## 1 Introduction and functional overview

The FlexRay Driver (Fr) abstracts the hardware related implementation details of specific FlexRay Communication Controllers (CC). This specification basically relies on FlexRay CCs compliant to the FlexRay specification [13]. Additionally older FlexRay controllers compliant to FlexRay specification [14] are supported by this specification. Different behaviours in this SWS resulting from the different supported FlexRay specifications are pointed out as footnotes or remarks where applicable.

All supported features of a FlexRay controller are encapsulated within the Fr module and shall be accessed via this uniform interface only. The APIs provide abstract functional operations that are mapped to a sequence of hardware accesses depending on the actual implemented Fr module. Thus, the FlexRay Interface (Frif), as the user of the Fr module, is independent of the underlying FlexRay CC hardware. The Fr module doesn't have a main-function or an ISR. All Fr module API functions are executed only in the context of the Frif.

A single Fr module supports only a single type of FlexRay CC hardware implementation. The Fr supports multiple FlexRay CCs of this single hardware implementation. The FlexRay Driver's prefix is uniquely assigned per Fr module to allow usage of different FlexRay Drivers, the names of which are separated by namespace. The Frif can access different FlexRay CC hardware implementations using different FlexRay Drivers. The Frif configuration determines which driver from among different types is used to access a particular CC.

The configuration of the Fr module shall be done at system configuration time, with the Fr module's specific configuration being generated by a Module Configuration Generator (MCG), which translates the parameters out of the ECU configuration parameters to Fr module specific configuration data structures.

Figure 1 depicts the basic structure of the FlexRay stack. One Frif accesses several CCs using one or several FlexRay Drivers.

LPdu	Datalink layer Protocol Datagram Unit
MCAL	Microcontroller Abstraction Layer
MCU	Microcontroller Unit
MISRA	Motor Industry Software Reliability Association
NIT	FlexRay Network Idle Time
n/a	Not Applicable
OS	Operating System
PLL	Phase Locked Loop
POC	Protocol Operation Control (see [13] for details)
POCState	Actual CC internal state of the POC. This state might differ from vPOC!State in certain cases, e.g., after FREEZE command invocation (see [13] for details).
SchM	Autosar Module: Schedule Manager
SRS	System Requirements Specification
SW	SoftWare
SW-C	SoftWare Component
vPOC	Data structure provided from the CC to the host at the CHI, which contains the actual POC status of the CC (see [13] for details).
XML	Extensible Markup Language

### 2.1 Glossary of terms

<b>Term:</b>	<b>Definition:</b>
absolute timer	An absolute timer is set to and triggered by an absolute global time of a FlexRay cluster. The FlexRay global time consists of a cycle and a macrotick offset
buffer	A buffer in the context of the Fr SWS describes a hardware transmit/receive resource, part of the FlexRay controller that is mapped to a FlexRay slot, channel, cycle for transmission or reception.
cluster	A communication system of multiple nodes connected to each other.
Macrotick	The macrotick represents the smallest unit of the global synchronized time of a FlexRay cluster.
Synchronized	A FlexRay CC is considered synchronized, to the FlexRay cluster connected to, as long as the following condition holds true: $((\text{!vPOC!Freeze}) \&\& (\text{vPOC!State} == \text{NORMAL\_ACTIVE}) \mid\mid (\text{vPOC!State} == \text{NORMAL\_PASSIVE}))$

### 3.3 Related specification

AUTOSAR provides a General Specification on Basic Software modules [12] (SWS BSW General), which is also valid for FlexRay Driver.

Thus, the specification SWS BSW General shall be considered as additional and required specification for FlexRay Driver.

## 4 Constraints and assumptions

### 4.1 Limitations

**[SWS\_Fr\_00449]** [ In the dynamic segment of each FlexRay Communication Cycle, a transmit/receive buffer of a FlexRay Communication Controller shall be used only one particular LPdu. This limits the reconfiguration possibilities and thus restricts the number of transmittable (sent and received) LPdus per dynamic segment to the accumulated number (over all CCs on one ECU) of transmit/receive buffers connected to one cluster. This limitation results from the unpredictability of the time of transmission of an LPdu within the dynamic segment. Because of that a point in time for the reconfiguration of a certain buffer for multiple usages within the dynamic segment cannot be predetermined. ] ()

### 4.2 Applicability to car domains

The FlexRay Communication stack can be used wherever high data rates and fault tolerant communication (in conjunction with [13]) are required. Furthermore it enables the synchronized operation of several ECUs within a car.

## 5 Dependencies to other modules

This chapter lists the modules interacting with the Fr module.

Modules that use Fr module:

- The Frlf is the only user of the Fr module (except initialization by EcuM). It uses the Fr module(s) to access possibly different FlexRay Communication Controllers in a uniform and abstract way.
- The EcuM initializes the Fr module by calling Fr\_Init.

Modules used by the Fr module:

- **[SWS\_Fr\_00453]** [ The Fr module shall use the BSW Scheduler mechanisms for data consistency when required. ] ()

Other Module dependencies:

- **[SWS\_Fr\_00454]** [ On certain systems the CC might share resources with other components (e.g., the MCU), and might depend on their configurations. If those resources are within the scope of the other modules (e.g., PLL configuration, memory mapping), then the Fr module doesn't configure those components but requires that their initialization precede the Fr module's initialization. ] ()

### 5.1 File structure

This section gives an overview about the files and their relations required for a proper implementation of the Fr module. Please note that the file structure is not completely specified but the implementation shall use at least the files and the file structure presented in this section.

**Figure 2 FlexRay Driver header file structure**

Figure 2 shows the relation of source code files and header files that shall be used for implementation.

**[SWS\_Fr\_00459]** [ Fr.h shall include Fr\_GeneralTypes.h for the include of general Fr type declarations.] ()

### 5.1.1 Code file structure

**[SWS\_Fr\_00116]** [ The code file structure shall not be completely defined within this specification.] (SRS\_BSW\_00346, SRS\_BSW\_00380, SRS\_BSW\_00158)

### 5.1.2 Header file structure

**[SWS\_Fr\_00101]** [ The implementation of the Fr module shall provide the header file *Fr.h*, which is the main module interface file.] (SRS\_BSW\_00302)

**[SWS\_Fr\_00464]** [ The file *Fr.h* shall contain all types and function prototypes required by the Fr module's environment.] ()

**[SWS\_Fr\_00117]** [ *Fr\_GeneralTypes.h* shall contain all types and constants that are shared among the AUTOSAR FlexRay modules Fr, FrIf and FrTrcv.] ()

SRS_BSW_00158	All modules of the AUTOSAR Basic Software shall strictly separate configuration from implementation	SWS_Fr_00116
SRS_BSW_00161	The AUTOSAR Basic Software shall provide a microcontroller abstraction layer which provides a standardized interface to higher software layers	SWS_Fr_00602
SRS_BSW_00162	The AUTOSAR Basic Software shall provide a hardware abstraction layer	SWS_Fr_00602
SRS_BSW_00164	The Implementation of interrupt service routines shall be done by the Operating System, complex drivers or modules	SWS_Fr_00602
SRS_BSW_00168	SW components shall be tested by a function defined in a common API in the Basis-SW	SWS_Fr_00602
SRS_BSW_00170	The AUTOSAR SW Components shall provide information about their dependency from faults, signal qualities, driver demands	SWS_Fr_00602
SRS_BSW_00172	The scheduling strategy that is built inside the Basic Software Modules shall be compatible with the strategy used in the system	SWS_Fr_00602
SRS_BSW_00302	All AUTOSAR Basic Software Modules shall only export information needed by other modules	SWS_Fr_00101
SRS_BSW_00305	Data types naming convention	SWS_Fr_00077, SWS_Fr_00110

SRS_BSW_00306	AUTOSAR Basic Software Modules shall be compiler and platform independent	SWS_Fr_00602
SRS_BSW_00307	Global variables naming convention	SWS_Fr_00098
SRS_BSW_00308	AUTOSAR Basic Software Modules shall not define global data in their header files, but in the C file	SWS_Fr_00102
SRS_BSW_00312	Shared code shall be reentrant	SWS_Fr_00602
SRS_BSW_00314	All internal driver modules shall separate the interrupt frame definition from the service routine	SWS_Fr_00602
SRS_BSW_00325	The runtime of interrupt service routines and functions that are running in interrupt context shall be kept short	SWS_Fr_00602
SRS_BSW_00327	Error values naming convention	SWS_Fr_00602
SRS_BSW_00328	All AUTOSAR Basic Software Modules shall avoid the duplication of code	SWS_Fr_00602
SRS_BSW_00330	It shall be allowed to use macros instead of functions where source code is used and runtime is critical	SWS_Fr_00602
SRS_BSW_00331	All Basic Software Modules shall strictly separate error and status information	SWS_Fr_00602
SRS_BSW_00333	For each callback function it shall be specified if it is called from interrupt context or not	SWS_Fr_00602
SRS_BSW_00334	All Basic Software Modules shall provide an XML file that contains the meta data	SWS_Fr_00080
SRS_BSW_00335	Status values naming convention	SWS_Fr_00602
SRS_BSW_00336	Basic SW module shall be able to shutdown	SWS_Fr_00014
SRS_BSW_00341	Module documentation shall contain all needed informations	SWS_Fr_00602
SRS_BSW_00342	It shall be possible to create an AUTOSAR ECU out of modules provided as source code and modules provided as object code, even mixed	SWS_Fr_00097
SRS_BSW_00343	The unit of time for specification and configuration of Basic SW modules shall be preferably in physical time unit	SWS_Fr_00602
SRS_BSW_00344	BSW Modules shall support link-time configuration	SWS_Fr_00602
SRS_BSW_00345	BSW Modules shall support pre-compile configuration	SWS_Fr_00027
SRS_BSW_00346	All AUTOSAR Basic Software Modules shall provide at least a basic set of module files	SWS_Fr_00116
SRS_BSW_00347	A Naming separation of different instances of BSW drivers shall be in place	SWS_Fr_00076
SRS_BSW_00348	All AUTOSAR standard types and	SWS_Fr_00099

	constants shall be placed and organized in a standard type header file	
SRS_BSW_00353	All integer type definitions of target and compiler specific scope shall be placed and organized in a single type header	SWS_Fr_00099
SRS_BSW_00358	The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void	SWS_Fr_00032
SRS_BSW_00359	All AUTOSAR Basic Software Modules callback functions shall avoid return types other than void if possible	SWS_Fr_00602
SRS_BSW_00360	AUTOSAR Basic Software Modules callback functions are allowed to have parameters	SWS_Fr_00602
SRS_BSW_00361	All mappings of not standardized keywords of compiler specific scope shall be placed and organized in a compiler specific type and keyword header	SWS_Fr_00099
SRS_BSW_00371	The passing of function pointers as API parameter is forbidden for all AUTOSAR Basic Software Modules	SWS_Fr_00602
SRS_BSW_00373	The main processing function of each AUTOSAR Basic Software Module shall be named according the defined convention	SWS_Fr_00602
SRS_BSW_00374	All Basic Software Modules shall provide a readable module vendor identification	SWS_Fr_00080
SRS_BSW_00375	Basic Software Modules shall report wake-up reasons	SWS_Fr_00602
SRS_BSW_00377	A Basic Software Module can return a module specific types	SWS_Fr_00602
SRS_BSW_00379	All software modules shall provide a module identifier in the header file and in the module XML description file.	SWS_Fr_00080
SRS_BSW_00380	Configuration parameters being stored in memory shall be placed into separate c-files	SWS_Fr_00116
SRS_BSW_00386	The BSW shall specify the configuration for detecting an error	SWS_Fr_00602
SRS_BSW_00404	BSW Modules shall support post-build configuration	SWS_Fr_00027, SWS_Fr_00032
SRS_BSW_00405	BSW Modules shall support multiple configuration sets	SWS_Fr_00032
SRS_BSW_00407	Each BSW module shall provide a function to read out the version information of a dedicated module implementation	SWS_Fr_00070
SRS_BSW_00410	Compiler switches shall have defined values	SWS_Fr_00602
SRS_BSW_00411	All AUTOSAR Basic Software Modules	SWS_Fr_00070, SWS_Fr_00340

	shall apply a naming rule for enabling/disabling the existence of the API	
SRS_BSW_00413	An index-based accessing of the instances of BSW modules shall be done	SWS_Fr_00075

## 7 Functional specification

### 7.1 General description

**[SWS\_Fr\_00465]** [ A single Fr module offers a uniform way to use features of FlexRay CCs independent of the CC implementation, thus hiding the actual hardware implementation (registers, buffers, etc.) from upper layers. ] (SRS\_Fr\_05064)

**[SWS\_Fr\_00466]** [ The Fr module maps abstract functional requests to sequences of CC specific hardware accesses. ] (SRS\_Fr\_05064)

A detailed description for all API services can be found in chapter 8.

### 7.2 Implementation Requirements

This chapter lists requirements that shall be fulfilled by Fr module implementations.

**[SWS\_Fr\_00076]** [ The Fr module's implementer shall replace all prefixes Fr within the Fr specification by a vendor specific prefix Fr\_<Vendor Id>\_<Vendor specific name> during implementation to allow the usage of different FlexRay Drivers within one build system. The Fr module's implementer shall apply this rule to all prefixes within filenames, Fr module specific datatypes, Fr module specific constants, Fr module specific global variables and API functions. ] (SRS\_BSW\_00347)

**[SWS\_Fr\_00097]** [ The Fr module shall implement the API functions specified by the Fr SWS as real C-code functions and shall not implement the API functions as macros. ] (SRS\_BSW\_00342)

**[SWS\_Fr\_00479]** [ The rationale of [SWS\\_Fr\\_00097](#) is to allow object code module integration. ] ()

**[SWS\_Fr\_00102]** [ None of the Fr module's header files shall define global variables. ] (SRS\_BSW\_00308)

**[SWS\_Fr\_00106]** [ The Fr module or the underlying hardware or both shall stop FlexRay timers in case of loss of synchronization. ] (SRS\_Fr\_05055)

The implementation may assume that

- The Fr module's environment shall call all LPdu-based services (`Fr_TransmitTxLPdu()`, `Fr_ReceiveRxLPdu()`, `Fr_CheckLPduTxStatus()`, `Fr_PreparesLPdu()`) synchronous to the FlexRay global time (at predefined determined points in time) in case of proper system operation.
- The Fr module's environment may call all non LPdu-based services at any time independent from the FlexRay global time.

### 7.3 Indexing Scheme

Users of the Fr identify Fr resources by using an indexing scheme as depicted in Figure 3.

Figure 3 FlexRay Driver indexing scheme

The following Fr resources are available:

**[SWS\_Fr\_00075]** [ CCs are identified via controller indices (`Fr_CtrlIdx`). ] (SRS\_BSW\_00413)

**[SWS\_Fr\_00467]** [ Each driver's CCs are identified by controller indices 0 to (n-1) where n is the number of CCs controlled by the particular Fr. ] (SRS\_Fr\_05065)

**[SWS\_Fr\_00344]** [ For each FlexRay CC the connected channels are identified by channel indices (`Fr_ChnIdx`). ] ()

**[SWS\_Fr\_00468]** [ A dedicated type that holds the enumerations `FR_CHANNEL_A`, `FR_CHANNEL_B` or `FR_CHANNEL_AB` represents the channel index. ] ()

**[SWS\_Fr\_00469]** [ Channel indices are only valid within a tuple <`Fr_CtrlIdx`, `Fr_ChnIdx`>. ] ()

**[SWS\_Fr\_00005]** [ Each FlexRay frame processed by Fr API functions is identified by an LPdu index (`Fr_LPduIdx`). ] (SRS\_Fr\_05003, SRS\_Fr\_05024)

**[SWS\_Fr\_00470]** [ Each LPdu carries the LSdu. Each controller's LPdus are identified by LPdu indices from 0 to (n-1) where n is the number of LPdus processed by the corresponding CC. ] ()

**[SWS\_Fr\_00471]** [ LPdu indices are only valid within a tuple <Fr\_CtrlIdx, Fr\_LPduIdx>. ] ()

**[SWS\_Fr\_00472]** [ An Fr\_LPduIdx uniquely identifies the following parameters of a FlexRay frame as a key: {Slot ID, Channel, cycle repetition, base cycle, transmit/receive}. ] ()

**[SWS\_Fr\_00345]** [ Each FlexRay CC contains absolute timers. Absolute FlexRay timers are identified via absolute timer indices (Fr\_AbsTimerIdx). ] ()

**[SWS\_Fr\_00473]** [ Each CC's absolute timers are identified by absolute timer indices from 0 to (n-1), where n is the number of absolute timers controlled by the particular CC. ] ()

**[SWS\_Fr\_00474]** [ Absolute timer indices are only valid within a tuple <Fr\_CtrlIdx, Fr\_AbsTimerIdx>. ] ()

The FlexRay Driver numbering scheme (Figure 3) assigns indices to these items on a per-driver basis. Note that only the FlexRay CCs handled by one specific Fr module (i.e., the FlexRay CCs of type A in the example given) are being assigned indices within the context of this Fr module. All other CCs (e.g., the FlexRay CC of type B) are not handled by this Fr module and thus no indices have been assigned to these FlexRay CCs within the context of this Fr module.

## 7.4 POC state machine control

**[SWS\_Fr\_00477]** [ Since a FlexRay CC is condition-based, it internally maintains a state machine, the Protocol Operation Control (POC) state machine. The state transitions are driven both by hardware related events as well as by commands passed by the host at the CHI (see [13] for details). ] ()

**[SWS\_Fr\_00478]** [ The CHI commands driving the POC state machine are incorporated into several Fr module API functions. API functions affecting the POC state of a FlexRay CC are:

- Fr\_StartCommunication()
- Fr\_HaltCommunication()
- Fr\_AbortCommunication()
- Fr\_SendWUP()
- Fr\_ControllerInit() ] ()

**[SWS\_Fr\_00438]** [ All API functions other than those listed above shall not change the POC state of the FlexRay CC.

Figure 4 shows the POC states of the FlexRay CC and the transitions applicable to the Fr module API functions. Note that

- certain transitions (marked with \*) are performed by the invocation of a single API function call (`Fr_ControllerInit()`).
- certain transitions might be implicitly performed by the FlexRay CC without external command invocation (dotted arrow)
- certain transitions specified cannot be performed by the current Fr module API (not drawn in Figure 4 – compare to [5]).

## 7.5 FIFO support and message ID filtering

To efficiently support reception in certain use-cases, FlexRay controllers might support receive-FIFOs. The receive-FIFOs accept FlexRay frames based on a set of configured filter criterias which match FlexRay specific properties such as frameID, cycle, channel, as well as protocol add-ons like the message ID, in hardware.

**[SWS\_Fr\_00593]** [ The hardware receive-FIFO shall be used if the FIFO filter-criterias as configured can be applied to the hardware FIFO. ] (SRS\_Fr\_05005, SRS\_Fr\_05006)

**[SWS\_Fr\_00594]** [ All LPdus (as configured within FrIf) matching a receive-FIFO's filter-criteria shall be assigned to the respective receive-FIFO. ] (SRS\_Fr\_05005)

**[SWS\_Fr\_00595]** [ No specific buffers shall be assigned to LPdus that are assigned to a receive-FIFO. ] (SRS\_Fr\_05005)

**[SWS\_Fr\_00596]** [ If Fr\_ReceiveRxLPdu() is called for an LPdu assigned to the receive FIFO, the service Fr\_ReceiveRxPdu() consumes the first valid frame out of the respective FIFO and returns it as received frame. There is no receive-FIFO specific API, thus keeping the upper layers unaffected. ] (SRS\_Fr\_05005)

**Hint:** This restricted implementation of the receive-FIFO covers a very typical use-case (FrTp):

- All received (L)Pdus assigned to the FIFO shall be processed by a single upper layer module.
- The upper layer does not care about the specific assignment of (L)Pdus to FlexRay FrameTriggerings.

**[SWS\_Fr\_00597]** [ LPdus received via the FIFO shall be returned in the same order as they were received on the FlexRay network. ] (SRS\_Fr\_05005)

## 7.6 Configuration description

**[SWS\_Fr\_00080]** [ The Fr module shall provide an XML file that contains the data, which is required for the SW identification and configuration parameters. This file shall describe vendor specific configuration parameters if applicable. ] (SRS\_BSW\_00003, SRS\_BSW\_00334, SRS\_BSW\_00374, SRS\_BSW\_00379)

**[SWS\_Fr\_00480]** [ A driver MCG reads the ECU configuration parameters of the Fr and the FrIf modules. While cluster related configuration parameters are contained in the FrIf module's configuration, CC related configuration parameters are contained in the Fr module's configuration. The Fr module's specific configuration tool shall read both ECU module configurations to derive the configuration parameters for all FlexRay CCs mapped to the Fr module. ] (SRS\_Fr\_05058)

**[SWS\_Fr\_00481]** [ All frame transmission/reception related configuration parameters are located only in the FrIf module description (within configuration containers 'FrIfLPdu' and 'FrIfFrameTriggering'). The Fr must be able to handle all transmission/reception requests of all related LPdus. The LPdus within the FrIf configuration contain both an LPduldx which is passed to the Fr API as well as a link to a frame triggering that holds the link of the LPdu to the FlexRay network (assignment to Slot, channel, cycle).

The CC configuration parameters related to frame transmission and reception shall be derived from the communication matrix the CC is mapped to within the FrIf. ] ()

**[SWS\_Fr\_00482]** [ For optimization purposes the Fr MCG shall read the FrIf job list for detecting the points in time certain actions on the Fr will be synchronously invoked by the FrIf (see [7] for the FrIf configuration parameters). ] ()

**[SWS\_Fr\_00483]** [ Based on those invocation times the Fr MCG might decide certain resource alignment optimizations for transmission and reception (share buffers among different LPdus). ] ()

**[SWS\_Fr\_00003]** [ If the FrIf job list contains dedicated buffer reconfiguration entries that allow for optimization, then the Fr module's MCG may decide to share one buffer for several LPdus within the static segment. ] ()

**[SWS\_Fr\_00624]** [ If an LPdu is dynamically reconfigurable ('FrIfReconfigurable' set to true) the MCG shall decide to assign a single exclusive hardware message buffer to those LPdus. ] ()

**[SWS\_Fr\_00484]** [ The Fr MCG shall have knowledge about the capabilities of the CC and the corresponding driver, therefore this tool is called driver dependent. ] ()

**[SWS\_Fr\_00485]** [ If an Fr MCG is unable to map all required communication operations to the available resources, then it has to report that conflict<sup>1</sup>. ] ()

**[SWS\_Fr\_00486]** [ The number of supported FlexRay CCs is defined at configuration time. ] ()

**[SWS\_Fr\_00487]** [ The MCG shall ensure the consistency of the generated configuration. ] ()

**[SWS\_Fr\_00027]** [ The Fr module shall support the pre-compile-time and post-build-time configuration classes. ] (SRS\_BSW\_00345, SRS\_BSW\_00404)

An assignment of those configuration classes to configuration parameters can be found in chapter 10.

**Hint:** The description of the software configuration itself is not part of this specification but very implementation specific.

A detailed description of all Fr related configuration parameters is specified in chapter 10 of this document. Additionally the configuration parameters of the FrIf (see chapter 10 of [7]) shall be evaluated for Fr module configuration.

## 7.7 Error classification

---

<sup>1</sup> This can result from either from running out of resources (e.g. buffers) or the mapping of the configuration to the particular device is not supported (e.g. configuration features supported in [13], but the device is not compliant to [14]).

## 8.4 Function definitions

During specification of the API functions the following guidelines were applied:

- The API functions of the Fr module shall have the return type `Std_ReturnType` or `void` (no return code).
- If an API function of the Fr module has the return type `Std_ReturnType`, and if the function performs its service successfully, then it shall return `E_OK` otherwise `E_NOT_OK`.
- If the Fr module's environment is passing input parameters by a reference, then the Fr SWS shall use the `const` qualifier (`const type *`) to guarantee that it doesn't change the input parameter.
- For output parameters, a memory address to store the parameter is passed as an argument.
- If API functions of the Fr module successfully finish (return `E_OK`), then all output parameters shall be written with valid values.
- If API functions of the Fr module erroneously finish (return `E_NOT_OK`), then no output parameter shall be written. Output parameters shall keep their original values in this case.

#### 8.4.32 Fr\_ReadCCConfig

[**SWS\_Fr\_00651]** [

<b>Service name:</b>	Fr_ReadCCConfig	
<b>Syntax:</b>	<pre>Std_ReturnType Fr_ReadCCConfig(     uint8 Fr_CtrlIdx,     uint8 Fr_ConfigParamIdx,     uint32* Fr_ConfigParamValuePtr )</pre>	
<b>Service ID[hex]:</b>	0x2e	
<b>Sync/Async:</b>	Synchronous	
<b>Reentrancy:</b>	Non Reentrant for the same device	
<b>Parameters (in):</b>	Fr_CtrlIdx	Index of FlexRay CC within the context of the FlexRay Driver.
	Fr_ConfigParamIdx	Index that identifies the configuration parameter to read. See macros FR_CIDX_<config_parameter_name>.
<b>Parameters (inout):</b>	None	
<b>Parameters (out):</b>	Fr_ConfigParamValuePtr	Address the output value is stored to.
<b>Return value:</b>	Std_ReturnType	E_OK: API call finished successfully. E_NOT_OK: API call aborted due to errors.
	<b>Description:</b> Reads a FlexRay protocol configuration parameter for a particular FlexRay controller out of the module's configuration.	

] ()

The function Fr\_ReadCCConfig shall perform the following tasks:

1. Read the value of the configuration parameter requested by Fr\_ConfigParamIdx from the configuration and write it to output parameter \*Fr\_ConfigParamValuePtr.
2. Return E\_OK.

[**SWS\_Fr\_00652]**] If the function Fr\_ReadCCConfig is able to and detects a hardware error while performing the requested functionality, then it shall call Dem\_SetEventStatus (FR\_E\_CTRL\_TESTRESULT, DEM\_EVENT\_STATUS\_FAILED) and return E\_NOT\_OK. ] ()

[**SWS\_Fr\_00653]**] If development error detection for the Fr module is enabled, and if the function Fr\_ReadCCConfig is called before the successful initialization of Fr,

then the function Fr\_ReadCCConfig shall raise the development error FR\_E\_INIT\_FAILED. ] ()

**[SWS\_Fr\_00654]** [ If development error detection for the Fr module is enabled, then the function Fr\_ReadCCConfig shall check the validity of the parameter Fr\_CtrIdx. If Fr\_CtrIdx is invalid, then the function Fr\_ReadCCConfig shall raise the development error FR\_E\_INV\_CTRL\_IDX. ] ()

**[SWS\_Fr\_00655]** [ If development error detection for the Fr module is enabled, then the function Fr\_ReadCCConfig shall check the validity of the parameter Fr\_ConfigParamIdx. **[SWS\_Fr\_00656]** [ If development error detection for the Fr module is enabled, then the function Fr\_ReadCCConfig shall check whether the parameter Fr\_ConfigParamValuePtr is a NULL pointer (NULL\_PTR). If Fr\_ConfigParamValuePtr is a NULL pointer, then the function Fr\_ReadCCConfig shall raise the development error FR\_E\_PARAM\_POINTER. ] ()

Configuration parameters values are specified as integer, float, enumeration or boolean. In order to map those values to the output parameter of type uint32, the following generic rules for conversion shall be applied for integer and float:

- **[SWS\_Fr\_00658]** [ integers are mapped 1 to 1. ] ()
- **[SWS\_Fr\_00659]** [ floats (units of seconds) are converted to units of nanoseconds (with nanosecond granularity) and converted to uint32. ] ()
- **[SWS\_Fr\_00661]** [ booleans shall output 1 for true and 0 for false. ] ()

For configuration parameters specified as enumeration type, the following mappings shall be applied:

**[SWS\_Fr\_00662]** [ If parameter Fr\_ConfigParamIdx is set to FR\_CIDX\_PCHANNELS (FrPChannels) then the value stored at Fr\_ConfigParamValuePtr shall be interpreted as the following literals

0 FR\_CHANNEL\_A  
1 FR\_CHANNEL\_B  
2 FR\_CHANNEL\_AB

## 8.5 Call-back notifications

The FlexRay driver does not call any callbacks.

## 8.6 Scheduled functions

The FlexRay driver, which is executed in the context of the FlexRay Interface has no function to be scheduled.

## 8.7 Expected Interfaces

In this chapter, all interfaces required from other modules are listed.

### 8.7.1 Mandatory Interfaces

This chapter defines all interfaces that are required to fulfill the core functionality of the module.

**[SWS\_Fr\_00390]** [

<b>API function</b>	<b>Description</b>
Dem_SetEventStatus	Called by SW-Cs or BSW modules to report monitor status information to the Dem. BSW modules calling Dem_SetEventStatus can safely ignore the return value.
Det_ReportRuntimeError	Service to report runtime errors. If a callout has been configured then this callout shall be called.

] ()

## 8.7.2 Optional Interfaces

This chapter defines all interfaces that are required to fulfill an optional functionality of the module.

[SWS\_Fr\_00391] [

<b>API function</b>	<b>Description</b>
Det_ReportError	Service to report development errors.
SchM_Enter_Fr	--
SchM_Exit_Fr	--

] ()

Further optional interfaces might be accessed in case the Fr uses other modules for accessing the CC hardware.

## 8.7.3 Configurable interfaces

There are no configurable interfaces related to the FlexRay driver.

## 9 Sequence diagrams

The usage of the driver is depicted in the Sequence diagrams of the FlexRay Interface.

## 10 Configuration specification

In general, this chapter defines configuration parameters and their clustering into containers. In order to support the specification Chapter 10.1 describes fundamentals. It also specifies a template (table) you shall use for the parameter specification. We intend to leave Chapter 10.1 in the specification to guarantee comprehension.

Chapter 10.2 specifies the structure (containers) and the parameters of the module FlexRay Driver.

Chapter 10.3 specifies published information of the module FlexRay Driver.

### 10.1 How to read this chapter

For details refer to the chapter 10.1 “Introduction to configuration specification” in *SWS\_BSWGeneral*.

## 10.2 Containers and configuration parameters

The following chapters summarize all configuration parameters.
