Advice to users of AUTOSAR Specification Documents:

AUTOSAR Specification Documents may contain exemplary items (exemplary reference models, "use cases", and/or references to exemplary technical solutions, devices, processes or software). Any such exemplary items are contained in the Specification Documents for illustration purposes only, and they themselves are not part of the AUTOSAR Standard. Neither their presence in such Specification Documents, nor any later AUTOSAR compliance certification of products actually implementing such exemplary items, imply that intellectual property rights covering such exemplary items are licensed under the same rules as applicable to the AUTOSAR Standard.

1 Scope of this document

The goal of AUTOSAR WP1.1.2 and this document is to define a common set of basic requirements that apply to all SW modules of the AUTOSAR Basic Software. These requirements shall be adopted and refined by the work packages responsible for the specification of Basic SW modules (WP4.2.2.1.x).

The functional requirements defined in this document shall be referenced in each Software Specification (SWS) document of the AUTOSAR Basic Software.

Constraints

First scope for specification of requirements on Basic Software Modules are systems which are not safety relevant. For this reason safety requirements are assigned to medium priority.
2 How to read this document

Each requirement has its unique identifier starting with the prefix “BSW” (for “Basic Software”). For any review annotations, remarks or questions, please refer to this unique ID rather than chapter or page numbers!

2.1 Conventions used

In requirements, the following specific semantics shall be used (based on the Internet Engineering Task Force IETF).

The key words "MUST", "MUST NOT", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "MAY", and "OPTIONAL" in this document are to be interpreted as:

- **SHALL**: This word means that the definition is an absolute requirement of the specification.
- **SHALL NOT**: This phrase means that the definition is an absolute prohibition of the specification.
- **MUST**: This word means that the definition is an absolute requirement of the specification due to legal issues.
- **MUST NOT**: This phrase means that the definition is an absolute prohibition of the specification due to legal constraints.
- **SHOULD**: This word, or the adjective "RECOMMENDED", mean that there may exist valid reasons in particular circumstances to ignore a particular item, but the full implications must be understood and carefully weighed before choosing a different course.
- **SHOULD NOT**: This phrase, or the phrase "NOT RECOMMENDED" mean that there may exist valid reasons in particular circumstances when the particular behavior is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label.
- **MAY**: This word, or the adjective „OPTIONAL“, means that an item is truly optional. One vendor may choose to include the item because a particular marketplace requires it or because the vendor feels that it enhances the product while another vendor may omit the same item. An implementation, which does not include a particular option, MUST be prepared to interoperate with another implementation, which does include the option, though perhaps with reduced functionality. In the same vein an implementation, which does include a particular option, MUST be prepared to interoperate with another implementation, which does not include the option (except, of course, for the feature the option provides.)
2.2 Requirements structure

Each module specific chapter contains a short functional description of the Basic Software Module. Requirements of the same kind within each chapter are grouped under the following headlines (where applicable):

Functional Requirements:
- Configuration (which elements of the module need to be configurable)
- Initialization
- Normal Operation
- Shutdown Operation
- Fault Operation
- …

Non-Functional Requirements:
- Timing Requirements
- Resource Usage
- Usability
- Output for other WPs (e.g. Description Templates, Tooling,...)
- …

Mapping to AUTOSAR releases

For each requirement defined in the document “General Requirements on Basic Software Modules”, there shall be a reference to the AUTOSAR release(s) for which the requirement is valid. This is achieved by the row “AUTOSAR release” in the requirement description table.

This Requirements Specification contains general requirements that are valid for all SW modules that are part of the AUTOSAR Basic Software.

The obligatory part of the requirements is stated in the description of each requirement.
3 Acronym and abbreviations

<table>
<thead>
<tr>
<th>Acronym</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interrupt frame</td>
<td>An interrupt frame is the code which is generated by the compiler or the assembler code for prefix and postfix of interrupt routines. This code is Microcontroller specific</td>
</tr>
</tbody>
</table>
4 General Requirements on Basic Software

The requirements on Basic Software cover the following domains:

- Body
- Powertrain
- Chassis
- Safety (assumption: covered, because hardware and system infrastructure are similar to the domains above)

The ECU application experience is taken from the following concrete applications:

- Sunroof and power window ECU
- Diesel engine ECU
- ESP ECU
- BMW, DC and VW standard software packages (‘Standard Core’, ‘Standard Software Platform’, ‘Standard Software Core’) including OSEK OS, communication modules, bootloader, basic diagnostic functions for the domains listed above
- Infotainment control ECU

4.1 Functional Requirements

4.1.1 Configuration

4.1.1.1 [BSW00344] Reference to link-time configuration

<table>
<thead>
<tr>
<th>Initiator</th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>23.07.2004</td>
</tr>
<tr>
<td>AUTOSAR Release</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description</td>
<td>Reference to link time configuration</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Importance</td>
<td>High</td>
</tr>
</tbody>
</table>

Description: All modules of the AUTOSAR Basic Software that operate on link-time configurable data at runtime shall use a read only reference (pointer) to an external configuration instance.

Rationale: Allow configurable functionality of modules that are deployed as object code. Usually those modules are drivers.

Use Case: Example:
```c
typedef struct
{
    void (*NotifyJobOk)(void);
    uint8 NormalReadBlockSize;
    uint8 FastReadBlockSize;
} Eep_ConfigType;

const Eep_ConfigType Eep_Config = /* instantiate */
{
    NULL,
    8,
    64                             /* and initialize */
};
```
4.1.1.2 [BSW00404] Reference to post build time configuration

| Initiator: | BMW |
| Date: | 23.07.2004 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | Reference to post build time configuration |
| Type: | New |
| Importance: | High |
| Description: | Modules of the AUTOSAR Basic Software that operate on one post build time configurable data entity shall use a read only reference (pointer) to an external configuration instance. (violation of this requirement must be reasoned) |
| Rationale: | As long as there is only one set of configuration data (i.e. we have no multiple configuration sets) the references can be resolved as constant pointers. The indirections shall be kept as simple as possible |
| Use Case: | -- |
| Dependencies: | [BSW00342] Usage of source code and object code |
| | [ECUC0048] Link-time configuration (see [ECU_CONF_SRS]) |
| Conflicts: | -- |
| Supporting Material: | -- |

4.1.1.3 [BSW00405] Reference to multiple configuration sets

| Initiator: | BMW / CAS |
| Date: | 27.10.2005 |
| AUTOSAR Release: | 2.0 and higher |
| Short Description: | Reference to multiple configuration sets |
| Type: | Changed (Telcon) |
| Importance: | High |
| Description: | Modules of the AUTOSAR Basic Software that operate on more than one post build time configurable data entity shall use a reference (pointer) to an external configuration instance. This reference is initialized at start-up of the module. It can only be changed at initialization-time. It must not be changed afterwards. |
| Rationale: | Application of the same software to different cars. |
| Use Case: | -- |
| Dependencies: | [BSW00342] Usage of source code and object code |
| | [ECUC0048] Link-time configuration (see [ECU_CONF_SRS]) |
| Conflicts: | -- |
| Supporting Material: | -- |
4.1.1.4 [BSW00345] Pre-compile-time configuration

**Initiator:** BMW  
**Date:** 23.07.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Pre-compile-time configuration  
**Type:** Changed to add "*.c" file  
**Importance:** High  
**Description:** All modules of the AUTOSAR Basic Software, operating on Pre-compile-time configuration data (not to be modified after compile time), shall group and export the configuration data to configuration files. 

Module specific configuration header file naming convention:  
<Module name>_Cfg.h and possibly  
<Module name>_Cfg.c

**Rationale:** Static configuration is decoupled from implementation. Separation of configuration dependent data at compile time furthermore enhances flexibility, readability and reduces version management as no source code is affected.

**Use Case:**

In Tp_Cfg.h:  
#define TP_USE_NORMAL_ADDRESSING  kTpOff  
#define TP_USE_NORMAL_FIXED_ADDRESSING  kTpOff  
#define TP_USE_EXTENDED_ADDRESSING  kTpOn

...  

in Tp.c:  
...  
#include "Tp_Cfg.h"

...  
#if (TP_USE_NORMAL_ADDRESSING == kTpOn)  
... do something  
#endif

**Dependencies:** [BSW158] Separation of configuration from implementation  
[ECUC0047] Pre-compile-time configuration (see [ECU_CONF_SRS])

**Conflicts:** --

**Supporting Material:** --

4.1.1.5 [BSW159] Tool-based configuration

**Initiator:** BMW  
**Date:** 10.02.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Tool-based configuration.  
**Type:** New  
**Importance:** High  
**Description:** All modules of the AUTOSAR Basic Software shall support a tool based configuration.

**Rationale:** Integration into AUTOSAR methodology

**Use Case:** The NVRAM manager can be automatically configured depending on the NV parameters and their corresponding attributes of the software components.

**Dependencies:** --

**Conflicts:** --

**Supporting Material:** --
### 4.1.1.6 [BSW167] Static configuration checking

<table>

<td>AUTOSAR Release</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description</td>
<td>Configure optional functionality in a way to minimize resource consumption</td>
</tr>
<tr>
<td>Type</td>
<td>Changed (18.03.2005)</td>
</tr>
<tr>
<td>Importance</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>Optional functionality of a Basic-SW component that is not required in the ECU shall be configurable at pre-compile-time (on/off).</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Optional functionalities of Basic SW components which are disabled by static configuration shall not consume resources (RAM, ROM, runtime). Implementation example: in C language, preprocessing directives can be used. Ensure optimal resource consumption. There are many requirements marked with high importance but not all are used in each ECU thus resource overhead must be avoided.</td>
</tr>
<tr>
<td>Use Case:</td>
<td>1. The development error detection is a statically configurable optional function that can be enabled and disabled. 2. The EEPROM write cycle reduction is a statically configurable optional function that can be enabled and disabled.</td>
</tr>
<tr>
<td>Dependencies:</td>
<td>--</td>

4.1.1.8 [BSW170] Data for reconfiguration of AUTOSAR SW-Components

**Initiator:** BOSCH  
**Date:** 24.11.2005  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** The AUTOSAR SW Components shall provide information about their dependency from faults, signal qualities, driver demands, ...  
**Type:** Changed  
**Importance:** High  
**Description:** AUTOSAR SW-Components may depend on the system fault state or configuration demand of OEM or driver. These reconfiguration dependencies must be provided during ECU configuration time. This information must be used for cross checks and functional evaluation at ECU configuration time and for correct shut down/activation behavior at runtime.  
**Rationale:** Resolve the interdependencies between AUTOSAR SW-Components.  
**Use Case:** A fault of the steering angle sensor will lead to reduced function of the related AUTOSAR SW-Components.  
**Example:**  
- faults (CAN bus off, sensor defective, calibration data checksum error)  
- signal quality (lambda sensor not yet in operating temperature range)  
- driver demands (disable ESP)  
- ...  
**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --

4.1.1.9 [BSW00380] Separate C-Files for configuration parameters

**Initiator:** WP1.1.2  
**Date:** 30.06.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Separate C-Files for configuration parameters  
**Type:** New  
**Importance:** High  
**Description:** Configuration parameters being stored in memory shall be placed into separate c-files (effected parameters are those from link-time configuration as well as those from post-build time configuration).  
**Rationale:** Enable the use of different object files.  
**Use Case:** --  
**Dependencies:** [BSW00381] Separate configuration header file for pre-compile time parameters  
[BSW00346] Basic set of module files  
**Conflicts:** --  
**Supporting Material:** Layered Software Architecture ([DOC_LAYERED_ARCH])

4.1.1.10 [BSW00419] Separate C-Files for pre-compile time configuration parameters

**Initiator:** WP1.1.2  
**Date:** 30.06.2005  
**AUTOSAR Release:** 2.0 and higher
**Short Description:** Separate C-Files for pre-compile time configuration parameters  
**Type:** New  
**Importance:** Medium  
**Description:** If a pre-compile time configuration parameter is implemented as "const" it should be placed into a separate c-file.  
**Rationale:** Enabling of object code integration. Separation of configuration from implementation.  
**Use Case:** --  
**Dependencies:** [BSW00380] Separate C-Files for configuration parameters  
**Conflicts:** --  
**Supporting Material:** Layered Software Architecture ([DOC_LAYERED_ARCH])

4.1.1.11 [BSW00381] Separate configuration header file for pre-compile time parameters

**Initiator:** WP1.1.2  
**Date:** 21.10.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Separate configuration header file for pre-compile time parameters  
**Type:** Changed (Telcon)  
**Importance:** High  
**Description:** The pre-compile time parameters shall be placed into a separate configuration header file.  
**Rationale:** Keep the configuration data separate.  
**Use Case:** --  
**Dependencies:** [BSW00345] Pre-compile-time configuration  
**Conflicts:** --  
**Supporting Material:** --

4.1.1.12 [BSW00412] Separate H-File for configuration parameters

**Initiator:** WP1.1.2  
**Date:** 30.06.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Separate H-File for configuration parameters  
**Type:** New  
**Importance:** High  
**Description:** References to c-configuration parameters (link time and post-build time) shall be placed into a separate h-file. The h-file shall be the same as pre-compile time parameters.  
**Rationale:** Put the references in the file yxz_cfg.h to enable access to the configuration data.  
**Use Case:** --  
**Dependencies:** [BSW00381] Separate configuration header file for pre-compile time parameters, [BSW00345] Pre-compile-time configuration  
**Conflicts:** --  
**Supporting Material:** --
4.1.1.13  [BSW00383] List dependencies of configuration files

| Initiator:  | WP1.1.2 |
| Date:       | 08.12.2005 |
| AUTOSAR Release: | 2.0 and higher |
| Short Description: | List dependencies of configuration files |
| Type:       | Changed |
| Importance: | High |
| Description: | The Basic Software Module specifications shall specify which other configuration files from other modules they use at least in the description. |
| Rationale:  | Resolve compatibility issues |
| Use Case:   | -- |
| Dependencies: | [BSW00384] List dependencies to other modules |
| Conflicts:  | -- |
| Supporting Material: | -- |

4.1.1.14  [BSW00384] List dependencies to other modules

| Initiator:  | WP1.1.2 |
| Date:       | 08.12.2005 |
| AUTOSAR Release: | 2.0 and higher |
| Short Description: | List dependencies to other modules |
| Type:       | Changed |
| Importance: | High |
| Description: | The Basic Software Module specifications shall specify at least in the description which other modules (in which versions) they require. |
| Rationale:  | Resolve compatibility issues |
| Use Case:   | -- |
| Dependencies: | [BSW00383] List dependencies of configuration files |
| Conflicts:  | -- |
| Supporting Material: | -- |

4.1.1.15  [BSW00387] Specify the configuration class of callback function

| Initiator:  | WP1.1.2 |
| Date:       | 08.12.2005 |
| AUTOSAR Release: | 2.0 and higher |
| Short Description: | Specify the configuration class of callback function |
| Type:       | Changed |
| Importance: | High |
| Description: | The Basic Software Module specifications shall specify how the callback function is to be implemented. (Pre-compile macro, pointer at link time, array of pointers at post-build time and pointer at post-build time) |
| Rationale:  | -- |
| Use Case:   | If a pre-compile time callback function (macro) shall be changed to a post build time multiple configuration-set callback function (pointer to a function). The implementation will change significantly. |
| Dependencies: | -- |
| Conflicts:  | -- |
| Supporting Material: | See Glossary ([GLOSSARY]) and ECU Configuration (WP4.1.1.2) ([ECU_CONF_SRS]) |
4.1.1.16  [BSW00388] Introduce containers

| Initiator: | WP1.1.2 |
| Date: | 30.06.2005 |
| AUTOSAR Release: | 2.0 and higher |
| Short Description: | Introduce containers |
| Type: | New |
| Importance: | High |
| Description: | Containers are used to group configuration parameters that are defined for the same object. Containers are to be defined whenever |
| | 1. Several configuration parameters logically belong together. |
| | 2. Configuration must be repeated with different parameter values for several entities of same type (e.g. the NVRAM manager has some parameters that are defined once for the whole module, which are collected in one container, and a set of parameters that are defined once per memory block, which are collected in another container. This second container is included in the first container and will be instantiated once for each memory block) |
| | 3. Containers may contain parameters of different configuration classes. This will not map to the software implementation! |
| Rationale: | Cluster the configuration parameters in order to ease the readability of code. |
| Use Case: | Header configuration file with sections for each container |
| Dependencies: | [BSW00389] Containers shall have names |
| Conflicts: | -- |
| Supporting Material: | See Glossary and ECU Configuration (WP4.1.1.2) |

4.1.1.17  [BSW00389] Containers shall have names

| Initiator: | WP1.1.2 |
| Date: | 30.06.2005 |
| AUTOSAR Release: | 2.0 and higher |
| Short Description: | Containers shall have names |
| Type: | New |
| Importance: | High |
| Description: | Containers shall have names – these names will map to section headers in the configuration header-files or configuration c-files containing the parameters |
| Rationale: | Enable referencing to the .XML document. |
| Use Case: | -- |
| Dependencies: | -- |
| Conflicts: | -- |
| Supporting Material: | See Glossary ([GLOSSARY]) and ECU Configuration (WP4.1.1.2) ([ECU_CONF_SRS]) |

4.1.1.18  [BSW00390] Parameter content shall be unique within the module

| Initiator: | WP1.1.2 |
| Date: | 30.06.2005 |
| AUTOSAR Release: | 2.0 and higher |
| Short Description: | Parameter content shall be unique within the module |
| Type: | New |
| Importance: | High |
| Description: | The same intention, logical contents or semantic shall be placed in one |
### 4.1.1.19 [BSW00391] Parameter shall have unique names

<table>
<thead>
<tr>
<th>Parameter only (There must not be several parameters with the same intention, logical contents or semantic)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Rationale:</strong> Avoid multitude identical definitions. Ease the maintenance</td>
</tr>
<tr>
<td><strong>Use Case:</strong> --</td>
</tr>
<tr>
<td><strong>Dependencies:</strong> --</td>
</tr>
<tr>
<td><strong>Conflicts:</strong> --</td>
</tr>
<tr>
<td><strong>Supporting Material:</strong> --</td>
</tr>
</tbody>
</table>

#### 4.1.1.19.1

**Initiator:** WP1.1.2  
**Date:** 30.06.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Parameter shall have unique names  
**Type:** New  
**Importance:** High  
**Description:** A parameters name must be unique per module. If the parameter is exported it must be unique to all modules using this parameter  
**Rationale:** Avoid mismatch in scope of parameter.  
**Use Case:** --  
**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --

#### 4.1.1.20 [BSW00392] Parameters shall have a type

<table>
<thead>
<tr>
<th>Parameters shall have a type</th>
</tr>
</thead>
</table>
| **Initiator:** WP1.1.2  
**Date:** 08.12.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Parameters shall have a type  
**Type:** Changed  
**Importance:** High  
**Description:** Each Parameter shall have a type. Types shall be based on primitive or, complex types defined within AUTOSAR specifications. I.e. they may be combined to structures, arrays etc. Parameters based on a “define” statement shall be put down in a way that the type can be checked by tool.  
**Rationale:** --  
**Use Case:** E.g. the type is used to generate the configuration data for post-build time configuration. Example:  
  - Type:#define MyExample ((uint8) 0815)  
  - Type:uint16  
**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --

#### 4.1.1.21 [BSW00393] Parameters shall have a range
### 4.1.1.22 [BSW00394] Specify the scope of the parameters

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>30.06.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description</td>
<td>Specify the scope of the parameters</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
</tbody>
</table>

**Description:** A parameter may only be applicable for the module it is defined in. In this case, the parameter is marked as "local". Alternatively, the parameter may be shared with other modules (i.e. exported). In that case, the scope shall list the names of the other modules sharing this parameter. Each parameter shall only be defined once in one module. All other modules sharing the parameter must not define the parameter again. Instead, the parameter is to be imported. This is applicable for c-code as well as for .XML configuration.

**Rationale:** --

**Use Case:** Importing and exporting could be achieved in different ways: external reference, redefinition in the other module.

**Dependencies:** --

**Conflicts:** --

**Supporting Material:** [BSW00391] Parameter shall have unique names

### 4.1.1.23 [BSW00395] List the required parameters (per parameter)

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>08.12.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description</td>
<td>List the required parameters (per parameter)</td>
</tr>
<tr>
<td>Type:</td>
<td>Changed</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
</tbody>
</table>

**Description:** The Basic Software Module specifications must list configuration parameters of this or other modules this parameter relies on. A dependency is for example: the value of another parameter influences or invalidates the setting of this parameter.

**Rationale:** --

**Use Case:** Specified parameter “Bit timing register” requires other parameters e.g., “input clock frequency” which is defined in another module.

**Dependencies:** --
4.1.1.24  [BSW00396] Configuration classes

**Initiator:** WP1.1.2  
**Date:** 08.12.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Configuration classes  
**Type:** Changed  
**Importance:** High  
**Description:** There are three main configuration classes. The Basic Software Module specifications must specify the classes to be supported (per parameter). The classes are:  
- pre-compile time configuration  
- link time configuration  
- post build time configuration (could be either loadable or multiple)  
**Rationale:** Enable optimizing towards different goals of configuration.

4.1.1.25  [BSW00397] Pre-compile-time parameters

**Initiator:** WP1.1.2  
**Date:** 30.06.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Pre-compile-time parameters  
**Type:** New  
**Importance:** High  
**Description:** The configuration parameters in pre-compile time are fixed before compilation starts. The configuration of the SW element is done at source code level.  
**Rationale:** Ease generation of efficient code.

4.1.1.26  [BSW00398] Link-time parameters

**Initiator:** WP1.1.2  
**Date:** 30.06.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Link-time parameters  
**Type:** New  
**Importance:** High  
**Description:** The link-time configuration is achieved on object code basis in the stage after compiling and before linking (locating).  
**Rationale:** Concept of configuration to support modules delivered as object code.
## 4.1.1.27 [BSW00399] Loadable Post-build time parameters

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>30.06.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Loadable Post-build time parameters</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>Parameter-sets are located in a separate segment and can be loaded after the code. (see definition of post-build time configuration in the AUTOSAR glossary). This means as well the memory layout of ext. conf. parameters must be known. This set of parameters may be optimized in a way (configuration is always located at the same address) that the pointer indirection is avoided.</td>
</tr>
</tbody>
</table>

## 4.1.1.28 [BSW00400] Selectable Post-build time parameters

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>30.06.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Selectable Post-build time parameters</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>Parameter will be selected from multiple sets of parameters after code has been loaded and started. During module startup (initialization) one of several configurations is selected. Only the power up initialization is allowed to select the parameter (parameter–set). This configuration is typically a data structure that contains the relevant parameter values (see definition of post-build time configuration in the AUTOSAR glossary).</td>
</tr>
</tbody>
</table>

## 4.1.1.29 [BSW00402] Published information

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>30.06.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Published information</td>
</tr>
</tbody>
</table>
General Requirements on Basic Software Modules

4.1.2 Wake-Up

4.1.2.1 [BSW00375] Notification of wake-up reason

| Initiator: | WP4.2.2.1.12 |
| Date: | 24.11.2005 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | Notification of wake-up reason |
| Type: | New |
| Importance: | High |

**Description:**
All Basic Software Modules that implement wake-up interrupts shall report the wake-up reason to the ECU State Manager via the IO Hardware Abstraction within the wake-up interrupt. Within this notification the ECU State Manager shall store the passed wake-up ID for later evaluation.

**Rationale:**
Allow ECU State Manager to decide which start-up sequence is chosen based on the wake-up reason.

**Use Case:**
A body ECU can wake-up from 3 different wake-up sources. Depending on the wake-up reason, the ECU
- blinks the door lock indication LEDs
- performs a full start-up
- evaluates the received key ID and decides to start-up and unlock or goto sleep again

**Dependencies:**
--

**Conflicts:**
--

**Supporting Material:**
--
4.1.3 Initialization

4.1.3.1 [BSW101] Initialization interface

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>DC</th>

</tr>
</tbody>
</table>

4.1.3.3 [BSW00406] Check module initialization

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>DC</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>20.06.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Check module initialization</td>
</tr>
<tr>
<td>Type:</td>
<td>new</td>
</tr>
<tr>
<td>Importance:</td>
<td>high</td>
</tr>
<tr>
<td>Description:</td>
<td>A static status variable denoting if a BSW module is initialized shall be initialized with value 0 before any APIs of the BSW module is called. The initialization function of the BSW modules shall set the static status variable to a value not equal to 0.</td>
</tr>
</tbody>
</table>
General Requirements on Basic Software Modules
V2.0.1

Rationale:
In API calls to not initialized BSW modules should report value like “Module not initialized” to Development Error Tracer (DET) if switched on. Without the initialization of the status variable within C-initialization the module is unable to check the status.

Use Case:
The call “Can_Write()” to the Can driver causes a call
Det_ReportError (ModuleId, ApiId, ErrorId);
in case the Can driver is not initialized. In this case the return value of the
“Can_Write()” function will be “E_NOT_OK”.

Dependencies:
Exception from [BSW101]
[BSW00338] Detection and Reporting of development errors
[BSW00369] Do not return development error codes via API

Conflicts: --
Supporting Material: --

4.1.4 Normal Operation

4.1.4.1 [BSW168] Diagnostic Interface of SW components

Initiator: BOSCH
Date: 06.05.2004
AUTOSAR Release: 1.0 and higher
Short Description: Diagnostic interface of SW components for external test
Type: Changed after review in DC
Importance: Medium
Description:
If a SW component above or below RTE has the requirement to be tested by external devices e.g. in the garage, the required function shall be accessed via a common API from diagnostics services in Basic-SW (function, data interface).

Rationale: Ensure less difference in handling and kind of API
Use Case: Tester in the garage requires calibration of a certain SW-component e.g. steering angle sensor monitoring in the ESP. The interface must remain to be ready for moving this SW-component. This interface can also be used by XCP.

Dependencies: --
Conflicts: --
Supporting Material: --

4.1.4.2 [BSW00407] Function to read out published parameters

Initiator: DC
Date: 15.09.2005
AUTOSAR Release: 2.0 and higher
Short Description: Function to read out published parameters
Type: Changed, to harmonize with SWS Template
Importance: High
Description:
Each BSW module shall provide a function to read out the version information of a dedicated module implementation.

Naming convention which shall be applied:
void <Module name>_GetVersionInfo(Std_VersionInfoType *versioninfo);
This API shall be pre-compile time configurable (see BSW00411).
The version number consists of three parts:

- Two bytes for the vendor ID
- One byte for the module ID
- Three bytes version number. The numbering shall be vendor specific; it consists of:
  - The major, the minor and the patch version number of the module.
- The AUTOSAR specification version number shall not be included.

**Rationale:**
If problems are detected within an ECU during lifetime this enables the garage to check the version of the modules. The AUTOSAR specification version number is checked during compile time (see requirement BSW004) and therefore not required in this API.

**Use Case:**
With this API the garage can read out version information which is implemented in a dedicated (erroneous) ECU to enable the decision whether a software update might be sufficient, or not.

**Dependencies:**
- [BSW00318] Format of module version numbers
- [BSW00374] Module vendor identification
- [BSW00411] Get version info keyword

**Conflicts:**
--

**Supporting Material:**
--
**General Requirements on Basic Software Modules**

**V2.0.1**

<table>
<thead>
<tr>
<th>Description:</th>
<th>BSW module main processing functions are only allowed to be allocated to basic tasks (see extended and basic task according to AUTOSAR OS classification).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rationale:</td>
<td>Typically, basic tasks are more efficient then extended tasks. Enables scheduleability analysis and predictability.</td>
</tr>
<tr>
<td>Use Case:</td>
<td>Enabling scheduleability analysis of the ECU.</td>
</tr>
<tr>

### 4.1.4.5 [BSW00425] Trigger conditions for schedulable objects

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>17.10.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Trigger conditions for schedulable objects</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
</tbody>
</table>
| Description: | The BSW module description template shall provide means to model the following trigger conditions of schedulable objects:  
• Cyclic timings (fixed and selectable during runtime)  
• Sporadic events |
| Rationale: | The model of the timing behavior of a BSW module can serve for the purpose of  
(1) documentation  
(2) integration → supports the design of the schedule module. |
| Use Case:  | - |
| Dependencies: | -- |
| Conflicts: | -- |
| Supporting Material: | -- |

### 4.1.4.6 [BSW00426] Exclusive areas in BSW modules

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>

4.1.4.10  [BSW00431] The BSW Scheduler module implements task bodies

Initiator: WP1.1.2
Date: 13.07.2005
AUTOSAR Release: 2.0 and higher
Short Description: The BSW Scheduler module implements task bodies in order to call main processing functions. The BSW scheduler module will only be implemented by the (ECU) system integrator.

Rationale:
(1) The single BSW modules do not know about ECU wide dependencies and scheduling implications. Only at system integration time timing dependencies and the proper scheduling strategy is known.
(2) The integrator of the BSW shall have proper means to guarantee a valid schedule. Indirect and intransparent timing dependencies between BSW modules shall be prohibited.
(3) Eases the integration task.
(4) Allow for non-preemptive as well as for preemptive scheduling strategies.
(5) Reduction of resources (e.g., minimize the number of used tasks).

Use Case: Example:

```c
TASK(BSW_Scheduler_10ms) {
    ...
    Eep_MainFunction_1();
    Nm_MainFunction_1();
    ...
}
```

```c
TASK(BSW_Scheduler_Communications) {
    ...
    CanIf_MainFunction_Receive();
    Com_MainFunction_Receive();
    Com_MainFunction_Transmit();
    CanIf_MainFunction_Transmit();
    ...
}
```

Dependencies: --
Conflicts: --
Supporting Material: [BSW00373], TIM00431

4.1.4.11  [BSW00432] Modules should have separate main processing functions for read/receive and write/transmit data path

Initiator: WP1.1.2
Date: 17.10.2005
AUTOSAR Release: 2.0 and higher
### Short Description:
Modules should have separate main processing functions for read/receive and write/transmit data path.

### Type:
New

### Importance:
Medium

### Description:
Modules which propagate data up (read, receive) or down (write, transmit) through the different layers of the BSW should have separate main processing functions for the read/receive and write/transmit data path.

### Rationale:
Enables efficient scheduling of the main processing functions in a more specific order to reduce execution time and latency.

### Use Case:
```c
TASK(BSW_Scheduler_Communications) {
    ...
    CanIf_MainFunction_Receive();
    Com_MainFunction_Receive();
    Com_MainFunction_Transmit();
    CanIf_MainFunction_Transmit();
    ...
}
```

### Dependencies:
- [BSW00373] Main processing function naming convention

### Conflicts:
--

### Supporting Material:
--

---

#### 4.1.4.12 [BSW00433] Calling of main processing functions

<table>
<thead>

<td>Short Description:</td>
<td>Calling of main processing functions</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>Main processing functions are only allowed to be called from task bodies provided by the BSW Scheduler.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Indirect and intransparent timing dependencies between BSW modules shall be prohibited.</td>
</tr>
<tr>
<td>Use Case:</td>
<td>--</td>
</tr>
<tr>
<td>Dependencies:</td>
<td>--</td>
</tr>
<tr>
<td>Conflicts:</td>
<td>--</td>
</tr>
<tr>
<td>Supporting Material:</td>
<td>--</td>
</tr>
</tbody>
</table>

---

#### 4.1.4.13 [BSW00434] The Schedule Module shall provide an API for exclusive areas

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>20.10.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>The Schedule Module shall provide an API for exclusive areas</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>The Schedule Module shall provide a (generic) API to enter or exit exclusive areas. The Schedule Module shall implement the proper data consistency strategy. This API shall be used by the BSW modules to implement exclusive areas.</td>
</tr>
</tbody>
</table>
4.1.5 Shutdown Operation

4.1.5.1 [BSW00336] Shutdown interface

| Initiator: | DC |
| Date: | 17.06.2004 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | Shutdown interface. |
| Type: | New ([BSW101] split up into two parts) |
| Importance: | High |
| Description: | If a Basic SW module needs to shutdown functionality (e.g. release hardware resources), this shall be done in a separate API function. |
| Rationale: | Interface to ECU state manager |

4.1.6 Fault Operation and Error Detection

4.1.6.1 [BSW00337] Classification of errors

| Initiator: | WP1.1.2 |
| Date: | 17.06.2004 |
| Short Description: | Classification of errors. |
| Type: | New |
| Importance: | High |
| Description: | All AUTOSAR Basic Software Modules shall distinguish between the following two types of errors:
- errors that can/shall only occur during development and where detection and/or reporting can be statically configured (on/off)
- errors that are expected to occur also in production code |
| Rationale: | Extended error detection for debugging, basic error detection for deployment. |
| Use Case: | The EEPROM driver provides internal checking of API parameters which is only activated for the first software integration test ('development build') and disabled afterwards ('deployment build'). |
| Dependencies: | [BSW00350] Development error detection keyword |
| Conflicts: | -- |
| Supporting Material: | -- |
4.1.6.2 [BSW00338] Detection and Reporting of development errors

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>17.09.2004</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Detection and Reporting of development errors</td>
</tr>
<tr>
<td>Type:</td>
<td>Changed (only one preprocessor switch)</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>All AUTOSAR Basic Software Modules shall report detected development errors to the Development Error Tracer (DET). The detection and reporting shall be statically configurable (ON/OFF) per module with one single preprocessor switch.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Ease of debugging for development</td>
</tr>
</tbody>
</table>
| Use Case:        | For the first SW integration, the extended error detection and reporting is enabled for all modules. Detected errors like
- EEPROM address access out of valid range
- Sending on non-existent CAN channel
- API service called without former module initialization are reported to the Development Error Tracer. The calls to the API function of the DET are counted and logged for later evaluation. After successful software integration, the reporting is disabled. |
| Dependencies:    | [BSW00337] Classification of errors [BSW00350] Naming convention of development error detection keyword |
| Conflicts:       | --                    |
| Supporting Material: | --          |

4.1.6.3 [BSW00369] Do not return development error codes via API

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>26.10.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Do not return development error codes via API</td>
</tr>
<tr>
<td>Type:</td>
<td>Changed</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>All AUTOSAR Basic Software Modules shall not return specific development error codes via the API. In case of a detected development error the error shall only be reported to the DET. If the API- function which detected the error has a return type it shall return E_NOT_OK.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>The production version of a module shall have a limited number of return values.</td>
</tr>
</tbody>
</table>
| Use Case:        | Example 1: API service with standard return values (E_OK/E_NOT_OK):
If a development error is detected within this API call, the API returns E_NOT_OK. |
| Conflicts:       | --                   |
| Supporting Material: | --                  |
4.1.6.4 [BSW00339] Reporting of production relevant error status

**Initiator:** WP1.1.2  
**Date:** 17.06.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Reporting of production relevant error status  
**Type:** Changed (10.11.2005)  
**Importance:** High  
**Description:** All AUTOSAR Basic Software Modules shall report error states that are relevant for diagnostics and/or application to the DEM (Diagnostic Event Manager).

For reporting an error state the following BSW specific interface of DEM shall be called:

```c
void Dem_ReportErrorStatus(
    Dem_EventIdType   EventId,
    Dem_EventStatusType  EventStatus
)
```

If an error event occurred, `EventStatus` shall be equal to: `'DEM_EVENT_STATUS_FAILED'`

If no error event occurred, `EventStatus` shall be equal to: `'DEM_EVENT_STATUS_PASSED'`

State information shall be transferred to the DEM whenever state information is checked. Checks are not required to be cyclically or in a fixed frequency.

**Rationale:** Central configuration and handling of error events instead of spreading the handling all over the Basic Software.

**Use Case:** Error events like:
- NVRAM data block checksum error
- EEPROM cell write failure
- SPI device failure
are reported to the DEM.

**Dependencies:** [BSW00337] Classification of errors  
[BSW00327] Error values naming convention  
[BSW00386] Configuration for detecting an error

**Conflicts:** --  
**Supporting Material:** --

4.1.6.5 [BSW00417] Reporting of Error Events by Non-Basic Software

**Initiator:** Error Handling  
**Date:** 11.10.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Reporting of Error Events by Non-Basic Software  
**Type:** New  
**Importance:** High  
**Description:** Software which is not part of the Basic Software (e.g. Application SW-C) shall report error events only after the DEM is fully operational.

**Rationale:** It is only possible to store errors in error memory after the DEM is fully operational. To simplify error handling within DEM (and to gain efficiency) this requirement is needed.

**Use Case:** Reporting of non plausible sensor values.

**Dependencies:** --  
**Conflicts:** --
### 4.1.6.6 [BSW00323] API parameter checking

| Initiator: | WP1.1.2 |
| Date: | 16.06.2004 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | API parameter checking. |
| Type: | New |
| Importance: | High |
| **Description:** | All AUTOSAR Basic Software Modules shall check passed API parameters for validity. This checking shall be statically configurable (on/off, via the global configuration switch for development error detection, see BSW00350) for those errors that only can occur during development. |
| Rationale: | Ease of debugging for development, efficient code for deployment. |
| **Use Case:** | The EEPROM driver provides internal checking of API parameters which is only activated for the first software integration test ('development build') and disabled afterwards ('deployment build'). |
| **Dependencies:** | [BSW00338] Detection and Reporting of development errors  
[BSW00350] Development error detection keyword  
[BSW00327] Error values naming convention |
| **Conflicts:** | -- |
| **Supporting Material:** | -- |

### 4.1.6.7 [BSW004] Version check

| Initiator: | BMW |
| Date: | 08.02.2006 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | Version check |
| Type: | Changed |
| Importance: | High |
| **Description:** | All Basic SW Modules shall perform a preprocessor check of the versions of all included files. The integration of incompatible files shall be avoided.  
For included header files:  
• `<MODULENAME>_AR_MAJOR_VERSION`  
• `<MODULENAME>_AR_MINOR_VERSION`  
shall be identical.  
For the module internal c and h files:  
• `<MODULENAME>_SW_MAJOR_VERSION`  
• `<MODULENAME>_SW_MINOR_VERSION`  
• `<MODULENAME>_AR_MAJOR_VERSION`  
• `<MODULENAME>_AR_MINOR_VERSION`  
• `<MODULENAME>_AR_PATCH_VERSION`  
shall be identical. |
| Rationale: | Compatibility enforcement, error avoidance, ease of integration |
| **Use Case:** | For the update of Basic Software Modules, version conflicts shall be detected.  
Example:  
• For included files from other modules, the AUTOSAR-MAJOR and MINOR Version shall be verified. I.e. Can.c includes Dem.h: Only |
MAJOR and MINOR shall be verified.

- For included files from the same module all the version numbers shall be verified.

### Dependencies:

- [BSW003] Version identification
- [BSW00318] Format of module version numbers
- [BSW00402] Published information

### Conflicts:

--

### Supporting Material:

--

### 4.1.6.8 [BSW00409] Header files for production code error IDs

**Initiator:** WP1.1.2

**Date:** 15.09.2005

**AUTOSAR Release:** 2.0 and higher

**Short Description:** Header files for production code error IDs

**Type:** New

**Importance:** High

**Description:**

All production-code-error-ID symbols shall be defined in the file Dem.h or any other DEM header file which shall be included by Dem.h. Each Basic SW Module shall include the file Dem.h to retrieve the production-code-error-ID symbols and their values.

**Rationale:**

The error codes shall be defined in a central file, to simplify the include structure of the DEM.

**Use Case:**

Example for **source code integration** (for Eep):

Dem.h specifies the production code error ID:

```c
#define EEP_E_COM_FAILURE   ((Dem_EventIDType) 14)
```

Eep.c:

```c
#include “Dem.h"

..  
Dem_ReportErrorStatus( EEP_E_COM_FAILURE, DEM_FAILED );
```

Example for **object code integration** (for Eep):

Dem.h specifies the production code error ID:

```c
#define EEP_E_COM_FAILURE   ((Dem_EventIDType) 14)
```

Eep_PBcfg.c, which needs to be compiled and linked with the object code delivery:

```c
#include “Dem.h”
#include “Eep_cfg.h”

..  
const Dem_EventIDType Eep_E_Com_Failure = 
 EEP_E_COM_FAILURE;
```

Eep_cfg.h, which needs to be compiled and linked with the object code delivery:

```c
extern const Dem_EventIDType Eep_E_Com_Failure;
```

Eep.c, which is delivered as object file:

```c
#include “Dem.h”
#include “Eep_cfg.h”

..  
Dem_ReportErrorStatus( Eep_E_Com_Failure, DEM_FAILED );
```
4.1.6.9  [BSW00385] List possible error notifications

<tr>
<td>AUTOSAR Release:</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>ECU layout abstraction</td>
</tr>
<tr>
<td>Type:</td>
<td>Changed after review in VCC (06.05.2004)</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>The AUTOSAR Basic Software shall provide a hardware abstraction layer which provides a stable interface to higher software layers which is independent from the ECU hardware layout.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Keep the impact of changes in the ECU hardware layout as small as possible. Portability and reusability of modules of higher software layers. Flexibility for changes in the ECU hardware layout.</td>
</tr>
</tbody>
</table>
| Use Case:     | • Change the hardware layout of the ECU (e.g. PortA.5 → PortD.7) without affecting software layers interfacing with the hardware abstraction layer.  
• Use the NVRAM manager with an internal and/or external EEPROM.  
• Provide uniform access to analog signals using the on-chip ADC or an external ADC ASIC. |
| Dependencies: | --                   |
| Conflicts:    | --                   |
| Supporting Material: | [DOC_LAYERED_ARCH] |

4.2.1.3 [BSW005] No hard coded horizontal interfaces within MCAL

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>05.08.2004</td>
</tr>
</tbody>
</table>
4.2.1.4 [BSW00415] User dependent include files

Initiator: WP1.1.2
Date: 08.11.2005
AUTOSAR Release: 2.0 and higher
Short Description: User dependent include files
Type: New
Importance: Low
Description: Interfaces which are provided exclusively for one module should be separated into a dedicated header file.

The format of the file name shall be: <ModuleName>_User.h

Comment: Common definitions for different interfaces (e.g. types) shall be defined in a common header file (e.g. <ModuleName>.h).

Rationale: Encapsulate an interface between modules in an include file
Use Case: Example: CanIf_Pdur.h, CanIf_NM.h
Dependencies: [BSW00346] Basic set of module files.
Conflicts: --
Supporting Material: < Module name > shall be derived from WP1.1.2 “List of Basic Software Modules”, [DOC_MOD_LIST] (2…8 characters). <User> shall be the user module from the same list.--

4.2.2 Software Integration Requirements

4.2.2.1 [BSW164] Implementation of interrupt service routines

Initiator: BMW
Date: 10.02.2004
AUTOSAR Release: 1.0 and higher
Short Description: Implementation of interrupt service routines
Type: New
Importance: High
Description: Only the Operating System, complex drivers and modules of the microcontroller abstraction layer are allowed to implement interrupt service routines.

Rationale: Portability and reusability.
The implementation of interrupt service routines is highly microcontroller
4.2.2.2 [BSW00325] Runtime of interrupt service routines

**Initiator:** CAS  
**Date:** 18.03.2005  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Runtime of interrupt service routines  
**Type:** Changed  
**Importance:** High  
**Description:**  
The runtime of interrupt service routines and functions that are running in interrupt context should be kept short. Where an interrupt service routine is likely to take a long time, an operating system task should be used instead.

**Rationale:**  
Real time behavior, avoid blocking of the whole system.

**Use Case:** An ISR calls a callback which is calling other callbacks.

**Dependencies:** [BSW00333] Documentation of callback function context

**Conflicts:** --

**Supporting Material:** --

4.2.2.3 [BSW00326] Transition from ISRs to OS tasks

**Initiator:** WP1.1.2  
**Date:** 02.06.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Transition from ISRs to OS tasks  
**Type:** New  
**Importance:** High  
**Description:**  
If a transition from an interrupt service routine to an operating system task is needed, it shall take place at the lowest level possible of the Basic Software, but at the latest in the RTE.

This means: no interrupts on application level.

**Rationale:**  
Real time behavior, avoid blocking of the whole system.

**Use Case:** Negative example: An interrupt in a CAN driver calls nested functions up to the application layer. Up there, nobody knows that he is running in interrupt context.

**Dependencies:** [BSW00344] Configuration at Runtime

**Conflicts:** --

**Supporting Material:** --

4.2.2.4 [BSW00342] Usage of source code and object code

**Initiator:** WP1.1.2  
**Date:** 24.11.2005
### General Requirements on Basic Software Modules

**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Usage of source code and object code  
**Type:** Changed  
**Importance:** High  
**Description:** It shall be possible to create an AUTOSAR ECU out of modules provided as source code and modules provided as object code, even mixed.  
**Rationale:** Allow both:  
- IP protection and guaranteed test coverage : object code  
- High efficiency and configurability at ECU configuration time (by integrator) : source code  
**Use Case:** Some simple drivers could be provided as object code. More complex and configurable modules could be provided as source code or even generated code.  
**Dependencies:** [BSW00344] Configuration at Runtime  
**Conflicts:** --  
**Supporting Material:** --

#### 4.2.2.5 [BSW00343] Specification and configuration of time

**Initiator:** WP1.1.2  
**Date:** 01.07.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Specification and configuration of time  
**Type:** New  
**Importance:** High  
**Description:** The unit of time for specification and configuration of Basic SW modules shall be a physical time unit, not ticks.  
**Rationale:** The duration of a "tick" varies from system to system.  
**Use Case:** The software specification defines the unit (e.g. μs, s), for software configuration these units are used.  
**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --

#### 4.2.2.6 [BSW160] Human-readable configuration data

**Initiator:** Volvo  
**Date:** 01.03.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Configuration files of AUTOSAR Basic SW module shall be readable for human beings  
**Type:** New  
**Importance:** High  
**Description:** Files holding configuration data for AUTOSAR Basic SW modules shall have a format that is readable and understandable by human beings.  
**Rationale:** Plausibility checking, comparison of different versions of configuration data.  
**Use Case:** XML is readable.  
**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --
4.2.3 Software Module Design Requirements

4.2.3.1 Software quality

4.2.3.1.1 [BSW007] HIS MISRA C

<table>
<thead>
<tr>
<th>Initiator</th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>27.10.2005</td>
</tr>
<tr>
<td>AUTOSAR Release</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>All Basic SW Modules written in C language shall conform to the HIS subset of the MISRA C Standard.</td>
</tr>
<tr>
<td>Type</td>
<td>Changed</td>
</tr>
<tr>
<td>Importance</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>MISRA C describes programming rules for the C programming language and a process to implement and follow these rules. Only in technically reasonable, exceptional cases MISRA violations are permissible. Such violations against MISRA rules shall be clearly identified and documented within comments in the C source code (including rationale why MISRA rule is violated). The comment shall be placed right above the line of code which causes the violation and have the following syntax: /* MISRA RULE XX VIOLATION: This the reason why the MISRA rule could not be followed in this special case*/</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Portability, maintainability, error avoidance, safety</td>
</tr>
<tr>

4.2.3.2 Naming conventions

4.2.3.2.1 [BSW00300] Module naming convention

<table>
<thead>
<tr>
<th>Initiator</th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>11.05.2004</td>
</tr>
<tr>
<td>AUTOSAR Release</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Module naming convention</td>
</tr>
<tr>
<td>Type</td>
<td>New</td>
</tr>
<tr>
<td>Importance</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>All AUTOSAR Basic Software Modules shall be identified by an unambiguous name. The module name is always part of related files. Convention for module related files: - &lt;Module name&gt;*. - Spelling of module name: First letter of each word upper case, consecutive letters lower case - Module name: 2..8 letters, derived from WP1.1.2 SW Module List - Wildcard replacement according to module related file set (either basic and recommended)</td>
</tr>
<tr>
<td>Rationale:</td>
<td>The module name serves as an identifier and classification mechanism in order to group module related files.</td>
</tr>
<tr>
<td>Use Case:</td>
<td>Example: Eep.c, Eep.h, Eep_Cfg.h</td>
</tr>
</tbody>
</table>
### 4.2.3.2.2 [BSW00413] Accessing instances of BSW modules

<table>
<thead>
<tr>
<th>Initiator</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>08.12.2005</td>
</tr>
<tr>
<td>AUTOSAR Release</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description</td>
<td>Accessing instances of BSW modules</td>
</tr>
<tr>
<td>Type</td>
<td>Changed</td>
</tr>
<tr>
<td>Importance</td>
<td>Medium</td>
</tr>
</tbody>
</table>
| Description | Instances of one type of BSW module are characterized by:
- same vendor,
- same functionality,
- same hardware device.

Instances should be accessed index based.

| Rationale | -- |
| Use Case | Example:
```
MyFunction(uint8 MyIdx, MyType MyParameters, ... );
```
Or optimised for sourcecode delivery:
```
#define MyInstance(p, index) Function##index (p)
```

| Dependencies | [BSW00347] Naming separation of drivers |
| Conflicts | -- |
| Supporting Material | -- |

### 4.2.3.2.3 [BSW00347] Naming separation of different instances of BSW drivers

<table>
<thead>
<tr>
<th>Initiator</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>23.11.2005</td>
</tr>
<tr>
<td>AUTOSAR Release</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description</td>
<td>Naming separation of different instances of BSW drivers</td>
</tr>
<tr>
<td>Type</td>
<td>Changed</td>
</tr>
<tr>
<td>Importance</td>
<td>High</td>
</tr>
</tbody>
</table>
| Description | Driver modules shall be named according to the following rules (only for implementation, not for the software specification):
- First the module name has to be listed: 
  `<Module name>`
- After that the vendor Id defined in the AUTOSAR vendor list has to be given 
  `<Vendor Id>`
- At last a vendor specific name follows 
  `<Vendor specific API name>`
- All parts shall be separated by underscores "_"
- This naming extension applies to the following externally visible elements of the module:
  - File names
  - API names
  - Published parameters s |

| Rationale | Avoidance of name clashes |
| Use Case | Examples: 
- EEPROM (LD): Eep_21_LDEepDriver.c |
### 4.2.3.2.4 [BSW00305] Self-defined data types naming convention

<table>
<thead>
<tr>
<th><strong>Initiator:</strong></th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Date:</strong></td>
<td>16.11.2005</td>
</tr>
<tr>
<td><strong>AUTOSAR Release:</strong></td>
<td>1.0 and higher</td>
</tr>
<tr>
<td><strong>Short Description:</strong></td>
<td>Self-defined data types naming convention</td>
</tr>
<tr>
<td><strong>Type:</strong></td>
<td>Changed (Use Case adapted)</td>
</tr>
<tr>
<td><strong>Importance:</strong></td>
<td>High</td>
</tr>
</tbody>
</table>
| **Description:** | All AUTOSAR Basic Software Modules shall label self-defined i.e. specific data types according to the following scheme:
- Composition of type: `<Module name>_<Type name> Type`
- Only one underscore between module name and type name
- Spelling of type: First letter of each word upper case, consecutive letters lower case

**Note:**
Basic AUTOSAR types ([BSW00304]) need not support the scheme defined here.

**Rationale:**
Enhance readability and unique classification of data type identifiers.

**Use Case:**
Examples:
- `Eep_LengthType`
- `Dio_SignalType`
- `Nm_StateType`

**Dependencies:** --
**Conflicts:** --
**Supporting Material:** BMW Standard Core Programming Guidelines

### 4.2.3.2.5 [BSW00307] Global variables naming convention

<table>
<thead>
<tr>
<th><strong>Initiator:</strong></th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Date:</strong></td>
<td>19.05.2004</td>
</tr>
<tr>
<td><strong>AUTOSAR Release:</strong></td>
<td>1.0 and higher</td>
</tr>
<tr>
<td><strong>Short Description:</strong></td>
<td>Global variables naming convention</td>
</tr>
<tr>
<td><strong>Type:</strong></td>
<td>New</td>
</tr>
<tr>
<td><strong>Importance:</strong></td>
<td>High</td>
</tr>
</tbody>
</table>
| **Description:** | All AUTOSAR Basic Software Modules shall label global variables according to the following scheme:
- Composition of name: `<Module name>_<Variable name>`
- Only one underscore between module name and variable name
- Spelling of name: First letter of each word upper case, consecutive letters lower case

**Rationale:**
Enhance readability and unique classification of global variables.

**Use Case:**
Examples:
- `Can_MessageBuffer[CAN_BUFFER_LENGTH]`
4.2.3.2.6 [BSW00310] API naming convention

Initiator: WP1.1.2
Date: 16.11.2005
AUTOSAR Release: 1.0 and higher
Short Description: API naming convention
Type: Changed (Use Case adapted)
Importance: High

Description: All AUTOSAR Basic Software Modules shall implement an API based on the following naming rules:
- Composition of API: <Module name>_ServiceName()
- Module name: 2..8 letters, derived from WP1.1.2 SW Module List
- Only one underscore between module name and service name
- Spelling of API: First letter of each word upper case, consecutive letters lower case

Rationale: Avoidance of name clashes, uniform AUTOSAR API; The API shows to which module it belongs

Use Case:
- Can_TransmitFrame()
- Nm_RequestBusCommunication()
- Adc_Init()
- Eep_Write()
- Nvm_GetState()

Dependencies: --
Conflicts: --
Supporting Material: WP1.1.2 SW Module List (module short names)

4.2.3.2.7 [BSW00373] Main processing function naming convention

Initiator: WP4.2.2.1.12
Date: 15.09.2005
AUTOSAR Release: 1.0 and higher
Short Description: Main processing function naming convention
Type: Changed, according to change request of FlexRay WP.
Importance: Medium

Description: The main processing function of each AUTOSAR Basic Software Module shall be named according to the following rule:

<Module name>_MainFunction_<module specific extension> ()

Module specific extension shall be used to distinguish between multiple main processing functions of one module (e.g. Cluster index, Rx/Tx ...). If only one main processing function exists in one module no module specific extension is required.

Main processing functions shall have no parameters and no return value. Main processing functions shall not be re-entrant.

Rationale: Many modules have one or more functions that have to be called cyclically
4.2.3.2.8  [BSW00327] Error values naming convention

Initiator: WP4.2.2.1.12  
Date: 07.05.2004  
AUTOSAR Release: 1.0 and higher  
Short Description: Error values naming convention  
Type: New  
Importance: High  
Description: All AUTOSAR Basic Software Modules shall apply the following naming rules for all error values:  
- Error values shall have only CAPITAL LETTERS  
- Naming convention: `<MODULENAME>_E_<ERRORNAME>`  
- If `<ERRORNAME>` consists of several words, they shall be separated by underscores  
Rationale: Avoidance of name clashes, uniform AUTOSAR error values; The error shows to which module it belongs.  
Use Case: The EEPROM driver has the following error values:  
- EEP_E_BUSY  
- EEP_E_PARAM_ADDRESS  
- EEP_E_PARAM_LENGTH  
- EEP_E_WRITE_FAILED  
Dependencies: [BSW00331] Separation of error and status values  
[BSW00369] Do not return development error codes via API  
Conflicts: --  
Supporting Material: `<MODULENAME>` shall be derived from WP1.1.2 "List of Basic Software Modules", [DOC_MOD_LIST] (2…8 characters)

4.2.3.2.9  [BSW00335] Status values naming convention

Initiator: WP4.2.2.1.12  
Date: 07.05.2004  
AUTOSAR Release: 1.0 and higher  
Short Description: Status values naming convention  
Type: New  
Importance: High  
Description: All AUTOSAR Basic Software Modules shall apply the following naming rules for status values that are visible outside of the module:  
- Status values shall have only CAPITAL LETTERS.
**4.2.3.2.10 [BSW00350] Development error detection keyword**

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>16.09.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Development error detection keyword</td>
</tr>
<tr>
<td>Type:</td>
<td>Changed, to match SWS template</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
</tbody>
</table>
| Description: | All AUTOSAR Basic Software Modules shall apply the following naming rule for enabling/disabling the detection and reporting of development errors: 

   `<MODULENAME>_DEV_ERROR_DETECT`

| Rationale: | Provide module wide debug instrumentation facilities. Each defined keyword has to be properly documented. |
| Use Case: | Example: |

   In Eep_Cfg.h:

   ```
   #define EEP_DEV_ERROR_DETECT ON /* detection module wide enabled */
   ```

   In source Eep.c:

   ```
   #include "Eep_Cfg.h"
   ```

   ```
   #if ( EEP_DEV_ERROR_DETECT == ON )
   ..
   .: development errors to be detected
   ..
   #endif /* EEP_DEV_ERROR_DETECT */
   ```

| Dependencies: | [BSW00337] Classification of errors  
[BSW00338] Detection and Reporting of development errors  
[BSW00345] Configuration at Compile time |
| Conflicts: | -- |
| Supporting Material: | `<MODULENAME>` shall be derived from WP1.1.2 “List of Basic Software Modules”, [DOC_MOD_LIST] (2…8 characters) |
### 4.2.3.2.11 [BSW00408] Configuration parameter naming convention

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>01.09.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Configuration parameter naming convention</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>Medium</td>
</tr>
</tbody>
</table>
| Description:| All AUTOSAR Basic Software Modules configuration parameters shall be named according to the following naming rules:
- Configuration parameters shall have only CAPITAL LETTERS
- Naming convention: `<MODULENAME>_<PARAMETERNAME>`

`<MODULENAME>` is the prefix according to AUTOSAR_WP1.1.2_BasicSoftwareModules.xls

If `<PARAMETERNAME>` consists of several words, they shall be separated by underscores

| Rationale: | Avoidance of name clashes, uniform AUTOSAR configuration naming. |
| Dependencies: | -- |
| Conflicts: | -- |
| Supporting Material: | `<MODULENAME>` shall be derived from WP1.1.2 “List of Basic Software Modules”, [DOC_MOD_LIST] (2…8 characters) |

### 4.2.3.2.12 [BSW00410] Compiler switches shall have defined values

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>15.09.2005</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>2.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Compiler switches shall have defined values</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
</tbody>
</table>
| Description:| Compiler switches shall be compared with defined values. Simple checks if a compiler switch is defined shall not be used.
In general “ON” and “OFF” shall be used to switch functionality on or off.
These symbols and their values are defined in Std_Types.h

| Rationale: | C-Language allows asking for defined symbols. This shall be avoided. |
| Dependencies: | -- |
| Conflicts: | -- |
| Supporting Material: | -- |
### 4.2.3.2.13 [BSW00411] Get version info keyword

<table>
<thead>
<tr>
<th><strong>Initiator:</strong></th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Date:</strong></td>
<td>16.09.2005</td>
</tr>
<tr>
<td><strong>AUTOSAR Release:</strong></td>
<td>2.0 and higher</td>
</tr>
<tr>
<td><strong>Short Description:</strong></td>
<td>Get version info keyword</td>
</tr>
<tr>
<td><strong>Type:</strong></td>
<td>New</td>
</tr>
<tr>
<td><strong>Importance:</strong></td>
<td>High</td>
</tr>
</tbody>
</table>

**Description:**

All AUTOSAR Basic Software Modules shall apply the following naming rule for enabling/disabling the existence of the API.

<Module name>_GetVersionInfo(…) (see BSW00407):

```plaintext
<MODULENAME>_VERSION_INFO_API
```

**Rationale:**

Enable/Disable the reading out of version information

**Use Case:**

Example:

In Eep_Cfg.h:

```c
#define EEP_VERSION_INFO_API ON /*API enabled */
```

**Dependencies:**

[BSW00407] Function to read out published parameters

**Conflicts:**

--

**Supporting Material:**

< MODULENAME > shall be derived from WP1.1.2 “List of Basic Software Modules”, [DOC_MOD_LIST] (2…8 characters)--
4.2.3.3 Module file structure

4.2.3.3.1 [BSW00346] Basic set of module files

**Initiator:** BMW  
**Date:** 24.11.2005  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Basic set of module files  
**Type:** Changed  
**Importance:** High

**Description:** All AUTOSAR Basic Software Modules shall provide at least the following files:

1. Module header file: `<Module name>.h`
2. Module callback header file: `<Module name>_Cbk.h`
   if callbacks are provided to other modules
3. Module source file: `<Module name>.c`
4. Module configuration file: `<Module name>_Cfg.h`
   customizable data for module configuration.
5. Module configuration parameters: `<Module name>_Lcfg.c`
   if link time configuration parameters are used
6. Module configuration parameters: `<Module name>_PBcfg.c`
   if post build time configuration parameters are used.

If a module is present several times in one ECU BSW00347 shall be applied for the files as well.

**Rationale:** Source code and configuration are strictly separated. User defined configurations will not imply the change of the original source code.

**Use Case:**  
- Eep.c, Eep.h:  
  - Code not to be modified by user.  
- Eep_Cfg.h:  
  - Pre-compile time configuration parameters (e.g., preprocessor switches)

**Dependencies:**  
- [BSW158] Separation of configuration from implementation  
- [BSW00345] Configuration at Compile time  
- [BSW00347] Naming separation of different instances of BSW drivers  
- [BSW00370] Separation of callback interface from API  
- [BSW00314] Separation of interrupt frames and service routines

**Conflicts:** --

**Supporting Material:** `< Module name >` shall be derived from WP1.1.2 “List of Basic Software Modules”, [DOC_MOD_LIST] (2…8 characters)

4.2.3.3.2 [BSW158] Separation of configuration from implementation

**Initiator:** BMW  
**Date:** 16.09.2005  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Separation of configuration from implementation.  
**Type:** Changed to harmonize with BSW00346  
**Importance:** High

**Description:** All modules of the AUTOSAR Basic Software shall strictly separate configuration from implementation.

**Rationale:** Easy and clear configuration.

**Use Case:** The file Adc_Cfg.h contains the pre-compile time configurable parameters to set the properties of the module Adc. Post build configuration parameters are stored in the file Adc_PBcfg.c

**Dependencies:**  
- [BSW00345] Configuration at Compile time  
- [BSW00346] Basic set of module files

**Conflicts:** --
4.2.3.3  [BSW00314] Separation of interrupt frames and service routines

Initiator: BMW
Date: 07.05.2004
AUTOSAR Release: 1.0 and higher
Short Description: Separation of interrupt frames and service routines
Type: New
Importance: High
Description: All internal driver modules shall separate the interrupt frame definition from the service routine in the following way:
- `<Module name>_Irq.c`: implementation of interrupt frame
- `<Module name>.c`: implementation of service routine called from interrupt frame
Rationale: Flexibility using different compilers and/or different OS integrations
Use Case: The interrupt could be realized as ISR frame of the operating system or implemented directly without changing the driver code.
The service routine can be called directly during module test without the need of causing an interrupt.
Dependencies: --
Conflicts: --
Supporting Material: `<Module name>` shall be derived from WP1.1.2 “List of Basic Software Modules”, [DOC_MOD_LIST] (2…8 characters)

4.2.3.4  [BSW00370] Separation of callback interface from API

Initiator: BMW
Date: 12.05.2004
AUTOSAR Release: 1.0 and higher
Short Description: Separation of callback interface from API
Type: New
Importance: High
Description: All AUTOSAR Basic Software Modules shall group and out-source callback declarations in a separate header file.
Callback header file naming convention: `<Module name>_Cbk.h`
Rationale: Separate and decouple callback declaration from explicitly exported functions. Limit access and prevent misuse of unintentionally exposed API. Promote better maintainability of callback declaration, implementation and configuration.
Use Case: Example: NVRAM-Manager
callback declaration file NvM_Cbk.h:
```c
... void NvM_NotifyJobOk ( void );
void NvM_NotifyJobError ( void );
...```
Dependencies: --
Conflicts: --
Supporting Material: `<Module name>` shall be derived from WP1.1.2 “List of Basic Software Modules”, [DOC_MOD_LIST] (2…8 characters)
4.2.3.4 Standard header files

4.2.3.4.1 [BSW00348] Standard type header

| Initiator: | BMW |
| Date: | 23.07.2004 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | Standard type header |
| Type: | Changed (OSEK OS compliance added because of naming conflict with E_OK) |
| Importance: | High |
| Description: | All AUTOSAR standard types and constants shall be placed and organized in a standard type header file. Standard type header file naming convention: Std_Types.h |
| Rationale: | Provide uniform framework wide access to standard types to be used by all modules. |
| Use Case: | Each module that uses AUTOSAR integer data types and/or the standard return type shall include the file Std_Types.h. |
| Dependencies: | [BSW00357] Standard API return type [BSW00353] Platform specific type header |
| Conflicts: | -- |

Supporting Material: Important note for implementation of this header file: Because E_OK is already defined within OSEK OS, E_OK has to be checked for being already defined:

```c
/* for OSEK compliance this typedef has been added */
#ifndef STATUSTYPEDEFINED
#define STATUSTYPEDEFINED
typedef unsigned char StatusType;
#define E_OK 0
#endif
```

4.2.3.4.2 [BSW00353] Platform specific type header

| Initiator: | BMW |
| Date: | 27.07.2004 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | Platform specific type header |
| Type: | New |
| Importance: | High |
| Description: | All integer type definitions of target and compiler specific scope shall be placed and organized in a single type header. Name of platform types header file: Platform_Types.h |
| Rationale: | Separate compiler and µC-specific integer types from standard types. |
| Use Case: | Changing the microcontroller and/or compiler shall only affect a limited number of files. In Platform_Types.h:
typedef signed char sint8; /* -128 .. +127 */
typedef unsigned char uint8; /* 0 .. 255 */
typedef signed short sint16; /* -32768 .. +32767 */
typedef unsigned short uint16; /* 0 .. 65535 */
...

Dependencies:
[BSW00304] AUTOSAR integer data types
[BSW00348] Standard type header

Conflicts:
--

Supporting Material:
--

4.2.3.4.3 [BSW00361] Compiler specific language extension header

Initiator: BMW
Date: 23.07.2004
AUTOSAR Release: 1.0 and higher
Short Description: Compiler specific language extensions
Type: New
Importance: High
Description:
All mappings of not standardized keywords of compiler specific scope shall be placed and organized in a compiler specific type and keyword header. Name of compiler specific type/keyword header file: Compiler.h
Rationale:
Provision of a compiler specific header containing proprietary pre-processor directives as well as wrapper macros for all specialized language extensions.
Use Case:
Different compilers can require extended keywords to be placed in different places. e.g.:

Compiler 1:
    void __far__ function();

Compiler 2:
    __far__ void function();

It is not possible to accommodate the different implementations with inline macros, so a function-like macro style is adopted instead. This macro wraps the return type of the function and therefore permits additions to made, such as __far__, either before or after the return type.

Example:
Compiler 1:
    #define FAR(x) x __far__

Compiler 2:
    #define FAR(x) __far__ x

    FAR(void) function();
can expand to the examples given above.

4.2.3.5 Module Design

4.2.3.5.1 [BSW00301] Limit imported information

**Initiator:** BMW  
**Date:** 13.05.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Limit imported information  
**Type:** New  
**Importance:** High  
**Description:** All AUTOSAR Basic Software Modules shall only import the necessary information (i.e. header files) that is required to fulfill the modules functional requirements.  
**Rationale:** Promote defensive module layout. Modules shall not import functionality that could be misused. Shorten compile times.

**Use Case:**  
**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --

4.2.3.5.2 [BSW00302] Limit exported information

**Initiator:** BMW  
**Date:** 11.05.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Limit exported information  
**Type:** New  
**Importance:** High  
**Description:** All AUTOSAR Basic Software Modules shall export only that kind of information in their correspondent header-files explicitly needed by other modules.  
**Rationale:** Prevent other modules accessing functionality and data that is ‘none of their business’.  
**Use Case:** The NVRAM Manager shall not know all processor registers because someone has included the processor register file in another header file used by the NVRAM manager.

**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --

4.2.3.5.3 [BSW00328] Avoid duplication of code

**Initiator:** WP4.2.2.1.12  
**Date:** 01.06.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Avoid duplication of code  
**Type:** Changed  
**Importance:** Medium  
**Description:** All AUTOSAR Basic Software Modules should avoid the duplication of code.  
**Rationale:** Avoid bugs during maintenance

**Use Case:** A module contains 4 code segments which are equal. During maintenance of
4.2.3.5.4 [BSW00312] Shared code shall be reentrant

Initiator: BMW  
Date: 12.05.2004  
AUTOSAR Release: 1.0 and higher  
Short Description: Shared code shall be reentrant  
Type: New  
Importance: High  
Description: All AUTOSAR Basic Software Modules implementing shared code shall ensure reentrancy if code is exposed to preemptive environments.

Rationale: Shared code eases functional composition, reusability, code size reduction and maintainability. As a drawback, shared code must be implemented reentrant if it is used in preemptive environments.

Use Case: A subroutine or function is reentrant if a single copy of the routine can be called from several task contexts simultaneously without conflict. Use the following reentrancy techniques:

- Avoid use of static and/or global variables
- Guard static and/or global variables using blocking mechanisms
- Use dynamic stack variables

Dependencies: --  
Conflicts: --  
Supporting Material: --

4.2.3.5.5 [BSW006] Platform independency

Initiator: BMW  
Date: 16.06.2004  
AUTOSAR Release: 1.0 and higher  
Short Description: The source code of software modules above the µC Abstraction Layer (MCAL) shall not be processor and compiler dependent.

Type: Changed: the source code is meant, not the object code. This has been unclear.

Importance: High  
Description: Those software modules have to be developed once and shall be compilable for all processor platforms without any changes. Any necessary processor or compiler specific instructions (e.g. memory locators, pragmas, use of atomic bit manipulations etc.) have to be exported to macros and include files.

Rationale: Minimize number of variants and development effort  
Use Case: NVRAM Manager, Network Management, …

Dependencies: --  
Conflicts: --  
Supporting Material: --
4.2.3.6 Types and keywords

4.2.3.6.1 [BSW00357] Standard API return type

**Initiator:** BMW  
**Date:** 26.07.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Standard API return type  
**Type:** Changed (from enum to unit8)  
**Importance:** Medium  
**Description:** For success/failure of an API call the following standard return type defined in Std_Types.h can be used:

```c
typedef uint8 Std_ReturnType
```

This type has the following values:

- `E_OK`: 0  
- `E_NOT_OK`: 1  

The values `E_OK` and `E_NOT_OK` are #defines.

If specific return types are required, the module has to define its own return types.

**Rationale:** Enforces usage of already defined types instead of attempting to override existing ones.

**Use Case:**

```c
#include "Std_Types.h"

Std_ReturnType Eep_Read  
  (  
    Eep_AddressType        EepromAddress,  
    const Eep_DataType    *DataBufferPtr,  
    Eep_LengthType         Length  
  )

Return value is `E_OK` if the service has been accepted.  
Return value is `E_NOT_OK`, if a development error has been detected.

```

**Dependencies:**  
- [BSW00348] Standard type header  
- [BSW00355] Do not redefine AUTOSAR integer data types  
- [BSW00377] Module specific API return types

**Conflicts:** --  
**Supporting Material:** --

4.2.3.6.2 [BSW00377] Module specific API return types

**Initiator:** WP1.1.2  
**Date:** 16.11.2005  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Module specific API return types  
**Type:** Changed (Typing Error in description)  
**Importance:** High  
**Description:** If a Basic Software Module needs module specific return types, it shall use one of the following possibilities:

1. Use `uint8` as return value, take the standard `E_OK` value from Std_Types.h and define additional return values using #define.
2. Define a module specific return value with `typedef enum`. Within this `enum`, `E_OK` cannot be used (because `E_OK` is already `#defined` in `Std_Types.h` and OSEK OS).

**Rationale:**

Example for possibility 1:
```c
uint8 Can_Write(...)
return values: E_OK (0), CAN_E_BUSY (1), CAN_E_FAILED (2)
E_OK is taken from Std_Types.h, CAN_E_BUSY and CAN_E_FAILED are #defines in can.h.
Note: no strong type checking possible because return type is `uint8` and values are only #defines. E_OK can be used.
```

Example for possibility 2:
```c
Can_ReturnType Can_Write(...)
Return values: CAN_OK, CAN_E_BUSY, CAN_E_FAILED
Can_ReturnType is an enumeration type in can.h:
typedef enum
{
    CAN_OK = 0,
    CAN_E_BUSY,
    CAN_E_FAILED
} Can_ReturnType;
Note: strong type checking possible because only the values of the enumeration may be assigned to variables of type Can_ReturnType. E_OK cannot be used here!
```

**Use Case:**

```c
#include "Std_Types.h"

Std_ReturnType Eep_Read
{
    Eep_AddressType EepromAddress,
    const Eep_DataType *DataBufferPtr,
    Eep_LengthType Length
}
```

Return value is `E_OK` if the service has been accepted. Return value is `E_NOT_OK`, if a development error has been detected.

**Dependencies:** [BSW00357] Standard API return type

**Conflicts:** --

**Supporting Material:** --

### 4.2.3.6.3 [BSW00304] AUTOSAR integer data types

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>07.05.2004</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>AUTOSAR integer data types</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
</tbody>
</table>
**Description:**
All AUTOSAR Basic Software Modules shall use the following data types instead of native C data types:

1. Fixed size guaranteed
   - Data type - Representation
     - `uint8`: 8 bit
     - `uint16`: 16 bit
     - `uint32`: 32 bit
     - `sint8`: 7 bit + 1 bit sign
     - `sint16`: 15 bit + 1 bit sign
     - `sint32`: 31 bit + 1 bit sign

2. Minimum size guaranteed, best type is chosen for specific platform (only allowed for module internal use, not for API parameters)
   - Data type - Representation
     - `uint8_least`: At least 8 bit
     - `uint16_least`: At least 16 bit
     - `uint32_least`: At least 32 bit
     - `sint8_least`: At least 7 bit + 1 bit sign
     - `sint16_least`: At least 15 bit + 1 bit sign
     - `sint32_least`: At least 31 bit + 1 bit sign

Above integer types shall be placed in the central AUTOSAR type header (Platform_Types.h) which is defined individually for each supported platform.

**Rationale:**
MISRA-C compliance.
The usage of native C-data types (`char, int, short, long`) is forbidden as size and sign are not unambiguously defined and therefore are platform specific. Portability, reusability

**Use Case:**
The `.least` data types can be chosen if optimal performance is required (e.g. for loop counters).

- `uint8_least` ... `uint32_least` could all be 32 bit on a 32 bit platform.

**Dependencies:**
[BSW00353] Platform specific type header

**Conflicts:**
--

**Supporting Material:**
[BSW007] HIS MISRA C

---

### 4.2.3.6.4 [BSW00355] Do not redefine AUTOSAR integer data types

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>05.08.2004</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Do not redefine AUTOSAR integer data types</td>
</tr>
<tr>
<td>Type:</td>
<td>Changed during WP1.1.2 review</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>All AUTOSAR Basic Software Modules shall NOT define own types on top of the AUTOSAR integer data types if this is not necessary and the data width is known at specification time.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Improve readability of source code. Avoid a flood of different cryptic types.</td>
</tr>
</tbody>
</table>
| Use Case: | Example 1: The parameter `DeviceIndex` is known during specification time (8 bit):
DO NOT:
typedef `uint8` `DeviceIndexType`

... 
static `DeviceIndexType` `DeviceIndex` |
PLEASE DO:
static uint8 DeviceIndex

Example 2:
The parameter DeviceAddress is platform dependent (could by 16..32 bit).
It is required for runtime efficiency, that the best type is chosen for a specific
platform:
On 16 bit platforms:
typedef uint16 DeviceAddressType

On 32 bit platforms:
typedef uint32 DeviceAddressType

Dependencies: [BSW00304] AUTOSAR integer data types
Conflicts: --
Supporting Material: --

4.2.3.6.5 [BSW00378] AUTOSAR boolean type

| Initiator: | WP1.1.2 |
| Date: | 10.02.2005 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | AUTOSAR boolean type |
| Type: | New (finally …) |
| Importance: | Low |
| Description: | For simple logical values and checks and for API return values the following
AUTOSAR boolean type defined in Platform_Types.h can be used:

    boolean

This type has the following values:
FALSE: 0
TRUE: 1

The only allowed operations are: assignment, return, test for equality with
TRUE or FALSE.

Rationale: Repeating requests of several WPs to define a boolean data type.

Use Case: API return value. Example:
In file Eep.h:
#include "Std_Types.h" /* this automatically includes
Platform_Types.h */

    boolean Eep_Busy(void) {...}

In calling module:
if (Eep_Busy() == FALSE) {...}

Dependencies: --
Conflicts: --
Supporting Material: Please refer to the AUTOSAR C Programming Guidelines for further
restrictions of usage of this type.
Compiler vendors that provide a boolean data type that cannot be disabled
have to change their compiler (i.e. make it ANSI C compliant).
4.2.3.6  [BSW00306] Avoid direct use of compiler and platform specific keywords

**Initiator:** BMW  
**Date:** 14.05.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Avoid direct use of compiler and platform specific keywords  
**Type:** Changed (poor BMW macros replaced by LiveDevices’ powerful macros)  
**Importance:** High  
**Description:** All AUTOSAR Basic Software Modules shall not use compiler or platform specific keywords directly.

**Rationale:**
Direct use of not standardized keywords like "_near", "_far", "_pascal" in the frameworks source code will create compiler and platform dependencies that must strictly be avoided. If no precautions were made, portability and reusability of influenced code is deteriorated and effective release management is costly and hard to maintain.

**Use Case:** If specific keywords are needed, they shall be redefined (mapped) as follows:

Compiler.h:
```
#define FAR(X)   __far__ (X);
```

Usage of macro within source code:
```
FAR(void) function();
```

**Dependencies:** [BSW00361] Compiler specific language extension header

4.2.3.7 Global data

4.2.3.7.1  [BSW00308] Definition of global data

**Initiator:** BMW  
**Date:** 12.05.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Definition of global data  
**Type:** Changed  
**Importance:** High  
**Description:** AUTOSAR Basic Software Modules shall not define global data in their header files. If global variables have to be used, the definition shall take place in the C file.

**Rationale:** Avoid multiple definition and uncontrolled spreading of global data, limit visibility of global variables.

**Use Case:** --  
**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --

4.2.3.7.2  [BSW00309] Global data with read-only constraint

**Initiator:** BMW  
**Date:** 12.05.2004
General Requirements on Basic Software Modules

<table>
<thead>
<tr>
<th>AUTOSAR Release:</th>
<th>1.0 and higher</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short Description:</td>
<td>Global data with read-only constraint</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>All AUTOSAR Basic Software Modules shall indicate all global data with read-only purposes by explicitly assigning the const keyword.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>In principle, all global data shall be avoided due to extra blocking efforts when used in preemptive runtime environments. Unforeseen effects are to occur if no precautions were made. If data is intended to serve as constant data, global exposure is permitted only if data is explicitly declared read-only using the const modifier keyword.</td>
</tr>
<tr>
<td>Use Case:</td>
<td>const uint8 MaxPayload = 0x18;</td>
</tr>
<tr>
<td>Dependencies:</td>
<td>--</td>
</tr>
<tr>
<td>Conflicts:</td>
<td>--</td>
</tr>
<tr>
<td>Supporting Material:</td>
<td>--</td>
</tr>
</tbody>
</table>

4.2.3.8 Interface and API

4.2.3.8.1 [BSW00371] Do not pass function pointers via API

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP1.1.2</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>The passing of function pointers as API parameter is forbidden for all AUTOSAR Basic Software Modules.</td>
</tr>
</tbody>
</table>
| Rationale: | • HIS MISRA C  
• Protected Operating System compatibility  
• Callbacks shall be defined statically at compile time, not during runtime |
| Use Case: | No, forbidden!!! |
| Dependencies: | [BSW007] HIS MISRA C |
| Conflicts: | -- |
| Supporting Material: | -- |

4.2.3.8.2 [BSW00358] Return type of init() functions

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>BMW</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>24.07.2004</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Return type of init() functions</td>
</tr>
<tr>
<td>Type:</td>
<td>New</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>The return type of init() functions implemented by AUTOSAR Basic Software Modules shall be void.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Errors in initialization data shall be detected during configuration time (e.g. by configuration tool).</td>
</tr>
<tr>
<td>Use Case:</td>
<td>--</td>
</tr>
<tr>
<td>Dependencies:</td>
<td>[BSW101] Initialization interface</td>
</tr>
<tr>
<td>Conflicts:</td>
<td>--</td>
</tr>
</tbody>
</table>
4.2.3.8.3 [BSW00414] Parameter of init function

**Initiator:** WP1.1.2  
**Date:** 08.02.2006  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Parameter of init function  
**Type:** Changed  
**Importance:** High  
**Description:** The init function in general shall have no parameter. If post build time configuration is required, the pointer to the configuration shall be passed. If instances of the module have to be addressed, the index and the according pointer to the configuration shall be passed.  
**Comment:** If a module provides different variants where only some are supporting post build time, multiple (selectable) configuration parameter sets, all variants shall have a pointer as parameter.  
**Rationale:** --  
**Use Case:**  
Example:  
void NvM_Init (void)  
Or in case of multiple (selectable) configurable configuration parameter sets:  
void Eep_Init (const Eep_ConfigType *ConfigPtr)  
Or in case of an instance index:  
void Fr_Init (uint8 Fr_CtrlIdx, const Fr_ConfigType *ConfigPtr)  
**Dependencies:** [BSW101] Initialization interface,  
[BSW00358] Return type of init() functions  
[BSW00400] Selectable Post-build time parameters  
**Conflicts:** --  
**Supporting Material:** --

4.2.3.8.4 [BSW00376] Return type and parameters of main processing functions

**Initiator:** WP1.1.2  
**Date:** 17.09.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Return type and parameters of main processing functions  
**Type:** New  
**Importance:** High  
**Description:** The return type of main processing functions implemented by AUTOSAR Basic Software Modules shall be void. These functions shall have no parameters.  
**Rationale:** Many modules have a function that has to be called cyclically (e.g. within an OS Task) and that does the main work of the module. Those functions shall have no parameters and no return value.  
**Use Case:** void Eep_MainFunction(void)  
**Dependencies:** [BSW00373] Main processing function naming convention  
**Conflicts:** --  
**Supporting Material:** --
## 4.2.3.8.5 [BSW00359] Return type of callback functions

| Initiator: | BMW |
| Date: | 05.08.2004 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | Return type of callback functions |
| Type: | Changed during WP1.1.2 review |
| Importance: | Medium |
| Description: | All AUTOSAR Basic Software Modules callback functions shall avoid return types other than void if possible. |
| Rationale: | Callbacks shall be used for notifications. Callbacks should never fail. |
| Use Case: | -- |
| Dependencies: | -- |
| Conflicts: | -- |
| Supporting Material: | -- |

## 4.2.3.8.6 [BSW00360] Parameters of callback functions

| Initiator: | BMW |
| Date: | 24.07.2004 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | Parameters of callback functions |
| Type: | New |
| Importance: | High |
| Description: | AUTOSAR Basic Software Modules callback functions are allowed to have parameters. |
| Rationale: | Enhance flexibility and scope of callback functionality. |
| Use Case: | If callback functions do serve as simple triggers, no parameter is necessary to be passed. |
| | If additional data is to be passed to the caller within the callback scope, it shall be possible to forward the contents of that data using a parameter. |
| Dependencies: | -- |
| Conflicts: | -- |
| Supporting Material: | -- |

## 4.2.3.8.7 [BSW00329] Avoidance of generic interfaces

| Initiator: | WP4.2.2.1.12 |
| Date: | 01.06.2004 |
| AUTOSAR Release: | 1.0 and higher |
| Short Description: | Avoidance of generic interfaces |
| Type: | New |
| Importance: | High |
| Description: | All Basic Software Modules shall not use generic interfaces. A ‘generic interface’ is an interface without a defined scope and content. |
| Rationale: | Avoidance of backdoors for incompatible extensions and hidden features. Increase readability. |
| Use Case: | Do not use IoctlSync/Async() function as defined in HIS specification. Behind this interface there can be anything. |
| Dependencies: | -- |
### 4.2.3.8.8 [BSW00330] Usage of macros / inline functions instead of functions

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>CAS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>08.12.2004</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Usage of macros / inline functions instead of functions</td>
</tr>
<tr>
<td>Type:</td>
<td>Changed</td>
</tr>
<tr>
<td>Importance:</td>
<td>Low</td>
</tr>
<tr>
<td>Description:</td>
<td>It shall be allowed to use macros instead of functions where source code is used and runtime is critical. It shall be allowed to use inline functions for the same purpose. Inline functions have the advantage (compared to macros) that the compiler can do type checking of function parameters and return values.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Improve runtime behavior.</td>
</tr>
<tr>
<td>Use Case:</td>
<td>--</td>
</tr>
<tr>
<td>Dependencies:</td>
<td>Macros as well as inline functions are only possible when source code is delivered.</td>
</tr>
<tr>
<td>Conflicts:</td>
<td>--</td>
</tr>
<tr>
<td>Supporting Material:</td>
<td>MISRA-C Attention has to be paid within reentrant systems.</td>
</tr>
</tbody>
</table>

### 4.2.3.8.9 [BSW00331] Separation of error and status values

<table>
<thead>
<tr>
<th>Initiator:</th>
<th>WP4.2.2.1.12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date:</td>
<td>09.06.2004</td>
</tr>
<tr>
<td>AUTOSAR Release:</td>
<td>1.0 and higher</td>
</tr>
<tr>
<td>Short Description:</td>
<td>Separation of error and status values</td>
</tr>
<tr>
<td>Type:</td>
<td>Changed (Use Case adapted to current EEPROM specification)</td>
</tr>
<tr>
<td>Importance:</td>
<td>High</td>
</tr>
<tr>
<td>Description:</td>
<td>All Basic Software Modules shall strictly separate error and status information. This requirement applies to return values and also to internal variables.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Common API specification of AUTOSAR Basic Software Modules.</td>
</tr>
<tr>
<td>Use Case:</td>
<td>Example (EEPROM driver): A module status is e.g. the state of a state machine and can be read by a separate Eep_GetStatus() function:</td>
</tr>
<tr>
<td></td>
<td>• EEP_UNIT</td>
</tr>
<tr>
<td></td>
<td>• EEP_IDLE</td>
</tr>
<tr>
<td></td>
<td>• EEP_BUSY</td>

4.2.4 Software Documentation Requirements

4.2.4.1 [BSW009] Module User Documentation

**Initiator:** BMW  
**Date:** 10.12.2003  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** All Basic SW Modules shall be documented according to a common standard.  
**Type:** New  
**Importance:** High  
**Description:** The module documentation shall contain at least the following items:  
- Cover sheet with title, version number, date, author, document status, document name  
- Change history with version number, date, author, change description, document status  
- Table of contents (navigable)  
- Functional overview  
- Source file list and description  
- Module requirements  
- Used resources (interrupts, µC peripherals etc.)  
- Integration description (OS, interface to other modules etc.)  
-  
- Configuration description with parameter, description, unit, valid range, default value, relation to other parameters  

The module documentation shall also contain examples for  
- the correct usage of the API  
- the configuration of the module

**Rationale:** User acceptance, maintainability, usability  
**Use Case:** Standard Core  
**Dependencies:**  
- [BSW010] Resource and runtime documentation  
- [BSW00333] Documentation of callback function context  
- AUTOSAR software description  
**Conflicts:** --  
**Supporting Material:** --

4.2.4.2 [BSW00401] Documentation of multiple instances of configuration parameters

**Initiator:** WP1.1.2  
**Date:** 09.11.2005  
**AUTOSAR Release:** 2.0 and higher  
**Short Description:** Documentation of multiple instances of configuration parameters  
**Type:** New  
**Importance:** High  
**Description:** “Multiplicity” defines how often an entity (in this case configuration parameter) is present. The multiplicity of each configuration parameter has to be documented. It shall be documented what determines the number of entries (e.g. “one per frame”).
4.2.4.3 [BSW172] Compatibility and documentation of scheduling strategy

| Rationale: | Overall (throughout the complete Basic Software) harmonization of configuration parameter naming. |
| Use Case:  | Id of a PDU is multiple time present dependent on the number of PDUs to be sent/received. |
| Dependencies: | -- |
| Conflicts: | -- |
| Supporting Material: | -- |

**4.2.4.3 [BSW172] Compatibility and documentation of scheduling strategy**

**Initiator:** BOSCH  
**Date:** 29.02.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Changed after WP1.1.2 review (01.07.2004)  
**Type:** Changed after WP1.1.2 review (01.07.2004)  
**Importance:** High  
**Description:** The scheduling strategy that is built inside the Basic Software Modules shall be compatible with the strategy used in the system.

To achieve this, the following items shall be documented:
- polling / event driven
- cooperative / pre-emptive
- for each cyclic function:
  - invocation rate (either fixed value or allowed range)
  - acceptable jitter
  - execution order (dependencies to other modules)
  - synchronous / asynchronous processing
  - minimum and maximum function runtime (WCET)
  - maximum interrupt rate

**Rationale:** Today scheduling mechanisms differ between ECUs. A Basic Software Module provides several entry points to be accessed by the other Basic Software Modules/surrounding system. E.g. a function can react directly on event or by a scheduled polling. The differences may result in difference in real-time requirements, system load, latency etc.!

**Use Case:** On the one hand it is possible to avoid any direct function call between BSW modules by using only scheduling and data interface – more deterministic.
On the other hand it is possible that beside the scheduling additional functional interfaces exists to control BSW modules – less deterministic.
The integrating SW-system and its SW-architecture might restrict direct function calls between SW-components. Thus not any SW-component will fit in this SW-system.

**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --

4.2.4.4 [BSW010] Memory resource documentation

**Initiator:** BMW  
**Date:** 10.12.2003  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** The memory consumption of all Basic SW Modules shall be documented for a defined configuration for all supported platforms.  
**Type:** New
General Requirements on Basic Software Modules
V2.0.1

4.2.4.5 [BSW00333] Documentation of callback function context

Initiator: WP4.2.2.1.12
Date: 09.06.2004
AUTOSAR Release: 1.0 and higher
Short Description: Documentation of callback function context
Type: New
Importance: High
Description: For each callback function it shall be specified if it is called from interrupt context or not.
Rationale: User awareness. The code inside a callback function called from an ISR has to be kept short.
Use Case: Some notification function is called from an ISR of the CAN driver. The user filling this callback function has to know that the function is running in interrupt context!
Dependencies: --
Conflicts: --
Supporting Material: --

4.2.4.6 [BSW00374] Module vendor identification

Initiator: WP4.2.2.1.12
Date: 08.02.2006
AUTOSAR Release: 1.0 and higher
Short Description: Module vendor identification
Type: New
Importance: Medium
Description: All Basic Software Modules shall provide a readable module vendor identification (according to HIS) in their published parameters.
Naming convention:
- `<MODULENAME>Vendor_ID`

The vendor ID shall be represented in `uint16` (16 bit).
Rationale: Allow identification of module vendor
Use Case: EEPROM_VENDOR_ID
Dependencies: --
Conflicts: --
Supporting Material: `<MODULENAME>` shall be derived from WP1.1.2 "List of Basic Software Modules", [DOC_MOD_LIST] (2…8 characters)
4.2.4.7 [BSW00379] Module identification

**Initiator:** WP1.1.2  
**Date:** 10.02.2005  
**AUTOSAR Release:** 1.0 and higher

**Short Description:** All software modules shall provide a module identifier in the header file and in the module XML description file.

**Type:** New  
**Importance:** High

**Description:** All software modules shall provide a module ID both in the header file and in the module XML description file. The value shall be taken from the Basic Software Module List.

**Rationale:** Required for error reporting to Development Error Tracer (DET).

**Use Case:** In file Eep.h:  
```c
#define EEP_MODULE_ID   90
```

**Dependencies:** [BSW00334] Provision of XML file

**Conflicts:** --

**Supporting Material:**  
- `<MODULENAME>_MODULE_ID`

4.2.4.8 [BSW003] Version identification

**Initiator:** BMW  
**Date:** 08.02.2006  
**AUTOSAR Release:** 1.0 and higher

**Short Description:** Version identification

**Type:** Changed  
**Importance:** Medium

**Description:** All software modules shall provide a readable software version number in all header files. Version number macros can be used for checking and reading out the software version of a software module during compile time and runtime. It is preferred to derive this information from the version management system automatically.

**Rationale:** Compatibility checking, configuration supervision

**Use Case:** --

**Dependencies:** [BSW004] Version check  
[BSW00318] Format of module version numbers

**Conflicts:** --

**Supporting Material:** --

4.2.4.9 [BSW00318] Format of module version numbers

**Initiator:** BMW  
**Date:** 16.11.2005
### General Requirements on Basic Software Modules

**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Format of module version numbers  
**Type:** Changed to match the SWS template  
**Importance:** High

**Description:** Each AUTOSAR Basic Software Module file shall provide version numbers in the header file as defined below:

Naming convention:
- `<MODULENAME>_SW_MAJOR_VERSION`
- `<MODULENAME>_SW_MINOR_VERSION`
- `<MODULENAME>_SW_PATCH_VERSION`
- `<MODULENAME>_AR_MAJOR_VERSION`
- `<MODULENAME>_AR_MINOR_VERSION`
- `<MODULENAME>_AR_PATCH_VERSION`

AR: Major/minor/patch version number of AUTOSAR specification which the appropriate implementation is based on.  
SW: Major/minor/patch version number of the vendor specific implementation of the module. The numbering shall be vendor specific, but it shall follow requirement [BSW00321](#).  

Each number shall be represented in `uint8` (8 bit).

**Rationale:** Allow version identification and version checking in between software modules.

**Use Case:** Example: Adc vendor module version 1.14.9; implemented according to the AUTOSAR Specification of ADC 2.1.12

```c
#define ADC_SW_MAJOR_VERSION 1  
#define ADC_SW_MINOR_VERSION 14  
#define ADC_SW_PATCH_VERSION 9  
#define ADC_AR_MAJOR_VERSION 2  
#define ADC_AR_MINOR_VERSION 1  
#define ADC_AR_PATCH_VERSION 12
```

**Dependencies:**
- [BSW00321](#) Enumeration of module version numbers  
- [BSW00374](#) Module vendor identification  
- [BSW00402](#) Published information

**Conflicts:** --

**Supporting Material:** `<MODULENAME>` shall be derived from WP1.1.2 “List of Basic Software Modules”, [DOC_MOD_LIST](#) (2…8 characters)

### 4.2.4.10 [BSW00321] Enumeration of module version numbers

**Initiator:** BMW  
**Date:** 11.05.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Enumeration of module version numbers  
**Type:** New  
**Importance:** High

**Description:** The version numbers of AUTOSAR Basic Software Modules shall be enumerated according to the following rules:
- Increasing a more significant digit of a version number resets all less significant digits
- The PATCH_VERSION is incremented if the module is still upwards and downwards compatible (e.g. bug fixed)
- The MINOR_VERSION is incremented if the module is still downwards compatible (e.g. new functionality added)
- The MAJOR_VERSION is incremented if the module is not compatible
### 4.2.4.11 [BSW00341] Microcontroller compatibility documentation

**Initiator:** WP1.1.2  
**Date:** 01.07.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Microcontroller compatibility documentation  
**Type:** New  
**Importance:** High  
**Description:** The module documentation of all microcontroller dependent modules shall specify the following items:  
- Microcontroller vendor  
- Microcontroller family  
- Microcontroller derivative  
- Microcontroller stepping (mask revision)  

**Rationale:** Opportunity to identify uniquely the specific microprocessor, including known bugs in the silicon so that its compatibility with the software can be established.  
**Use Case:** Different mask revisions of e.g. TriCore  
**Dependencies:** --  
**Conflicts:** --  
**Supporting Material:** --

### 4.2.4.12 [BSW00334] Provision of XML file

**Initiator:** WP1.1.2  
**Date:** 16.06.2004  
**AUTOSAR Release:** 1.0 and higher  
**Short Description:** Provision of XML file  
**Type:** Changed (vendor ID removed from API)  
**Importance:** High  
**Description:** All Basic Software Modules shall provide an XML file that contains the meta data which is required for the SW configuration and integration process.  
**Comment:** This meta data will be defined by WP4.1.1.2. As a preliminary hint, this data describes  
- Names of the API services provided by this modules including the assignment to the AUTOSAR API specification  
- Names of API services required by this module  
- Error names and their semantics  
- Module documentation
### Rationale:
- Being able to have several drivers of the same type (e.g. 2 different external flash drivers) on the same ECU without name clash
- Ensure system consistency and correctness

### Use Case:
```
<function_provided>
  <name>Eep_Write</name>
  <prototype>Eep_ST16RF42_Write</prototype>
</function_provided>
```

ST16RF42 is the type of the external EEPROM

### Dependencies:
--

### Conflicts:
--
