Towards a Centralized/Zonal Architecture

Function Architecture

- ▶ **Reduce cost**
 - > ECU consolidation
 - > Simplified wiring
- ▶ **Reduce CO₂ footprint**
 - > Lighter wiring harness
- ▶ **Enable the software defined vehicle**
 - > Decouple hardware from software
 - > New (purely) software-driven vehicle functions
 - > Increase the value of a vehicle over its lifetime

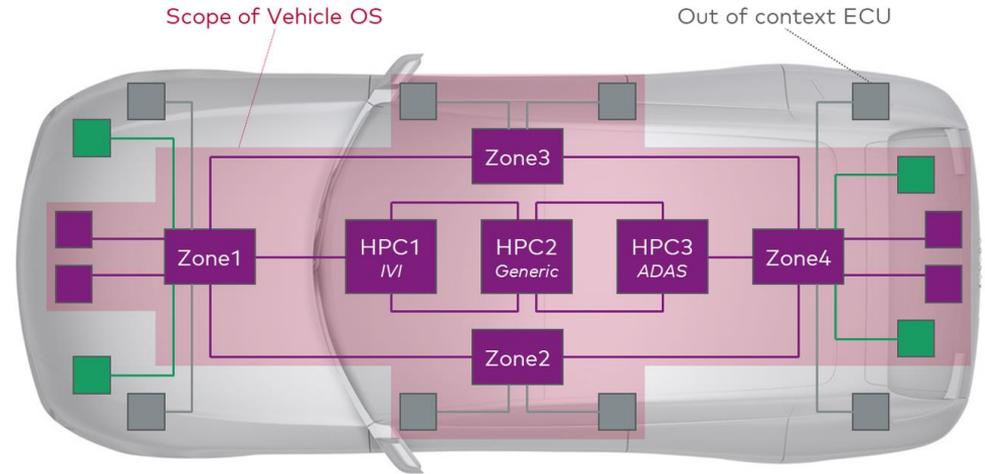

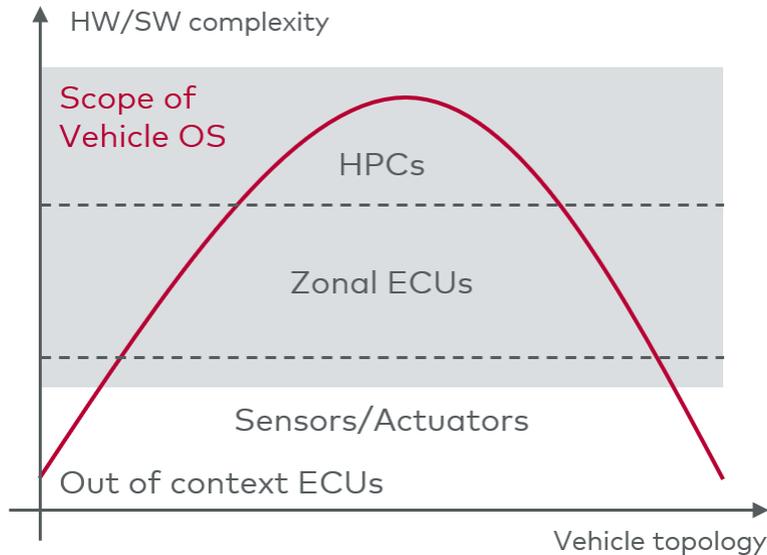

Centralized/Zonal Architecture

Software Defined Vehicle

In context of the E/E system, there are three enablers for the software defined vehicle

- ▶ Architecture: HPCs and zonal ECUs ✓
- ▶ Hardware: High-performance microcontrollers and microprocessors ✓
- ▶ Software: Powerful software platform and ecosystem → **Vehicle OS**
 - > To cope with the increasing SW complexity, mainly in HPCs and zonal ECUs, controlled by OEMs
 - > Separate software solution for small ECUs, potentially developed out of context, controlled by Tier1s

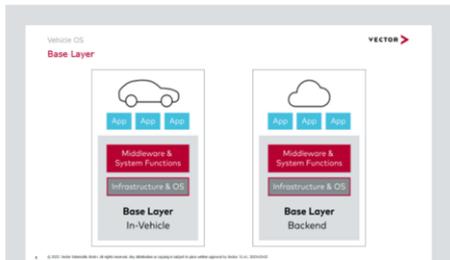

Definition

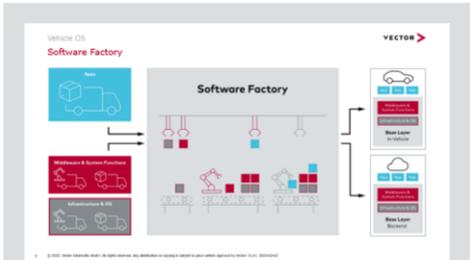

Vehicle OS = C(Base Layer + Software Factory)

- ▶ A **Vehicle OS** is a development and operations platform for services and applications of all vehicle domains. It consists of a Base Layer and a Software Factory and supports collaboration between companies.

- ▶ The Vehicle OS runtime software is called **Base Layer** and its instantiation may differ from target to target (e.g., microcontroller, micro-processor, and backend).

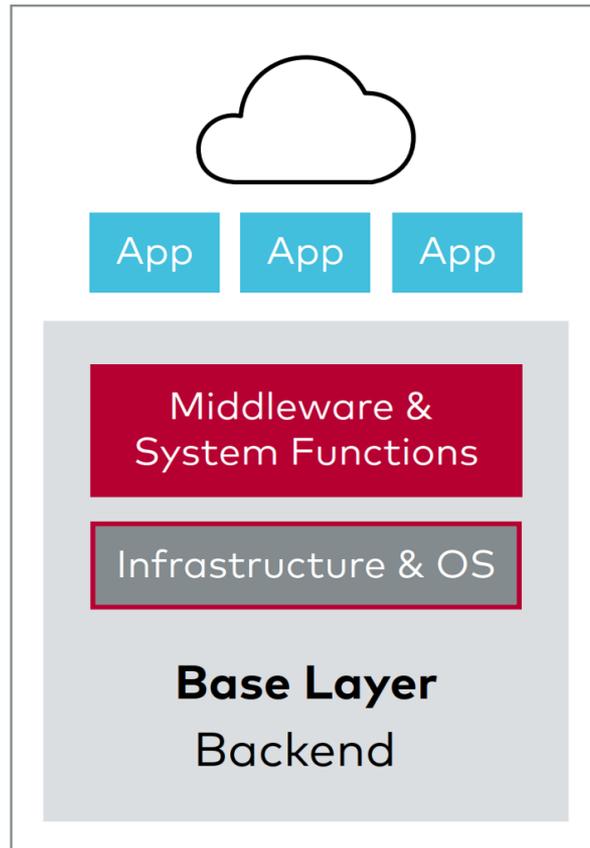

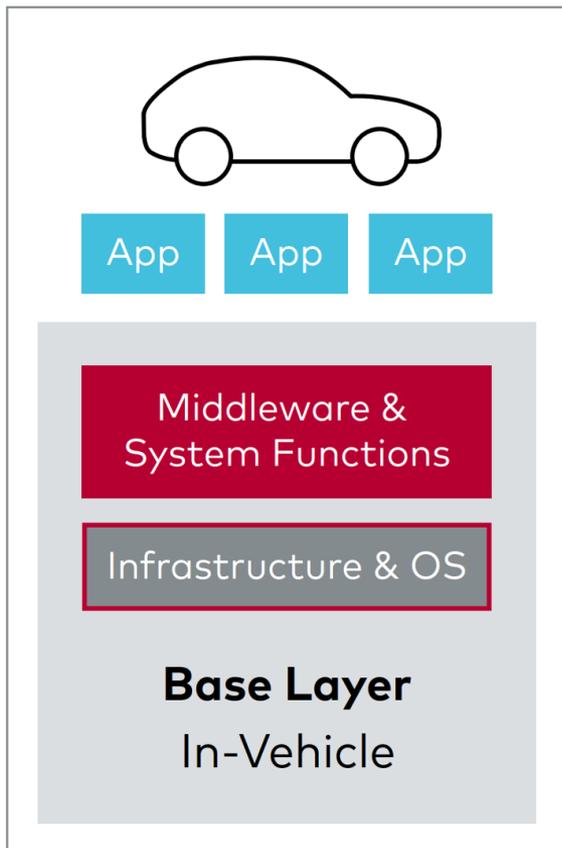

- ▶ As Vehicle OS infrastructure, the **Software Factory** supports and automates the developer's journey to develop, integrate and deploy Base Layer and applications.

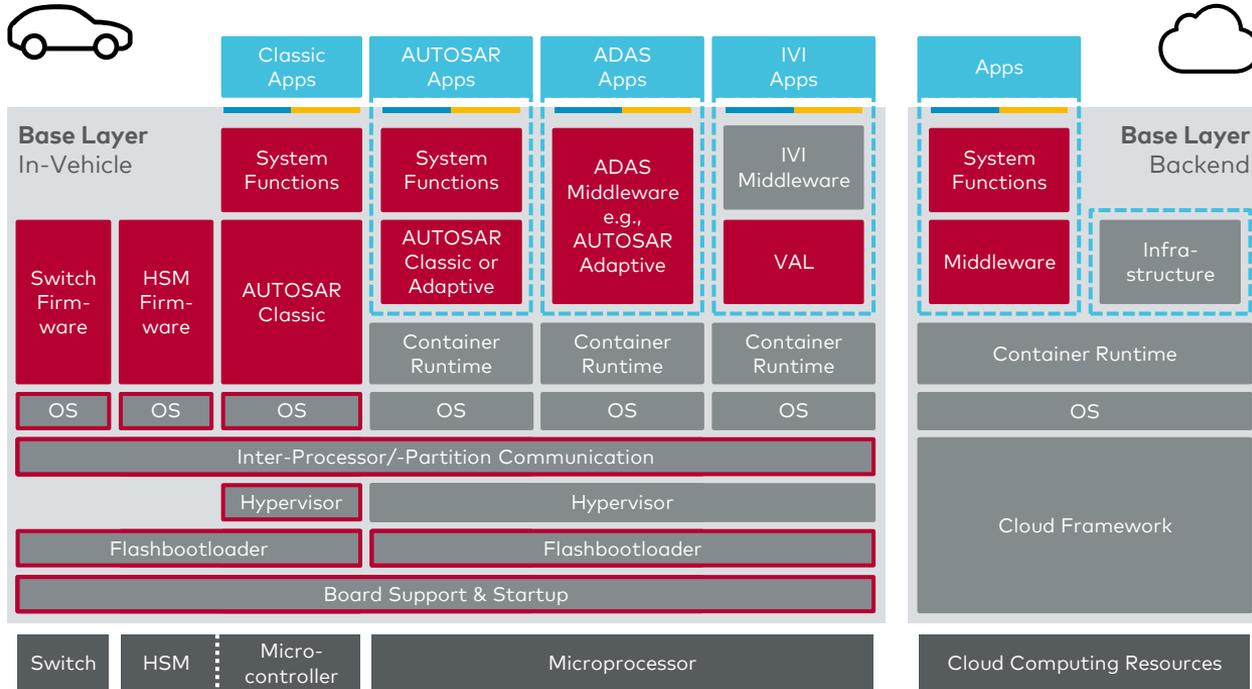

- ▶ Close and agile **Collaboration (C)** between OEM and suppliers via a supporting platform is key for success.

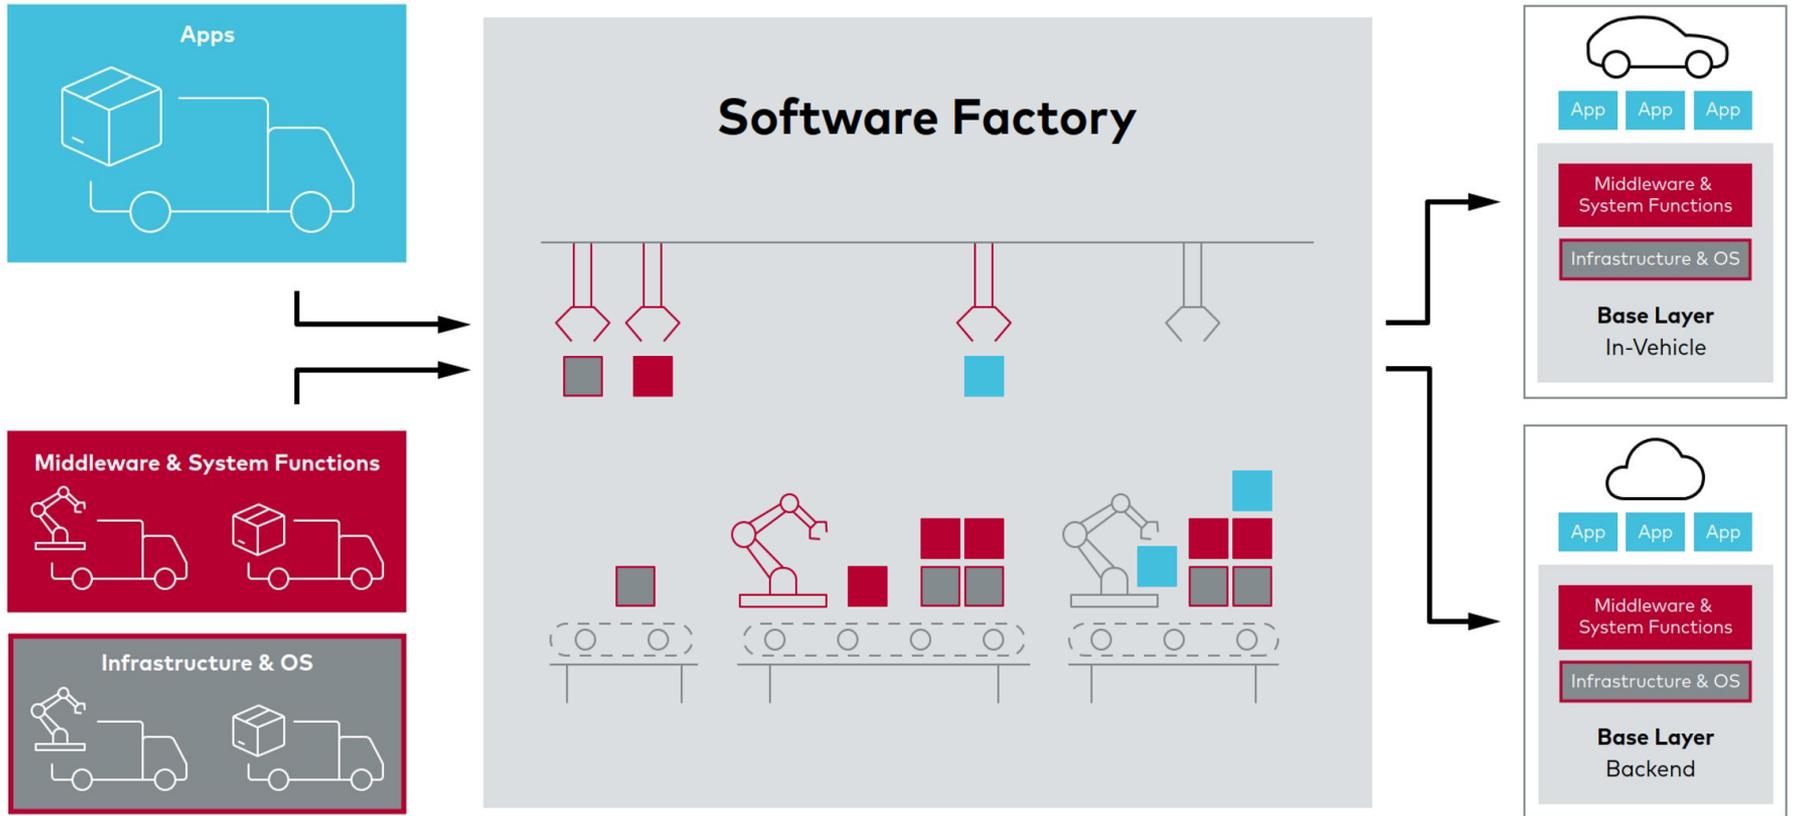

Base Layer

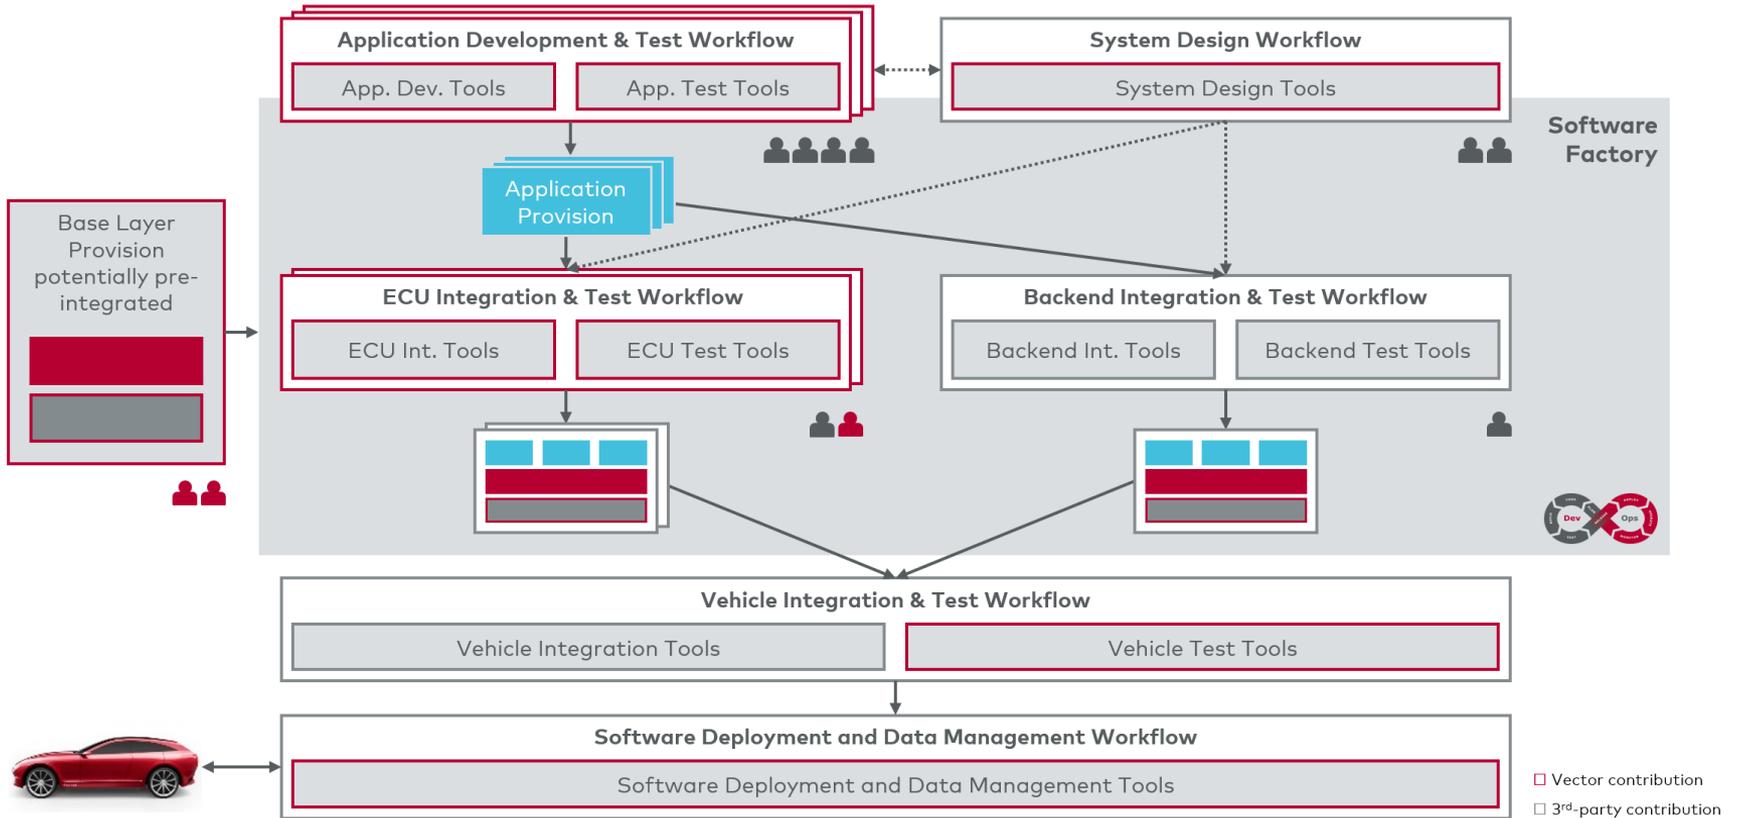

Base Layer: Building Blocks

Software Factory

Software Factory: Workflow and Tools

The Vehicle OS Is the Next Step in Simplifying Our Customer Life

For our customers, we see big benefits when following the Vehicle OS approach

▶ Base Layer

- > With a Base Layer, Vector provides aligned building blocks for a safe and secure embedded runtime software
 - > This goes beyond single products like MICROSAR Classic or MICROSAR Adaptive
 - > If desired, a Base Layer can also be pre-integrated by Vector (e.g., in software platform scenarios)
 - > This includes the integration with 3rd party products like POSIX OS or microprocessor hypervisor

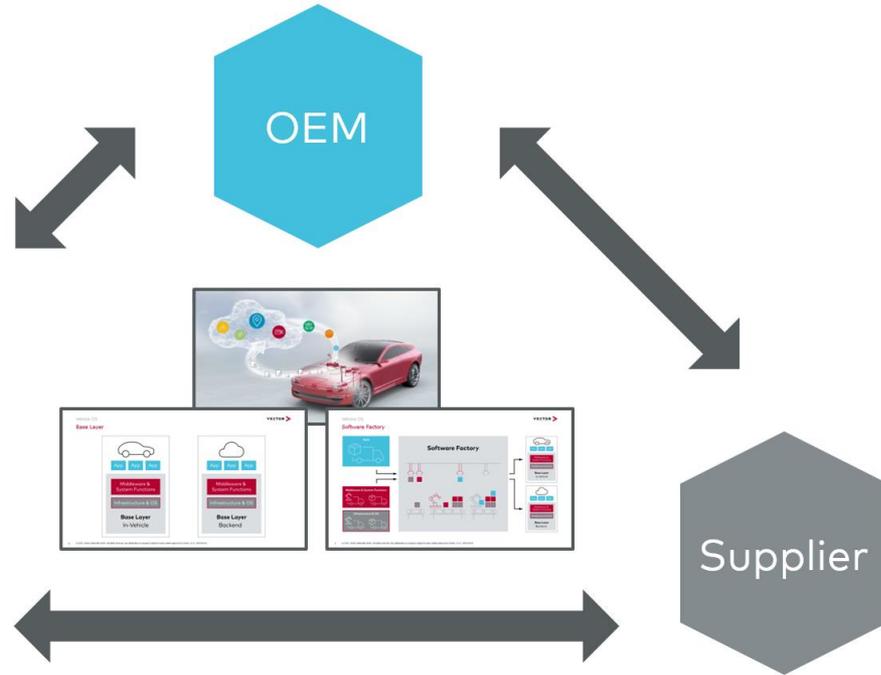

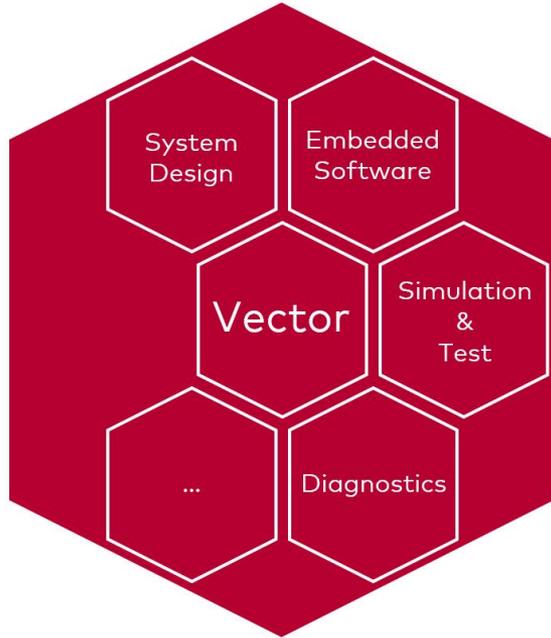

▶ Software Factory

- > Big ECUs like HPCs run hundreds of applications, developed asynchronously all over the world
- > Additionally, today's software developers want to follow a feature-based development approach by using e.g., well-known Git workflows
- > Without a high degree of automation, software integration and test become major pain points in this scenario
- > Our answer to this challenge is the Software Factory enabling a highly automated software integration and test process according to the DevOps principle
- > The result is a scalable development environment that enables focusing on application development

Vector's strategy

- ▶ For Vector, the Vehicle OS is a common vision shared between many products of different product lines, and not limited to embedded software
- ▶ Many products are and will be aligned to this vision with the goal of providing a powerful software platform and a corresponding development and operations ecosystem

Collaboration & Summary

Let's shape the future of automotive software together!

Marcelino Varas | Vector

- ▶ Model based E/E system design
- ▶ Contribution of the system design to the vehicle OS concept
- ▶ PREEvision as system design tool

12:00 p.m. CEST

Automotive Software Factory

Matthias Wernicke | Vector

- ▶ Key elements of an Automotive Software Factory
- ▶ Workflows for application development and base layer integration
- ▶ Tool building blocks provided by Vector

12:30 p.m. CEST

Lunch Break & Exhibition

Time for networking & visiting the exhibition

1:30 CEST

Cloud-Native Technologies for In-Vehicle Software

Andreas Raisch | Vector

- ▶ Applying cloud native paradigms to automotive software
- ▶ Deployment in the heart of the workflow
- ▶ Where are we today - what's next?

3:15 p.m. CEST

Coffee Break - Exhibition - Get Together with Open End

Time for networking & visiting the exhibition
