit

[SWS_FrTSyn_00069] Definition of callback function FrTSyn_TriggerTransmit

Upstream requirements: [RS_TS_20043](#)

Service Name	FrTSyn_TriggerTransmit	
Syntax	<pre>Std_ReturnType FrTSyn_TriggerTransmit (PduIdType TxPduId, PduInfoType* PduInfoPtr)</pre>	
Service ID [hex]	0x41	
Sync/Async	Synchronous	
Reentrancy	Reentrant for different PduIds. Non reentrant for the same PduId.	
Parameters (in)	TxPduId	ID of the SDU that is requested to be transmitted.
Parameters (inout)	PduInfoPtr	Contains a pointer to a buffer (SduDataPtr) to where the SDU data shall be copied, and the available buffer size in SduLength. On return, the service will indicate the length of the copied SDU data in SduLength.
Parameters (out)	None	
Return value	Std_ReturnType	E_OK: SDU has been copied and SduLength indicates the number of copied bytes. E_NOT_OK: No SDU data has been copied. PduInfoPtr must not be used since it may contain a NULL pointer or point to invalid data.
Description	Within this API, the upper layer module (called module) shall check whether the available data fits into the buffer size reported by PduInfoPtr->SduLength. If it fits, it shall copy its data into the buffer provided by PduInfoPtr->SduDataPtr and update the length of the actual copied data in PduInfoPtr->SduLength. If not, it returns E_NOT_OK without changing PduInfoPtr.	
Available via	FrTSyn.h	

Note: The function [FrTSyn_TriggerTransmit](#) might be called by the [FrTSyn](#) module's environment in an interrupt context.

[SWS_FrTSyn_00070]

Upstream requirements: [SRS_BSW_00323](#), [SRS_BSW_00337](#), [SRS_BSW_00386](#)

[The callback function [FrTSyn_TriggerTransmit](#) shall inform the [Det](#), if development error detection is enabled ([FrTSynDevErrorDetect](#) is set to TRUE) and if function call has failed because of the following reasons:

- Invalid [TxPduId](#) ([FRTSYN_E_INVALID_PDUID](#))
- [PduInfoPtr](#) or [SduDataPtr](#) equals [NULL_PTR](#) ([FRTSYN_E_NULL_POINTER](#))

8.1.4.3 FrTSyn_IcvGenerationIndication

[SWS_FrTSyn_91001] Definition of API function FrTSyn_IcvGenerationIndication

Upstream requirements: [RS_TS_20074](#)

Service Name	FrTSyn_IcvGenerationIndication	
Syntax	<pre>void FrTSyn_IcvGenerationIndication (uint32 jobId, Crypto_ResponseType result)</pre>	
Service ID [hex]	0x05	
Sync/Async	Synchronous	
Reentrancy	Reentrant	
Parameters (in)	jobId	JobID of the operation that caused the callback.
	result	Contains the result of the cryptographic operation.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	By this API service the FrTSyn gets an indication and the result of ICV generation.	
Available via	FrTSyn.h	

[SWS_FrTSyn_00151]

Upstream requirements: [SRS_BSW_00323](#), [SRS_BSW_00337](#), [SRS_BSW_00386](#)

[The function [FrTSyn_IcvGenerationIndication](#) shall inform the [Det](#), if development error detection is enabled ([FrTSynDevErrorDetect](#) is set to TRUE) and if the function call has failed because of the following reasons:

- jobId is invalid ([FRTSYN_E_PARAM](#))

8.1.4.4 FrTSyn_IcvVerificationIndication

[SWS_FrTSyn_91002] Definition of API function FrTSyn_IcvVerificationIndication

Upstream requirements: [RS_TS_20074](#)

Service Name	FrTSyn_IcvVerificationIndication	
Syntax	<pre>void FrTSyn_IcvVerificationIndication (uint32 jobId, Crypto_ResponseType result)</pre>	
Service ID [hex]	0x06	
Sync/Async	Synchronous	

Reentrancy	Reentrant	
Parameters (in)	jobId	JobID of the operation that caused the callback.
	result	Contains the result of the cryptographic operation.
Parameters (inout)	None	
Parameters (out)	None	
Return value	None	
Description	By this API service the FrTSyn gets an indication and the result of ICV verification.	
Available via	FrTSyn.h	

]

[SWS_FrTSyn_00152]

Upstream requirements: [SRS_BSW_00323](#), [SRS_BSW_00337](#), [SRS_BSW_00386](#)

[The function [FrTSyn_IcvVerificationIndication](#) shall inform the [Det](#), if development error detection is enabled ([FrTSynDevErrorDetect](#) is set to TRUE) and if the function call has failed because of the following reasons:

- jobId is invalid ([FRTSYN_E_PARAM](#))

]

8.1.5 Scheduled functions

These functions are directly called by the Basic Software Scheduler. The following functions shall have no return value and no parameters. All functions shall be non-reentrant.

8.1.5.1 FrTSyn_MainFunction

[SWS_FrTSyn_00071] Definition of scheduled function FrTSyn_MainFunction

Upstream requirements: [RS_TS_20043](#)

[

Service Name	FrTSyn_MainFunction
Syntax	void FrTSyn_MainFunction (void)
Service ID [hex]	0x04
Description	Main function for cyclic call / resp. Timesync message transmission
Available via	FrTSyn_SchM.h

]

[SWS_FrTSyn_00072]

Upstream requirements: [RS_TS_20043](#)

[The frequency of invocations of [FrTSyn_MainFunction](#) is determined by the configuration parameter [FrTSynMainFunctionPeriod](#).]

8.1.6 Expected Interfaces

In this section, all interfaces required by other modules are listed.

8.1.6.1 Mandatory Interfaces

This section defines all interfaces that are required to fulfill a mandatory functionality of the module.

[SWS_FrTSyn_00074] Definition of mandatory interfaces required by module FrTSyn

Upstream requirements: [RS_TS_20043](#)

[

API Function	Header File	Description
FrIf_GetCycleLength	FrIf.h	This API returns the configured time of the configuration parameter "GdCycle" in nanoseconds for the FlexRay controller with index FrIf_CtrlIdx.
FrIf_GetGlobalTime	FrIf.h	Wraps the FlexRay Driver API function Fr_GetGlobalTime(). Important Note: FrIf_GetGlobalTime may be called within an exclusive area.
FrIf_GetMacroticksPerCycle	FrIf.h	Retrieves the amount of Macroticks per Cycle
FrIf_GetState	FrIf.h	Get current FrIf state.
StbM_GetCurrentVirtualLocalTime	StbM.h	Returns the Virtual Local Time of the referenced Time Base.

]

8.1.6.2 Optional Interfaces

This section defines all interfaces that are required to fulfill an optional functionality of the module.

[SWS_FrTSyn_00075] Definition of optional interfaces requested by module FrTSyn

Upstream requirements: [RS_TS_20043](#)

API Function	Header File	Description
Crc_CalculateCRC8H2F	Crc.h	This service makes a CRC8 calculation with the Polynomial 0x2F on Crc_Length
Csm_MacGenerate	Csm.h	Uses the given data to perform a MAC generation and stores the MAC in the memory location pointed to by the MAC pointer.
Csm_MacVerify	Csm.h	Verifies the given MAC by comparing if the MAC is generated with the given data.
Csm_SignatureGenerate	Csm.h	Uses the given data to perform the signature calculation and stores the signature in the memory location pointed by the result pointer.
Csm_SignatureVerify	Csm.h	Verifies the given signature by checking if it was generated with the given data.
Det_ReportError	Det.h	Service to report development errors.
Det_ReportRuntimeError	Det.h	Service to report runtime errors. If a callout has been configured then this callout shall be called.
IdsM_ReportSecurityEvent	IdsM.h	This API is the interface to report security events to the IdsM.
LSduR_FrTSynTransmit (draft)	LSduR_FrTSyn.h	Requests transmission of a PDU.
StbM_BusSetGlobalTime	StbM.h	Allows the Time Base Provider Modules to forward the Rx Time Tuple to the StbM.
StbM_FrSetMasterTimingData	StbM_FrTSyn.h	Provides Flexray Timesyn module specific data for a Time Master to the StbM.
StbM_FrSetSlaveTimingData	StbM_FrTSyn.h	Allows the FrTSyn Module to forward Flexray specific details to the StbM.
StbM_GetCurrentTime	StbM.h	Returns a time tuple (Local time, Global time and Timebase status) and user data details Note: This API shall be called with locked interrupts / within an Exclusive Area to prevent interruption (i.e., the risk that the time stamp is outdated on return of the function call).
StbM_GetRxFreshness	StbM.h	This interface is used by the StbM to query the current freshness value.
StbM_GetTimeBaseStatus	StbM.h	Returns detailed status information for a Synchronized (or Pure Local) Time Base.
StbM_GetTimeBaseUpdateCounter	StbM.h	Allows the Timesync Modules to detect, whether a Time Base should be transmitted immediately in the subsequent <Bus>TSyn_MainFunction() cycle.
StbM_GetTxFreshness	StbM.h	This API returns the freshness value from the Most Significant Bits in the first byte, of the Freshness array, in big endian format.
StbM_GetTxFreshnessTruncData	StbM.h	This interface is used by the StbM to obtain the current freshness value. The interface function provides also the truncated freshness transmitted in the secured time sync message.
StbM_SPduTxConfirmation	StbM.h	This interface is used by the StbM to indicate that the Secured Time Synchronization Message has been initiated for transmission.

9.3 FlexRay Secure Time Synchronization Sequence

Figure 9.3: FlexRay Secure Time Synchronization Sequence

10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification section 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave section 10.1 in the specification to guarantee comprehension.

Section 10.2 specifies the structure (containers) and the parameters of the Time Synchronization over FlexRay.

Section 10.4 specifies published information of the Time Synchronization over FlexRay.

10.1 How to read this chapter

For details refer to [3] Chapter 10.1 “Introduction to configuration specification”.

10.2 Containers and configuration parameters

The following sections summarize all configuration parameters of the Time Synchronization over FlexRay. The detailed meaning of the parameters is described in chapters 7 and 8.

10.2.1 Variants

[SWS_FrTSyn_00077]

Upstream requirements: [RS_TS_20046](#)

[The Time Synchronization over FlexRay shall support the configuration for Time Master, Time Slave and Time Gateway.]

The module supports different post-build variants (previously known as post-build selectable configuration sets), but not post-build loadable configuration.

10.2.2 FrTSyn

[ECUC_FrTSyn_00001] Definition of EcucModuleDef FrTSyn [

Module Name	FrTSyn
Description	This represents the specific configuration variant for the TSyn on Flexray.
Post-Build Variant Support	true
Supported Config Variants	VARIANT-PRE-COMPILE

Included Containers		
Container Name	Multiplicity	Dependency
FrTSynGeneral	1	This container holds the general parameters of the Flexray-specific Synchronized Time-base Manager
FrTSynGlobalTimeDomain	1..*	This represents the existence of a global time domain on Flexray. The FrTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains. If the FrTSyn exists it is assumed that at least one global time domain exists.

」

10.2.3 FrTSynGeneral

[ECUC_FrTSyn_00003] Definition of EcucParamConfContainerDef FrTSynGeneral 「

Container Name	FrTSynGeneral
Parent Container	FrTSyn
Description	This container holds the general parameters of the Flexray-specific Synchronized Time-base Manager
Multiplicity	1
Configuration Parameters	

Included Parameters		
Parameter Name	Multiplicity	ECUC ID
FrTSynDevErrorDetect	1	[ECUC_FrTSyn_00002]
FrTSynEnableSecurityEventReporting	1	[ECUC_FrTSyn_00044]
FrTSynMainFunctionPeriod	1	[ECUC_FrTSyn_00016]
FrTSynTimeValidationSupport	1	[ECUC_FrTSyn_00040]
FrTSynVersionInfoApi	1	[ECUC_FrTSyn_00019]

Included Containers		
Container Name	Multiplicity	Dependency
FrTSynSecurityEventRefs	0..1	Container for the references to IdsMEvent elements representing the security events that the FrTSyn module shall report to the Ids M in case the corresponding security related event occurs (and if FrTSynEnableSecurityEventReporting is set to true). The standardized security events in this container can be extended by vendor-specific security events.

」

[ECUC_FrTSyn_00002] Definition of EcucBooleanParamDef FrTSynDevErrorDetect

Parameter Name	FrTSynDevErrorDetect		
Parent Container	FrTSynGeneral		
Description	Switches the development error detection and notification on or off. • true: detection and notification is enabled. • false: detection and notification is disabled.		
Multiplicity	1		
Type	EcucBooleanParamDef		
Default value	false		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–

10.2.5 FrTSynGlobalTimeDomain

[ECUC_FrTSyn_00004] Definition of EcucParamConfContainerDef FrTSynGlobalTimeDomain [

Container Name	FrTSynGlobalTimeDomain
Parent Container	FrTSyn
Description	This represents the existence of a global time domain on Flexray. The FrTSyn module can administrate several global time domains at the same time that in itself form a hierarchy of domains and sub-domains. If the FrTSyn exists it is assumed that at least one global time domain exists.
Multiplicity	1..*
Configuration Parameters	

Included Parameters		
Parameter Name	Multiplicity	ECUC ID
FrTSynEnableTimeValidation	0..1	[ECUC_FrTSyn_00041]
FrTSynGlobalTimeDomainId	1	[ECUC_FrTSyn_00005]
FrTSynGlobalTimeNetworkSegmentId	0..1	[ECUC_FrTSyn_00042]
FrTSynSynchronizedTimeBaseRef	1	[ECUC_FrTSyn_00018]

Included Containers		
Container Name	Multiplicity	Dependency
FrTSynGlobalTimeMaster	0..1	Configuration of the global time master. Each global time domain is required to have exactly one global time master. This master may or may not exist on the configured ECU.
FrTSynGlobalTimeSlave	0..1	This represents the time slave for the enclosing global time domain.
FrTSynGlobalTimeSyncDataIDList	0..1	The DataIDList for SYNC messages ensures the identification of data elements due to CRC calculation and message authentication process.

]

[ECUC_FrTSyn_00041] Definition of EcucBooleanParamDef FrTSynEnableTime Validation [

Parameter Name	FrTSynEnableTimeValidation		
Parent Container	FrTSynGlobalTimeDomain		
Description	Enables/disables time recording for Time Validation for a specific Time Domain.		
Multiplicity	0..1		
Type	EcucBooleanParamDef		
Default value	–		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency	Only valid if FrTSynTimeValidationSupport is TRUE. Value set according to parameter StbMEnableTimeValidation of the referenced Time Base in the StbM.		

]

[ECUC_FrTSyn_00005] Definition of EcucIntegerParamDef FrTSynGlobalTimeDomainId [

Parameter Name	FrTSynGlobalTimeDomainId		
Parent Container	FrTSynGlobalTimeDomain		
Description	The global time domain ID.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 15		
Default value	–		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–

FrTSynGlobalTimeTxPeriod	1	[ECUC_FrTSyn_00014]
FrTSynImmediateTimeSync	1	[ECUC_FrTSyn_00031]

Included Containers		
Container Name	Multiplicity	Dependency
FrTSynGlobalTimeMasterPdu	1	This container carries all properties required to configure the PDU sent by the global time master for the given global time domain.
FrTSynGlobalTimeTxIcvGeneration	0..1	This container collects configuration that shall be used for ICV generation.

]

[ECUC_FrTSyn_00032] Definition of EcucFloatParamDef FrTSynCyclicMsgResumeTime [

Parameter Name	FrTSynCyclicMsgResumeTime		
Parent Container	FrTSynGlobalTimeMaster		
Description	Defines the time where the 1st regular cycle time based message transmission takes place, after an immediate transmission before. Unit: seconds		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	[0 .. INF[		
Default value	–		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency			

]

[ECUC_FrTSyn_00033] Definition of EcucFloatParamDef FrTSynGlobalTimeDebounceTime

Parameter Name	FrTSynGlobalTimeDebounceTime		
Parent Container	FrTSynGlobalTimeMaster		
Description	This represents the configuration of a TX debounce time for SYNC messages compared to a message before with the same PDU. Unit: seconds		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	[0 .. 4]		
Default value	—		
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Dependency			

[ECUC_FrTSyn_00013] Definition of EcucEnumerationParamDef FrTSynGlobalTimeTxCrcSecured

Parameter Name	FrTSynGlobalTimeTxCrcSecured		
Parent Container	FrTSynGlobalTimeMaster		
Description	This represents the configuration of whether or not CRC is supported.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	CRC_NOT_SUPPORTED	This represents a configuration where CRC is not supported.	
	CRC_SUPPORTED	This represents a configuration where CRC is supported.	
Post-Build Variant Value	true		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	—	
	Post-build time	—	
Dependency			

[ECUC_FrTSyn_00048] Definition of EcucEnumerationParamDef FrTSynGlobalTimeTxIcvSecured

Parameter Name	FrTSynGlobalTimeTxIcvSecured	
Parent Container	FrTSynGlobalTimeMaster	
Description	This parameter controls whether or not ICV generation shall be supported.	
Multiplicity	1	
Type	EcucEnumerationParamDef	
Range	ICV_NOT_SUPPORTED	The Timesync module shall not generate the ICV.
	ICV_SUPPORTED	The Timesync module shall generate the ICV.
Default value	ICV NOT SUPPORTED	

Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants

[ECUC_FrTSyn_00055] Definition of EcucEnumerationParamDef FrTSynRxIcvVerificationType [

Parameter Name	FrTSynRxIcvVerificationType		
Parent Container	FrTSynGlobalTimeSlave		
Description	This parameter controls whether or not ICV verification shall be supported.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	ICV_IGNORED	The Timesync module accepts Time Synchronization messages, which are ICV secured (without actually validating the ICV) and those which are not ICV secured. That means, the Timesync module ignores the ICV.	
	ICV_NOT_VERIFIED	The Timesync module accepts only Time Synchronization messages, which are not ICV secured. All other Time Synchronization messages are ignored.	
	ICV_OPTIONAL	The Timesync module accepts only Time Synchronization messages which are not ICV secured and Time Synchronization messages which are ICV secured and have the correct ICV. All other Time Synchronization messages are ignored.	
	ICV_VERIFIED	The Timesync module accepts only Time Synchronization messages, which are ICV secured and have the correct ICV. All other Time Synchronization messages are ignored.	
Default value	ICV_IGNORED		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency

Figure 10.7: FrTSynGlobalTimeSlave

10.2.12 FrTSynGlobalTimeSlavePdu

[ECUC_FrTSyn_00012] Definition of EcucParamConfContainerDef FrTSynGlobalTimeSlavePdu

Container Name	FrTSynGlobalTimeSlavePdu
Parent Container	FrTSynGlobalTimeSlave
Description	This container carries all properties required to configure the PDU received by the time slave for the given global time domain. Supported MetaData entry: TIMETUPLE_TYPE_PTR
Multiplicity	1
Configuration Parameters	

Included Parameters		
Parameter Name	Multiplicity	ECUC ID
FrTSynGlobalTimeSlaveHandleId	1	[ECUC_FrTSyn_00011]
FrTSynGlobalTimePduRef	1	[ECUC_FrTSyn_00020]

No Included Containers

[ECUC_FrTSyn_00011] Definition of EcucIntegerParamDef FrTSynGlobalTimeSlaveHandleId

Parameter Name	FrTSynGlobalTimeSlaveHandleId		
Parent Container	FrTSynGlobalTimeSlavePdu		
Description	This represents the handle ID of the PDU that contains the global time information.		
Multiplicity	1		
Type	EcucIntegerParamDef (Symbolic Name generated for this parameter)		
Range	0 .. 65535		
Default value	–		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency	withAuto = true		

For parameter table [\[ECUC_FrTSyn_00020\] FrTSynGlobalTimePduRef](#), see definition below container [FrTSynGlobalTimeMasterPdu](#).

10.2.13 FrTSynGlobalTimeRxIcvVerification

[ECUC_FrTSyn_00056] Definition of EcucParamConfContainerDef FrTSynGlobalTimeRxIcvVerification

Container Name	FrTSynGlobalTimeRxlcvVerification		
Parent Container	FrTSynGlobalTimeSlave		
Description	This container collects configuration required for ICV verification.		
Multiplicity	0..1		
Post-Build Variant Multiplicity	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Configuration Parameters			

Included Parameters		
Parameter Name	Multiplicity	ECUC ID
FrTSynlcvRxLength	1	[ECUC_FrTSyn_00059]
FrTSynlcvVerificationAttempts	1	[ECUC_FrTSyn_00062]
FrTSynlcvVerificationBase	1	[ECUC_FrTSyn_00058]
FrTSynlcvVerificationTimeout	1	[ECUC_FrTSyn_00061]
FrTSynRxAuthenticationBuildAttempts	1	[ECUC_FrTSyn_00064]
FrTSynlcvVerificationFvldRef	0..1	[ECUC_FrTSyn_00057]
FrTSynlcvVerificationJobRef	1	[ECUC_FrTSyn_00060]

No Included Containers

]

[ECUC_FrTSyn_00059] Definition of EcucIntegerParamDef FrTSynlcvRxLength [

Parameter Name	FrTSynlcvRxLength		
Parent Container	FrTSynGlobalTimeRxlcvVerification		
Description	Length of ICV to be used for verification of received ICV within Sync Message.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 236		
Default value	–		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency			

]

[ECUC_FrTSyn_00062] Definition of EcucIntegerParamDef FrTSynIcvVerification Attempts

Parameter Name	FrTSynIcvVerificationAttempts		
Parent Container	FrTSynGlobalTimeRxIcvVerification		
Description	This parameter specifies the number of ICV verification attempts that are to be carried out when the verification of the ICV failed for a given secured SYNC message. If zero is set, then only one ICV verification attempt is done.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default value	0		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency			

[ECUC_FrTSyn_00058] Definition of EcucEnumerationParamDef FrTSynIcvVerificationBase

Parameter Name	FrTSynIcvVerificationBase		
Parent Container	FrTSynGlobalTimeRxIcvVerification		
Description	Symmetric or asymmetric cryptography selection for the ICV verification.		
Multiplicity	1		
Type	EcucEnumerationParamDef		
Range	ICV_MAC	Symmetric cryptography selection for the ICV verification.	
	ICV_SIGNATURE	Asymmetric cryptography selection for the ICV verification.	
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency			

[ECUC_FrTSyn_00061] Definition of EcucFloatParamDef FrTSynIcvVerification Timeout

Parameter Name	FrTSynIcvVerificationTimeout		
Parent Container	FrTSynGlobalTimeRxIcvVerification		
Description	Timeout of ICV verification (respective CSM job completion in asynchronous behaviour). A value of 0 disables the ICV timeout monitoring. Unit: Seconds		
Multiplicity	1		
Type	EcucFloatParamDef		
Range	[0 .. INF[		
Default value	–		

Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency			

[ECUC_FrTSyn_00064] Definition of EcucIntegerParamDef FrTSynRxAuthenticationBuildAttempts

Parameter Name	FrTSynRxAuthenticationBuildAttempts		
Parent Container	FrTSynGlobalTimeRxIcvVerification		
Description	This parameter specifies the number of authentication build attempts that are to be carried out when the verification of the ICV failed for a given SYNC message. If zero is set, then only one ICV verification attempt is done.		
Multiplicity	1		
Type	EcucIntegerParamDef		
Range	0 .. 65535		
Default value	0		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency			

[ECUC_FrTSyn_00057] Definition of EcucReferenceDef FrTSynIcvVerificationFvIdRef

Parameter Name	FrTSynIcvVerificationFvIdRef		
Parent Container	FrTSynGlobalTimeRxIcvVerification		
Description	This represents the reference to the FV taken to generate the ICV generation.		
Multiplicity	0..1		
Type	Symbolic name reference to StbMFreshnessValue		
Post-Build Variant Multiplicity	false		
Post-Build Variant Value	false		
Multiplicity Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency			

[ECUC_FrTSyn_00060] Definition of EcucReferenceDef FrTSynIcvVerificationJobRef [

Parameter Name	FrTSynIcvVerificationJobRef		
Parent Container	FrTSynGlobalTimeRxIcvVerification		
Description	This represents the reference to the CSM job to fetch the CSM job ID.		
Multiplicity	1		
Type	Symbolic name reference to CsmJob		
Post-Build Variant Value	false		
Value Configuration Class	Pre-compile time	X	All Variants
	Link time	–	
	Post-build time	–	
Dependency			

]

Figure 10.8: FrTSynGlobalTimeRxIcvVerification

10.3 Constraints

[SWS_FrTSyn_CONSTR_00001] [If the CSM job used to verify the **ICV** is configured in synchronous behaviour, then the **FrTSynIcvVerificationTimeout** shall be set to 0.]

[SWS_FrTSyn_CONSTR_00002]

Status: DRAFT

[If the CSM job used to generate the `ICV` is configured in synchronous behavior, then the `FrTSynIcvGenerationTimeout` shall be set to 0.]

[SWS_FrTSyn_CONSTR_00003] `FrTSynGlobalTimeMasterPdu` and `FrTSynGlobalTimeSlavePdu` constraint for keeping the local buffer

Status: DRAFT

[The configuration of `FrTSynGlobalTimeMasterPdu` and `FrTSynGlobalTimeSlavePdu` shall refer to PDUs where `KeepLocalPduBuffer` is set to `FALSE`.

Otherwise the configuration shall be rejected as invalid.]

10.4 Published Information

For details refer to [3] Chapter 10.3 “*Published Information*”.

A Not applicable requirements

[SWS_FrTSyn_NA_00999]

Upstream requirements: RS_TS_00002, RS_TS_00005, RS_TS_00006, RS_TS_00007, RS_TS_00008, RS_TS_00009, RS_TS_00010, RS_TS_00011, RS_TS_00014, RS_TS_00015, RS_TS_00016, RS_TS_00017, RS_TS_00018, RS_TS_00019, RS_TS_00021, RS_TS_00024, RS_TS_00025, RS_TS_00026, RS_TS_00027, RS_TS_00029, RS_TS_00030, RS_TS_00031, RS_TS_00032, RS_TS_00033, RS_TS_00035, RS_TS_00036, RS_TS_00037, RS_TS_00038, RS_TS_00039, RS_TS_20031, RS_TS_20032, RS_TS_20033, RS_TS_20034, RS_TS_20035, RS_TS_20037, RS_TS_20038, RS_TS_20047, RS_TS_20048, RS_TS_20051, RS_TS_20052, RS_TS_20053, RS_TS_20054, RS_TS_20058, RS_TS_20059, RS_TS_20060, RS_TS_20061, RS_TS_20062, RS_TS_20066, RS_TS_20068, RS_TS_20069, RS_TS_20070

[These requirements on Time Synchronization from the RS Time Synchronization [1] are not applicable to [FrTSyn](#), because they refer either to network types other than FlexRay or to the Time Base Manager module]

[SWS_FrTSyn_NA_00998]

Upstream requirements: SRS_BSW_00168, SRS_BSW_00170, SRS_BSW_00375, SRS_BSW_00416, SRS_BSW_00417, SRS_BSW_00422, SRS_BSW_00425, SRS_BSW_00432, SRS_BSW_00461, SRS_BSW_00469, SRS_BSW_00471, SRS_BSW_00472

[These requirements of the [4, SRS BSWGeneral] are not traced to FrTSyn spec items, because they refer to functionality that is not supported by the FrTSyn.]

[SWS_FrTSyn_NA_00997]

Upstream requirements: SRS_BSW_00388, SRS_BSW_00389, SRS_BSW_00390, SRS_BSW_00392, SRS_BSW_00393, SRS_BSW_00395, SRS_BSW_00403, SRS_BSW_00478

[These requirements of the [4, SRS BSWGeneral] are not traced to FrTSyn spec items, because they apply only to EcuC elements.]

Note: EcuC elements do not support trace links

[SWS_FrTSyn_NA_00996]

Upstream requirements: SRS_BSW_00369, SRS_BSW_00383, SRS_BSW_00384, SRS_BSW_00419

[These requirements of the [4, SRS BSWGeneral] are not traced to FrTSyn spec items, because they do not apply to FrTSyn specific spec items.]

Note: These requirements of the [4, SRS BSWGeneral] are generic in nature and would affect all or very many requirements (e.g. non-functional requirement like naming conventions) or cannot be traced to any requirement at all (but just explanatory chapters of the SWS).

B Change history of AUTOSAR traceable items

Please note that the lists in this chapter also include constraints and specification items that have been removed from the specification in a later version. These constraints and specification items do not appear as hyperlinks in the document.
